**Area della Ricerca di Pisa**

# OUTLINE

A wide-angle, low-angle shot of a city at night. The sky is a deep blue, transitioning to orange and yellow near the horizon. Buildings of various heights are silhouetted against the light. A river or canal runs through the center, its surface calm and dark, reflecting the warm lights from the buildings and street lamps. On the right side, a long, curved embankment or bridge is visible, lined with streetlights that cast a warm glow. The overall atmosphere is peaceful and urban.

- **Intro on relevant laser needs and features**
- **Roadmap for laser driver development**
- **Short-medium term options**
- **Constraints and high efficiency options**
- **Engaged developments**
- **Summary**

# Grand challenges of laser-plasma technology

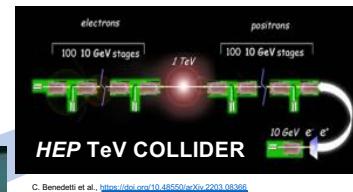

Aiming at extensive use of multiple (hundreds of) laser units at **high average power**

Limited by laser technology

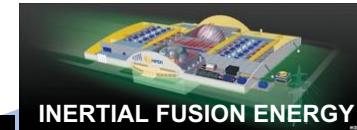

R. Assmann et al., <https://doi.org/10.1140/epjst/e2020-000127-8>

EuPRAXIA  
Preparatory  
phase

R&D

Towards  
CDR

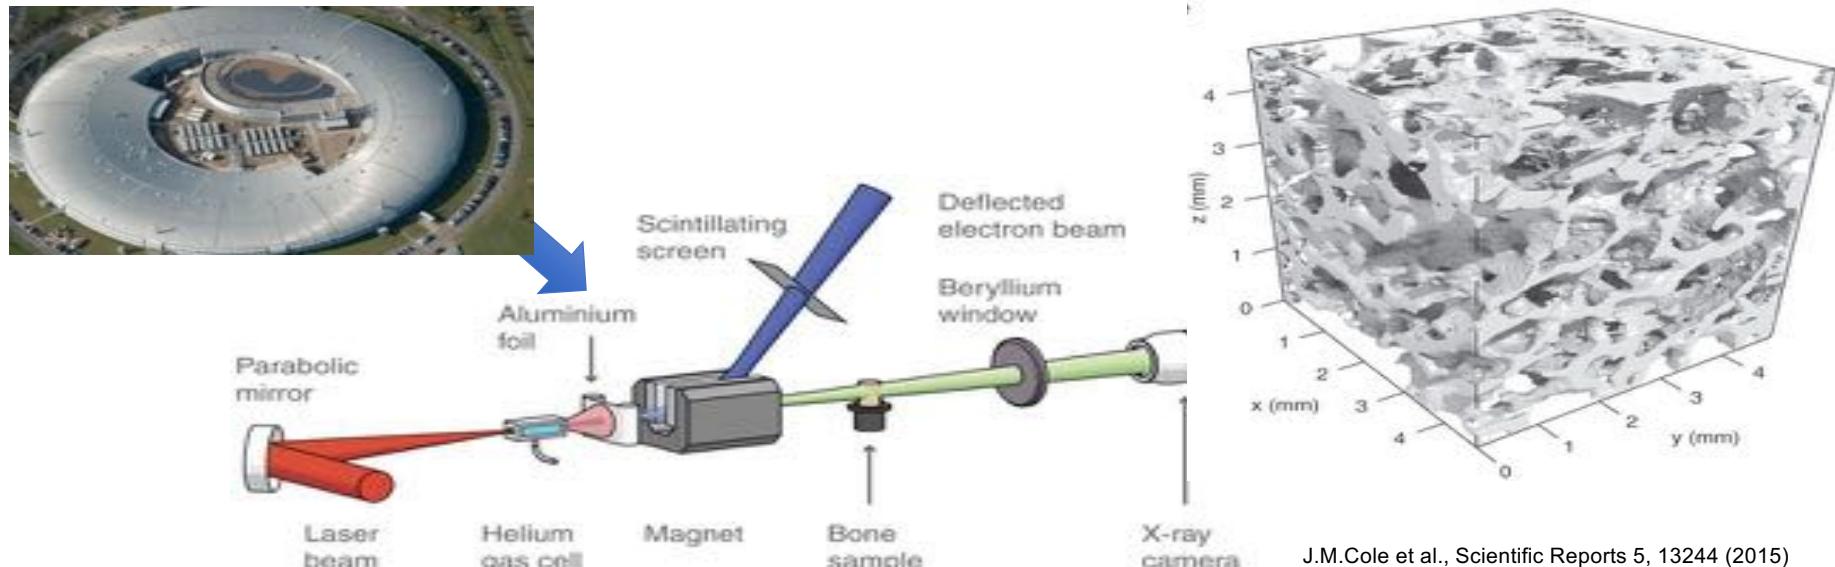

Towards  
CDR

Cost, durability, energy efficiency, mass production of underlying laser components **key to enable these developments.**

# Mature applications: X-ray imaging

X-ray imaging for compact, high resolution (phase contrast imaging) bio-medical diagnostics

Address some of the needs of large SR facility users

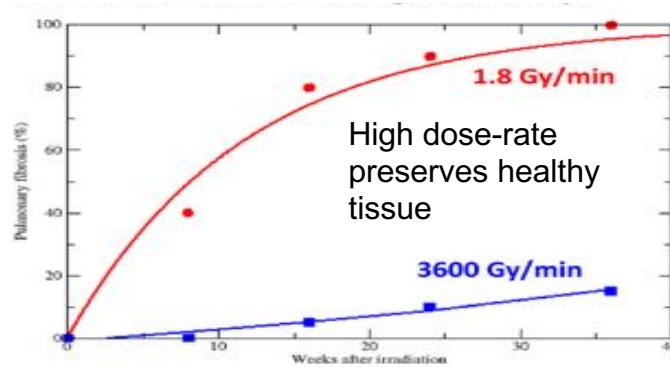

J.M.Cole et al., Scientific Reports 5, 13244 (2015)

Needs next generation high repetition rate kW laser driver

# Emerging applications: radiotherapy

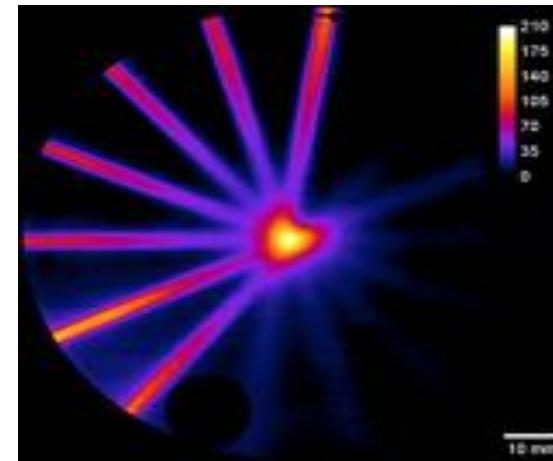

## LPA beams can meet specifications of advanced radiotherapy approaches

Laser-driven electron beams can provide ultra-high dose-rate to meet requirements of future “**FLASH**” radiotherapy with **Very High Energy electrons (VHEE)** in a compact size:

V. Favaudon et al., [Sci Transl Med.](#) 2014 Jul 16;6(245):245ra93

VHEE with Laser driven: Dosimetry

Proof of principle Multi-Field Radiation Therapy Very high energy electrons. (L.Labate et al. Sci Rep, 2020)

Almost none of the 13000 radiotherapy linacs worldwide can deliver FLASH beams: a huge potential still to be addressed, with major R&D in RF accelerators and novel accelerators, including laser-driven LPA.

Needs next generation of high repetition rate <kW laser driver

# Emerging applications: industry and security

High energy X-rays or neutron sources are being developed for industry and security

Industrial high temporal resolution X-ray imaging - C. M. Brenner et al, PPCF, 58 014039, (2015)

Laser driven neutron sources at Los Alamos

New high intensity laser based facility (80M GBP investment) to support science, technology, innovation and industry.

The figure consists of six panels arranged in a 3x2 grid, each illustrating a specific application of high-intensity lasers:

- Top Left:** Inspection for failure modes in very dense and heavy metals such as steel.
- Top Right:** Penetrating beams, for fast throughput monitoring and testing of critical components in extreme performance conditions.
- Middle Left:** Inspection of battery components, full-scale systems and fuel cells for micron-scale defects with micro CT.
- Middle Right:** Ultra high contrast, high resolution and high throughput biological micro CT imaging.
- Bottom Left:** Fast scan time for CT imaging of large metallic additively manufactured parts and in-build imaging inspection for quality assurance and validation.
- Bottom Right:** Inspection for quality assurance and detection of micron-level cracks and defects in extreme performance composite materials.

The Extreme Photonics Applications Centre, CLF, UK

Moving to implementation of kW laser technology for users

# High intensity lasers: evolution

Major breakthrough following Chirped Pulse Amplification

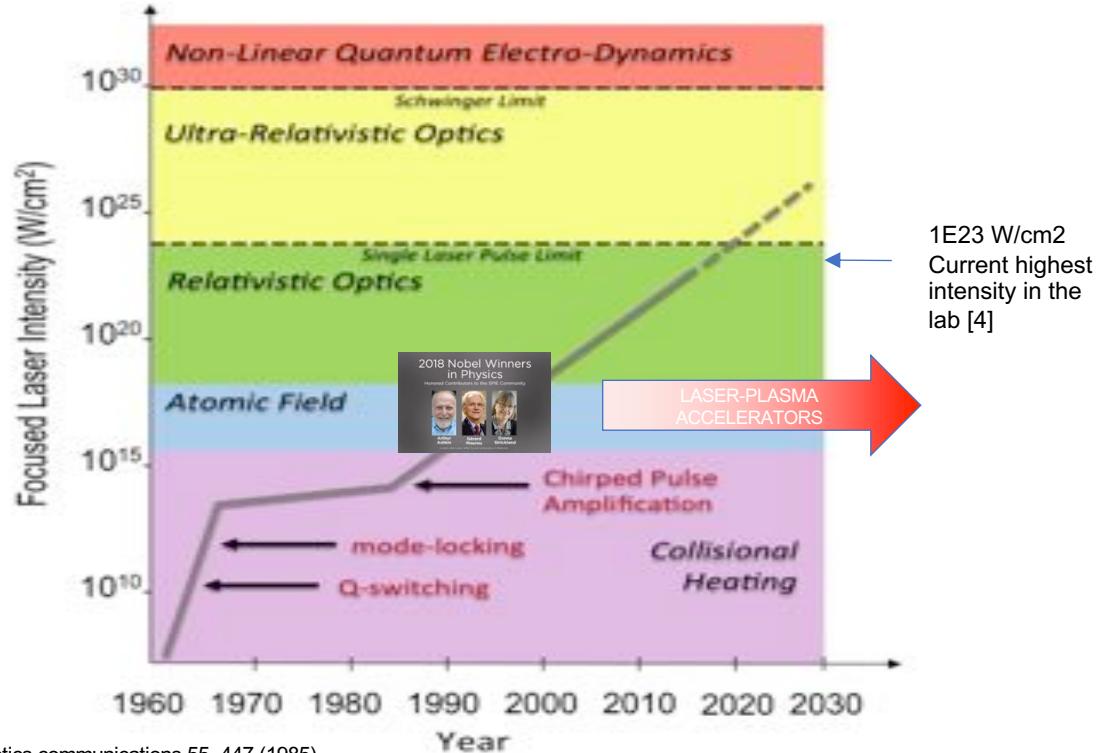

Current laser technology development of CPA lasers [1] mainly driven by **extreme intensity** applications;

Laser-Plasma acceleration has developed along with progress in laser performance;

Recent LWFA-FEL demonstration [2] highlights the role of laser stability and control;

**Need to** focus on the technology required to achieve **high-repetition rate at multi-joule ( $\approx 100$  TW) scale** [3], with high quality and enhanced control and stability;

**Key role of industry** to establish turn-key, high average/peak power ultrashort pulse technology;

# What laser driver specs for future LPAs

Rapidly evolving scenario for laser technologies relevant for plasma acceleration towards multi-stage accelerators design:

Pillars for a **STRATEGY** for laser drivers for plasma accelerators:

- Ultrashort pulses (large bandwidth <50 fs)
- High Repetition rate (100 Hz – 50 kHz)
- High average power (kW -10s kW)
- High wall-plug efficiency (>10%)

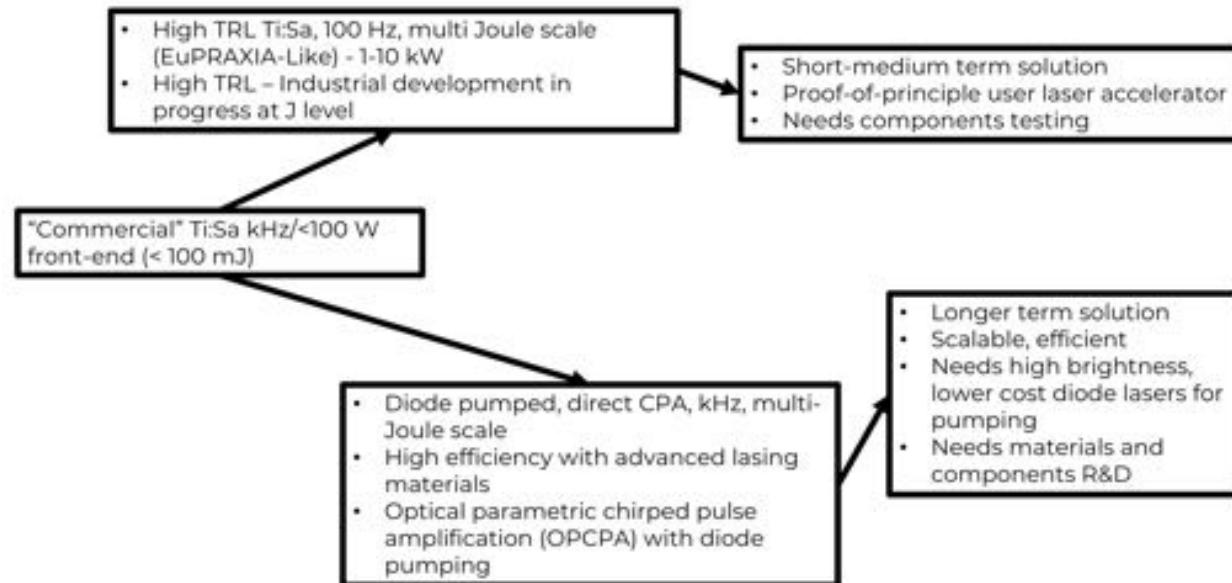

- [IFAST EU project on novel accelerator techniques just funded \(Coordinated by CERN\): https://ifast-project.eu/](https://ifast-project.eu/)
- Task on “Lasers for Plasma Acceleration (LASPLA)”
  - Roadmap to foster delivery of industrial laser drivers for the plasma-based accelerator.
  - Networking among main laser lab working on LPA laser-driver R&D.

L.A. Gizzi, F. Mathieu, P. Mason, P P Rajeev, *Laser drivers for Plasma Accelerators*, in Félicie Albert et al, *2020 roadmap on plasma accelerators*, 2021 New J. Phys. 23 031101, <https://doi.org/10.1088/1367-2630/abcc62>

# Roadmap for laser driver development

Part of the WP6: Novel Particle Accelerators Concepts and Technologies of i.FAST

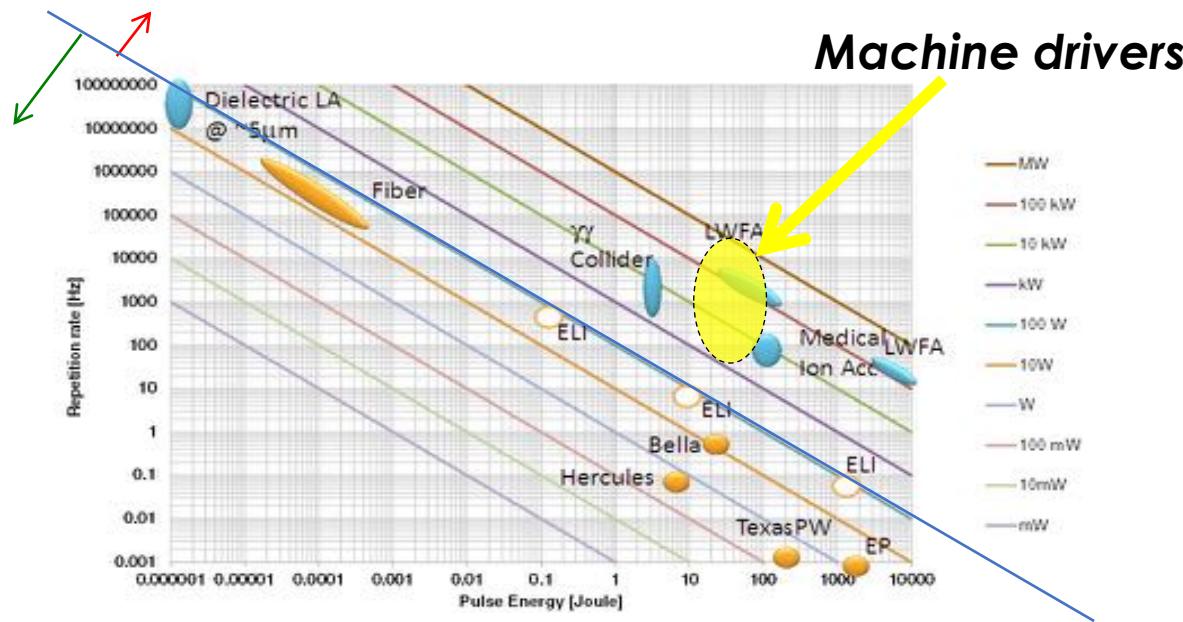

Innovation Fostering in Accelerator Science and Technology (i.FAST) coordinated by CERN <https://ifast-project.eu/>

# Average power

Current requirement for LPA driver: PW-class system, with high repetition rate ( $\approx$ kHz)

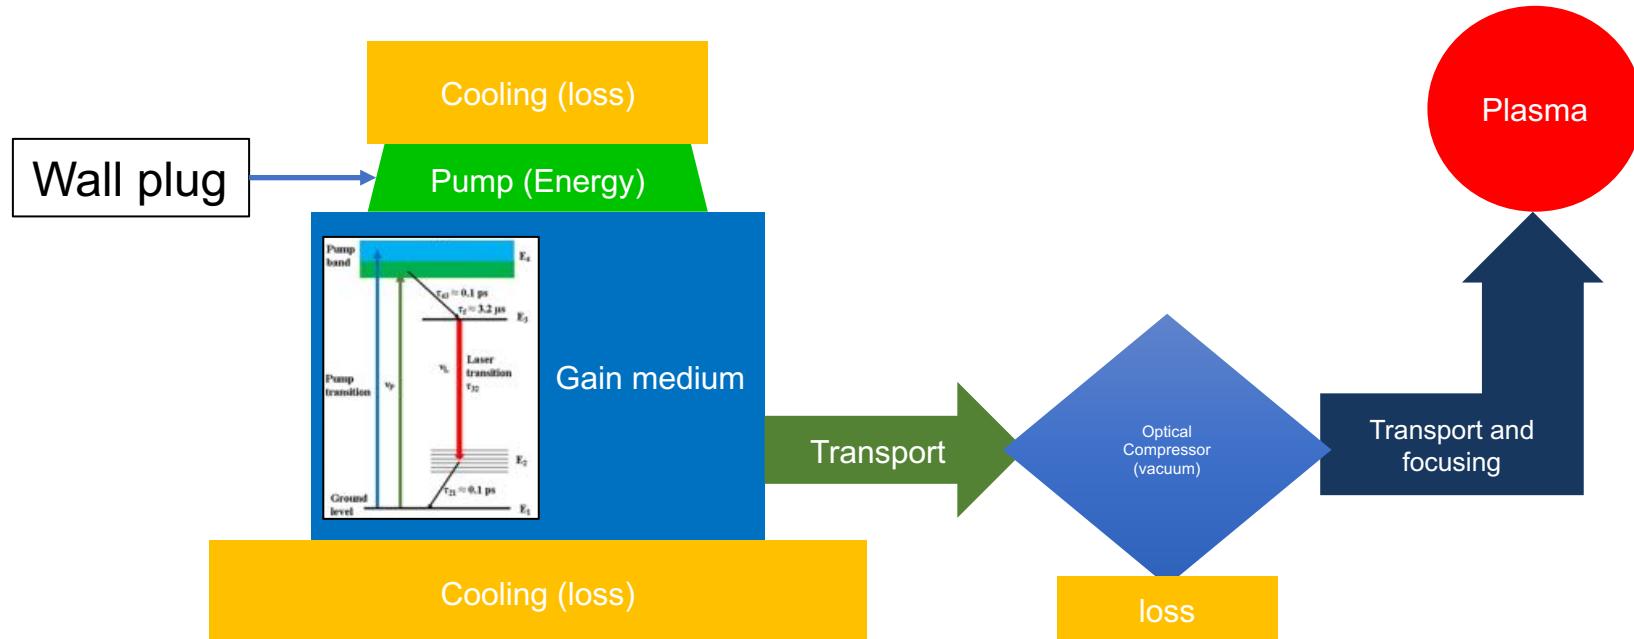

Demanding high average power

Major effort required to fill the gap between **existing** and **required** laser technology

# Relevant blocks of a laser driver

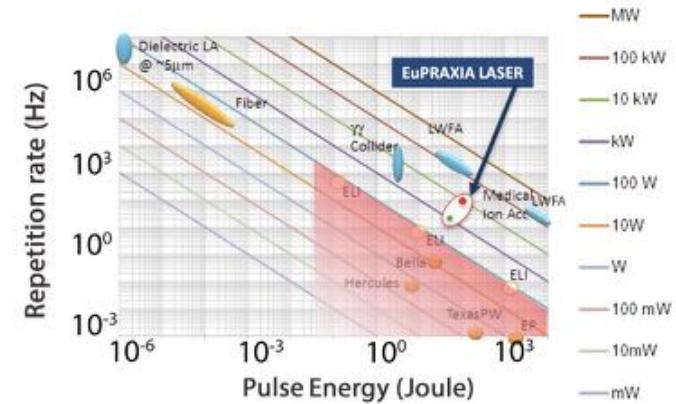

Tackle power and coupling efficiencies and losses

# Roadmap on LPA Laser Driver technology

Laser-driven plasma acceleration needs ultrashort, high power lasers with high average power

- Current industrial technology: ≈ **Ti:Sa technology, pumped by flash-lamp pumped lasers**
  - Robust, reliable industrial technology
- Mature technology: ≈ **Ti:Sa technology, pumped by diode-pumped lasers**
  - Strong R&D effort in place (e.g HAPLS@ELI)
  - ≈ 3-5 years to go to first industrial LWFA demonstrator (e.g. Eupraxia) [1]
- Beyond TiSA: targeting **higher wall-plug efficiency and rep. rate, kHz and beyond, stability, control (space, time, spectral)**
  - 5-10 yrs for first efficient, multi-kW-scale demonstrator,
  - A strategy is needed to steer effort in the LPA laser driver direction: LASPLA

The L3-HAPLS at ELI Beelines Research Center in the Czech Republic. Credit: ELI Beelines\*

<https://doi.org/10.1140/epjst/e2020-000127-8>

# The EuPRAXIA Project

A New European High-Tech Research Facility Delivering Frontier Science

1

Building a facility with very high field plasma accelerators, driven by lasers or beams  
1 – 100 GV/m accelerating field

Shrink down the facility size

Experimental techniques and typology of samples

Coherent imaging:

X-ray absorption spectroscopy

Raman spectroscopy

Photo-fragmentation of molecules

2

Producing particle and photon pulses to support several urgent and timely science cases

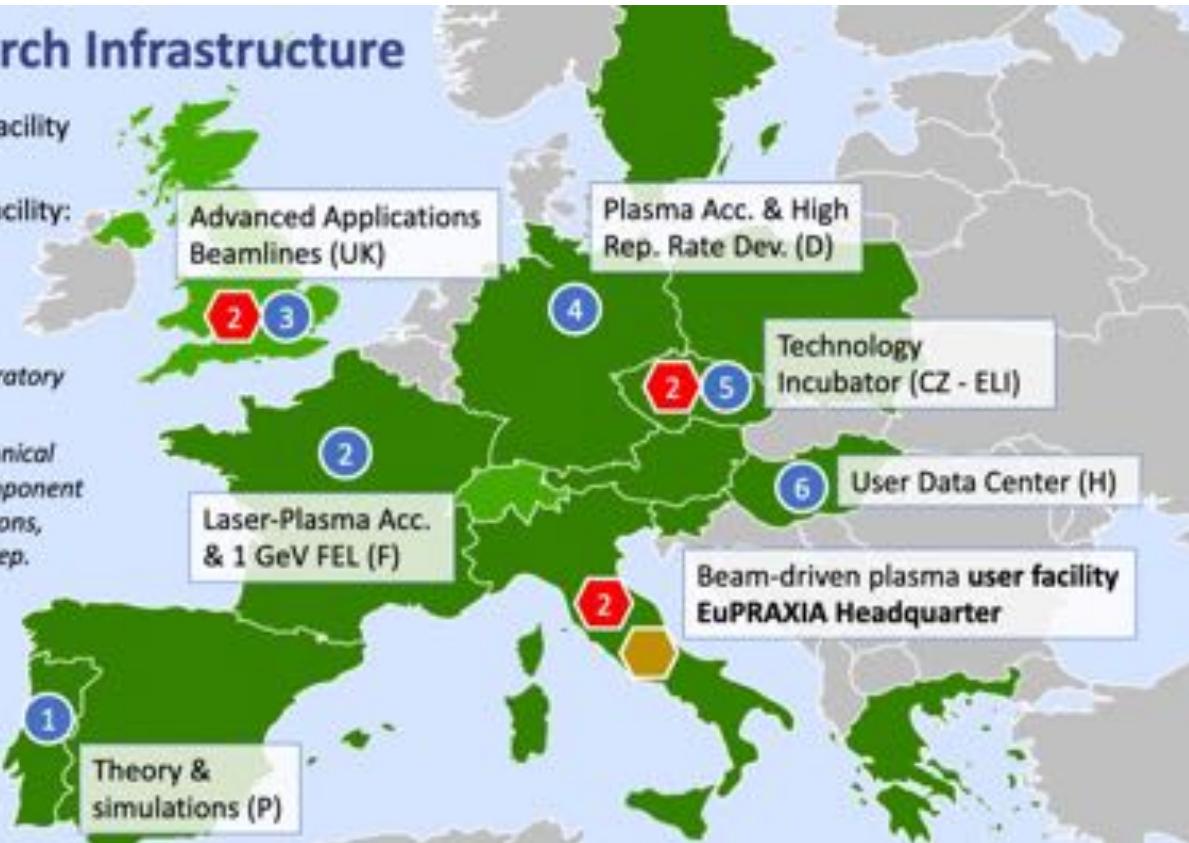

Enable frontier science in new regions and parameter regimes

## Distributed Research Infrastructure

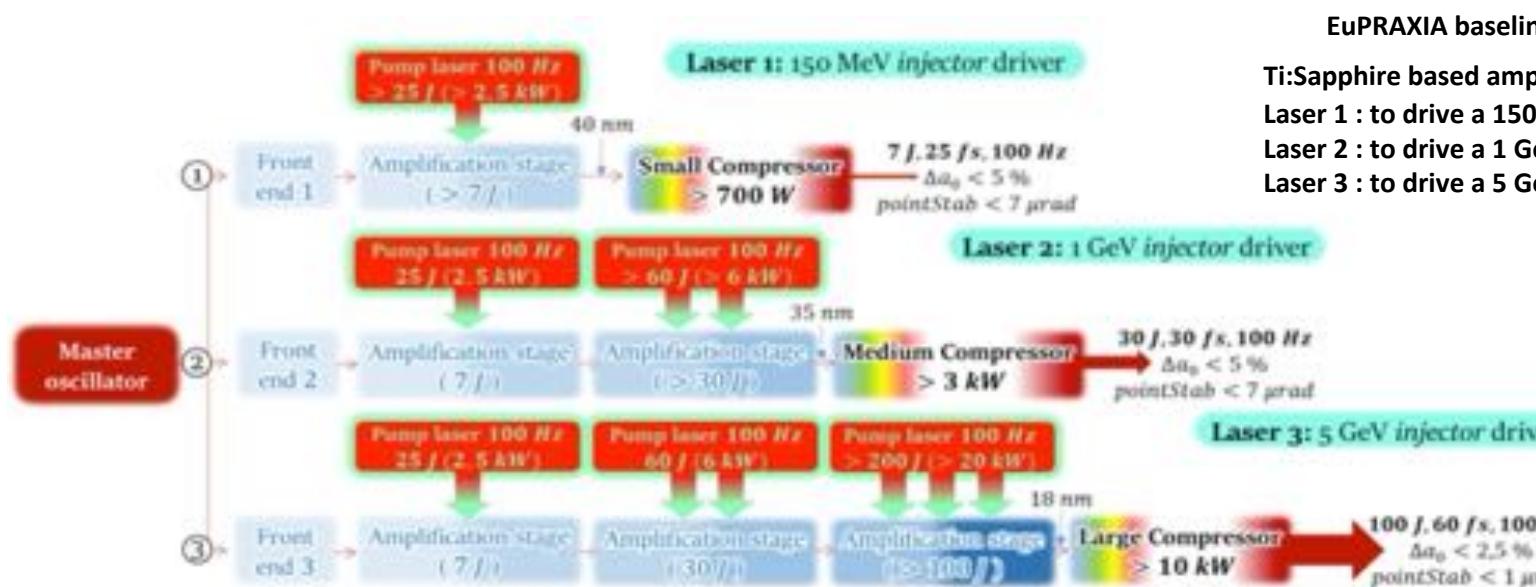

- ➊ Beam-driven plasma user facility  
EuPRAXIA Headquarter
- ➋ Laser-driven plasma user facility:  
candidates
- ➌ Excellence Center

Second site will be decided in Preparatory Phase project.

Excellence centers (EC) perform technical developments, prototyping and component construction. Number of EC's, locations, roles, responsibilities reviewed in Prep. Phase.

The current EuPRAXIA laser design relies on Titanium Sapphire technology to address average (10 kW) and peak (PW) power as required by the project (1-5GeV LWFA).

•L.A. Gizzì, et al., A viable laser driver for a user plasma accelerator, *NIMA* **909**, 58 (2018); <https://doi.org/10.1063/1.4984906>

•R. Assmann et al., EuPRAXIA Conceptual Design Report, *The European Physical Journal Special Topics* **229**, 3675–4284 (2020); <https://doi.org/10.1140/epist/e2020-000127-8>

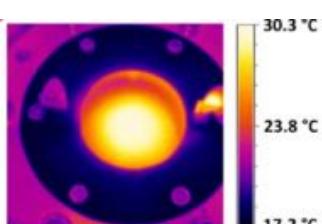

•Water cooled Ti:Sa amplifier under development at ELI-HU (After V. Cvilyák *et al.*, *Opt. Lett.*, **41**, 3017, 2016)

•Fluid (D<sub>2</sub>O) cooled Nd:YAG laser, 20 kW CW pump power, D<sub>2</sub>O (After X. Fu *et al.*, *Opt. Express*, **22**, 18421 (2014))

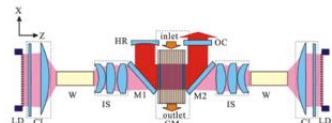

•Fluid (Siloxane) cooled Nd:YLF laser, 5 kW CW pump power (After Z. Ye *et al.*, *Opt. Express*, **24**, 1758 (2016))

- Requirements on energy, pulse duration, stability etc set by the LPA working point
- Design based on CPA in Ti:Sapphire, dictated by requirements vs. time scale
- Thermal management issues to be addressed by means of liquid cooling
- Main developments required:
  - Prototyping of Ti:Sa amplifiers: fluid cooling: pilot studies
  - Addressing 100 Hz pump lasers developments
  - Thermal management of compressor gratings
  - Stability (pointing & more) and active control
  - Driver pulse temporal shaping and synchronization
- Construction
- Integration Issues

# **THERMAL MANAGEMENT OF POWER AMPLIFIERS**

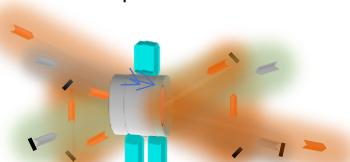

# WATER/GAS COOLING

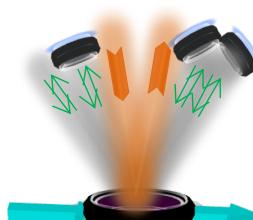

**Prototyping needed**

# AMPLIFIER GEOMETRY TRANSMISSION VS. REFLECTION

## Multipass transmission

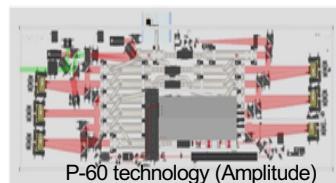

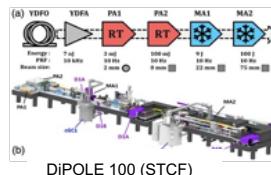

## Multipass reflection

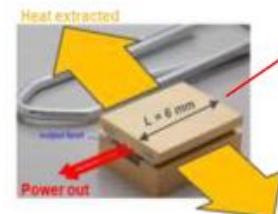

## Prototyping needed

# DPSSL PUMP SOURCES TECHNOLOGY

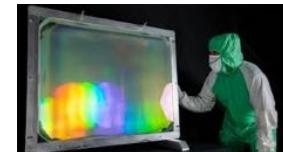

**Currently no solution for  
full system specs (P1):  
development**

# DIODE LASERS EFFICIENCY, BRIGHTNESS AND LIFETIME

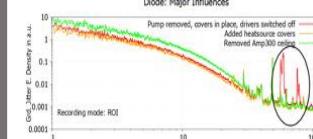

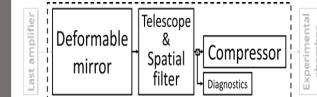

## Needs development

# COMPRESSOR AND TRANSPORT: THERMAL AND MECHANICAL

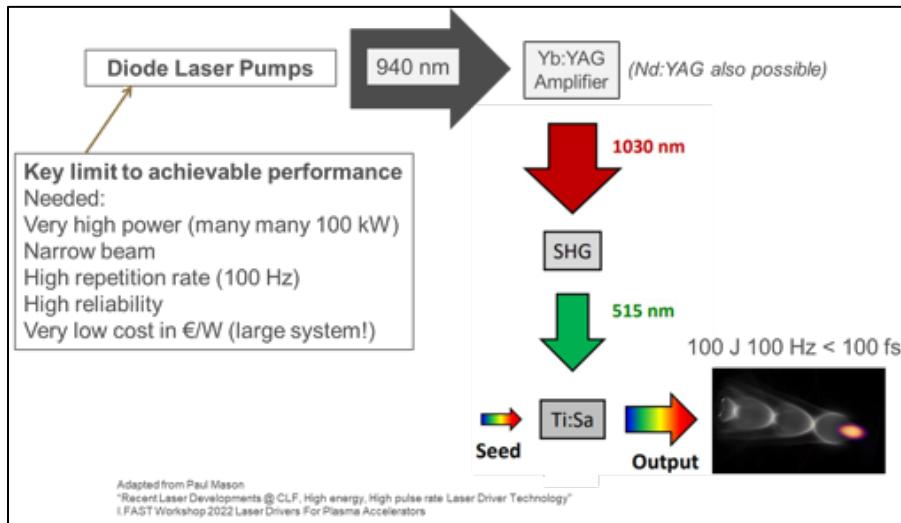

**Gold**  $\rightarrow$  MD, MLD, MMLD  
**reduction** of the thermal load  
**cooling** of residual heat  
**control** of thermal effects

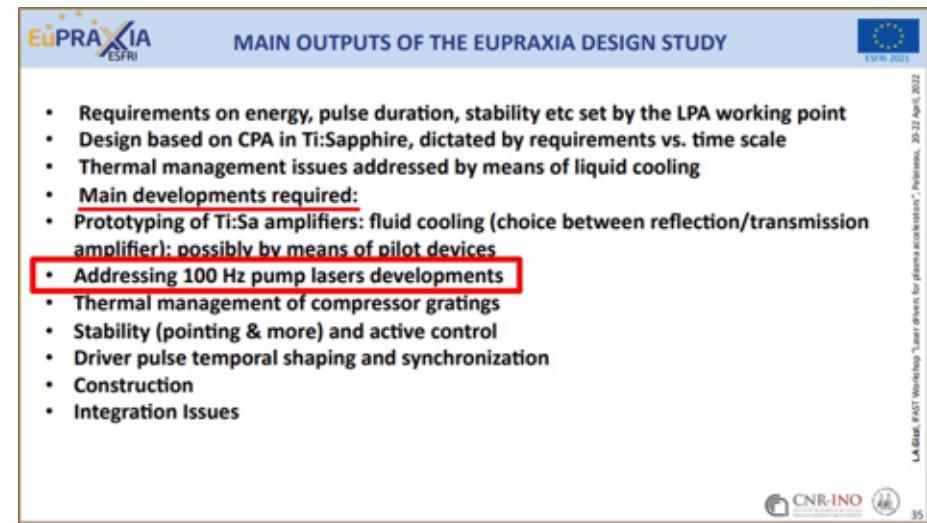

Main challenges: large optics,  
**mechanical stability**, beam  
quality control, pointing  
stability

# Diode laser pump challenge: viable 100 Hz

## Diode lasers source of all optical power in EuPRAXIA

## Challenge: 100 Hz pump supply

**Preparatory review with Industry Berlin, held 5 October 2022 „Berlin Laser Tech Symposium“**

Large industry: Coherent, Leonardo, Lumibird, Jenoptik, Hamamatsu, High-tech SMU: Lastrronics

Research: CNR (L. Gizzi). Chair: FBH Berlin (P. Crump)

**Consensus: Economic high duty cycle diode laser pumps remain extremely challenging**  
Improved packaging and diodes and their reliability assurance strongly demanded

# Diode specifications: known and open issues

## Diode pump laser technical specs

- 20...100 Hz
- ~ 80 cm<sup>2</sup> square flat-top beam, imaged into amplifier, with up to several meters offset
- < 6° divergence angle, high polarization purity
- Multiple 500 kW units needed for largest system
- Yb:YAG:  $\lambda = 940$  nm, ~ 500  $\mu$ s pulses (5% duty cycle) – high duty cycle packaging needed
- Nd:YAG:  $\lambda = 800$  nm, ~ 200  $\mu$ s pulses (2% duty cycle) – higher power diodes needed

## Key open topics:

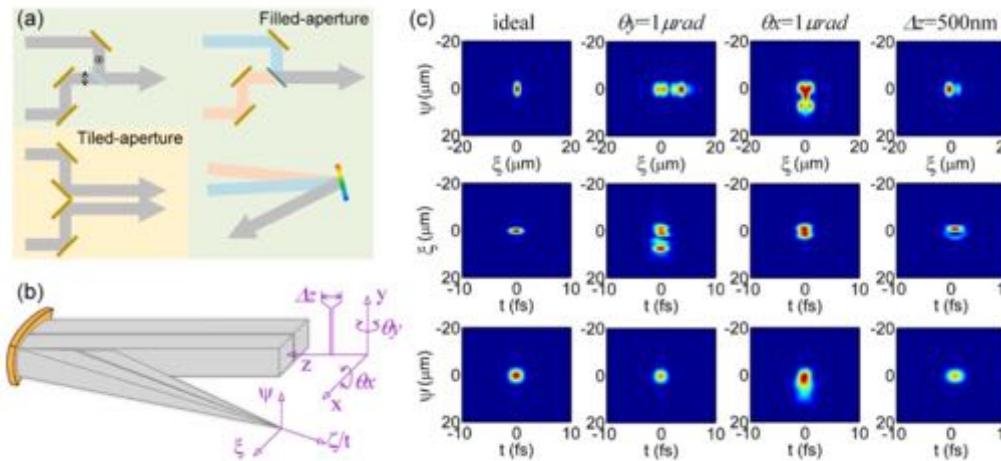

- Lifetime requirements (uptime, system size, replacement rates / failure rate)
- Costs (purchase, maintenance, operation)
- Efficiency (energy cost of operation)
- Specifications / requirements for alternative wavelengths

## Needed diode laser pump development goals and research efforts (3 y technology, 3 y qualification)

- Improved diode laser performance: higher efficiency, higher power
- Improved packaging: high performance economical cooling
- Cost reduction: higher power (€/W), yield (€)
- **Prototyping of new concepts (e.g 780 nm or 1600 nm for Thulium)**
- Reliability assurance (low failure rate)
- Security of supply: standardization, assurance of supply chain; European supply

# Coherent Combination

Coherent combination has been proposed for Ti:Sa beamlets, in a similar approach as fiber combination, but with tiled-aperture.

Z. Li, et al., Laser Photonics Rev. 2023, 17, 210070

- Significant engineering issues to be overcome, but in line with current active control approach
- Could relax constraints on heat load management of >kW beamline and need of large optics
- Needs CDR

# Ongoing 100 Hz developments

# Intermediate milestone

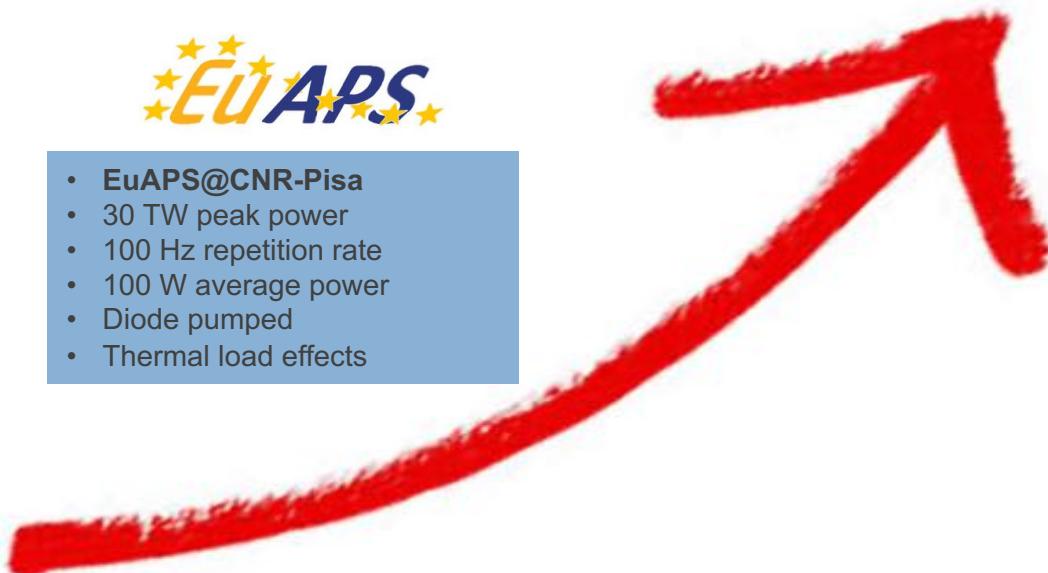

**Eupraxia laser development is aimed at delivering more efficient, kW-PW laser driver for plasma acceleration at >100 Hz rate**

- EuPRAXIA
- PW class,
- 100 Hz repetition rate,
- multi kW average power,
- diode pumped
- Full thermal load transport

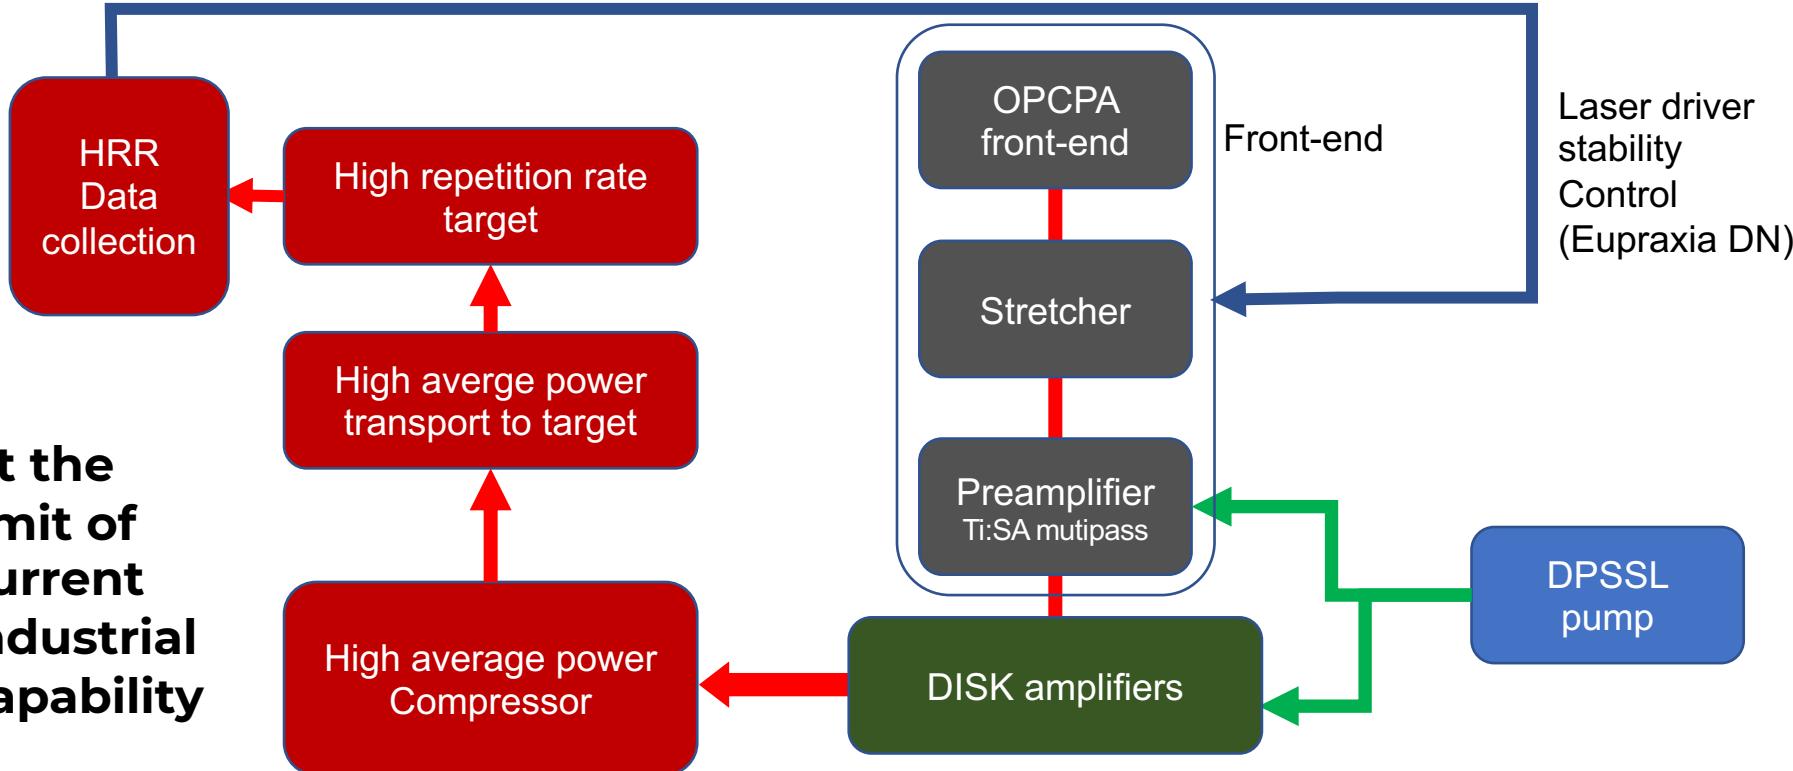

- EuAPS@CNR-Pisa
- 30 TW peak power
- 100 Hz repetition rate
- 100 W average power
- Diode pumped
- Thermal load effects

- **CURRENT**
- **PW class,**
- **Hz repetition rate,**
- **≈10 W average power**
- **flashlamp pumped**
- **No thermal load transport**

# 100 Hz, J-scale laser beamline

**At the  
limit of  
current  
industrial  
capability**

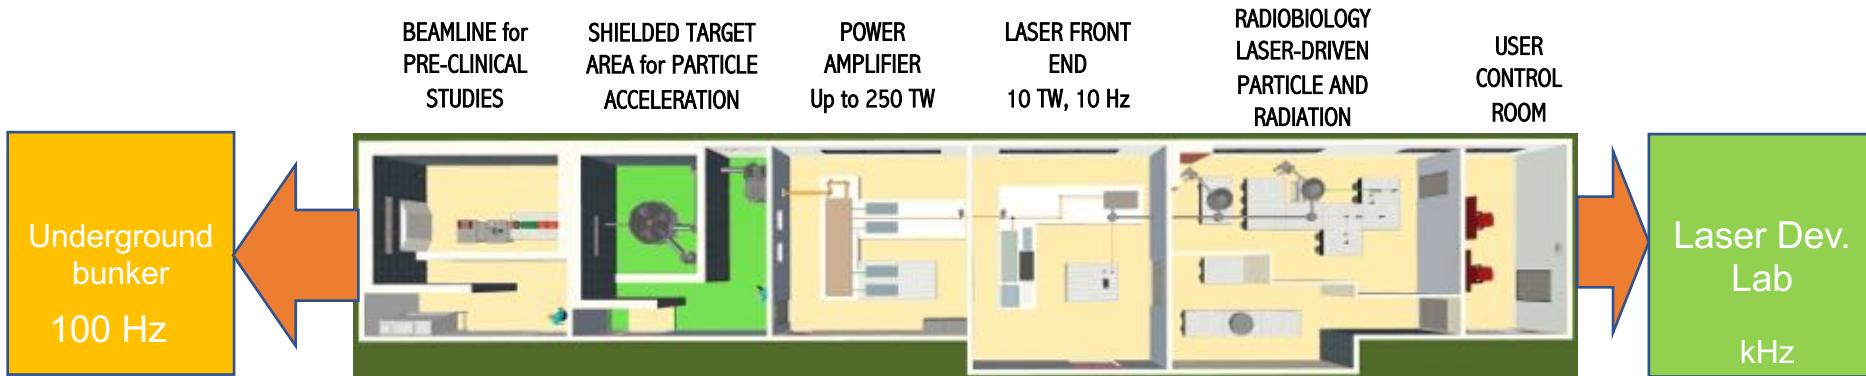

**Joule scale / 100 Hz / > 100 W**

Funded by the  
European Union  
NextGenerationEU

# 100 Hz beamline upgrade at ILIL

## UPGRADE OF ILIL FACILITY FOR:

1. Upgrade of existing laser system (240 TW) for enhanced stability and control
2. New laser systems for high repetition rate operation (100 Hz-1J, 1kHz-20 mJ)
3. New Infrastructure development for user access to beamlines

# New High Repetition Rate Target Area

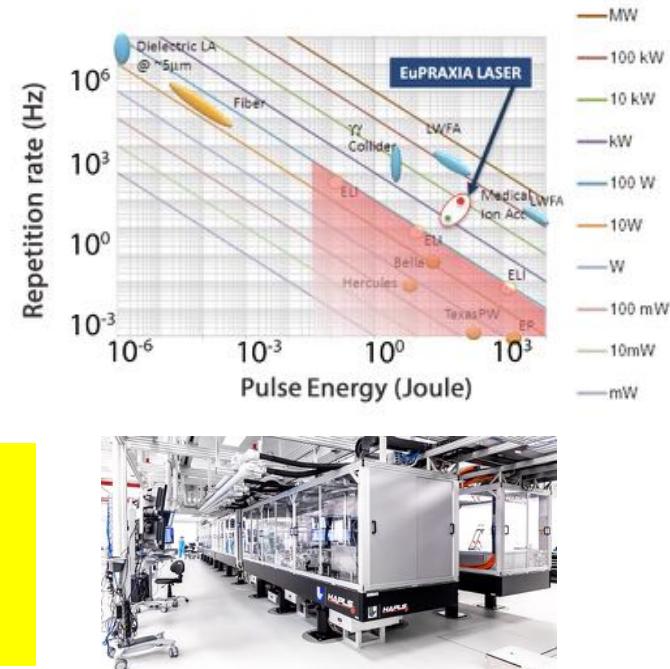

# **kHz laser driver development for LPA**

# Roadmap on LPA Laser Driver technology

Laser-driven plasma acceleration needs ultrashort, high power lasers with high average power

- Current technology: ≈ **Ti:Sa technology, pumped by flash-lamp pumped lasers**
  - Robust, reliable industrial technology
- Mature technology: ≈ **Ti:Sa technology, pumped by diode-pumped lasers**
  - Strong R&D effort in place (e.g HAPLS@ELI)
  - ≈ 3-5 years to go to first industrial LWFA demonstrator (e.g. Eupraxia) [1]
- **Beyond TiSA: targeting higher wall-plug efficiency and rep. rate, kHz and beyond, stability, control (space, time, spectral);**
  - **5-10 yrs for first efficient**, multi-kW-scale demonstrator,
  - A strategy is needed to steer effort in the LPA laser driver direction: LASPLA

The L3-HAPLS at ELI Beamlines Research Center in the Czech Republic. Credit: ELI Beamlines\*

[1] R. Assmann et al., EuPRAXIA Conceptual Design Report, The European Physical Journal Special Topics **229**, 3675–4284 (2020)  
[2] C. Danson et al., Petawatt and exawatt class lasers worldwide High Power Laser Sci. and Eng. **7**, e54 (2019)

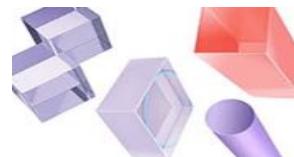

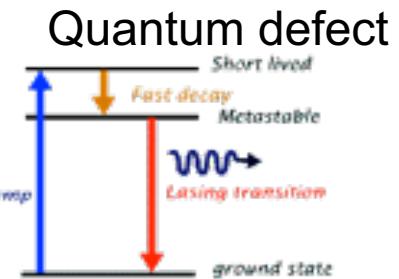

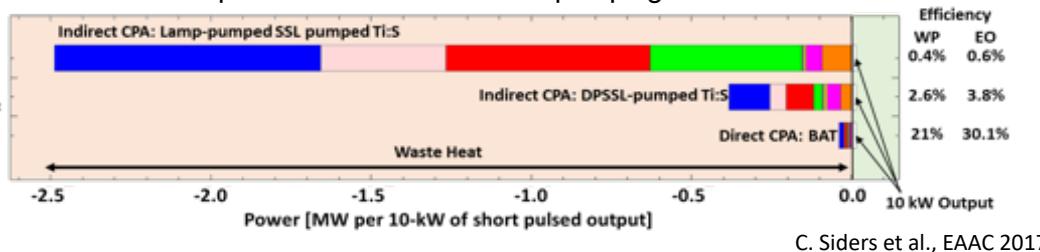

# Efficiency path

TiSa technology is prompt and will demonstrate repetitive operation 24/7 and stability, but not scalable with poor efficiency (% level) due to the indirect pumping architecture:

**Direct CPA is a solution for wall-plug (WP) efficiency and high rep-rate.**

From flashlamp to indirect to direct diode pumping

- Output
- Slab Heating
- Fluorescence
- Transport
- Unconverted Light
- Pump Light Loss
- Pump Heat
- Electronics Heat
- Refrigeration

WP Efficiency > 20% possible:

We need a **gain medium** that can support amplification on a large bandwidth, has a **low quantum defect** and can be pumped **directly** with diode lasers: **endless quest for the perfect laser medium!!**

# Several options under development

**Fiber laser technology** targeting the best WPE 30% in CW mode and coherent combination is being developed (FSU Jena-Fraunhofer IOF and Ecole Polytechnique-Thales in France).

Suited for moderate energy per pulse/high rep-rate (10s of kHz);

Now 96 fibers delivering 23 mJ and 674 W in a 235 fs pulse

**Direct Chirped Pulse Amplification** with lasing media pumped directly by diodes is ideal for higher efficiency and higher rep-rate;

several materials under consideration, Yb:CaF<sub>2</sub>, Tm:YLF, Tm:Lu<sub>2</sub>O<sub>3</sub> (with cross-relaxation and multi-pulse extraction) ...

PENELOPE (Jena) 150 J, 1 Hz, at 1030 nm

Available ps kW thin disk lasers using plasma modulation (Oxford<sup>2</sup>)

**OPCPA** optical parametric amplification within large-aperture lithium triborate (LBO) crystals;

ELI-Beamlines facility, L1 ALLEGRA (100 mJ at 1 kHz) and L2 AMOS (100 TW, 2 to 5 J between 10 and 50 Hz), and the Shenguang II Multi-PW beamline(SIOM, China) ...

**Thin Disk ps Lasers** + spectral broadening + post compression<sup>3</sup>

Industrial technology with demonstrated >kW operation ar  $\approx$ J per pulse energy.

# Thulium based gain materials: Tm:YLF

## Currently under investigation(\*): Tm:YLF

- Emission at 1,9  $\mu\text{m}$ , eye safe;
- Ultrashort pulse (<100 fs);
- High peak power  $\approx \text{PW}$ ;
- High average power (scalable from kW to 300 kW);
- Direct pumping at 808 nm, using diodes operating in CW mode (available and scalable);
- Multi-pulse extraction at high repetition rate
- 10 kHz; Ideal for accelerator technology;
- High efficiency;
- Mature material technology (crystal growth);

C. Haefner et al., EAAC 2017

## Tm: YLF Full specifications

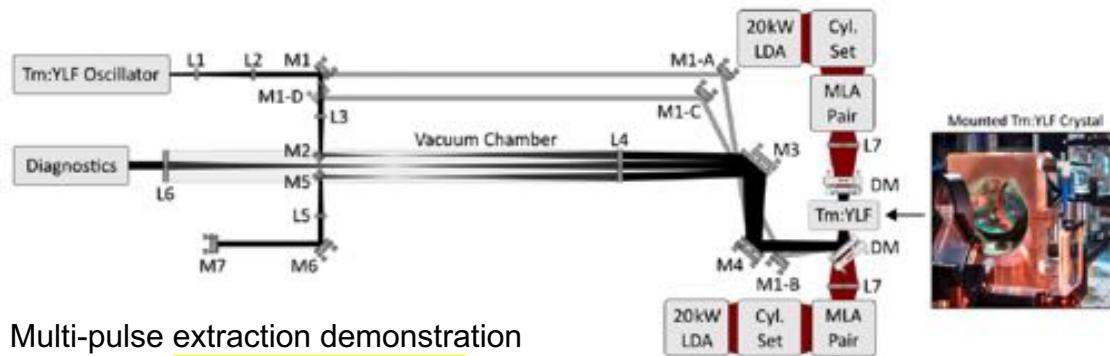

Absorption peak wavelength	792 nm
Absorption cross-section at peak	$0.55 \times 10^{-20} \text{ cm}^2$
Absorption bandwidth at peak wavelength	16 nm
Laser wavelength	1900 nm
Lifetime of 3F4 thulium energy level	16 ms
Emission cross-section @1900 nm	$0.4 \times 10^{-20} \text{ cm}^2$
Refractive index @1064 nm	$n_{\text{o}}=1.448, n_{\text{e}}=1.470$
Crystal structure	tetragonal
Density	3.95 g/cm <sup>3</sup>
Mohs' hardness	5
Thermal conductivity	6 Wm <sup>-1</sup> K <sup>-1</sup>
$d\alpha/dT$	$-4.6 \times 10^{-6} (\text{1}/\text{C}) \text{ K}^{-1}$
Thermal expansion coefficient	$10.1 \times 10^{-6} (\text{1}/\text{C}) \text{ K}^{-1}$
Typical doping level	2-4 at.%

## High Efficiency enabled by multipulse extraction (energy storage)

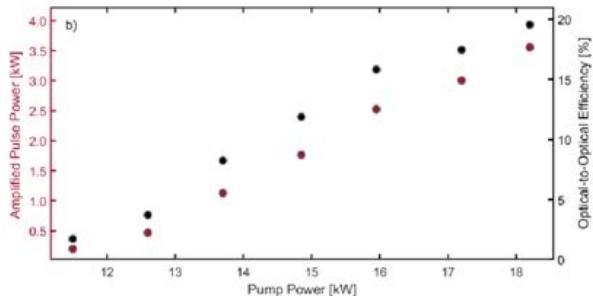

Relatively new approach for short pulse operation: needs R&D, but promising

# Recent advances with Tm:YLF

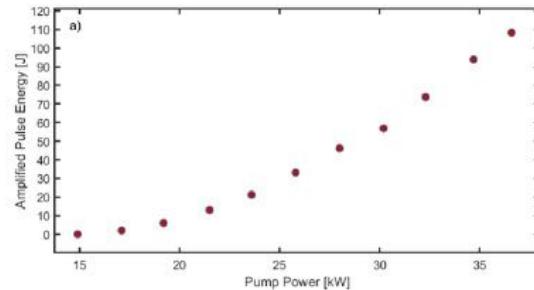

Energy density storage and extraction capabilities of Diode pumped Tm:YLF (narrowband)

Multi-pulse extraction demonstration resulting in **3.6 kW output power**

Amplified pulse energy measurements up to **108.3 J** for the 6-pass Tm:YLF power amplifier

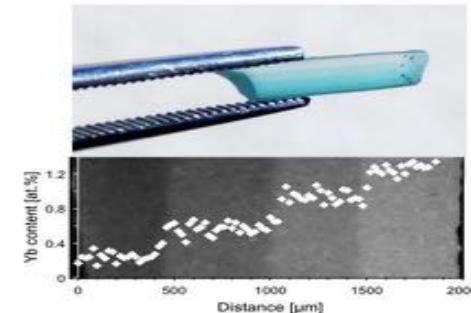

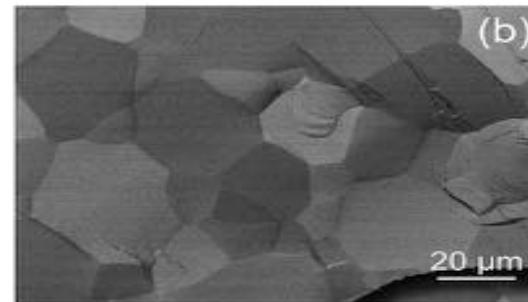

- “The multiple proof-of-principle demonstrations [...] reveal the potential for high efficiency, high energy density extraction using Tm:YLF for future high peak and average power laser systems.”
- “Additional efforts are currently in progress to conduct chirped pulse amplification of ultrashort pulses using Tm:YLF at the joule-level for the first time.”

Issa Tamer, et al., "High energy operation of a diode-pumped Tm:YLF laser," Proc. SPIE 12401, High Power Lasers for Fusion Research VII, 1240109 (14 March 2023); doi:10.1117/12.2649103

# Laser grade ceramic option

- Faster and cheaper vs. single crystal growth process – for cubic crystalline structure.
- Large components, -shaping, -graded doping also optimized for thermal management – **features not available for single crystals**.
- Several compositions (e.g. **YAG**, **LuAG**, **Sc<sub>2</sub>O<sub>3</sub>**, **Lu<sub>2</sub>O<sub>3</sub>**) and dopants (**Nd**, **Yb**, **Er**, **Tm**...) already available
- Spectroscopic and thermomechanical properties similar to those of the corresponding single crystals
- Better uniformity of dopant distribution on large gain elements

Industrial and R&D effort: **KONOSHIMA** (Japan); Research in China, Japan, Russia, USA, France and Italy (ISTEC-CNR) (ZENITH Smart Polycrystals)

# Ceramic option: Tm in sesquioxide host

Sesquioxides doped with Tm<sup>3+</sup>, such as Tm:Lu<sub>2</sub>O<sub>3</sub>, Tm:Y<sub>2</sub>O<sub>3</sub>, and Tm:Sc<sub>2</sub>O<sub>3</sub>, are also emerging materials: their better thermo-optical properties make them promising for power scaling applications.

The growth of sesquioxide single crystals is very complicated, while it is possible to produce them in transparent ceramic form thanks to their cubic crystalline structure and optical isotropy.

## Advantages of ceramic medium:

High thermal and mechanical features

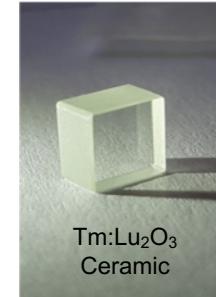

Scalable size

Custom doping

Optimize energy efficiency

## Best “hosts” for Thulium:

- yttrium lithium fluoride (YLF),
- yttrium aluminum garnet (YAG)
- • Lutetium oxide ( $Lu_2O_3$ )

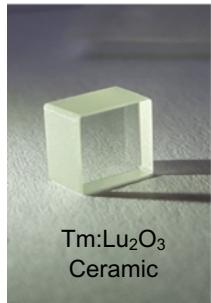

Tm:Lu<sub>2</sub>O<sub>3</sub>  
Ceramic

# Ceramic option: Tm Lu<sub>2</sub>O<sub>3</sub>

Tm:Lu<sub>2</sub>O<sub>3</sub>  
Ceramic

Laser material: Tm:Lu<sub>2</sub>O<sub>3</sub>

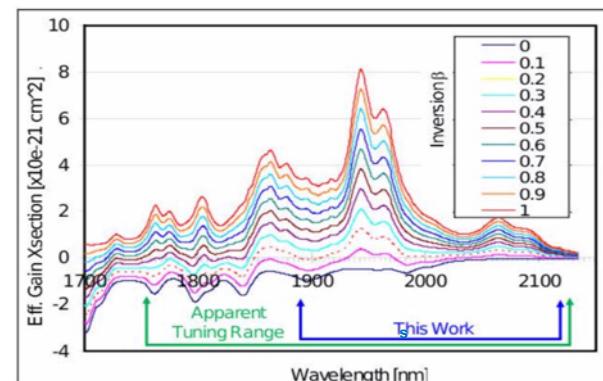

- Emission at 2 μm;
- Large amplification bandwidth
- Direct pumping at 800 nm, using diodes operating in CW mode (available and scalable);
- Cross relaxation partially compensates quantum defect - option of in-band pumping.
- Multi-pulse extraction at high repetition rate > 10 kHz; Ideal for accelerator technology;
- Mature material technology (large ceramic).

# Higher wpe: In-band pumping for low qd

Thulium based gain medium can also be pumped with in-band absorption with virtually marginal quantum defect: High efficiency and lower heat deposition.

>80% slope efficiency demonstrated in fibers

M. Lenski et al., Opt. Express  
30, 44270-44282 (2022)

New path for intra-band pumping and marginal quantum defect: step change in wpe?

# Summary

Grand challenges of laser-plasma technologies (including collider) are **limited by laser technology** and cost;

LWFA accelerators require industrial-strength PW-kW laser system, **beyond current state-of-the-art** ;

Industry delivering PW systems now entering development of kW regime with higher efficiency ( $\approx\%$  level) **with diode pumping of Ti:Sa based systems**;

Short term **medical and industrial applications** are now mature and can motivate industrial investments;

Future large-scale needs >1 kW average power, already under development, aiming at **>20% WP efficiency**;

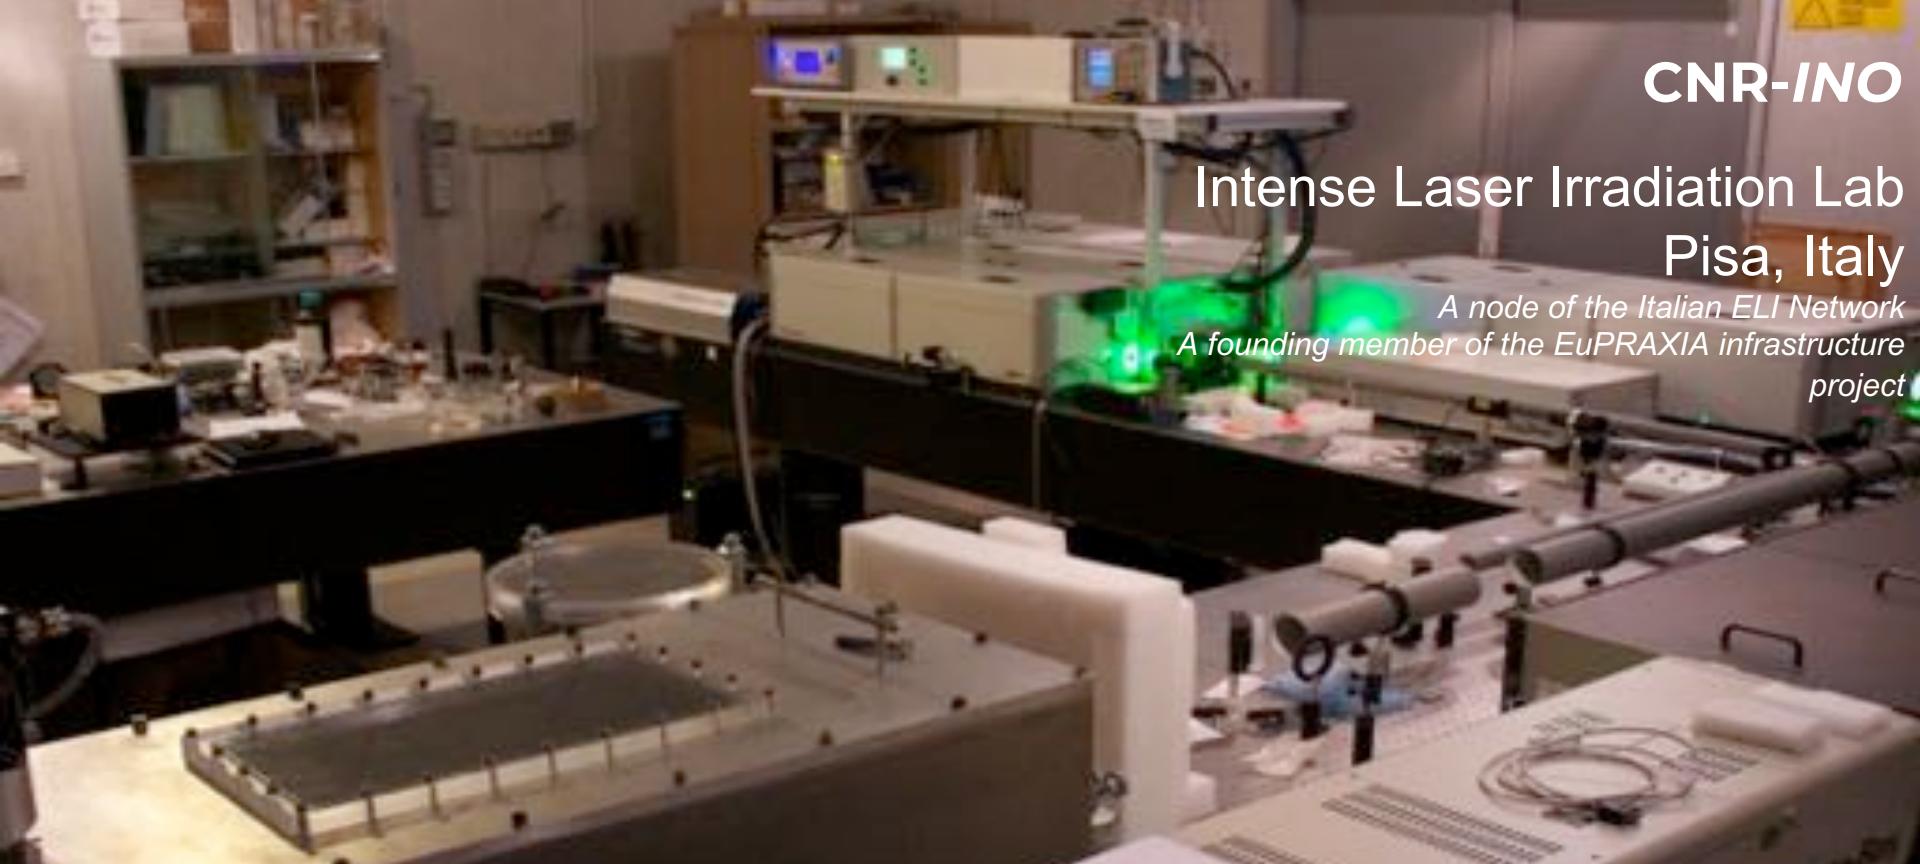

DPSSL with new materials (Tm:XX) among possible high efficiency solutions, scalable at high average power and high repetition rate;

Infrastructure development and operation a major **thrust** for laser R&D and TRL
