CKM global fits and new physics in meson mixing

"This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 101031558"

Luiz VALE SILVA (IFIC, UV – CSIC)

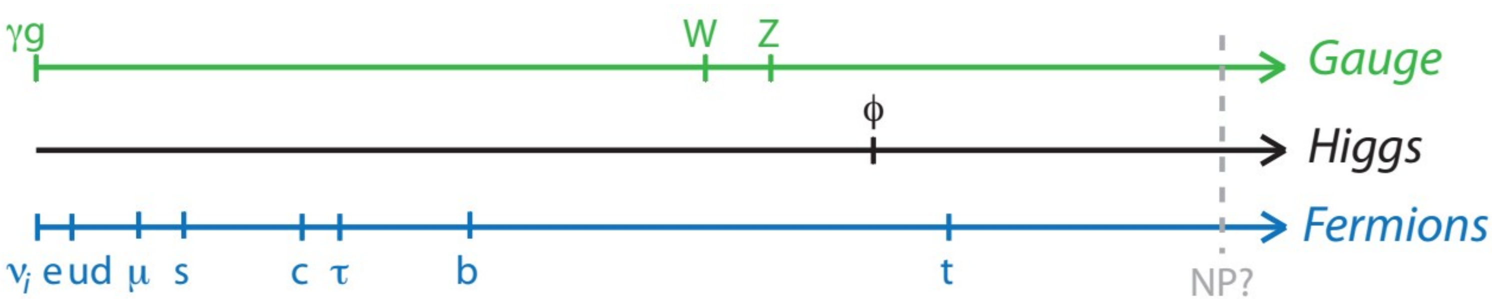
[Charles, Descotes-Genon, Ligeti, Monteil, Papucci, Trabelsi, LVS, PRD 102, 056023 (2020), arXiv:2006.04824]

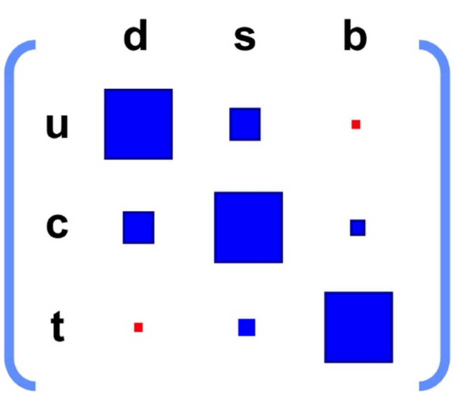
6th FCC Physics Workshop, Krakow, 25/01/2023

The Standard Model (SM) and Beyond

- **Flavour physics** played a central role in the **formulation of the SM** (new fermion generations, manifestation of CP Violation, etc.)
- **Many flavour observables enjoy the status of *precision physics*, thanks to progress in different fronts (e.g.** QCD inputs)
- **Flavour physics** can play a **leading role** in addressing the questions left open by the SM, and reveal New Physics sectors

Hierarchies in the spectrum of particles and CKM matrix:

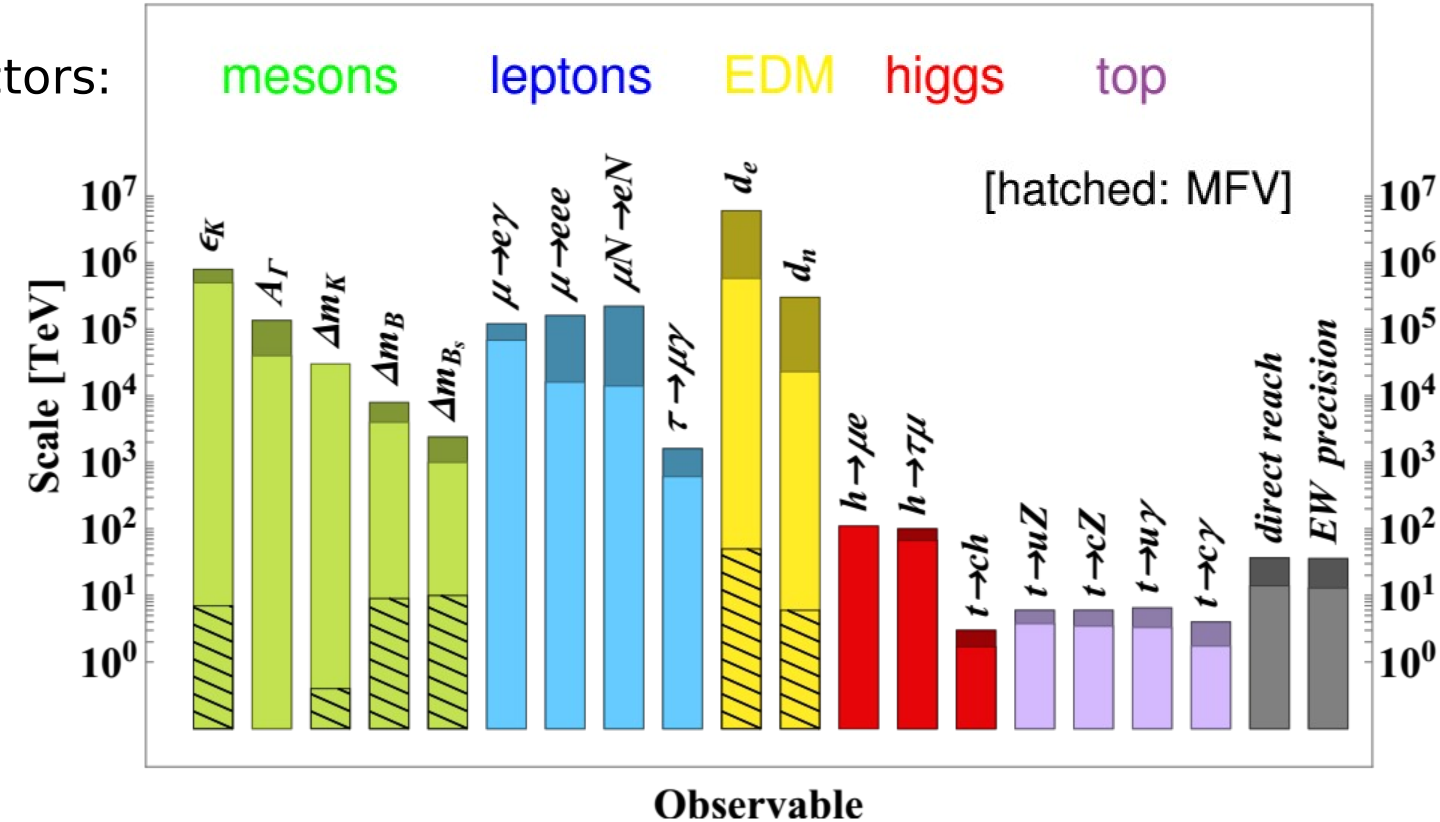




Reach to New Physics (NP)

- **Low-energy observables** → probe energies much beyond the reach of direct searches
- **The bounds on non-SM contributions shape NP candidates**
- **If deviation seen, possible NP manifestation!**

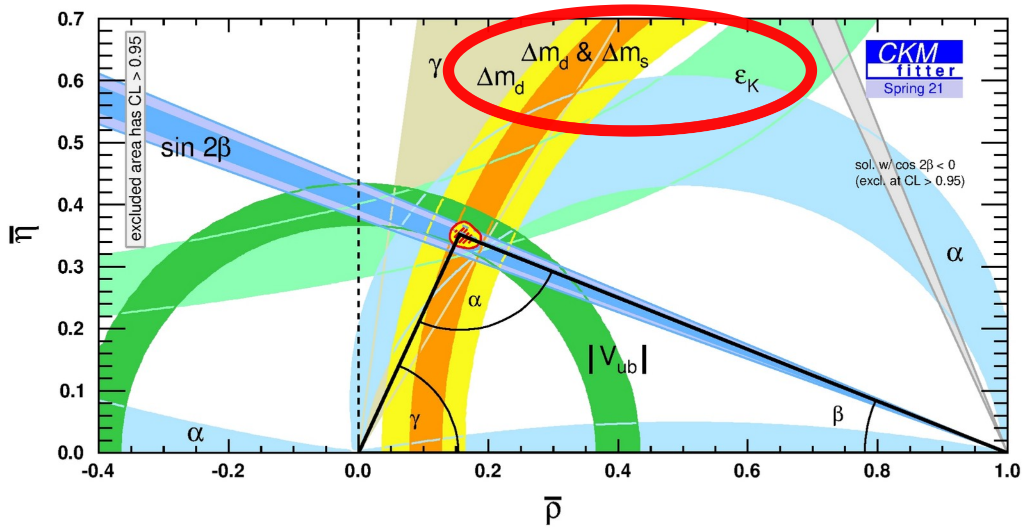
Different sectors:



[European Strategy Update 2020, arXiv:1910.11775]

Current status of flavour

- **Overall agreement w/ the SM, but some existing tensions (e.g., incl. vs excl. $|V_{xb}|$)**



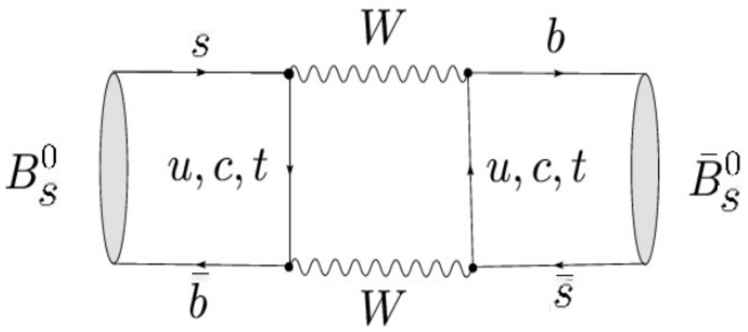
[CKMfitter update as of Spring '21]

- **Flavour is one of the main physics cases for <u>future experiments</u>**
- **Future data will guide the field**, <u>testing present anomalies</u> and possibly <u>revealing new ones</u>

NP in B meson mixing

- **HERE:** **address <u>present and future bounds</u> on NP in |ΔB|=2, and discuss <u>future limitations</u>**

- **|ΔB|=2: NP competes with suppressions in the SM (GIM/loop), and enjoy the status of precision physics**



- **Not discussing D meson mixing**

[K meson mixing: PRD 89, 033016 (2014), arxiv:1309.2293]

- **Combine projections for future data**: need global fit including “tree” and “loop” observables

[see e.g. CKMfitter]

NP in B meson mixing

- **NP in |ΔB|=2:**
  h_d and h_s set sizes

Bag parameters,
↓ decay constants

$$M_{12} = M_{12}^{\text{SM}} \times (1 + h\, e^{2i\sigma})$$

↑ ↗
NP parameters

- **Assumptions**:
  - No NP in |ΔF|=1:
    tree level in SM (γ, $|V_{ub}|$, $|V_{cb}|$, ...) free of NP
  - NP is short-distance
  - Unitarity of the CKM 3x3 matrix
  - Unrelated NP in B_d and B_s systems

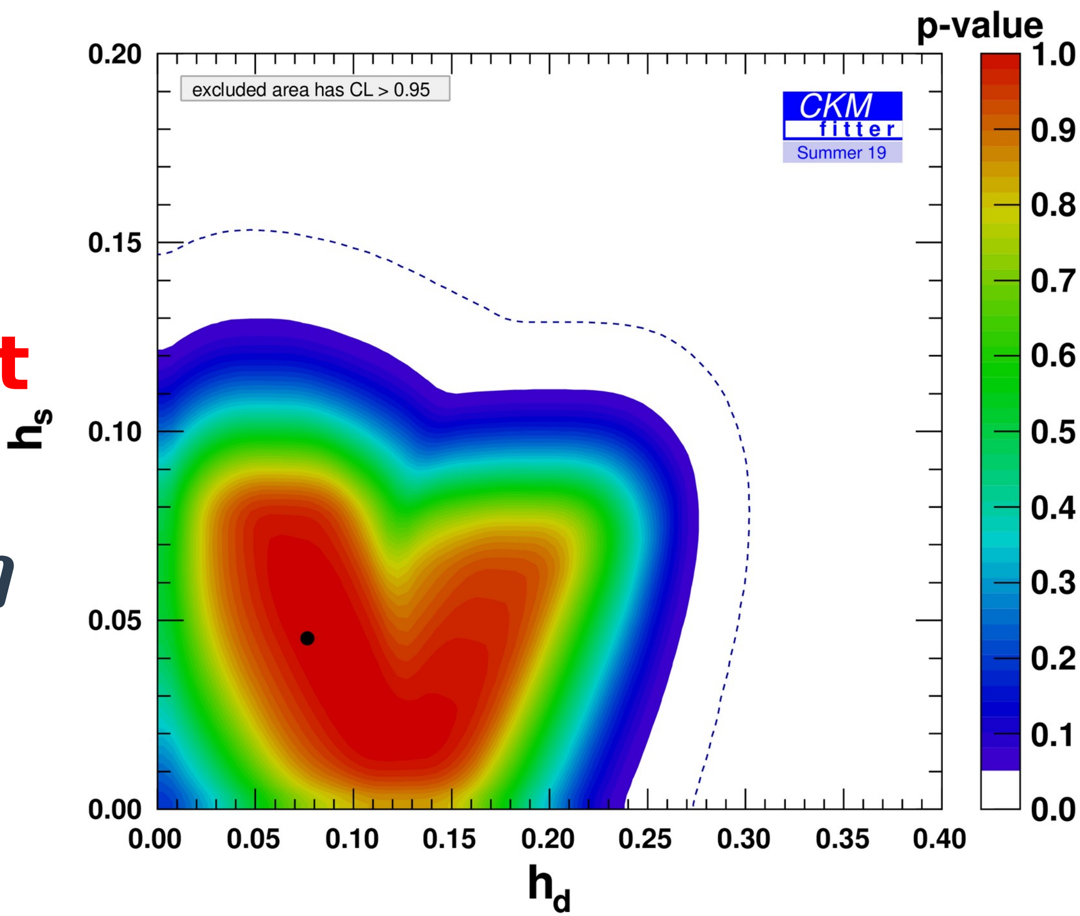
[See: PRD 89, 033016 (2014), arxiv:1309.2293]

- SMEFT: **four-quark operators** of different chiral structures

Present status of NP in B meson mixing

- **Agreement with the SM (h_d=h_s=0) at ~1σ**
- **Allowed size for NP at the level of O(20%)!**
- **Extractions of ρ and η** (Wolfenstein parm.) degrade by factor ~3

Status as of Summer '19



Black dot: best fit point; σ_d and σ_s are unconstrained

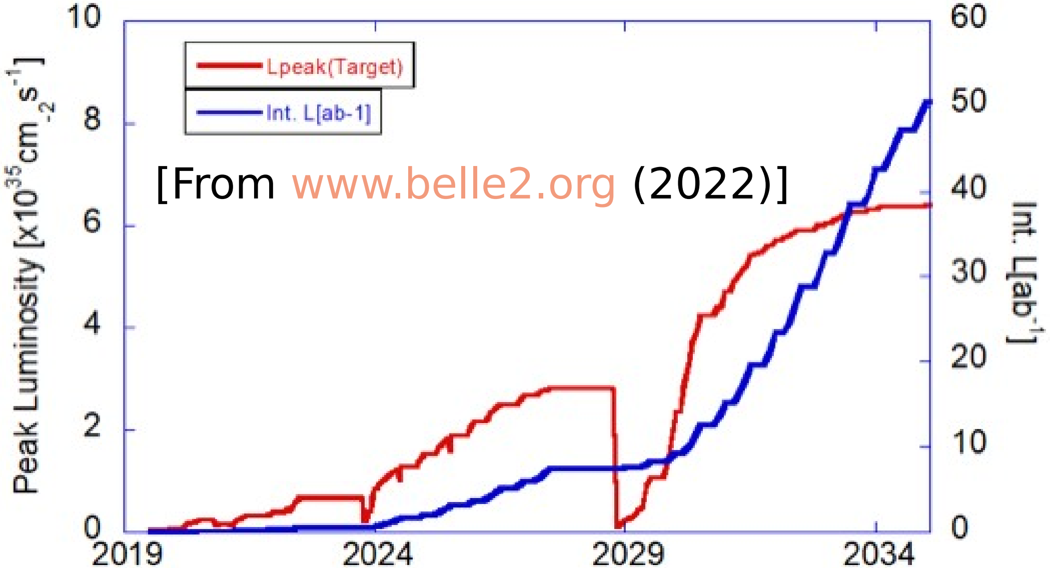
New era of flavour ahead

	LHC era			HL-LHC era	
	Run 1 (2010-12)	Run 2 (2015-18)	Run 3 (2021-24)	Run 4 (2027-30)	Run 5+ (2031+)
ATLAS, CMS	25 fb^{-1}	150 fb^{-1}	300 fb^{-1}	⟶	3000 fb^{-1}
LHCb	3 fb^{-1}	9 fb^{-1}	23 fb^{-1}	50 fb^{-1}	*300 fb^{-1}

* assumes a future LHCb upgrade to raise the instantaneous luminosity to $2x10^{34}$ $cm^{-2}s^{-1}$

[↑ See arXiv:1808.08865]

- Expression of interest for an **LHCb Upgrade II**
- **Belle II**: 50x the Belle and nearly 100x the BaBar data sets; ongoing discussions about **upgrade**



[From www.belle2.org (2022)]

Benchmarks for the future

- **Phase I**: **LHCb-upgrade I** 50/fb, & **Belle II** 50/ab
- **Phase II: LHCb-upgrade II** 300/fb, & **Belle II upgrade** 250/ab
- **Phase III: Phase II + FCC-ee**

FCC-ee: initial phase of FCC; operates at different EW thresholds: **5×10^{12} Z bosons**, **10^8 WW pairs**, $>10^6$ Higgses, $>10^6$ tt pairs

Attribute	$\Upsilon(4S)$	pp	Z^0
All hadron species		✓	✓
High boost		✓	✓

and EPJPlus 136, 912 arXiv:2106.12168]

Experimental and theoretical inputs

- **Caveat**: experimental sensitivity studies for FCC still in progress...
- **$|V_{ub}|_{SL}$ & $|V_{cb}|_{SL}$**: dominance of stat. Uncs. @ Phase II (Belle II U.)

  $|V_{cb}|$ accuracy ~0.4% @ FCC-ee: $W \to bc$ [Schune, Monteil]

  [incl. vs excl. inputs and impact on extraction of NP in $|\Delta F|=2$: De Bruyn, Fleischer, Malami, van Vliet]

  [recent B_c to $\tau\nu$ @ Tera-Z: Zheng, Xu, Cao, Yu, Wang, Prell, Cheung, Ruan; Amhis, Hartmann, Helsens, Hill, Sumensari]
- **Future stat. accuracy in angles (α, β, β_s, γ) ~< 1°**

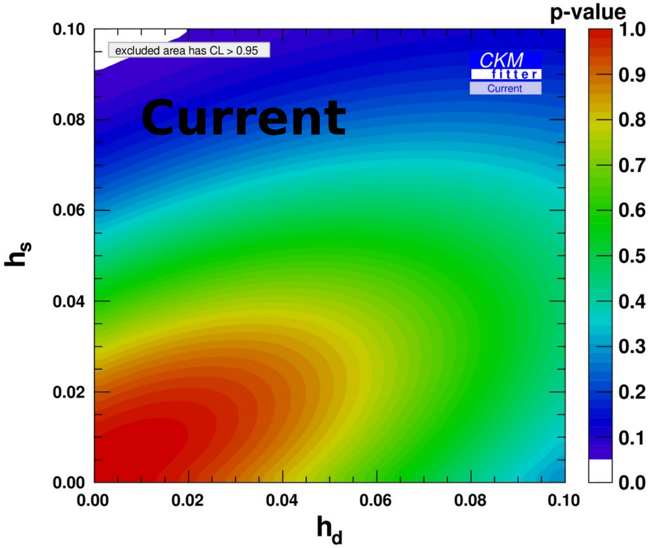
  At this level of exp. accuracy: need for theo. studies of isospin breaking corrections, penguin pollution, etc.

  [recent dedicated α @ Tera-Z (B^0 to $\pi^0\pi^0$): Wang, Descotes-Genon, Deschamps, Li, Chen, Zhu, Ruan]

  [recent Tera-Z studies of β_s, etc.: Aleksan, Oliver, Perez; Aleksan, Oliver, Perez; Li, Ruan, Zhao]
- Phases I and II uncs. for **Lattice QCD** (decay constants, bag parameters) < 1%

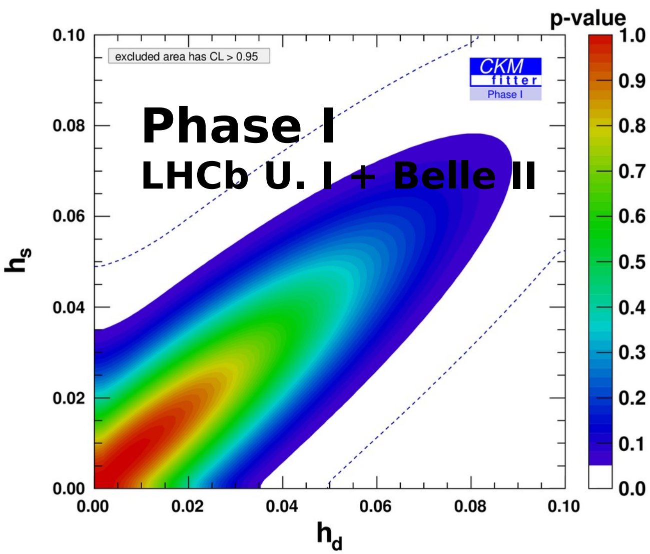
  Literature discusses Lattice QCD projections up to Phase II

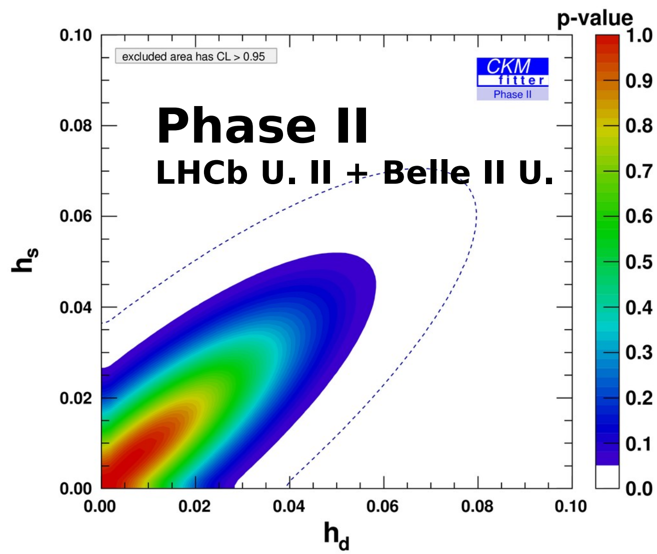
Future improvements



- SM reference: <u>shift the central values</u>
- Compared to Current, **improvement by factor >3 (5) at Phase I (II)**

Sensitivities	Summer 2019	Phase I	Phase II
h_d	0.26	0.073	0.049
h_s	0.12	0.065	0.044

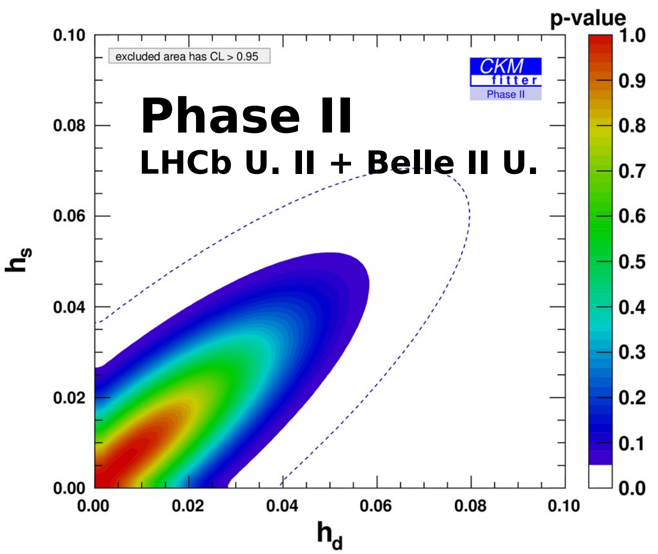


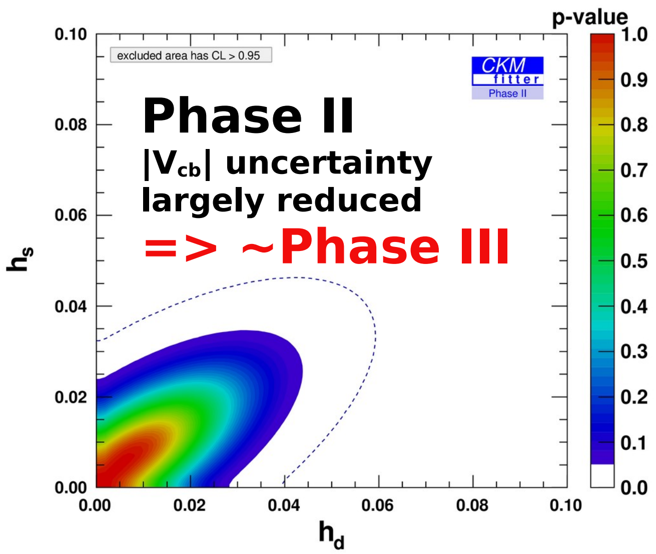


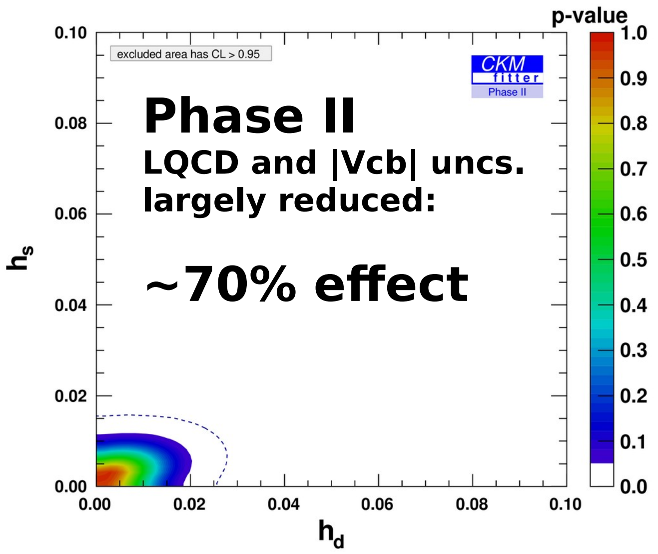
Bottlenecks

Necessary improvements beyond current expectations **for enhancing sensitivity to NP**:

- **Lattice QCD** (also short-distance QCD corrections)
- **$|V_{cb}|$**, overall normalization (Wolfenstein parameter A)
- **Individual impacts on h_d and h_s**: O(20-30)%







Future reach to NP in B meson mixing

$$\frac{C_{ij}^2}{\Lambda^2}(\bar{q}_{i,L}\gamma_\mu q_{j,L})^2, \quad \Rightarrow \quad h \simeq 1.5\frac{|C_{ij}|^2}{|\lambda_{ij}^t|^2}\frac{(4\pi)^2}{G_F\Lambda^2} \simeq \frac{|C_{ij}|^2}{|\lambda_{ij}^t|^2}\left(\frac{4.5\ \text{TeV}}{\Lambda}\right)^2,$$

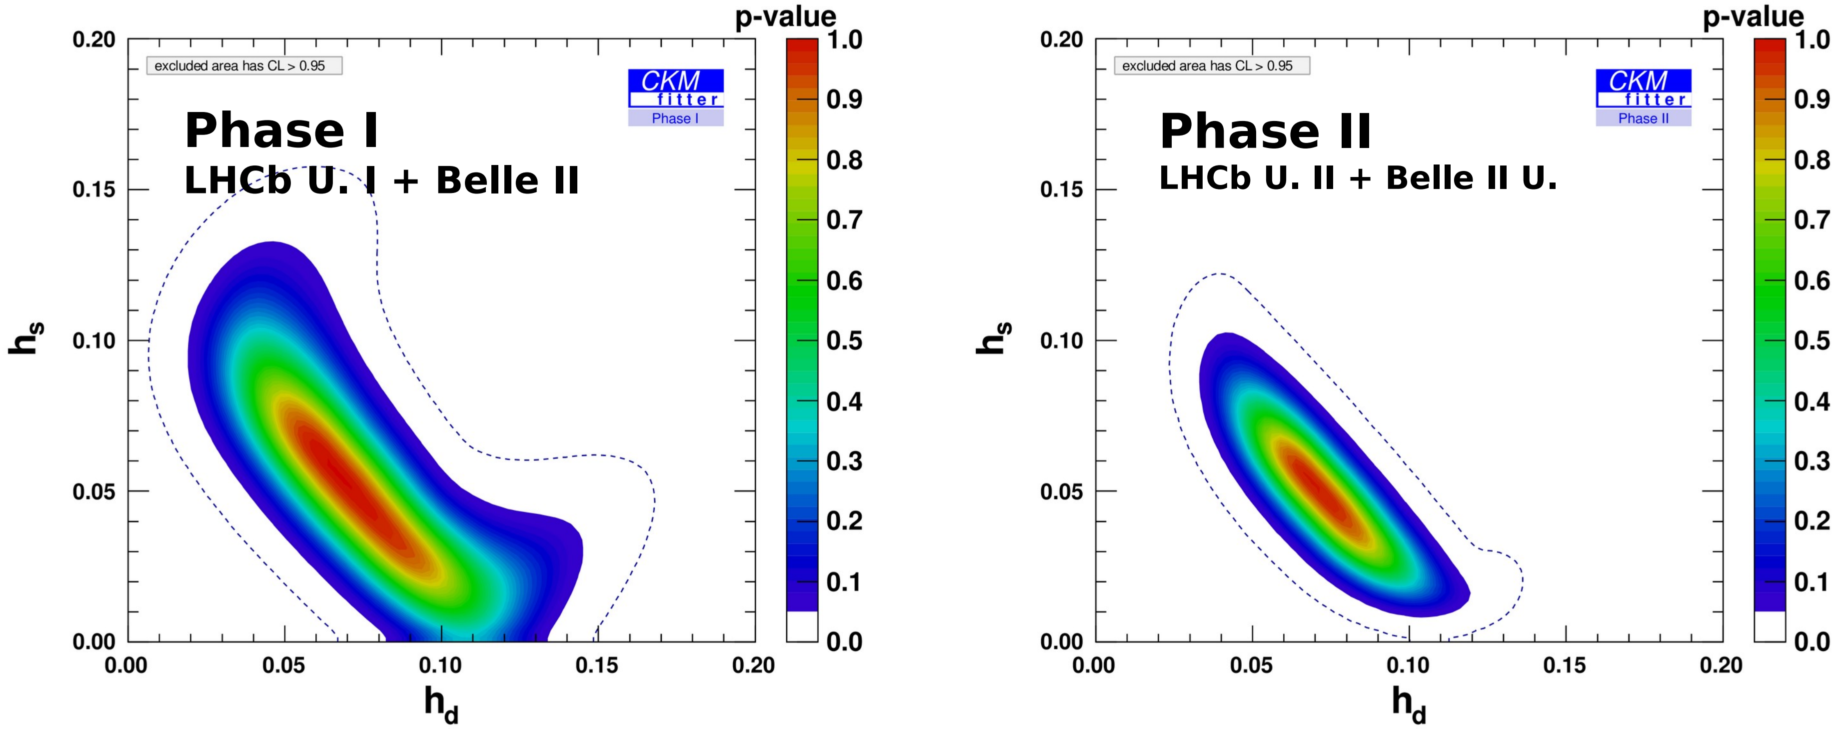
$$\sigma = \arg(C_{ij}\lambda_{ij}^{t*}),$$

- In the absence of suppressions: **NP scale >> TeV**
- Possible flavour and loop suppressions: **alleviate bounds on NP**

		Sensitivity for Summer 2019 [TeV]		Phase I Sensitivity [TeV]		Phase II Sensitivity [TeV]	
Couplings	NP loop order	B_d mixing	B_s mixing	B_d mixing	B_s mixing	B_d mixing	B_s mixing
$\lvert C_{ij}\rvert = \lvert V_{ti}V_{tj}^*\rvert$	Tree level	9	13	17	18	20	21
(CKM-like)	One loop	0.7	1.0	1.3	1.4	1.6	1.7
$\lvert C_{ij}\rvert = 1$	Tree level	1×10^3	3×10^2	2×10^3	4×10^2	2×10^3	5×10^2
(No hierarchy)	One loop	80	20	2×10^2	30	2×10^2	40

Discovery prospects

B meson mixing observables also provide potential **discovery for NP**



Conclusions

- Flavour physics: crucial in **shaping the SM**, but also in looking for **candidates of NP**
- $|\Delta B|=2$: only one flavour aspect of future experimental and theoretical progress
- Allowed NP in B meson mixing **still large**: bounds will largely improve
- Identified future limitations in Phase II:

  LQCD and $|V_{cb}|$
- Complementarity: FCC-ee addresses $|V_{cb}|$ bottleneck

BACK UP!

Experimental quantities vs. theoretical ones

Observables considered in the fit that are modified by NP in |ΔB|=2:

$$\Delta_q = |\Delta_q| e^{i2\Phi_q^{\mathrm{NP}}}$$

parameter	prediction in the presence of NP
Δm_q	$\lvert\Delta_q^{\mathrm{NP}}\rvert \times \Delta m_q^{\mathrm{SM}}$
2β	$2\beta^{\mathrm{SM}} + \Phi_d^{\mathrm{NP}}$
$2\beta_s$	$2\beta_s^{\mathrm{SM}} - \Phi_s^{\mathrm{NP}}$
2α	$2(\pi - \beta^{\mathrm{SM}} - \gamma) - \Phi_d^{\mathrm{NP}}$
$\Phi_{12,q} = \mathrm{Arg}[-\frac{M_{12,q}}{\Gamma_{12,q}}]$	$\Phi_{12,q}^{\mathrm{SM}} + \Phi_q^{\mathrm{NP}}$
A_{SL}^q	$\frac{\Gamma_{12,q}}{M_{12,q}^{\mathrm{SM}}} \times \frac{\sin(\Phi_{12,q}^{\mathrm{SM}}+\Phi_q^{\mathrm{NP}})}{\lvert\Delta_q^{\mathrm{NP}}\rvert}$
$\Delta\Gamma_q$	$2\lvert\Gamma_{12,q}\rvert \times \cos(\Phi_{12,q}^{\mathrm{SM}} + \Phi_q^{\mathrm{NP}})$

Different representation

$$\langle B_q | \mathcal{H}_{\Delta B=2}^{\rm SM+NP} | \bar{B}_q \rangle \equiv \langle B_q | \mathcal{H}_{\Delta B=2}^{\rm SM} | \bar{B}_q \rangle \times (\mathrm{Re}(\Delta_q) + i\,\mathrm{Im}(\Delta_q))$$

$$\mathrm{Re}(\Delta_q) + i\mathrm{Im}(\Delta_q) = r_q^2 e^{i2\theta_q} = 1 + h_q e^{i\sigma_q}$$
