

# Production of Medical Radionuclides in Russia: Status and Future

*B.L. Zhuikov*

Institute for Nuclear Research  
of Russian Academy of Sciences, Moscow-Troitsk

*3<sup>rd</sup> International Nuclear Chemistry Congress  
Sicily - Italy, Sept. 18-23, 2011*

# *Main Producers of Medical Isotopes in Russia*

- **Kurchatov Institute of Atomic Energy (Moscow): cyclotron, liquid fuel reactor**
- **Production Association MAYAK (Ozersk, Ural region): nuclear reactor, hot cells**
- **Research Institute of Atomic Reactors (Dimitrovgrad): high flux reactor, hot cells**
- **Medical Preparations Plant (Moscow): hot cells**
- **Institute for Physics and Power Engineering (Obninsk): hot cells**
- **Karpov Institute of Physical Chemistry (Obninsk): nuclear reactor, hot cells**
- **Cyclotron Co. (Obninsk): 23 MeV and 14 MeV cyclotrons**
- **Khlopin Radio Institute (St-Petersburg): cyclotron**
- **Central Research Institute of Radiology and Roentgenology (St-Petersburg)**
- **State Institute of Applied Chemistry (St-Petersburg): hot cells**
- **Institute for Nuclear Research of Russian Academy of Sciences (Troitsk): LINAC**

# *Kurchatov Institute of atomic Energy, Moscow*

**“ARGUS” – 20 kW solution reactor  
Fuel:  $\text{UO}_2\text{SO}_4$  water solution (HEU)**

## **SOLUTION REACTOR:**

**$^{99}\text{Mo}$  (under development)**

**$^{89}\text{Sr}$  via  $^{89}\text{Kr}$  (under development)**

## **CYCLOTRON 30 MeV:**

**$^{201}\text{Tl}$  ( $^{203}\text{Tl}$ -targets)**

**$^{123}\text{I}$  (via irradiation of  $^{124}\text{Xe}$ )**

# *Production Association MAYAK, Ozersk, Chelyabinsk region (URAL)*

**Reactors «Ruslan» and «Ludmila»**

**RADIOISOTOPE PLANT**

**Produced radionuclides:**

**$^{89,90}\text{Sr}$ ,  $^{32}\text{P}$ ,  $^{35}\text{S}$ ,  $^{14}\text{C}$ ,  $^{99}\text{Mo}$  (under development)**

**Process facility for production of gamma-sources (Co-60, Ir-192, etc.) for medicine, sterilizers and flaw meters**

**RADIOISOTOPE PLANT**

**Radioactive isotopes**

# *Research Institute of Atomic Reactors (RIAR), Dimitrovgrad (Volga region)*

## Produced radionuclides:

$^{117m}\text{Sn}$ ,  $^{125}\text{I}$ ,  $^{131}\text{I}$ ,  $^{188}\text{W}$ ,  $^{89}\text{Sr}$ ,  $^{153}\text{Sm}$ ,  $^{177}\text{Lu}$ ,  
 $^{144}\text{Ce}$  - spring microsources, actinides

$^{99}\text{Mo}$  (starting up)

**Nuclear reactors for isotope production: RBT-10/1 and 10/2  
BOR-60 (fast neutrons) SM-3  $2 \cdot 10^{15} \text{ n/cm}^2 \cdot \text{s}$**

# *Mo-99 Crisis and the Role of Russia*

*About 80% of all radiodiagnostic procedures are performed with  $^{99\text{m}}\text{Tc}$*

## *Consumption of molybdenum-99 (6-day decay)*

**In the world: 12 000 Ci/week**  
**in USA: 5 000 - 7 000 Ci/week**  
.....  
**in Russia 200 Ci/week**

### *Main producers:*

<b>MDS Nordion (Canada –NRU, Maple-1)</b>	<b>40%</b>	←
<b>Covidien (Netherlands - HFR, Belgium - BR2, France - Osiris)</b>	<b>25%</b>	
<b>IRE (Belgium)</b>	<b>20%</b>	
<b>NTR (South Africa)</b>	<b>10%</b>	
<b><u>Others:</u></b>	<b>5%</b>	

**Russia, Australia, Indonesia, Argentina, Chili, Poland, Romania, Pakistan, Egypt**  
**NEAR FUTURE: China (2015), Japan (2014), South Korea (2016)**

### *Russian project at RIAR (Dimitrovgrad) (2011-2012)*

**1<sup>st</sup> step: 800-1000 Ci/week, 2<sup>nd</sup> step: 2200-2500 Ci/week**  
**(Alkaline technology of German company Isotope Technologies Dresden)**

# *The most prospective ways solving the “Mo-99 crisis”*

- 1. Targets from low enriched uranium (LEU), 19.9% or lower  $^{235}\text{U}$**   
*Successful developments in Argentina, South Korea, Australia, South Africa, Belgium*
- 2. Solution reactors**  
*Developments in USA (Babcock & Wilcox - Covidien), Taiwan, Russia (KI-“ARGUS”)*  
*The most prospective challenge: LEU*
- 3. Accelerators – mainly of electrons ( $\gamma$ , n)**  
*also protons ( $p$ , n) IRE/IBA: Ta+p (350 MeV, 1000  $\mu\text{A}$ )*
- 4. Neutron capture  $^{98}\text{Mo}$  (n,  $\gamma$ )  $^{99}\text{Mo}$**   
*Less effective local production in many places in small amounts*

**THERE ARE SEVERAL MORE APPROACHES**

# *Karpov Institute of Physical Chemistry (Obninsk branch)*

**Nuclear reactor  
Hot cells**

## **PRODUCED RADIONUCLIDES**

**$^{99}\text{Mo}$  (local supplies and export)**

**$^{99\text{m}}\text{Tc}$ -generator**

**$^{131}\text{I}$ -sodium iodide, sodium  
hippurate, bengal rose,  
human serum albumin**

**$^{125}\text{I}$  (under development)**

**$^{67}\text{Ga}$ -citrate**

**$^{188}\text{W}/^{188}\text{Re}$ -generator**

**(under development)**

**$^{103}\text{Pd}$  (together with INR)**

# *Institute for Physics and Power Engineering (IPPE), Obninsk, Kaluga region*

First world's nuclear power plant

## MEDICAL ISOTOPE PRODUCTION

- $^{125}\text{I}$  – microspheres for prostate cancer therapy
- $^{90}\text{Sr}$  – microspheres for cardio-vascular therapy
- $^{99\text{m}}\text{Tc}$ -generator (GMP in project)
- $^{188}\text{W}/^{188}\text{Re}$ -generator
- $^{225}\text{Ac}$ ,  $^{225}\text{Ac}/^{213}\text{Bi}$ -generator (under development)
- $^{133}\text{Xe}$
- $^{32}\text{P}$

# *Cyclotron Co., Obninsk (at IPPE site)*

## **TWO CYCLOTRONS:**

**23 MeV (1100 $\mu$ A) and 14 MeV (1500 $\mu$ A) protons, deuterons,  $\alpha$ -particles**

## **PRODUCED RADIONUCLIDES**

**$^{67}\text{Ga}$ ,  $^{68}\text{Ga}$ ,  $^{103}\text{Pd}$ ,  $^{111}\text{In}$ ,  $^{85}\text{Sr}$ ,**

**$^{68}\text{Ge}/^{68}\text{Ga}$ -generator**

## **7 HOT CELLS**

**KURCHATOV INSTITUTE  
OF ATOMIC ENERGY**  
p - 30 MeV,  
Solution nuclear reactor

**DUBNA**

**JOINT INSTITUTE  
FOR NUCLEAR RESEARCH**  
p-680 MeV, Pulse nuclear reactor  
 $\alpha$  - 36 MeV, Heavy Ions

**INSTITUTE OF  
BIOPHYSICS**  
Radiopharmaceuticals

**MOSCOW**

**TROITSK**

**INSTITUTE FOR  
NUCLEAR RESEARCH**  
p - 160-600 MeV

## *Isotopes Produced in INR and Possible Activity Generating in One Accelerator Run at 120 $\mu$ A*

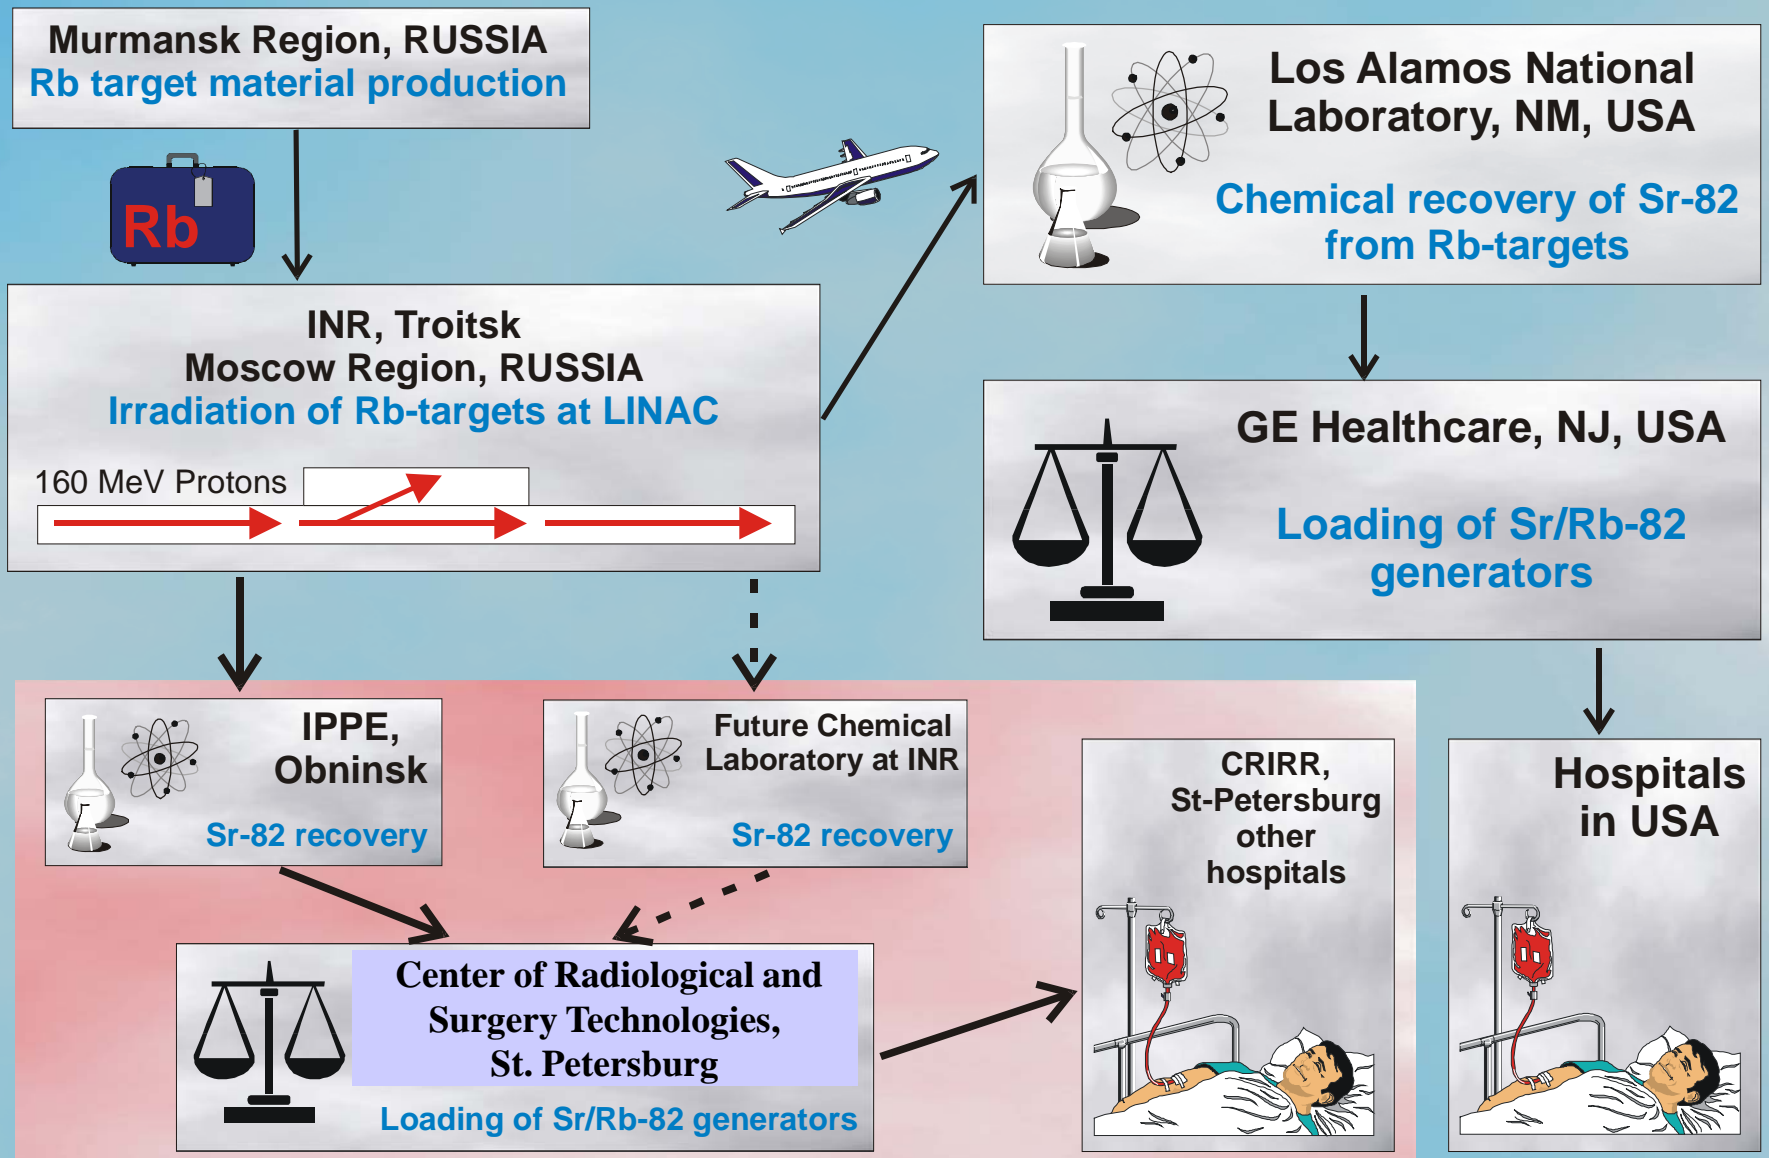

Radio-nuclide	Half life period	Target	Energy range, MeV	Bombardment period, hr	Activity produced in one run at EOB, Ci
<b>Sr-82</b>	25.5 d	Rb	100-40	250	5
<b>Na-22</b>	2.6 y	Mg, Al	150-35	250	2
<b>Cd-109</b>	453 d	In	150-80	250	2
<b>Pd-103</b>	17 d	Ag	150-50	250	50
<b>Ge-68</b>	288 d	Ga, GaNi	50-15	250	0.5
<b>Sn-117m</b>	14 d	Sb, TiSb	150-40	250	3
<b>Se-72</b>	8.5 d	GaAs	60-45	250	3
<b>Cu-67</b>	62 hr	Zn-68	150-70	100	10
<b>Cu-64</b>	12.7 hr	Zn	150-40	15	15
<b>Ac-225</b>	10 d	Th	150-40	250	4
<b>Ra-223</b>	11.4 d	Th	150-40	250	13

**Green** – regular mass production

**Blue** – technology developed, test samples supplied to customers

**Red** – production method developed, technology under development

# Production and Transportation Scheme of Strontium-82

# *Processing of INR metallic rubidium target for recovery strontium-82 at Los Alamos*

(successful GIIP project INR with LANL)

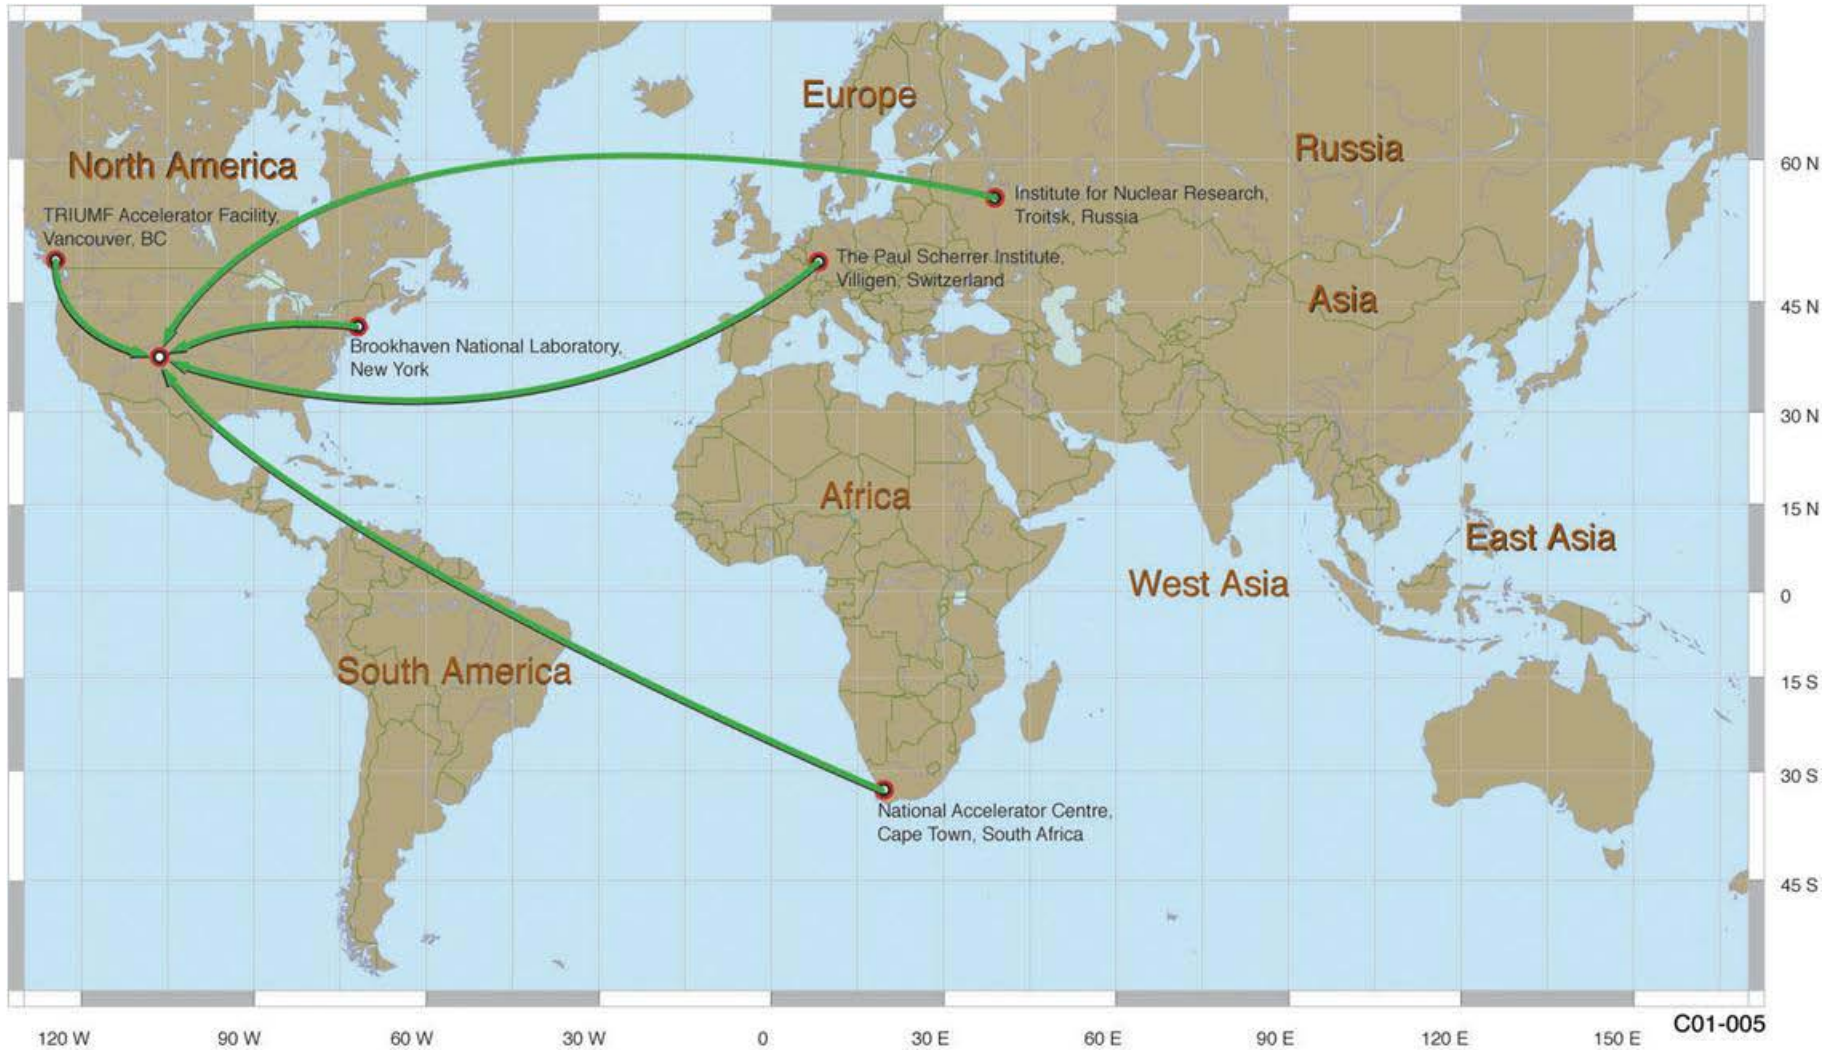

**Total amount of irradiated and shipped target: more than 100**

# *Existing Accelerator Facilities for Radioisotope Production at High Intensity Proton Beam of Middle Energy*

- **Brookhaven National Laboratory (NY, USA)**  
**200 MeV, 100  $\mu$ A**
- **Los Alamos National Laboratory (NM, USA)**  
**100 MeV, 200  $\mu$ A**
- **TRIUMF (Vancouver, Canada)**  
**110 MeV, 70  $\mu$ A**
- **iThemba Laboratory (Cape Town, South Africa)**  
**66 MeV, 150  $\mu$ A**
- **Institute for Nuclear Research (Troitsk, Russia)**  
**160 MeV, 120  $\mu$ A**

*(Regular beam currents on typical targets)*

# Virtual Isotope Center- supplementing and extending existing availability

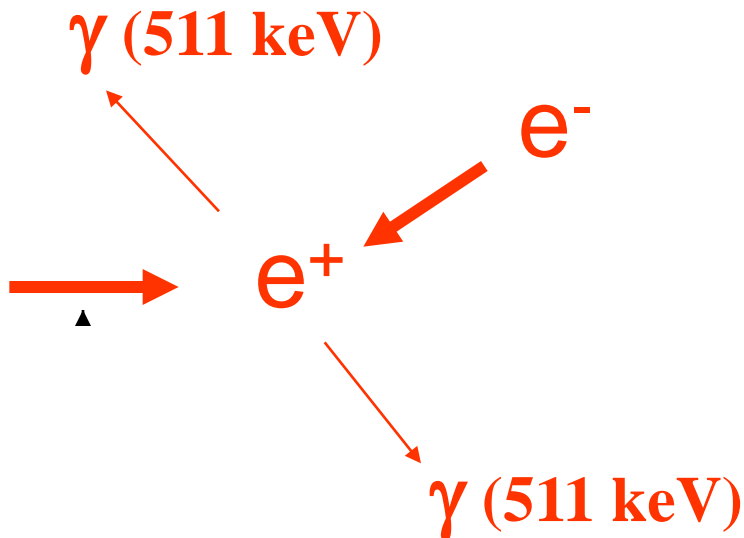

# *Radiochemical facility based on a new technology of strontium-82 sorption directly from liquid metallic rubidium (in hot cells at IPPE, Obninsk)*

*Temperature dependence of Sr-sorption*

# Short-lived radionuclides used in PET

- $^{18}\text{F}$  (110 min)
- $^{15}\text{O}$  (2 min)
- $^{13}\text{N}$  (10 min)
- $^{11}\text{C}$  (20 min)
- $^{82}\text{Rb}$  (1.3 min)
  - ↑  
 $^{82}\text{Sr}$  (25.5 d)
- $^{68}\text{Ga}$  (68 min)
  - ↑  
 $^{68}\text{Ge}$  (271 d)

# *Principle of Operation with $^{82}\text{Sr}/^{82}\text{Rb}$ - Generator: an alternative of $^{13}\text{N}$ and $^{99\text{m}}\text{Tc}$ in some cases*

**Injection system**

Saline solution  
0.9% NaCl

**Generator**

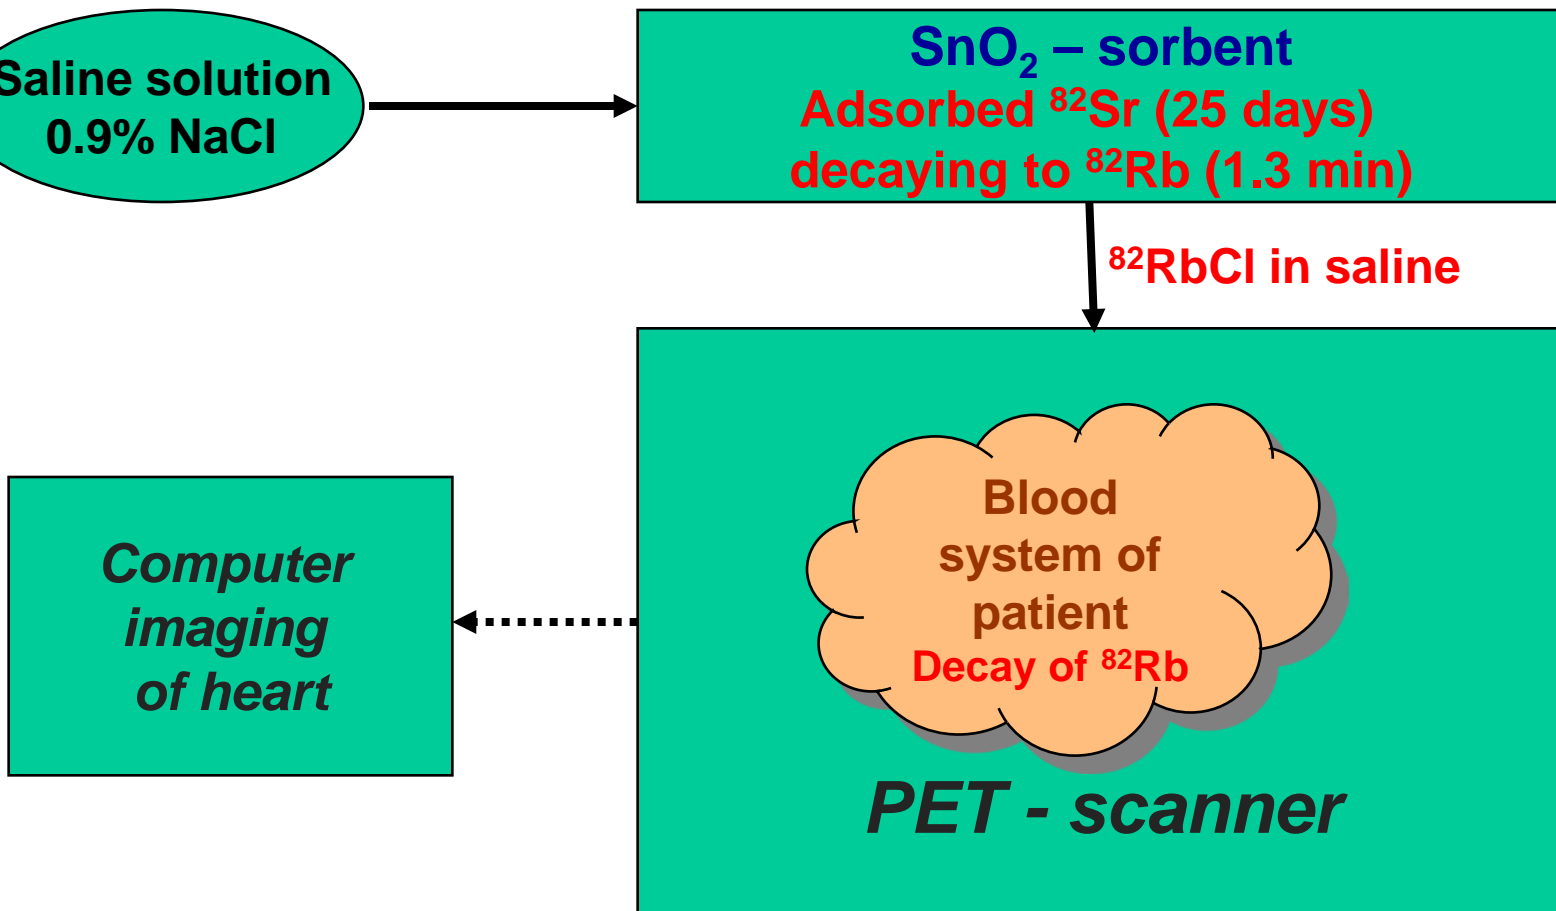

$\text{SnO}_2$  – sorbent  
Adsorbed  $^{82}\text{Sr}$  (25 days)  
decaying to  $^{82}\text{Rb}$  (1.3 min)

$^{82}\text{RbCl}$  in saline

Computer  
imaging  
of heart

Blood  
system of  
patient  
Decay of  $^{82}\text{Rb}$

**PET - scanner**

**CardioGen-82<sup>®</sup> US  
Sr/Rb-82 Generator  
(10/30 kG, 100-120 mCi,  
28-day operation)  
RECALL in July 2011**

**GR-01 Russian  
Sr/Rb-82 Generator in  
tungsten container  
(21/38 kG, 50-160 mCi,  
60-day operation)**

*Preclinical and clinical tests of Russian Sr/Rb-82 generator for cardio diseases at PET facility in Center of Radiological and Surgery Technologies, St. Petersburg*

**Heart of the first patient**

**Ameboid glioma of right parietal lobe**

***More than 150 patients have been treated within the clinical trials***

**Expected approval for routine use in Russia: December, 2011**

**6 PET centers only in Russia are ready to consume; 31 – in near future**

# *Proposed Accelerator Facilities for Radioisotope Production at High Intensity Proton Beam of Middle Energy*

- **ARRONAX/IBA (Nantes, France)**  
H<sup>-</sup> Cyclotron - 70 MeV, 2x375 μA
- **Institute for Nuclear Research (Troitsk, Russia)**  
H<sup>-</sup> Cyclotron - 120 MeV, 1000 μA: production of <sup>82</sup>Sr, <sup>117m</sup>Sn, <sup>225</sup>Ac, <sup>223</sup>Ra
- **Petersburg Nuclear Physics Institute**  
H<sup>-</sup> Cyclotron - 80 MeV, 100-200 μA, Isotope separator facility: <sup>82</sup>Sr from Y-target
- **Institute for Nuclear Research of National Academy of Sciences of Ukraine (Kiev)**  
H<sup>+</sup> Cyclotron, 70 MeV, 100 μA (<sup>82</sup>Sr production from RbCl-target)
- **Legnaro National Laboratory, INFN (Padova, Italy)**  
Cyclotron - 70 MeV, 2x400 μA
- **Positron Corporation (Illinois, USA)**  
H<sup>-</sup> Cyclotron - 70 MeV, 2x375 μA: <sup>82</sup>Sr production
- **Proton Engineering Frontier Project (Gyeongju, South Korea)**  
LINAC - 100 MeV, >300 μA
- **National Institute for Radioelements, IRE and IBA (Belgium)**  
Cyclotron - 350 MeV, 1000 μA (Ta-target to produce neutrons for <sup>99</sup>Mo)
- **TRIUMF (Vancouver, Canada)**  
Existing H<sup>-</sup> cyclotron - 500 MeV. Isotope separator facility: <sup>99</sup>Mo from <sup>98</sup>Mo-targets

Стенд облучения изотопных мишеней

New cyclotron  
(in building #25)

# Prospect Facility for On-Line Sr-82 Production

## Main Parameters:

Target material:  $Rb+3\% O$  (liquid)

Beam current:  $\geq 300 \mu A$

Proton energy range: 80-40 MeV

Energy release: 12 kW

Rb volume:  $\sim 1.5 L$

Rb flow:  $\sim 5 L/min$

Target diameter:  $\sim 8 cm$

Production yield:  $0.45 mCi/\mu A \cdot hr$

Production capacity  $^{82}Sr$ : 3 Ci/day  
at EOB

# *Production $^{117m}\text{Sn}$ from antimony targets*

*$T_{1/2}=14.0$  d*

*Low energy conversial Auger-electrons 127 and 152 keV*

*Range in water: 0.22 и 0.29 mm*

*Metallic Sb-target in graphite  
shell covered with nickel*

*Target from intermetallic  
compound TiSb*

**Mutual development of INR and BNL, USA (S. Srivastava et al.) with participation of MSU (Moscow) and IPPE (Obninsk), supported by GIPP foundation**

*Application of  $\alpha$ -active actinium-225 and radium-223  
for therapy of oncology diseases:  
directly or via short-lived bismuth-213 and lead-211*

• **Prostate cancer, mammary gland,  
brain, bone, stomach, pancreas,  
ovaries cancer**

• **Melanoma**

• **Celothelioma**

• **Leukemia**

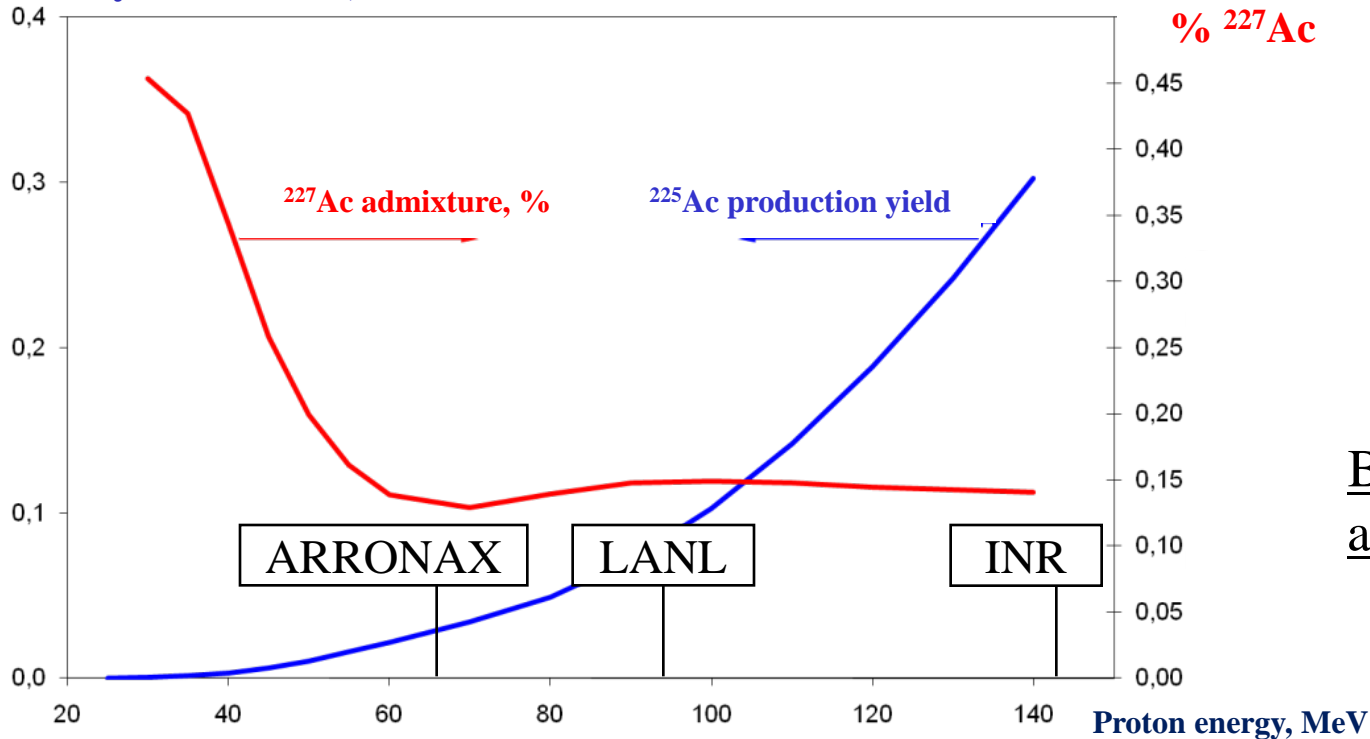

By Institute of Gene Biology of RAS  
– A.S.Sobolev et al.

**The radionuclides are incorporated into artificial modular NANOTRANSPORTERS (platforms) of polypeptide structure providing the address delivery of the radionuclide to the cells and the given cell component, e.g., to nucleus**

# *Production of $^{225}\text{Ac}$ from nat. Th irradiated with protons*

$^{225}\text{Ac}$  yield at EOB, mCi/uA.h

Backup production at BNL (200 MeV) is reasonable

**Potential production at 160 MeV**  
**(at customer's calibration time):**

***2 Ci per week  $^{225}\text{Ac}$  after 10-day decay***  
***(current world production is about 0.15 Ci per month)***

***4 Ci per week  $^{223}\text{Ra}$  after 16-day decay***

## *Possibility of Medical Isotope Production at INR*

RADIO-NUCLIDE	APPLICATION	HALF-LIFE	ANNUAL PRODUCTION, Ci		PATIENT AMOUNT (per year)
			Linear accelerator	New cyclotron	
<sup>82</sup> Sr	PET- diagnostics (cardiology)	25 d	30	400	500 000
<sup>117m</sup> Sn	Therapy, $\gamma$ -diagnostics (bone cancer, cardio vascular disease)	14 d	10	30	1 000
<sup>67</sup> Cu	Therapy (oncology)	62 h	20	100	1 000
<sup>64</sup> Cu	Therapy, PET- diagnostics (oncology)	12.7 h	150	700	1 000
<sup>72</sup> Se	PET- diagnostics (oncology)	8.5 d	15	60	80 000
<sup>103</sup> Pd	Therapy (cancer of prostate, liver, mammary gland, rheumatoid arthritis)	17 d	200	800	10 000
<sup>225</sup> Ac	Therapy (oncology)	10 d	8	100	100 000
<sup>223</sup> Ra	Therapy (bone cancer)	11.4 d	20	500	300 000

# *Problems to be Solved in Isotope Production and Investigations*

- 1. Efficient international collaboration**
- 2. Government funding is necessary**
- 3. Disposition of funds for R&D: overcoming agency barriers**
- 4. Enough qualified and independent international committee for distribution of funds in realization of isotope projects is necessary**
- 5. Improvement the system for transportation logistics**
- 6. To reduce bureaucratic regulations (not reducing safety)**
- 7. Severely growing rates for electricity power, heat, leasing, wastes management, etc.**

***THANK YOU !***
