Setting the scale of NP?

One of the most striking results in our field is in the muon anomalous magnetic moment

FNAL news page

From perturbative unitarity constraints on NP interpretations of $g-2$ results ([Phys. Rev. D 104, 055035 \(2021\)](#).)

“...in order to resolve the new physics origin of the SMEFT operators behind Δa_μ one would need to probe high-energy scales **up to the PeV**”

“.. simplified models [...] still imply new on-shell states below **200 TeV**”

Not everything is said and
done yet

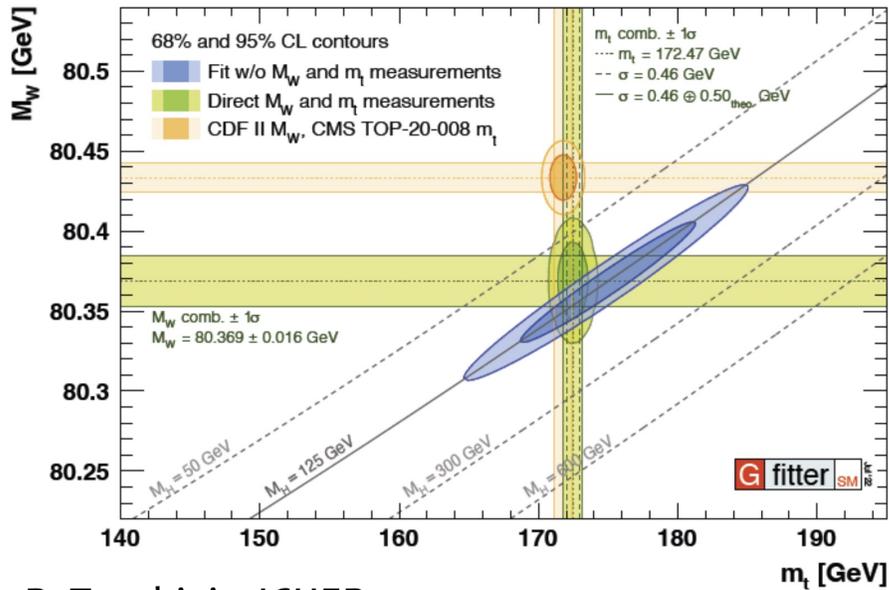

LHC RUN 3

BEAMS, DETECTORS, ACTION

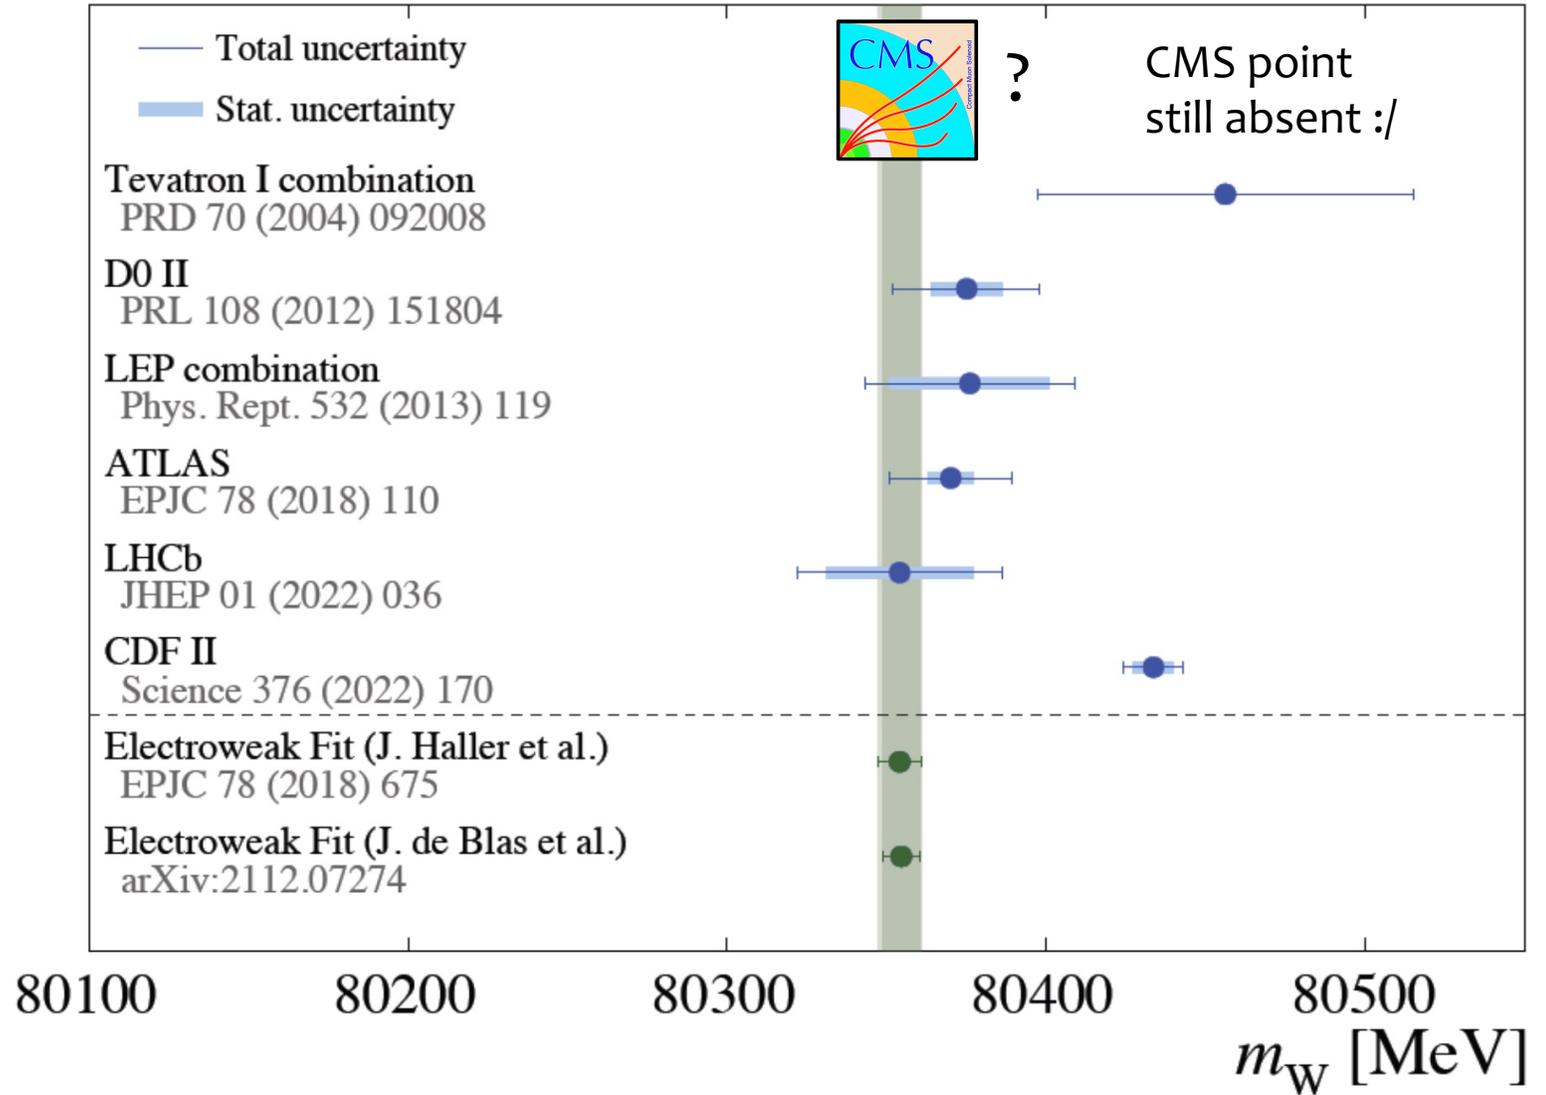

W mass

Understanding our precision W-mass measurements together will take **more data and more time** (exp-vs-exp & exp-vs-theory)

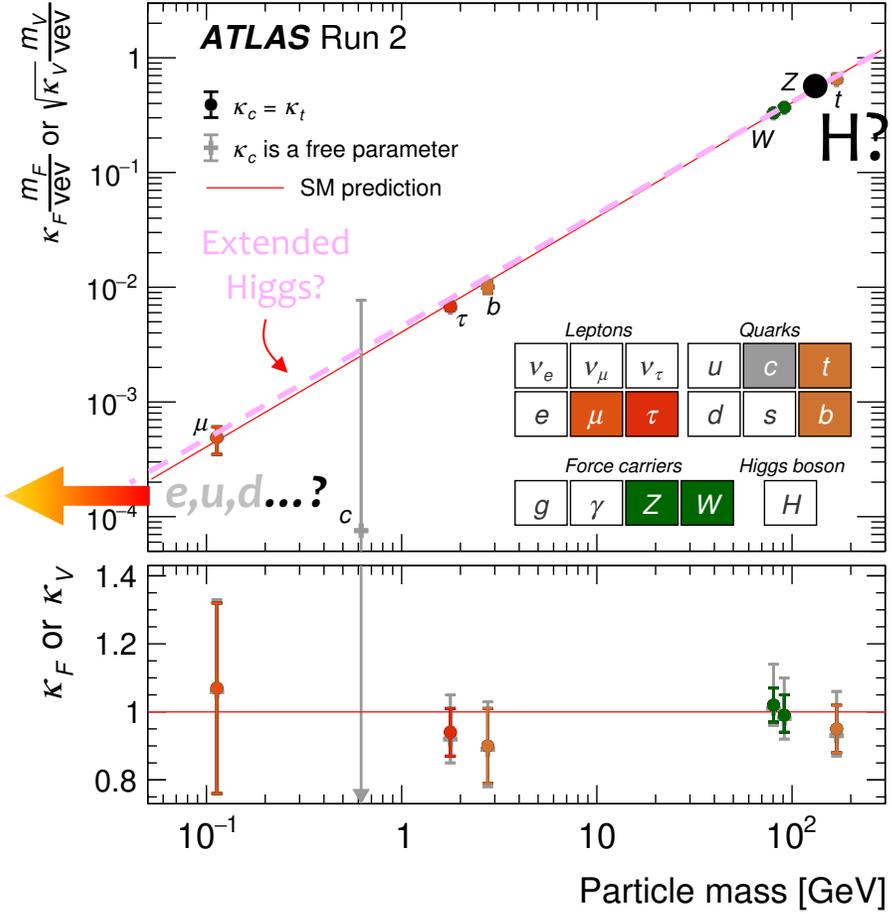

R. Tenchini – ICHEP 2022

LHCB-FIGURE-2022-003

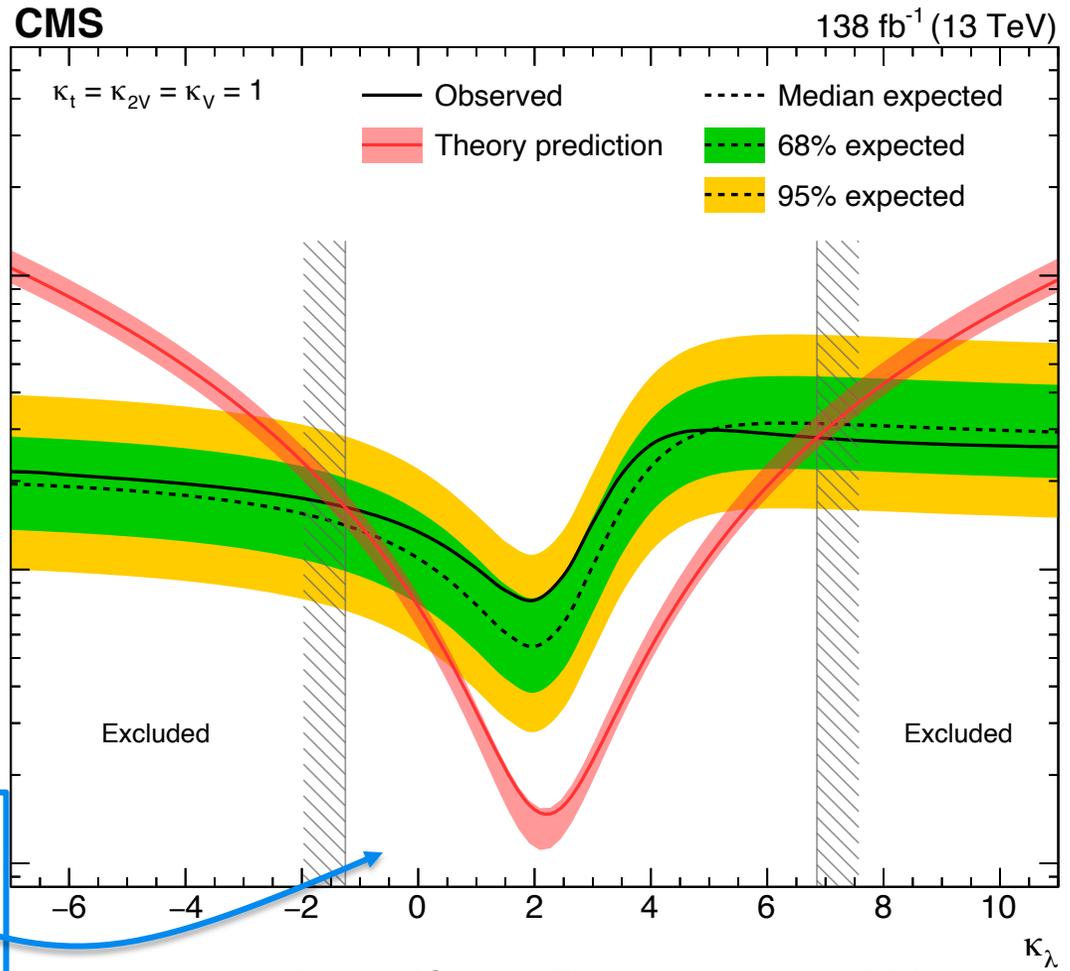

Higgs Physics

10 years of Higgs boson measurements still leave room for new physics!

Nature volume 607 (2022)

- HH → bbbb,
- HH → bbττ
- HH → bbγγ
- HH → bbZZ(4l)
- HH → multilep.

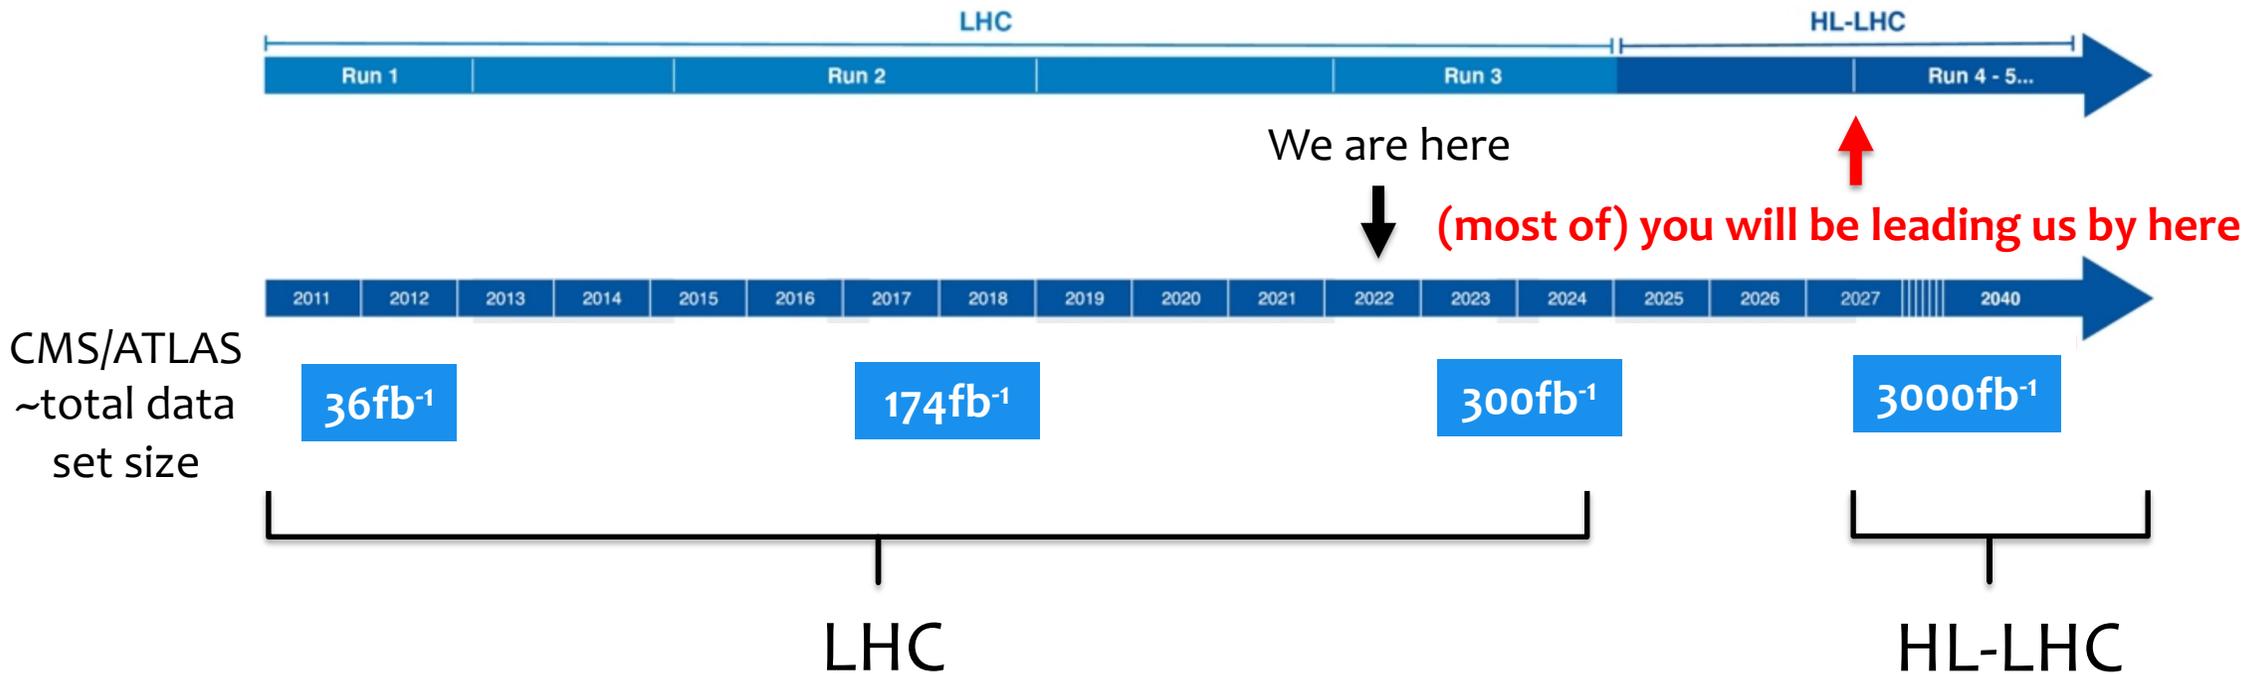

Nature volume 607 (2022)

Measuring self-coupling to 50% would be interesting for understanding early-universe evolution (Phys. Rev. D 97, 075008 (2018))

We've barely begun with the LHC

After Run-3 of the LHC, the next phase is the **high-luminosity (HL)-LHC**

~20X the data we have today!

Expect **> 160M H-bosons / 120k HH pairs** Per-expt by the end of the **HL-LHC** !

Precision Measurements for Discovery

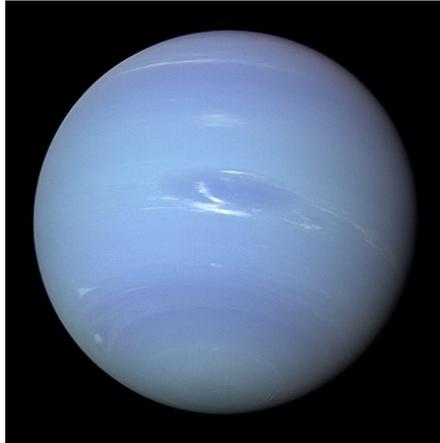

Examples from the past have taught us that precision measurements can lead to *revolutionary discoveries...*

Herschel 1781

Uranus discovery
“as a planet” (1781)

Le Verrier, Galle, d'Arrest 1846

Neptune discovered with 1°
of predicted position (1846)

Precise measurements of position
revealed deviations from expected orbit
→ new planet predicted (1845/46)

Measurements of Mercury's orbit reveals
43 arcseconds/century anomaly
→ new planet (or body) predicted (1859)

Slide shamelessly stolen from excellent Jesse Liu (Cambridge) seminar

Further 600-something evidence?

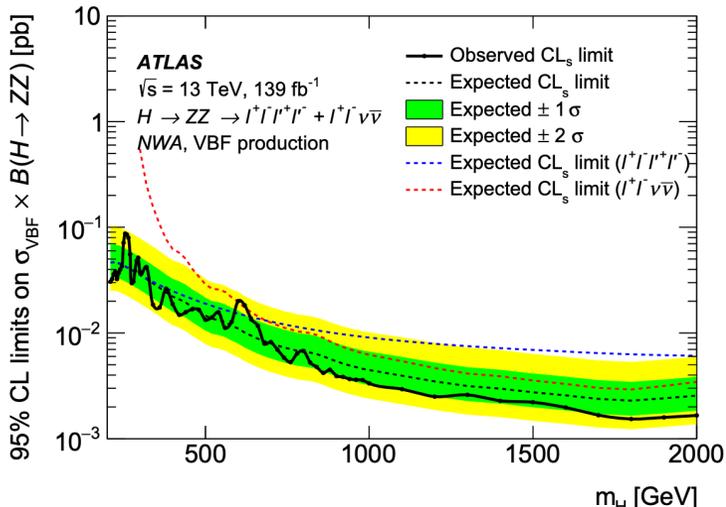

<https://arxiv.org/abs/2111.08962> (acc by IJMP A)

Maurizio Consoli & Leonardo Cosmai

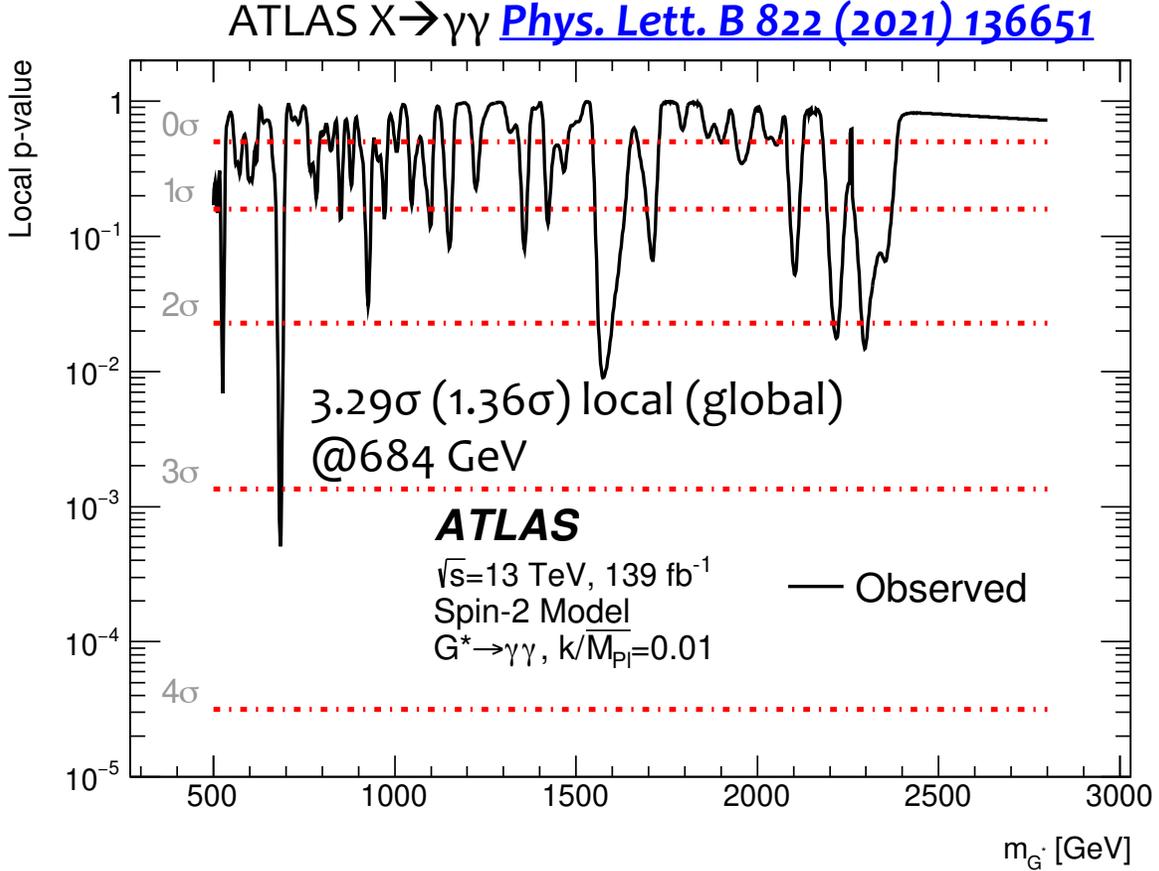

In the region of invariant mass $620 \div 740$ GeV, we have analyzed the ATLAS sample of 4-lepton events that could indicate a new scalar resonance produced mainly via gluon-gluon fusion. These data suggest the existence of a new heavy state H whose mass $660 \div 680$ GeV would fit well with the theoretical range $M_H = 690 \pm 10$ (stat) ± 20 (sys) GeV for the hypothetical second resonance of the Higgs field that has been recently proposed and which would couple to longitudinal W's with the same typical strength of the low-mass state at 125 GeV. Since the total width Γ_H is very poorly determined, to sharpen

prediction

According to their estimate, 2.5σ local, 1.4σ global, from ATLAS $H \rightarrow ZZ$ search for $M_X = 660-680$ GeV

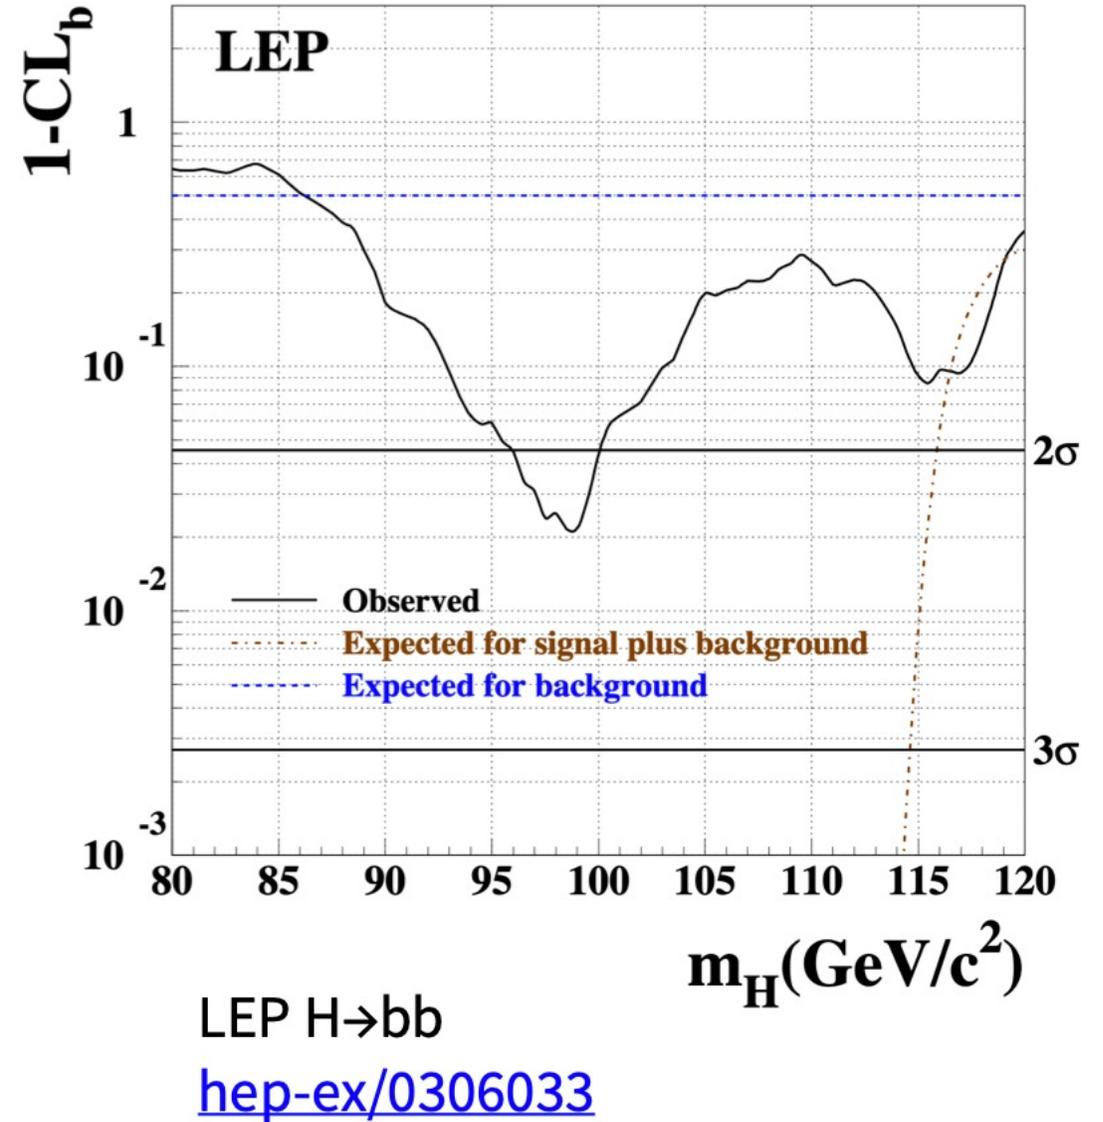

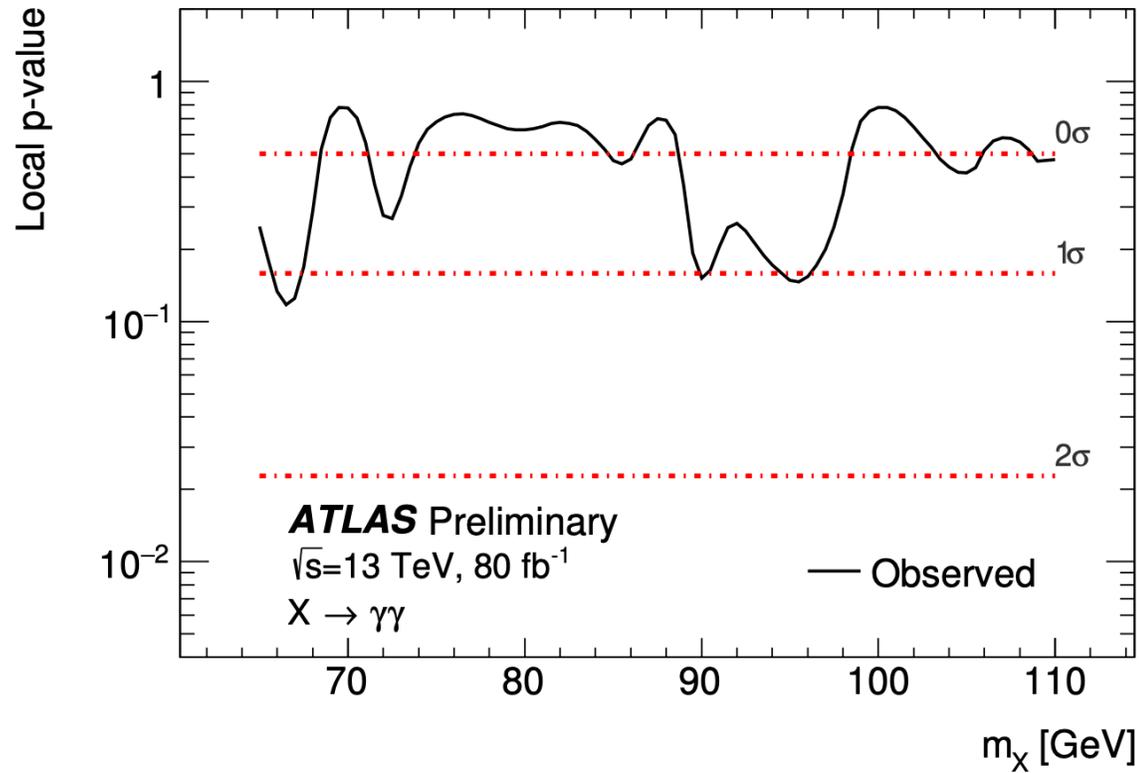

ATLAS search in $H \rightarrow ZZ \rightarrow 4l/2l2\nu$
 Eur. Phys. J. C 81 (2021) 332

Further 90-something evidence?

[ATLAS-CONF-2018-025](#)

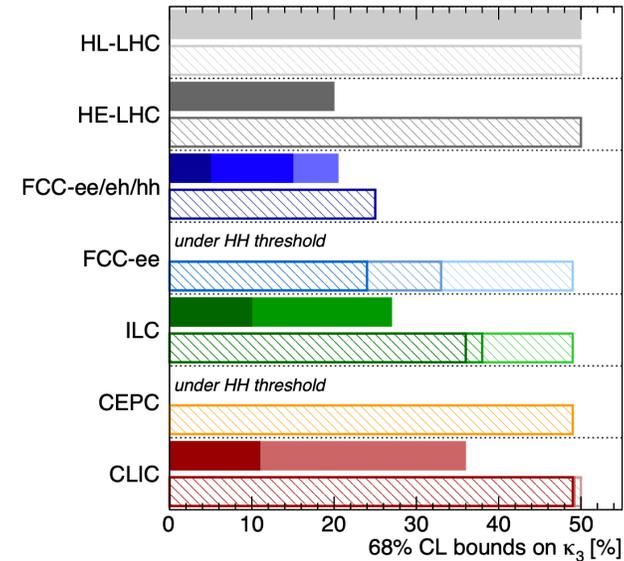

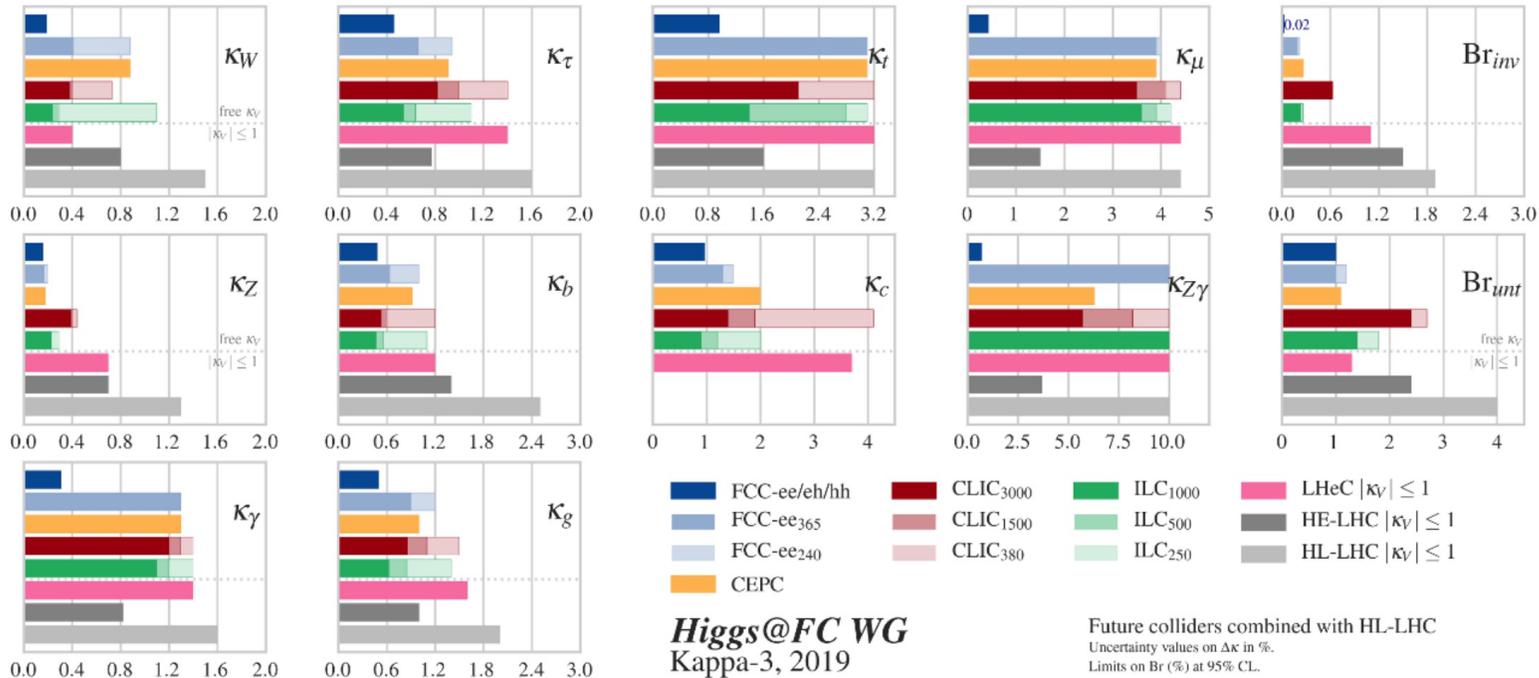

Higgs boson couplings beyond the HL-LHC

The **long road ahead** for the Higgs has many potential options but all lead to high precision ($\sim\%$ level) characterization of the Higgs boson couplings

Higgs boson **self-coupling** requires **high energy machine** for $\%$ level
