

Did some work on bbm4 probably best to wait for analysis and more input Aitor/wp5 before actual assembling

A curiosity F.Y.I.

For the bending experiments we needed to hold the alpside on a concave surface somehow this works like a charm (after 2 years failing to hold silicon on a convex surface ????) we current don't see a use for it in assembly for its3.

Extra:

The silicon layer we glued in utrecht spontaneous broke after a couple months while piking it up
It had been handled quite a lot before no problem.(I hope the cern engineering module is still good ?)

(Carbon fiber support is on hold as long as the carbonfoom is stil the preverd construction)
