

# Hybrid Monte Carlo framework, single-module optimisation and DD4hep integration

Marco Pizzichemi

University of Milano-Bicocca and CERN

*On behalf of the LHCb ECAL Upgrade II R&D group*

# Outline

- ▶ Description of **HybridMC**: framework developed to perform detailed simulations of the modules proposed for ECAL upgrade 1b & II
- ▶ **Single module** optimization and studies performed with HybridMC
- ▶ Integration of the MC framework into the **LHCb simulation framework**

# HybridMC framework description

# Why propagating optical photons?

In principle, ray-tracing of optical photons is useful to **study in detail** the performance of prototypes

# Why propagating optical photons?

In principle, ray-tracing of optical photons is useful to **study in detail** the performance of prototypes

- ▷ Impact of scintillating material characteristics
- ▷ Impact of light transport, attenuation length
- ▷ Impact of surface state of scintillators and absorbers
- ▷ Evaluation of performance degradation by radiation damage
- ▷ Possibility to develop and test strategies to extract information from detector pulses
- ▷ Study of impact of spill over on resolutions
- ▷ Possibility to emulate electronics, study signal sampling etc.

# Why propagating optical photons?

In principle, ray-tracing of optical photons is useful to **study in detail** the performance of prototypes

- ▷ Impact of scintillating material characteristics
- ▷ Impact of light transport, attenuation length
- ▷ Impact of surface state of scintillators and absorbers
- ▷ Evaluation of performance degradation by radiation damage
- ▷ Possibility to develop and test strategies to extract information from detector pulses
- ▷ Study of impact of spill over on resolutions
- ▷ Possibility to emulate electronics, study signal sampling etc.

Nevertheless full ray-tracing of optical photon requires **too much CPU time**: approx. 1-2h/GeV

Need to develop a framework that allows **good level of realism** while keeping the simulation **much faster** than full ray-tracing

# Why propagating optical photons?

In principle, ray-tracing of optical photons is useful to **study in detail** the performance of prototypes

- ▶ Impact of scintillating material characteristics
- ▶ Impact of light transport, attenuation length
- ▶ Impact of surface state of scintillators and absorbers
- ▶ Evaluation of performance degradation by radiation damage
- ▶ Possibility to develop and test strategies to extract information from detector pulses
- ▶ Study of impact of spill over on resolutions
- ▶ Possibility to emulate electronics, study signal sampling etc.

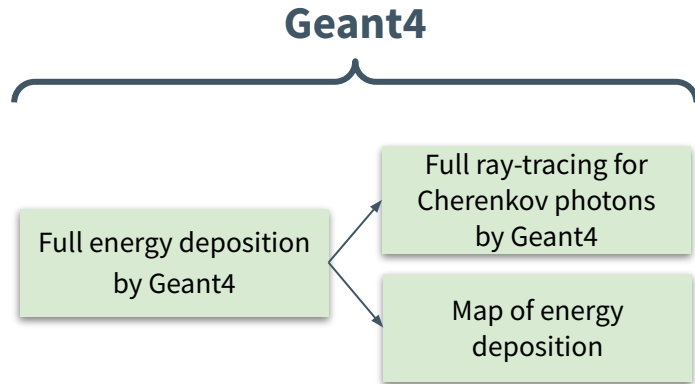

Nevertheless full ray-tracing of optical photon requires **too much CPU time**: approx. 1-2h/GeV

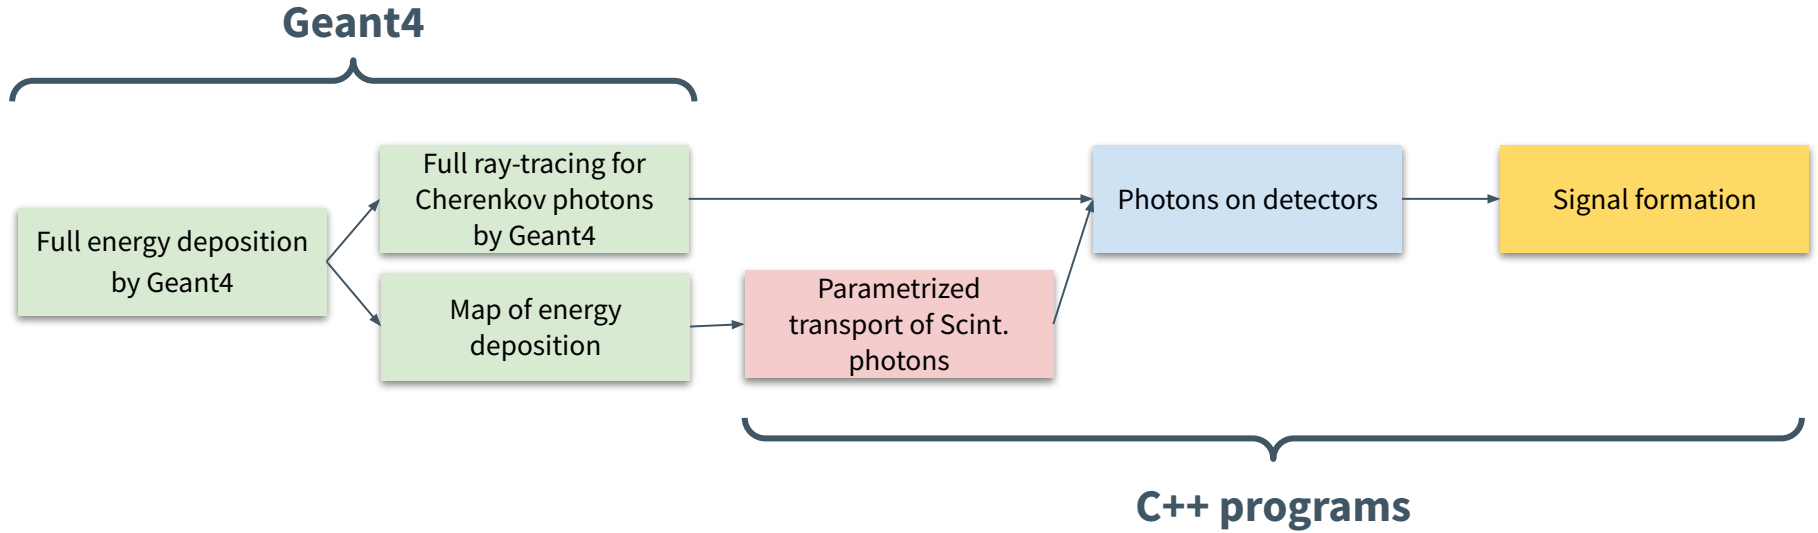

Need to develop a framework that allows **good level of realism** while keeping the simulation **much faster** than full ray-tracing

# Framework structure

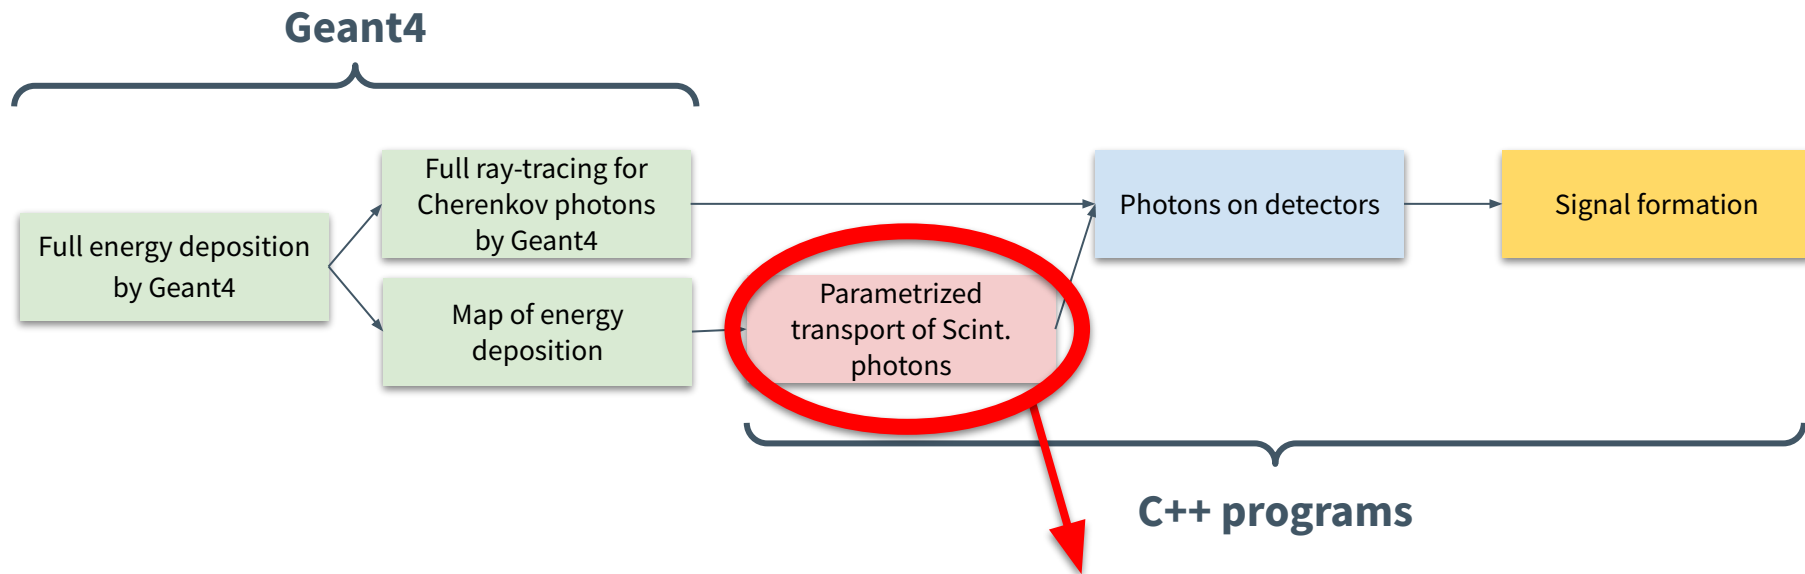

# Framework structure

# Framework structure

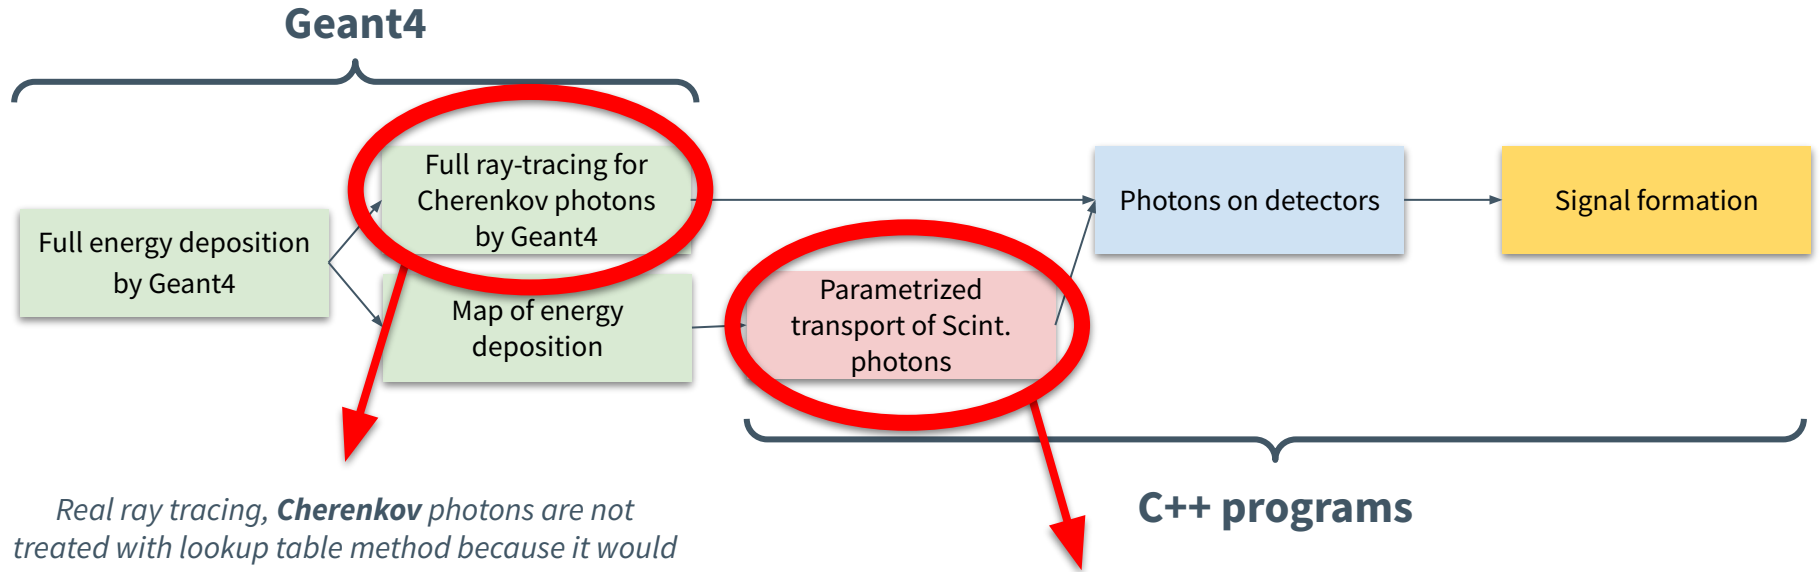

Obtained via **optical calibration** on the basis of energy deposition map.

No real ray tracing in G4. More details in next slides, check also:

# Framework structure

*Real ray tracing, **Cherenkov** photons are not treated with lookup table method because it would be more complicated (directionality involved)*

**C++ programs**

*Obtained via **optical calibration** on the basis of energy deposition map.  
No real ray tracing in G4. More details in next slides, check also:*

*Other optimizations developed to reduce the CPU time due to Cherenkov propagation*

# Optical calibration

Transport of optical photons is parametrized with a **lookup table approach**

- ▶ Assign a **photon extraction and a propagation time distribution** to each point (x,y,z,energy) of the module
- ▶ Use these distribution to **decide the fate** of each photon generated by energy deposition
- ▶ Exploit SPACAL modules symmetry: transport photons **up to fiber exit** -> one crystal per section is enough
- ▶ The procedure (we call it optical calibration) needs to be done **only once for each module** configuration

# Optical calibration

Scan the crystal(s) on a space/energy grid, produce distributions of output photons

Produce N photons

*Non-perfect reflector*

# Optical calibration

Scan the crystal(s) on a space/energy grid, produce distributions of output photons

Produce N photons

Photons exiting front face

*Non-perfect reflector*

Record time of arrival  
of photons that exit  
the crystals

Photons exiting back face

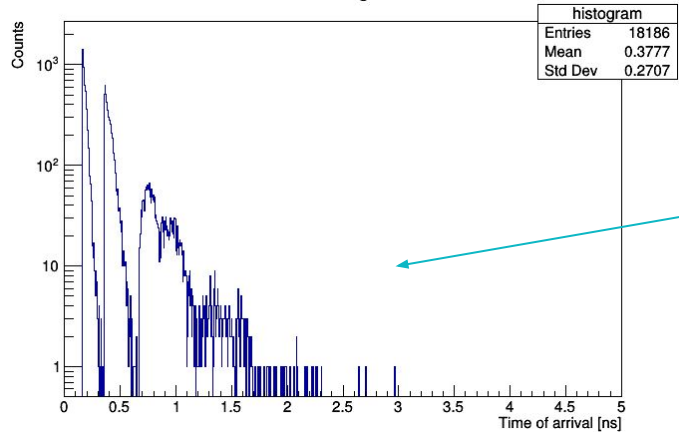

# Optical calibration

Scan the crystal(s) on a space/energy grid, produce distributions of output photons

Produce N photons

Photons exiting front face

*Non-perfect reflector*

Record time of arrival  
of photons that exit  
the crystals

Photons exiting back face

# Optical calibration

Scan the crystal(s) on a space/energy grid, produce distributions of output photons

Produce N photons

*Non-perfect reflector*

Record time of arrival of photons that exit the crystals

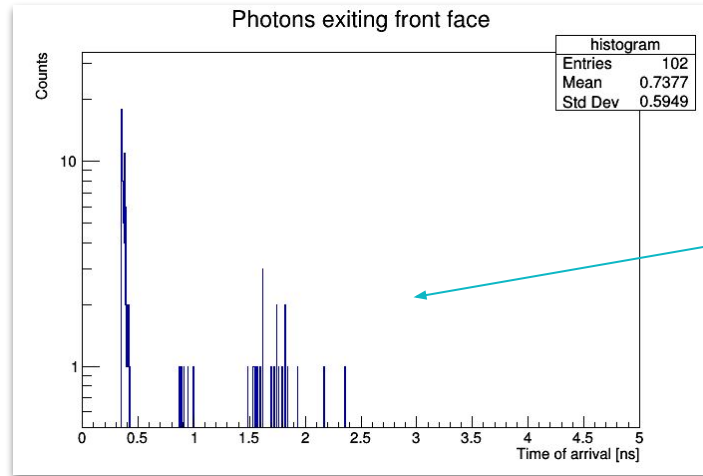

# Optical calibration

Scan the crystal(s) on a space/energy grid, produce distributions of output photons

Produce N photons

*Non-perfect reflector*

Record time of arrival  
of photons that exit  
the crystals

Use these histograms as **PDFs** to generate **photon extraction probability** and **time of transport**

# Validation of optical calibration

Check if the optical calibration approach (Hybrid MC) provides same result as letting Geant4 perform full ray-tracing

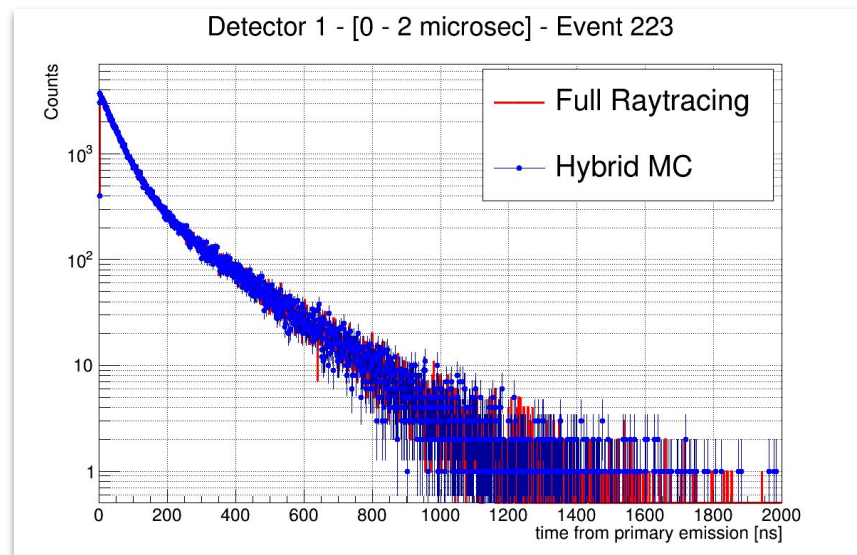

Simplified configuration, shoot 1 GeV electrons into a single fiber, record photons extracted (e.g. from the right side)

# Validation of optical calibration

Check if the optical calibration approach (Hybrid MC) provides same result as letting Geant4 perform full ray-tracing

Simplified configuration, shoot 1 GeV electrons into a single fiber, record photons extracted (e.g. from the right side)

Very good agreement both in number of photons extracted and in time profile

# Signal formation and analysis

Output of Hybrid simulation (optical photons)

Group photons per photo-detector

Apply spatial efficiency map

Apply Quantum Efficiency

List of photoelectrons per detector

Digitization based on DRS4

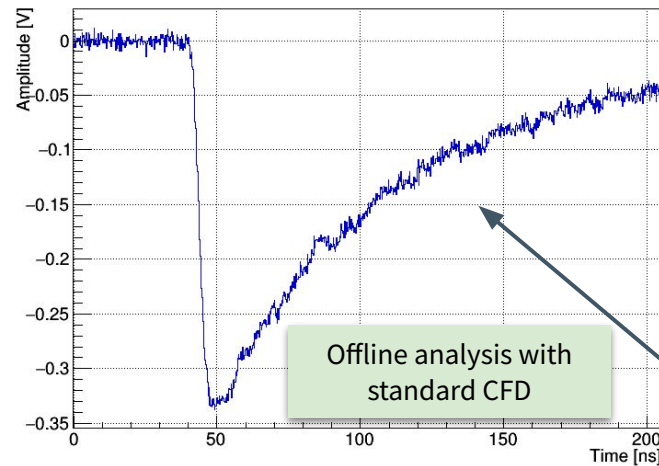

Single electron response

Sum of all single electron pulses

Optical photons at interface SPACAL to photodetector

Typical pulse generated by signal formation

# Full ECAL simulations

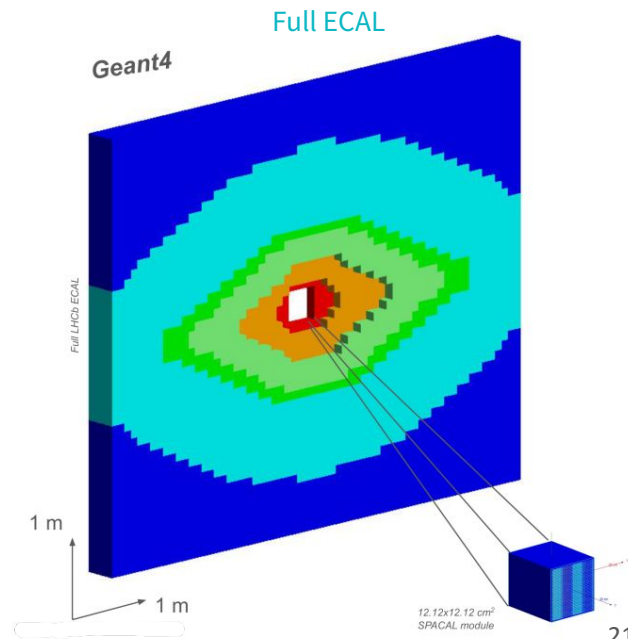

- Full ECAL configurations **combining single module descriptions**
- 3312 modules, no impact on intrinsic simulation time
- Very useful for **reconstruction** and **physics potential studies** which need a full ECAL
  - Need particle flux at entry of ECAL as input
  - Tilting of modules in central region implemented
  - All needed configuration and calibration files included
  - See **Physics benchmarking of the baseline** session tomorrow at 9am

- Pre-packaged configurations** available:

- Run3: Shashlik only, current config
- Run4:  $2 \times 2 \text{ cm}^2$  and  $3 \times 3 \text{ cm}^2$  SPACAL with poly + W&Pb abs., single side readout
- Run4 rotated: same as Run4 but with titled SPACAL modules
- Run5:  $1.5 \times 1.5 \text{ cm}^2$  W+GAGG and  $3 \times 3 \text{ cm}^2$  Pb+Poly SPACAL, double side readout
- Run5 rotated: same as Run5 but with titled SPACAL modules
- Run5 downscoped: same as Run5 but all modules single side readout
- Run5 option2: same as Run5 but with different module distribution
- Run5 tungsten: same as Run5 but with W+Poly instead of Pb+Poly

- Example of **ongoing investigation**:

- Comparison of performance for a physics study of **current ECAL at the end of Run3** with respect to the **Run4 proposed upgraded** configuration
- Radiation damage of Run3 Shashlik implemented based on irradiation tests

# CPU-time, running on lxplus

Full ECAL simulations (here for Run5 configuration) with LHCb flux: about **15s/GeV** of CPU time -> gain factor 200-500

**N.B.** a set of scripts is included in the framework to easily **run the HybridMC on the grid**

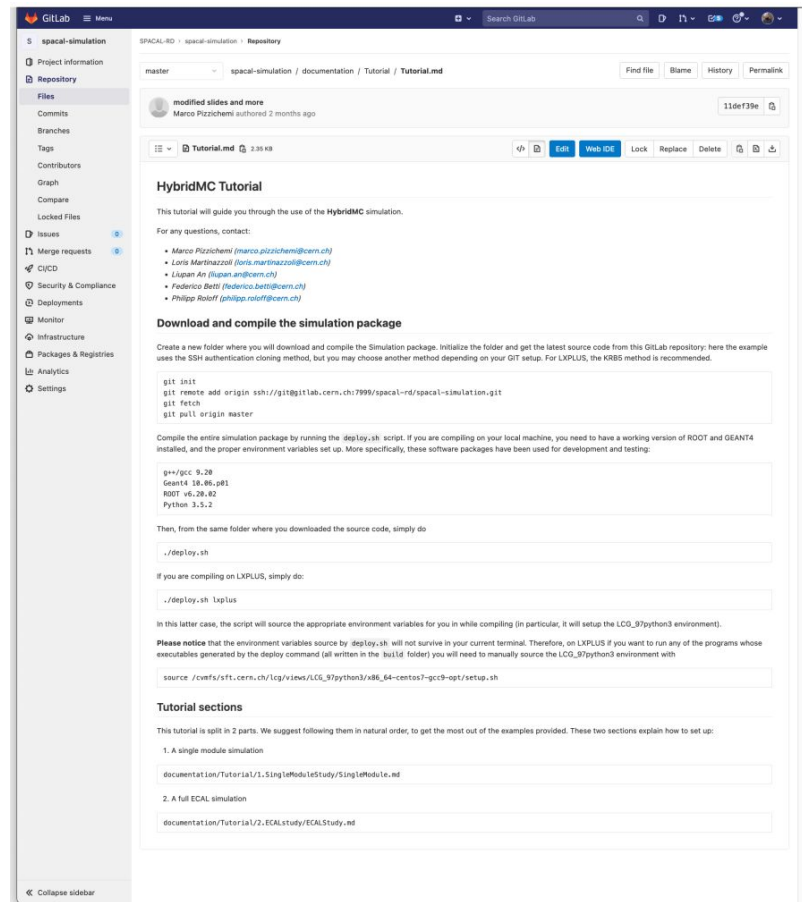

# Code and support material

**Framework code available** to the collaboration on CERN GitLab:

- ▶ <https://gitlab.cern.ch/spacal-rd/spacal-simulation>
- ▶ Extensive documentation available in the repository
- ▶ Pre-packaged configurations and scripts available in repo

**Full tutorial available:**

- ▶ Introduction ([link](#))
- ▶ Part 1 ([link](#)): Single module simulation
- ▶ Part 2 ([link](#)): ECAL physics studies with Hybrid MC
- ▶ Extra information ([link](#)): creating flux files
- ▶ Video recording ([link](#))

The screenshot shows the GitLab interface for the repository 'spacal-simulation'. The main content area displays the 'Tutorial.md' file, which is titled 'HybridMC Tutorial'. The tutorial text includes:

- A heading 'HybridMC Tutorial'.
- A sub-heading 'HybridMC Tutorial'.
- A paragraph: 'This tutorial will guide you through the use of the HybridMC simulation.'
- A section 'For any questions, contact:' followed by a list of contributors: Marco Pizzichemi, Loris Martinazzoli, Likuan An, Federico Belli, and Philippe Roloff.
- A section 'Download and compile the simulation package'.
- A code block showing the steps to clone the repository: 

```
git init
git remote add origin ssh://git@gitlab.cern.ch:7999/spacal-rd/spacal-simulation.git
git fetch
git pull origin master
```
- A paragraph explaining that the 'deploy.sh' script should be run to compile the simulation package.
- A code block showing the contents of 'deploy.sh': 

```
g++/gcc 9.20
Geant4 10.06.p01
ROOT v6.28.02
Python 3.5.2
```
- A paragraph stating that the script will source environment variables for the user.
- A 'Please notice' section warning that the environment variables sourced by 'deploy.sh' will not survive in the current terminal.
- A code block showing the command to source the environment variables: 

```
source /cvmfs/ft.cern.ch/lcg/views/LCG_97python3/A86_64-centos7-gcc9-opt/setup.sh
```
- A section 'Tutorial sections' with two numbered items: '1. A single module simulation' and '2. A full ECAL simulation'.
- Code blocks for the file paths: 

```
documentation/Tutorial/1_SingleModuleStudy/SingleModule.md
```

 and 

```
documentation/Tutorial/2_ECALStudy/ECALStudy.md
```

# Single module studies with HybridMC

# Single module performance simulation

Performance of full scale **SPACAL modules proposed for Run4-5**, varying materials, segmentation and readout strategy

Single Readout  
Monolithic Module

Double Readout  
Segmented Module

Double Readout  
Monolithic Module

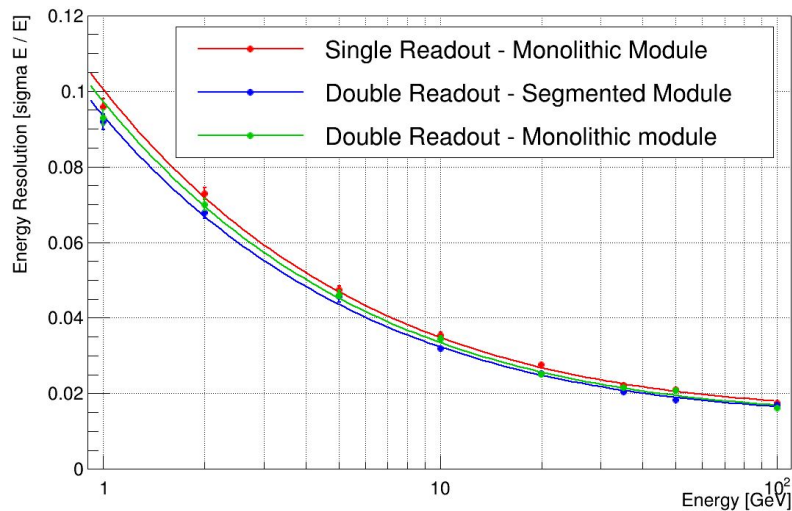

- ▷ Readout from face drawn in red
- ▷ Always a mirror on section ends, if not coupled to the readout
- ▷ In this drawing, dimensions reported for WGAGG modules (but of course different for PbPoly and WPoly)

# Energy resolution and angular dependence

Example plots shown for **WGAGG** modules

Energy Resolution with e<sup>-</sup>, WGAGG

E<sub>res</sub> at different electron angles - Optimized WGAGG module

- ▶ Energy resolution mostly not affected by module segmentation and readout scheme
- ▶ With longitudinally segmented module, scan of resolution variation with particle incidence angle:
  - ▶ Performance degradation at low angles
  - ▶ Optimal performance starting from 3°+3°

# Front/back timestamps combination

- Time resolution is the performance of **target cell** (seed cell), so either 1 or 2 timestamps are available to use
- Single Readout, Monolithic Module:** nothing to combine
- Double Readout,** both **Segmented** and **Monolithic** modules:

- ▶ Simple average:

$$t_{best} = \frac{t_{front} + t_{back}}{2}$$

- ▶ Weighted average:

$$t_{best} = \frac{\sum_{i=1}^2 w_i \cdot t_i}{\sum_{i=1}^2 w_i} \quad w_i = \frac{1}{\sigma_i^2}$$

Time resolution of front or back section

- ▶ Covariance combination:

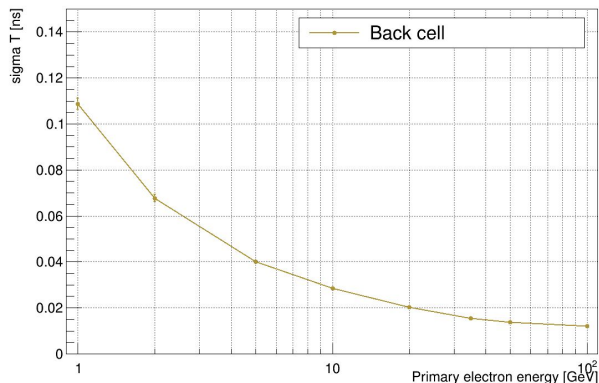

$$t_{best} = \sum_{i=1}^2 w_i \cdot t_i \quad w_1 = \frac{\sigma_2^2 - \sigma_{1,2}}{\sigma_1^2 + \sigma_2^2 - 2 \cdot \sigma_{1,2}} \quad w_2 = \frac{\sigma_1^2 - \sigma_{1,2}}{\sigma_1^2 + \sigma_2^2 - 2 \cdot \sigma_{1,2}}$$

where  $\sigma_{1,2}$  is the covariance element, calculated on N events for a given energy as:

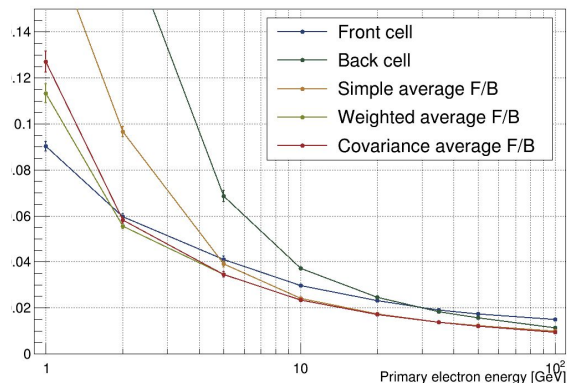

$$\sigma_{1,2} = \frac{1}{N} \sum_i^N (t_{1,i} - \hat{t}_1) \cdot (t_{2,i} - \hat{t}_2)$$

# WGAGG time resolution

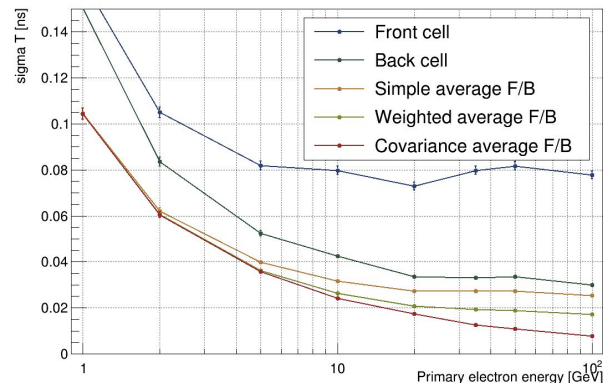

Single Readout  
Single module

Double Readout  
Segmented module

Double Readout  
Monolithic module

- ▷ Segmented module:
  - ▶ Front and back intersect around 30 GeV
  - ▶ Simple average performs poorly at low energy
  - ▶ Weighted and covariance average performing equal
- ▷ Monolithic module with double readout:
  - ▶ Back always better than front
  - ▶ Covariance average performs better (front/back timestamps correlated)

# WGAGG best results for the 3 configurations

- ▶ Time resolutions expected to be better than 20 ps above 20 GeV for all configurations
- ▶ Single side readout on monolithic modules provides worst timing performance
- ▶ Very similar performance from segmented and monolithic modules when using double readout

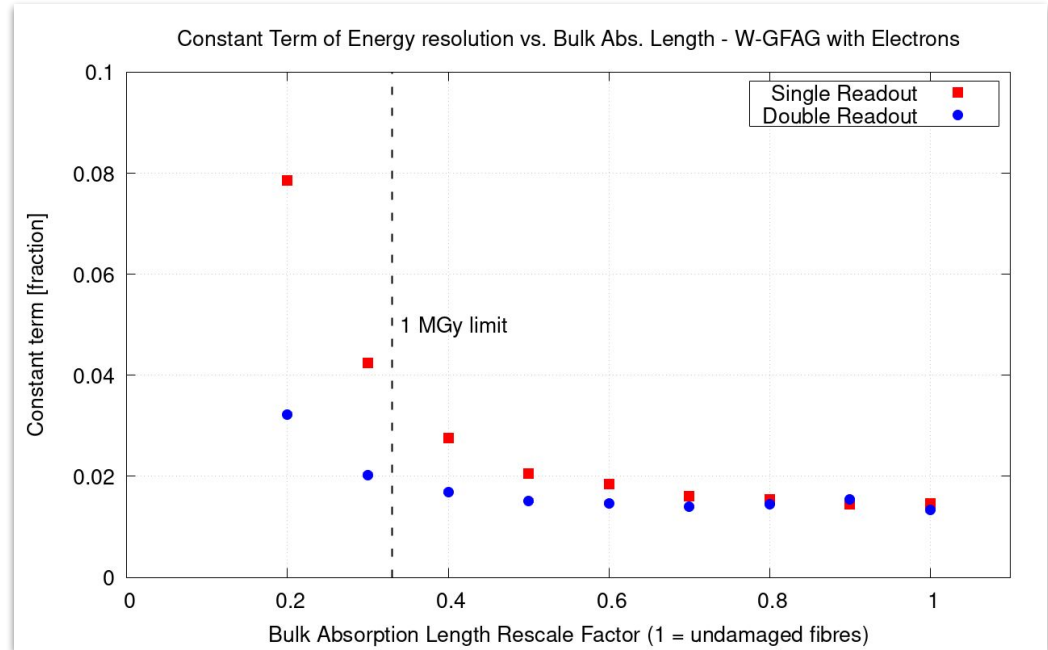

# Radiation damage study

Radiation damage simulated as a **loss of transparency** in scintillators -> **rescaling** bulk material absorption length

TABLE I  
MEASURED ATTENUATION LENGTH OF THE GAGG FIBER  
BEFORE AND AFTER IRRADIATION

GAGG fibre	$\lambda_{att}$ [cm]
Before irradiation	101.5
After irradiation	33.6

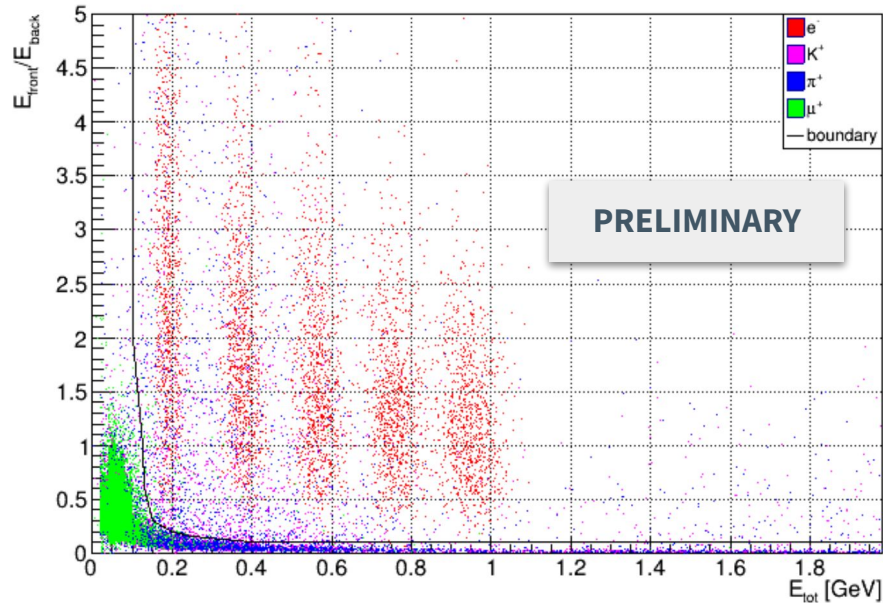

L. Martinazzoli, doi: 10.1109/TNS.2020.2975570

- ▷ Double readout segmented more robust to radiation damage, mostly because scintillators are shorter
- ▷ Expected performance remains acceptable up to 1 MGy, constant term < 2%

# Electrons-hadrons discrimination

Ongoing studies to explore the possibility to **discriminate  $e^-$  from hadrons** with SPACAL modules, based on energy distribution

- ▶ Several combinations of energy deposited in cells and sections can be used
- ▶ Much better  $e^-/\pi^+$  separation efficiency found when the module is segmented longitudinally

# Comparison to test beam results

# Simulation of test beam modules

Test beam modules: 3x3 cells with some non-negligible **material budget** between front and back section (easy detachment)

WGAGG

0.065 mm	ESR
0.3 mm	Alu
<b>1.5 mm</b>	<b>Stainless</b>
2.37 mm	Air
<b>1.05 mm</b>	<b>Stainless</b>
0.3 mm	Alu
0.065 mm	ESR

PbPoly

0.065 mm	ESR
<b>2.0 mm</b>	<b>Stainless</b>
1.0 mm	Air
<b>2.0 mm</b>	<b>Stainless</b>
0.065 mm	ESR

- ▶ Performance degradation expected with respect to optimized modules (12x12 cm<sup>2</sup> section, with negligible separation)

# Comparison with test beam data

- ▶ The MC framework reproduces well the **test beam measurement**, once the separation material is included
- ▶ Modules for usage in **LHCb ECAL** will be designed with optimized separation (e.g. thin reflector foil)
- ▶ The framework allows to **predict** the energy resolution expected with **optimized modules**

# Comparison with test beam data

		Measurements on TB modules [%]	MC simulations on TB modules [%]	MC simulations on optimized modules [%]
WGAGG	<i>Sampling term</i>	$10.6 \pm 0.1$	$10.2 \pm 0.1$	$9.2 \pm 0.1$
	<i>Constant term</i>	$1.9 \pm 0.5$	$1.98 \pm 0.04$	$1.18 \pm 0.03$
PbPoly	<i>Sampling term</i>	$10.0 \pm 0.6$	$10.3 \pm 0.1$	$9.7 \pm 0.1$
	<i>Constant term</i>	$1.16 \pm 0.06$	$0.94 \pm 0.04$	$0.56 \pm 0.05$

Expected energy resolution in **optimized modules** in line with requirements

# Integration with LHCb framework

# Integration into LHCb simulation framework

- ▶ Integration of the ECAL upgrade configurations into Gauss is desirable
  - ▶ Will allow simulate ECAL with a flux of particles that passed through the other upgraded sub-detectors
  - ▶ Needed in any case in time for Run4 & Run5
- ▶ Several steps required
  - ▶ Port geometry to DD4Hep
  - ▶ Implement scoring (hits)
  - ▶ Port current parametrization strategy into the LHCb framework, verify functionality against current HybridMC
  - ▶ Develop further parametrizations (CPU time currently not compatible with LHCb requirements)
- ▶ Current situation
  - ▶ Geometry of baseline Run5 ECAL ported to DD4Hep
  - ▶ Run4 geometry description in DD4Hep almost completed
  - ▶ Checks of geometry ongoing
  - ▶ Starting implementation of scoring

# DD4Hep - Run3 ECAL

The Bologna group already implemented the description of Run3 LHCb ECAL (and HCAL) in DD4hep (i.e. SHASHLIK modules)

We started the ECAL Run4 and Run 5 implementations based on their code (many thanks to Lorenzo and Stefano!)

# Module and ECAL implementations in DD4Hep

Some examples of SPACAL and Shashlik modules geometries, and the full Run5 ECAL, implemented in DD4Hep

Implementation of signal formation ongoing!

# Conclusions

- ▽ Full MC simulation framework developed, HybridMC
  - ▶ Allows to perform detailed simulations in reasonable time
  - ▶ Useful for both prototype developments and physics benchmark studies
  - ▶ Well documented, available to the collaboration
- ▽ Several single module studies performed
  - ▶ Complete characterization and optimization of the various SPACAL flavours
  - ▶ Good agreement with test beam data
  - ▶ Prediction of optimized module performance in line with requirements
- ▽ Integration into the LHCb simulation framework ongoing
  - ▶ Geometrical description in DD4Hep of the Run4-5 configuration prepared
  - ▶ Ongoing work on signal formation
  - ▶ Long term goal: port the HybridMC approach into the LHCb simulation framework and develop further parametrizations to allow speed-up when simulating the entire LHCb experiment

Thank you for your attention!
