

FASER

**13th International “Hiroshima”
Symposium on the Development and
Application of Semiconductor
Tracking Detectors (HSTD13)**

Early performance of the tracking detector for the FASER experiment

Tomohiro Inada (CERN)
for the FASER Collaboration

FASER - New experiment at the LHC Run3

FASER

- **ForwArd Search ExpeRiment (FASER) at the LHC**

- ▶ Placed **480 m downstream of the ATLAS IP** on the beam axis
- ▶ Started the **operation** from July 2022 (LHC run3)

- **Physics motivation**

- ▶ **New long-lived particle searches in MeV-GeV masses**
- ▶ **All flavors of neutrinos at the TeV-energy frontier**

Favorable location

- **Very low background from collision**
 - **Only high-energy muon** at about $1/\text{cm}^2/\text{sec}$
- **Low radiation level from the LHC**
 - 4×10^6 1-MeV neutron/cm²/year

VIEWPOINT

The Dawn of Collider Neutrino Physics

Elizabeth Worcester

Brookhaven National Laboratory, Upton, New York, US

July 19, 2023 • Physics 16, 113

The first observation of neutrinos produced at a particle collider opens a new field of study and offers ways to test the limits of the standard model.

Google Earth, imagery (c)2023 Maxar Technologies, map data (c)2023; CERN; adapted by APS/Alan Stonebraker

FASER detector

“The FASER detector” paper
[arxiv: 2207.11427](https://arxiv.org/abs/2207.11427)

Small, inexpensive detector

10cm radius

7m long

Electromagnetic Calorimeter

4 LHCb outer EM calorimeter modules

Tracking spectrometer stations

3 layers per station with 8 ATLAS SCT barrel modules in each layer

Scintillator veto system

Three 20mm scint. 300x300mm wide

Front Scintillator veto system

Two 20mm scintillators 350x300mm wide

Decay volume

To ATLAS IP

Interface Tracker (IFT)

FASERν emulsion detector

1.1 ton detector
 730 layers of 1.09mm tungsten+emulsion neutrino target and tracking detector provides $8\lambda_{\text{int}}$

Trigger / timing scintillator station

10mm thick scintillators with dual PMT readout for triggering and timing measurement ($\sigma=400\text{ps}$)

Trigger / pre-shower scintillator system

Magnets

0.57 T dipoles
 200mm aperture
 1.5m decay volume

All detector components are successfully installed in T12 in March 2022

FASER Tracking components

3 tracker stations + Interface tracker placed after the FASERv emulsion detector

Semiconductor Tracker (SCT) modules

→ 8 modules per tracker plane

Tracker Station

spare modules given by ATLAS

Tracker Plane

3 Tracker planes per station (12 in total)

- ▶ 80 μ m strip pitch, 40 mrad stereo angle (17 μ m / 580 μ m resolution)
 - ▶ precision measurement in bending (vertical) plane
 - ▶ 8 SCT modules give a 24cm x 24cm tracking layer
 - ▶ **ABCD readout chip**
 - ▶ **Custom made flexible cable** used to connect pigtail to **PCB patch panel**

Tracker Readout, Cooling, and Power

• Tracker Readout

- Tracker Readout Board (TRBs) : general purpose FPGA board,
 - 1 TRB / tracker plane (12 in total)
- 3m-long Twinax cables used to send data from patch-panel to TRB

• Cooling

- Low radiation environment
- Remove heat from the on-detector ASIC (~40W/plane)
 - water chiller at about 15 °C sufficient

• Power and DCS

- Wiener MPOD power supplies
- Custom board for tracker interlock & monitoring (TIM)
 - monitoring tracker temperatures by sending Detector Control System (DCS)

2 front panels LEDs

24V discrete wire to TRB adapter

Water Chiller

FASER Operation in the LHC Run3

- **Successfully operated during 2022-23**

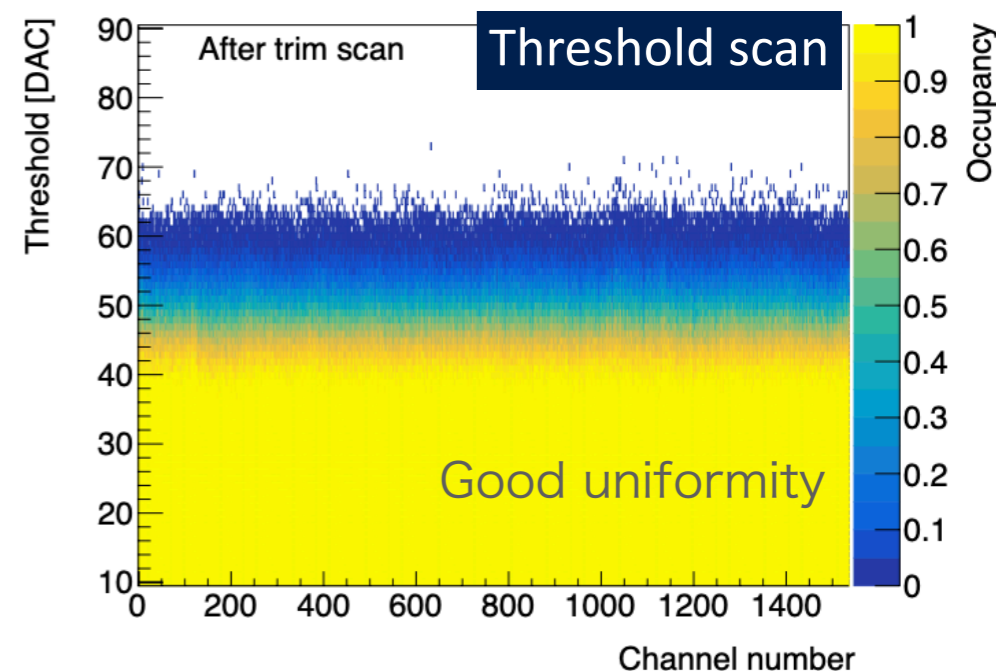

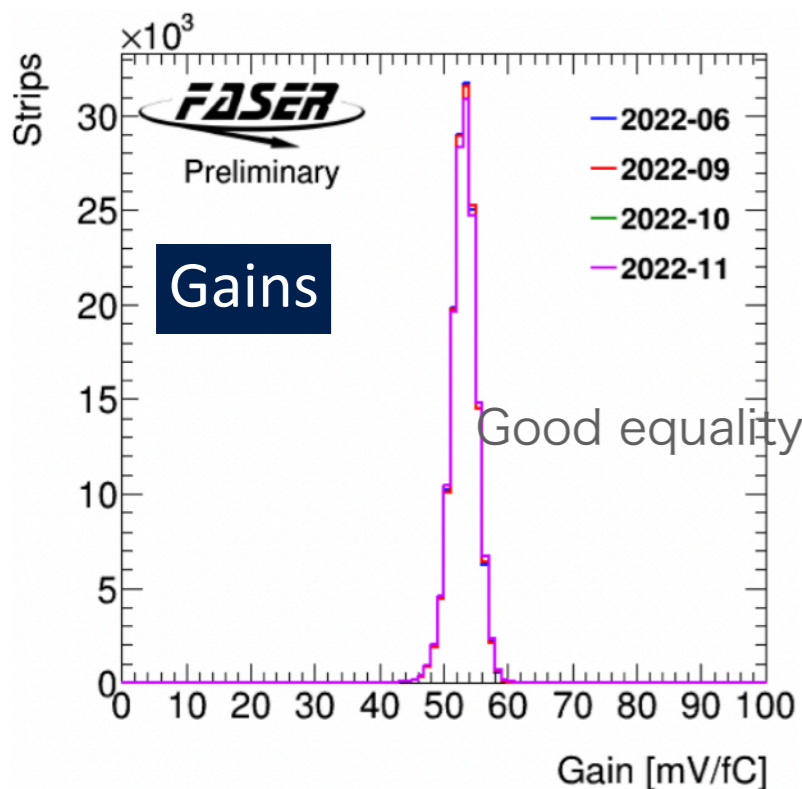

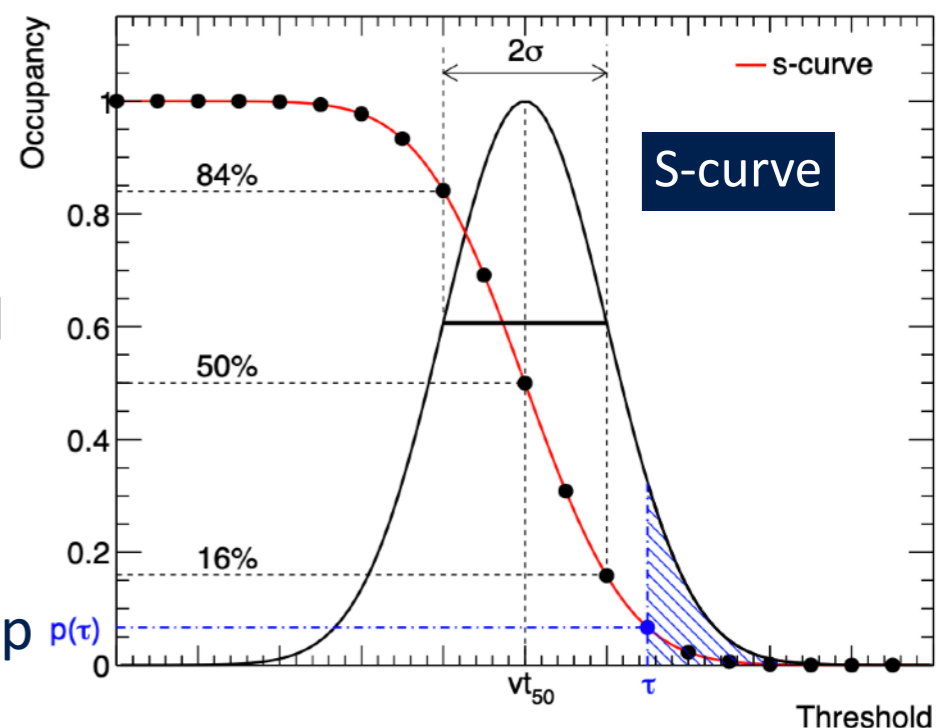

- Successfully constructed, installed and commissioned
- Continuous and largely automatic data-taking at up to 1.3 kHz
- Lightweight operational model
 - No control room

Tracker calibration

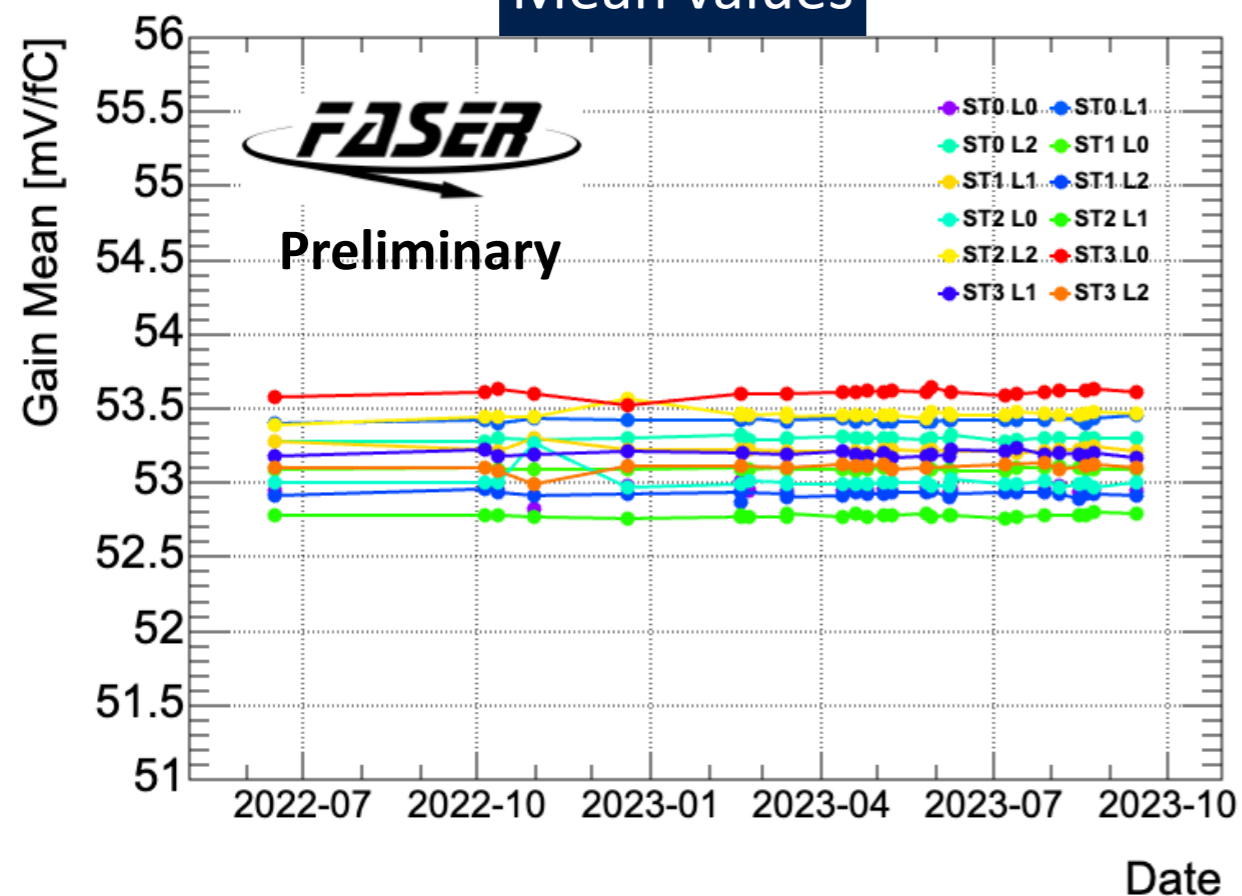

- Tracker calibrations are performed regularly during non-beam time with internal calibration circuit ref: [arXiv:2112.01116](https://arxiv.org/abs/2112.01116)
- Keep uniformity of threshold distributions
 - Estimated response curves by changing injection charges and measured the values at 50 % occupancy (*i.e.* vt_{50})
 - Showing good linearity around 1 fC
 - Averaged adjusted gain over all chips is ~ 54 mV/fC
 - good agreement with previous studies by ATLAS SCT group

NIM A 568 (2006) 642-671

Long-term stability (Gain)

Mean values

Standard Deviations

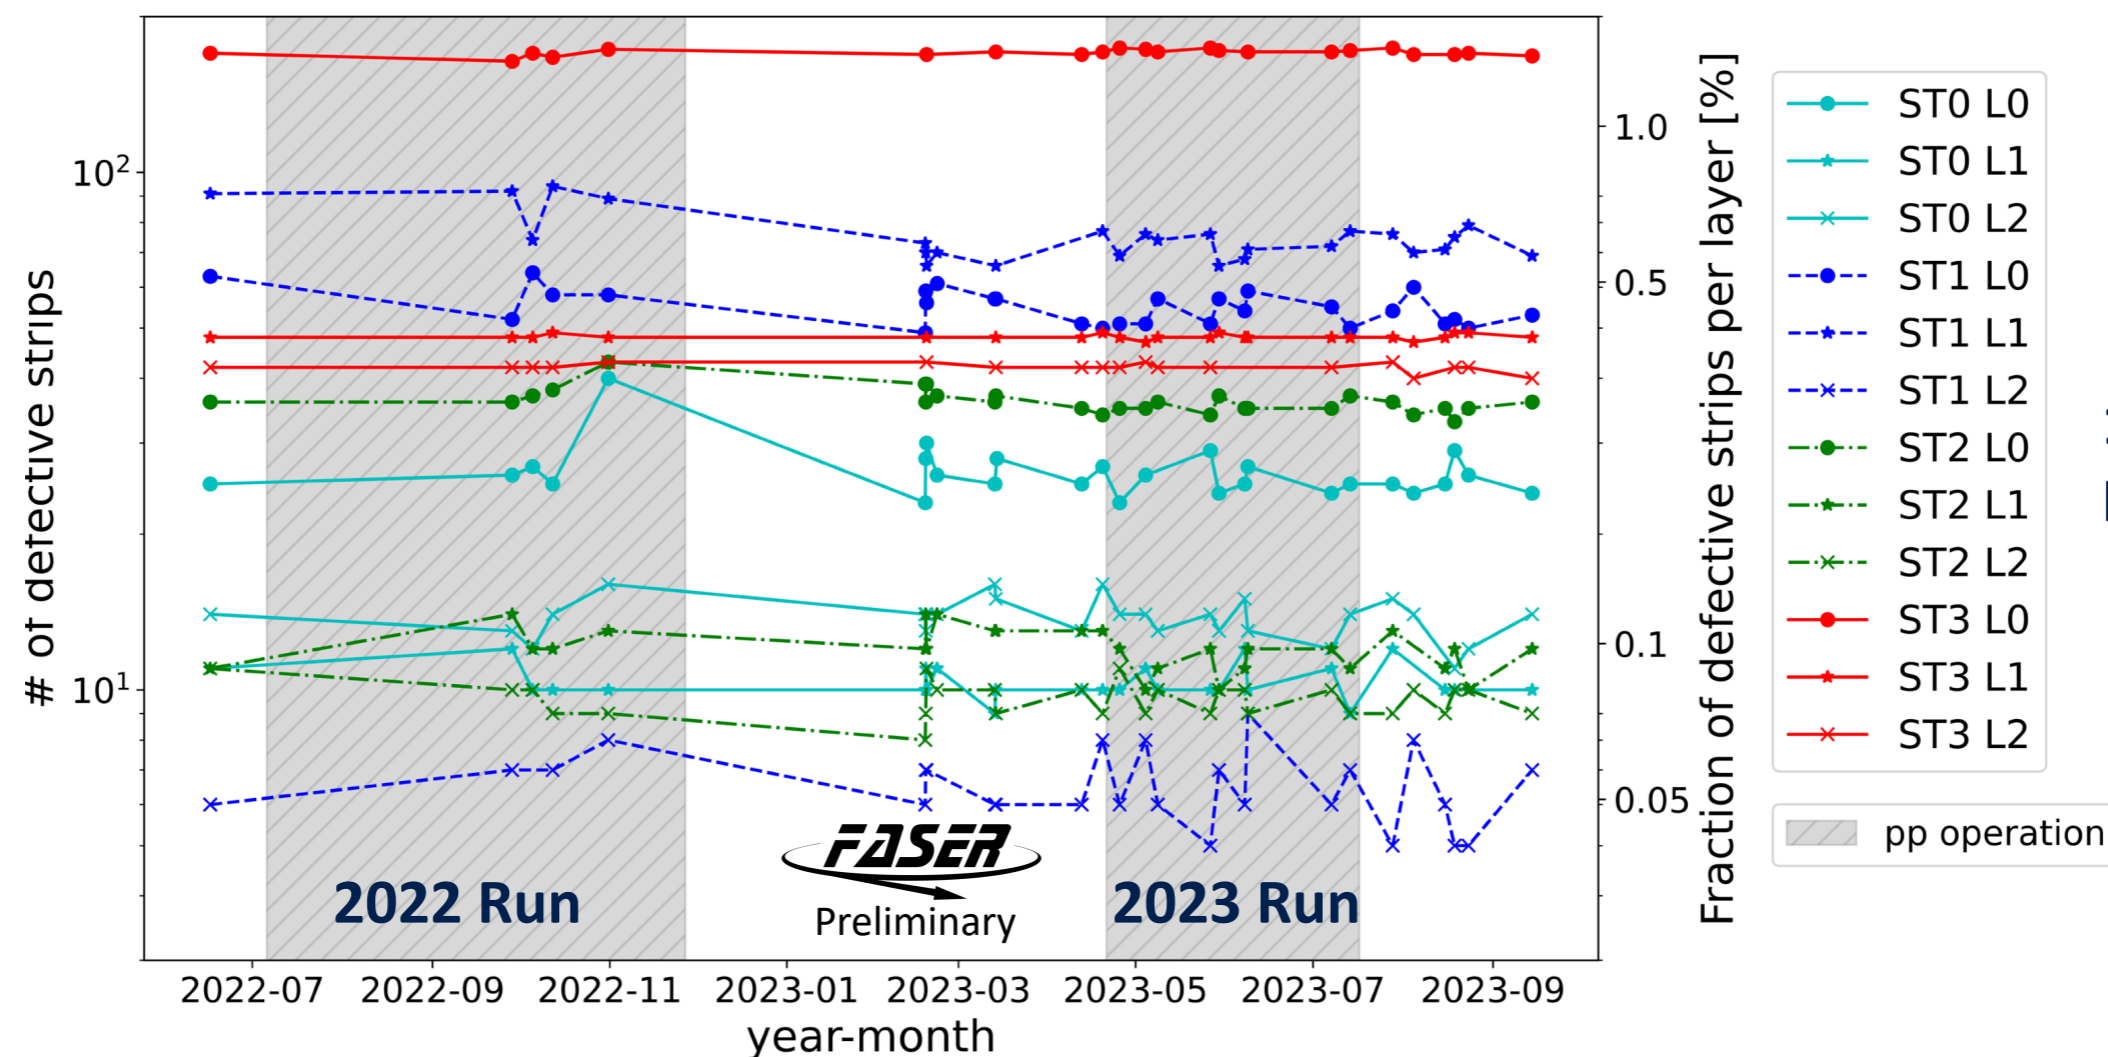

- Gain = relation between comparator voltage and effective threshold charge
- Performed regular calibration runs in 2022 and 2023 during non LHC beam time
- Monitored the average and standard deviation (spread) of distributions in each layer
 - Please note that defective strips are removed before
- Have been achieving stable operation, keeping the consistency of the tracker performance

Long-term stability (ENC noise)

- Noise = threshold dispersion at charge injection of 2fC
- Performed calibration runs in 2022 and 2023 during non LHC beam time
- Monitored the average and standard deviation (spread) of distributions in each layer
 - Please note that defective strips are removed before
- Have been achieving stable operation, keeping the consistency of the tracker performance.

Monitoring defective strips for 2022-2023

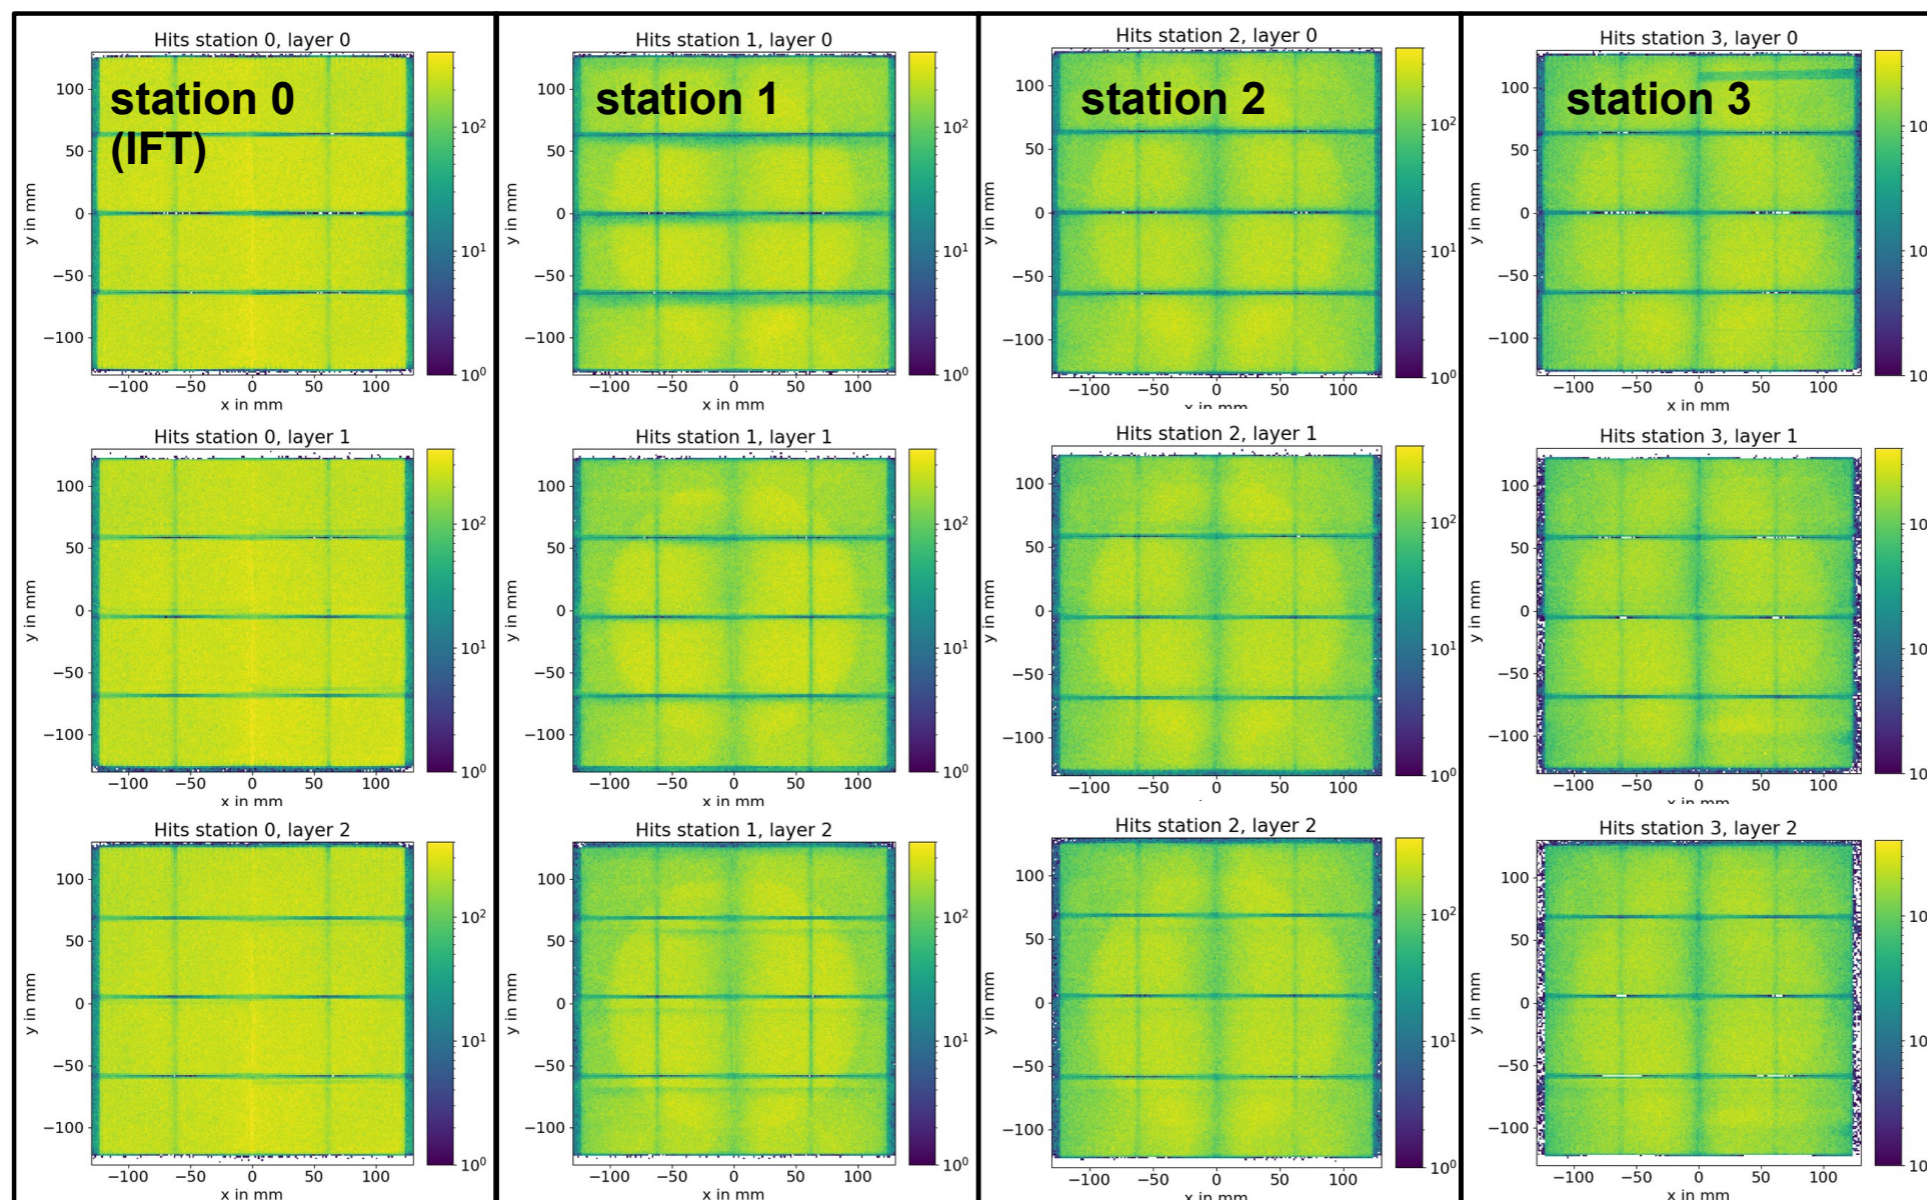

- Monitored # of defective strips during 2-year operation
- Criteria for defective strips: 1) dead and noisy strips identified by a regular calibration, 2) low gain (<40 mV/fC), 3) low ENC (<850 electrons), 4) untrimmable strips (i.e. showing non-uniformity of the threshold)
- ST3/L0 shows the largest number (>100), which is almost clustered in 1 chip (known before)
- More than 99.7 % of strips are available in all layers

Monitoring noisy strips for 2022-2023

- Monitored # of noisy strips during 2-year operation, identified at offline analysis
- Criteria for noisy strips: occupancy > 0.01 (requirement is 5×10^{-4})
- Only 0.2 % of all strips are identified as noisy
 - Heavily overlapped with the ones labelled as defective

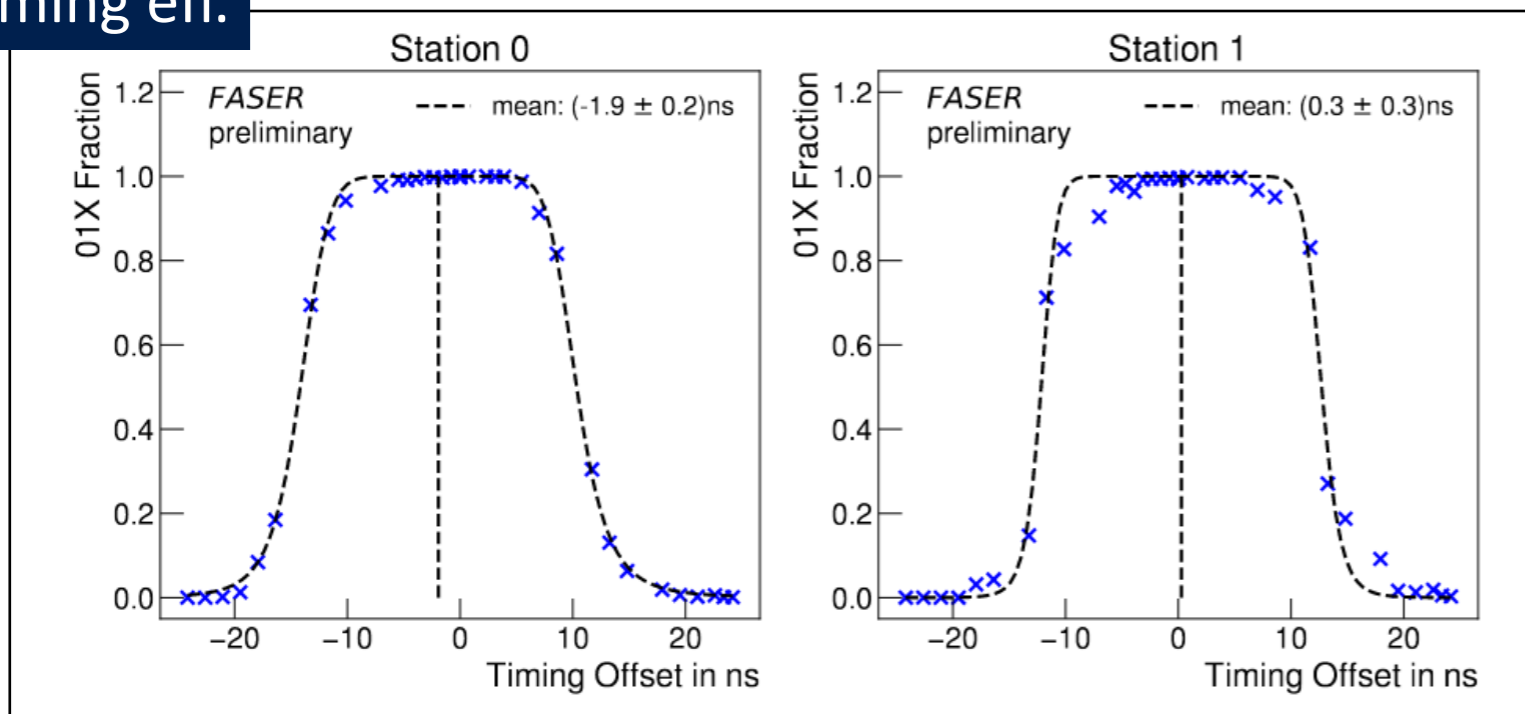

Detector Hit Map

Distribution of **hits on track** show excellent detector coverage in all layers
 Inefficiencies in between modules from module edges expected
 Station design **shifts planes ± 5 mm** in order to avoid overlapping inefficiencies

Detector Timing and Hit Efficiency

Timing eff.

Early LHC fills used to timing scan:

- $\sim 1\text{kHz}$ of muon rate through FASER
- ABCD chip readout
 - returns last 3 bits in its pipeline upon arrival of L1A
 - Hit = patten 010 and 011 (= 01X)
- Fine timing via clock adjustment on the tracker DAQ boards
- Chose center of the efficiency plateau

Hit eff.

Efficiency evaluation:

- Track reconstruction per station with 1 of 6 strip sensor layers blinded
 - Efficiency = find strip in blinded sensor layer compatible with track ($\Delta y = 500\mu\text{m}$)
- Hit efficiency of $99.64 \pm 0.10\%$ at threshold 1.0 fC and sensor bias 150V

Track reconstruction with ACTS software

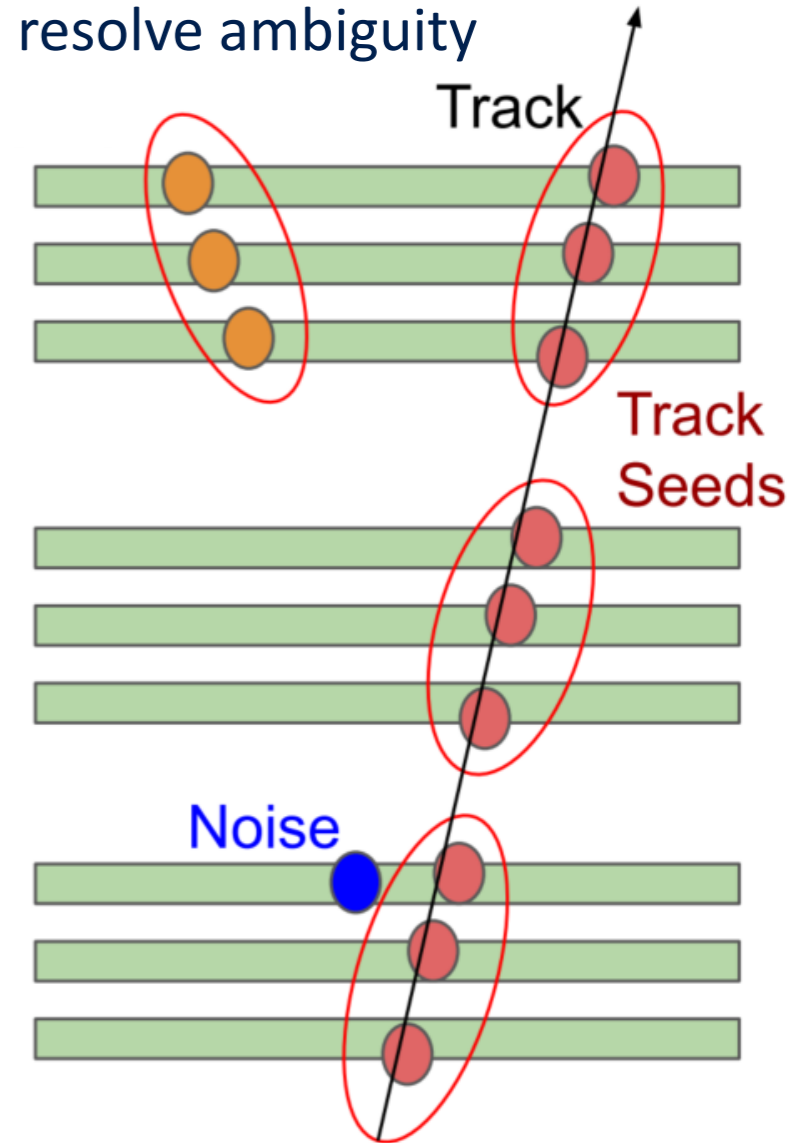

Tracking is performed based on software (Calypso) based on ACTS*

* [ACTS: A Common Tracking Software](#)

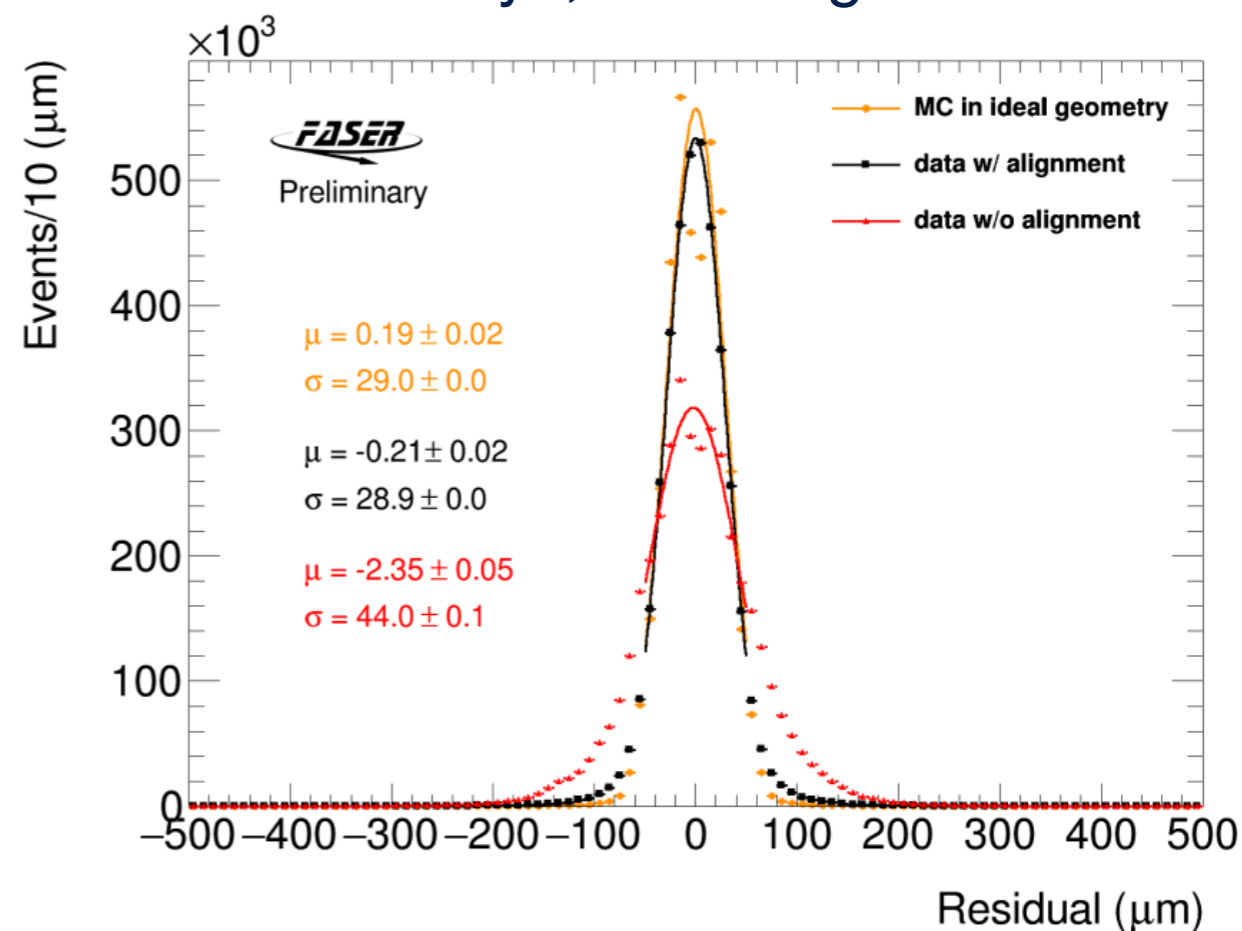

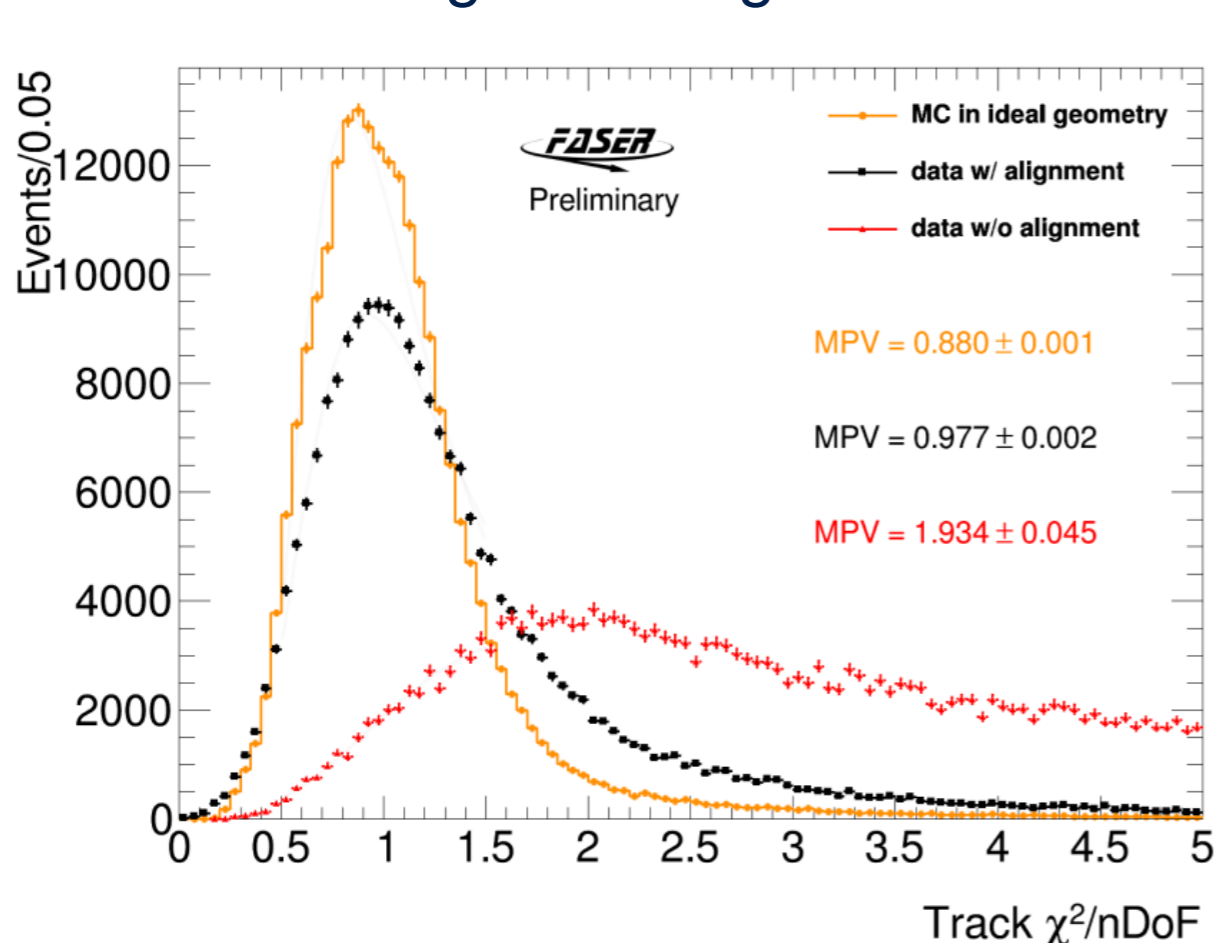

- (Combinatorial) Kalman Filter w/ cluster or spacepoint
- Same Event Data Model with ATLAS (Athena)

Use Kalman filter to resolve ambiguity

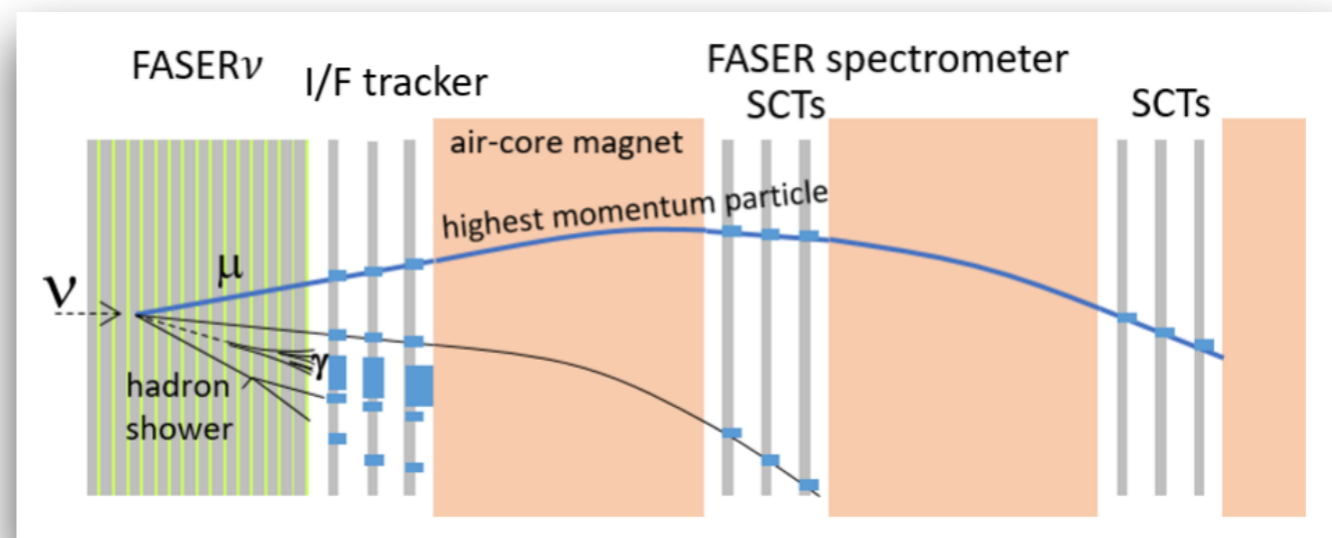

First alignment with collision data

- First alignment: should be simple and robust for 3 stations
- Iterative local χ^2 alignment inside each tracker station
 - Using good tracks (e.g. $p_z > 300 \text{ GeV}$, $n\text{Clusters} > 14$, $\chi^2 < 200$, $r < 95 \text{ mm}$)
- Validated with MC simulation
- Only consider 2 of 6 degree of freedoms, Y translation and Z rotation
 - Silicon strip detector, precision on Y is much better than X
 - Track parameters and residuals are improved significantly
- Global alignment algorithm has been tested in these days, including the IFT

Future prospects

- Track matching between trackers and the emulsion detector
 - Enable charge identification or $\nu_\mu/\bar{\nu}_\mu$ classification, and potentially $\nu_\tau/\bar{\nu}_\tau$
 - Alignment is the crucial part due to the difference of a spatial resolution

Conclusion

- **FASER** is the new experiment at the LHC from Run3
- Data-taking is super smooth, recorded **~98 % of delivered data**.
- FASER tracker is consists of **4 Silicon strip trackers**
 - Keeping the consistency of the tracker performance for **2-year operation**
 - More than **>99.7 % strips** are available
 - ATLAS SCT is working ver well even about >15 years after the construction (~2005-2006)
- The first alignment with collision data is done with simple and robust ways
 - To be improved with a global alignment algorithm such as millepede II
 - Try to match tracks between the IFT and emulsion for $\nu_\mu/\bar{\nu}_\mu$ classification

Up

FASER SCT Tracker

Patch-panel

Flex cable

The Barrel Module

- 2112 Identical **Barrel Modules** required for SCT mounted on **4 Barrels (B3, B4, B5, B6)**

4 single-sided *p-in-n* ac-coupled **silicon microstrip sensors**, 80 μm pitch, mounted back-to-back, 40 mrad stereo rotation angle

12 128-channel **ABCD3TA** binary readout ASICs

Thermo-mechanical baseboard - encapsulated thermalised pyrolytic graphite with fused **BeO** facings

Bridged wrap-around hybrid – copper-polyimide flex glued on carbon-carbon substrate

FASER SCT Tracker: Module QA

SCT modules used had passed ATLAS QA in ~2005 and then been kept in storage. Important to test their functionality.

SCT module QA at CERN in March 2019. Identified > 80 good spare modules – more than enough for FASER needs.

Performance seems not to be degraded by long term storage/age.

FASER SCT Tracker: Mechanics

CNC machining of layer frame gives position of each SCT module at better than 10um.
 Metrology of frame – measures fiducial marks on SCT modules with a few um accuracy.
 Fully automated procedure – measures all marks on one side in 15mins.
 Will form the basis of the per plane alignment.

Precision of the 3 layers in a station defined by precision pin in frame (10um accuracy).

FASER SCT Tracker Cooling

- Due to the low radiation in T112 the silicon can be operated at room temperature, but the detector needs to be cooled to remove heat from the on-detector ASICs
 - ~5W per module => 40W/plane => 360W in full detector
- Tracking layer designed to give sufficient thermal and mechanical properties, whilst minimizing material in tracking volume
- Use simple water chiller with inlet temperature 10-15 degrees
 - Tracking stations flushed with dry air to avoid condensation
 - Hardware interlock to turn off tracker if cooling / humidity control fails

SMC chiller

Tracking layer frame, CNC machined from single Al block. Frame contains 5mm cooling pipe running around the outside.

Thermal performance validated by FEA simulations and measurements (NTC on each SCT module, and 2 on frame)

FASER SCT Tracker Cooling

be operated at room temperature, heat from the on-detector ASICs detector al and mechanical properties, whilst

10-15 degrees condensation humidity control fails

ASICs

SMC chiller

machined from single Al block. Frame contains 5mm cooling pipe running around the outside.

Thermal performance validated by FEA simulations and measurements (NTC on each SCT module, and 2 on frame)

Tracker Cooling system

Two air-cooled water chiller used, whose coolant temperature at **15 °C**

- one is running to cool the detector and the other acts as a hot spare
- If both chillers are not operating correctly, the power supply system is forced to be turned off by the hardware interlock system
- Module temperature is kept well **below 30 °C**

Sensor	DCS warning	DCS automatic actions	Hardware interlock
Module temperature	>30°C	>31°C	-
Plane humidity	>10%	-	-
Frame temperature	>23.0°C	-	<5°C or >25°C

glass-transition temperature of the glue: 35°C

Tracker Plane Metrology and Survey

Each plane/station is measured with a mechanical touch-probe and an optical camera

- All frames satisfied the required tolerances ($\pm 20 \mu\text{m}$) with respect to the CAD manufacturing drawings
- The maximum deviation was $100 \mu\text{m}$ in positioning the SCT module

Before and after installation T112, 3D laser scanning was performed by the CERN survey group

- measured the position of the survey points on the tracker station with $O(16 \mu\text{m})$ accuracy.
