Multi-VO Rucio

Thursday 10 November 2022 14:30 (15 minutes)

Multi-Vo Rucio allows a single instance of Rucio serve several VOs. Each VO is separated into its own namespace, providing complete separation between the VOs data, and each VO with their own customisability with policy packages.

Work is underway to ensure Multi-VO capabilities for the new WebUI, and integration with DIRAC workflow management software.
The Multi-VO instance of Rucio is also in a transition phase moving it to a Kubernetes deployment.
