

*Measurements of processes sensitive to quartic  
electroweak couplings in ATLAS*

XII International Conference on New Frontiers in Physics, Crete, Greece

10<sup>th</sup> -23<sup>rd</sup> July 2023

**Brandeis**  
UNIVERSITY

Shalu Solomon  
on behalf of the ATLAS Collaboration

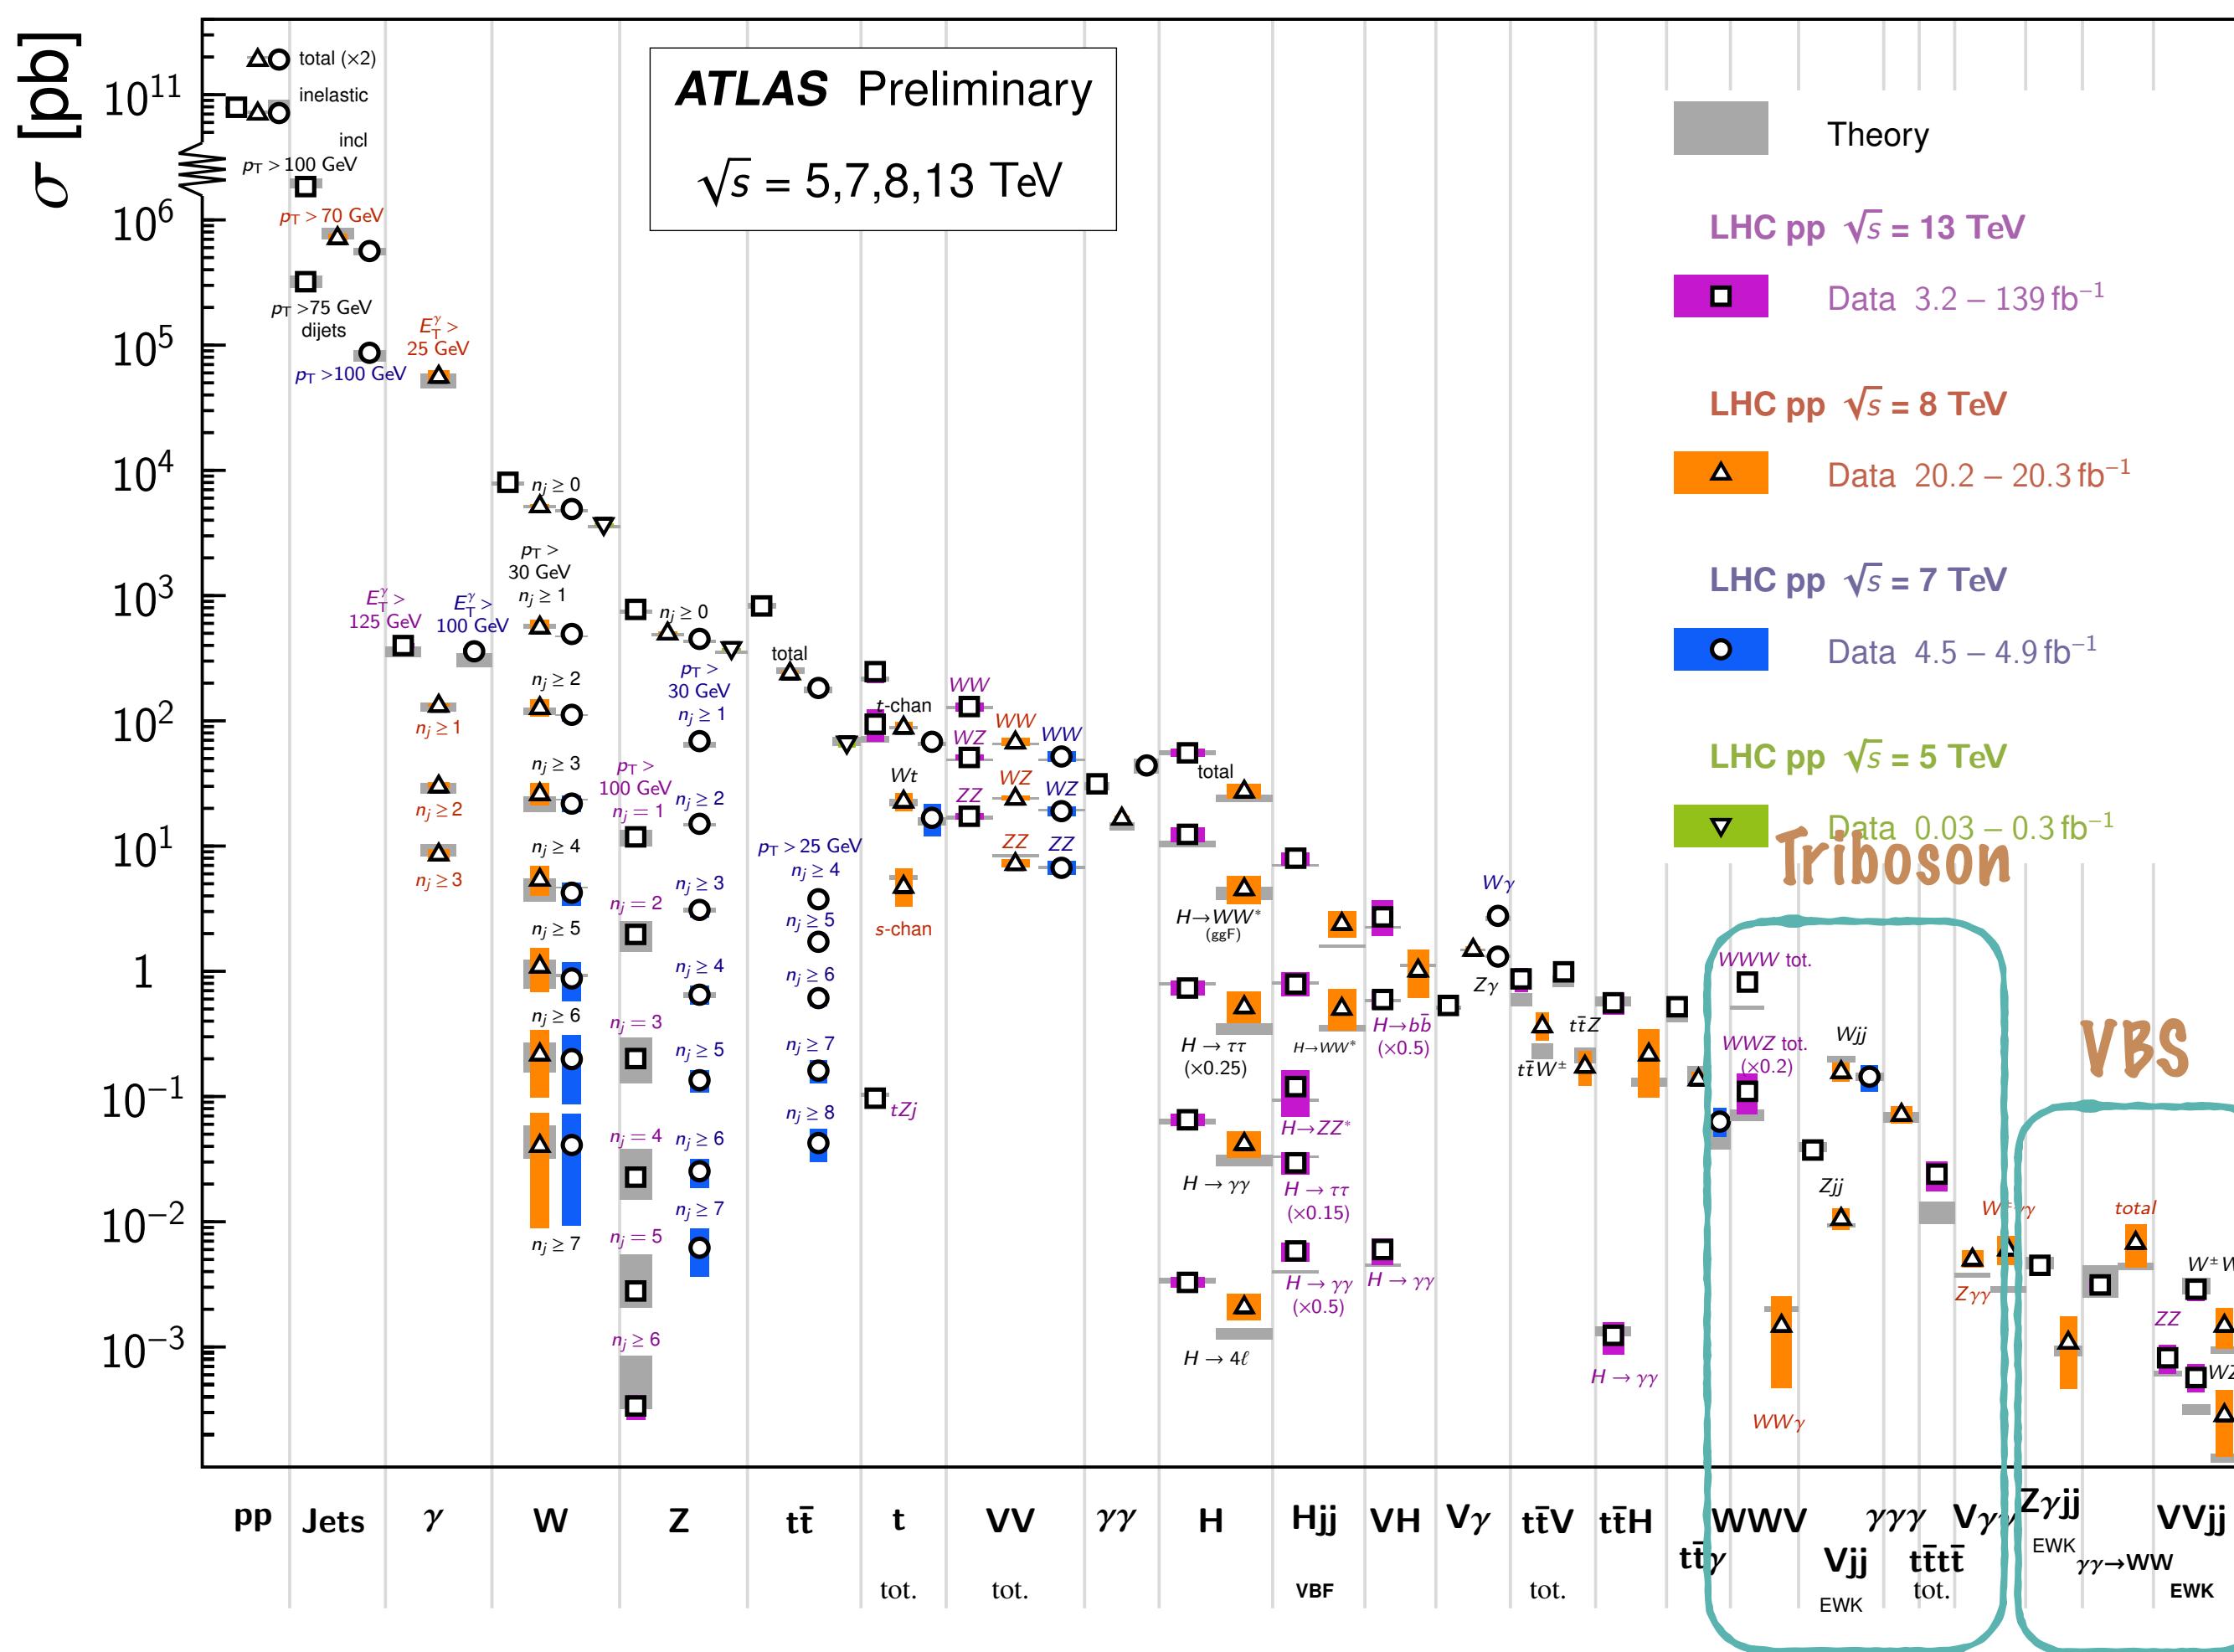

# Introduction

- Multiboson interactions serve as a stringent test of the Standard Model
- The non-Abelian nature of the electroweak theory allows for triple and quartic gauge interactions
- Diboson production via vector boson scattering (VBS) and triboson production are direct probes of tree-level quartic gauge couplings
- Test the Standard Model predictions for gauge boson self-interactions and electroweak symmetry breaking with the Higgs mechanism
- Study BSM effects by parametrizing any deviations from the Standard Model using the Effective Field Theory (EFT) such as anomalous triple/quartic gauge couplings

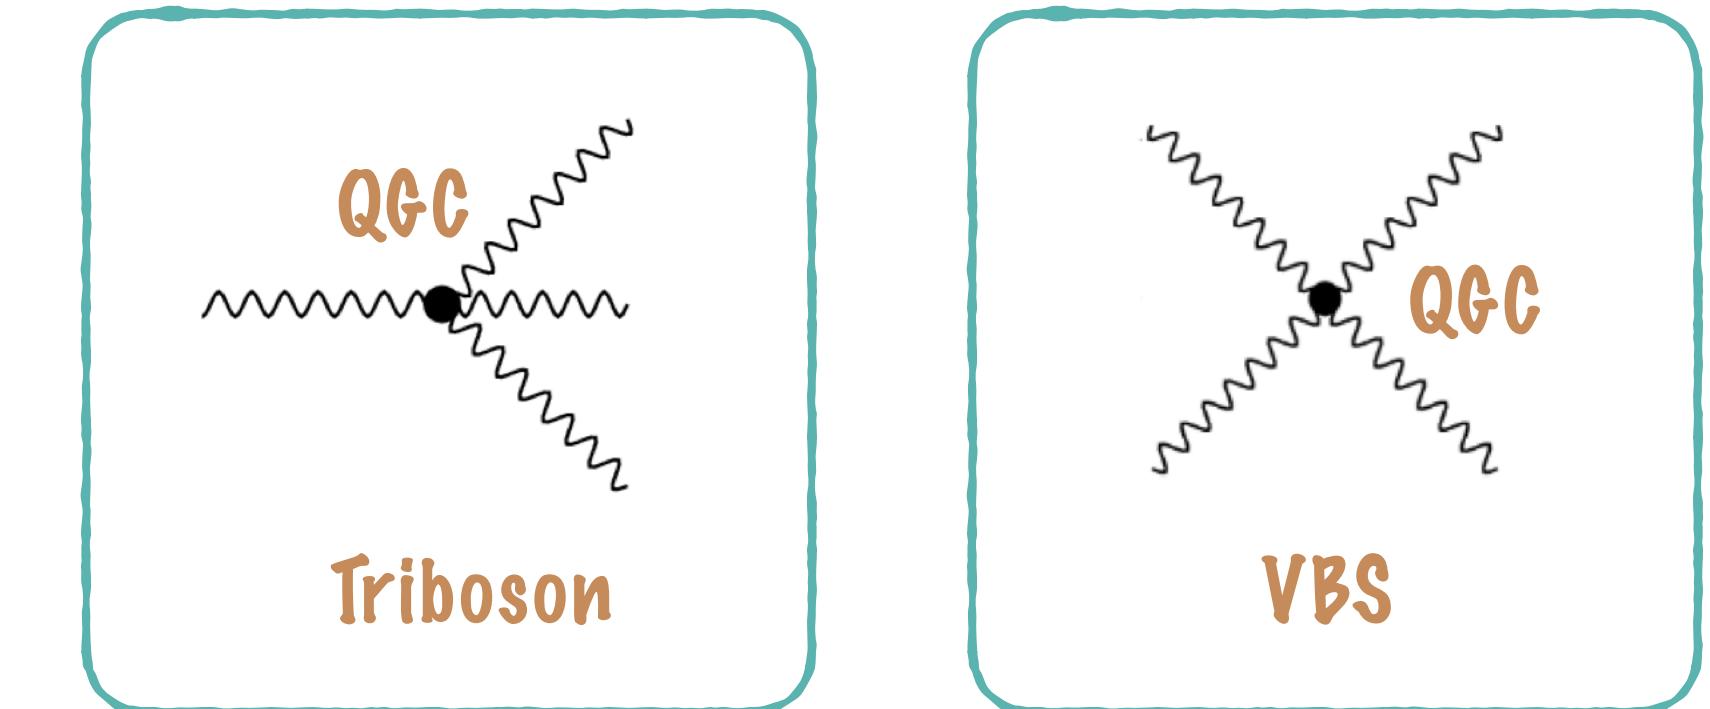

$$\mathcal{L}_{SMEFT} = \mathcal{L}_{SM} + \sum_i \frac{c_i^{d=6}}{\Lambda^2} \mathcal{O}^{d=6} + \sum_i \frac{c_i^{d=8}}{\Lambda^4} \mathcal{O}^{d=8} + \dots$$

# Introduction

## Standard Model Production Cross Section Measurements

- Amongst the rarest processes studied at the LHC

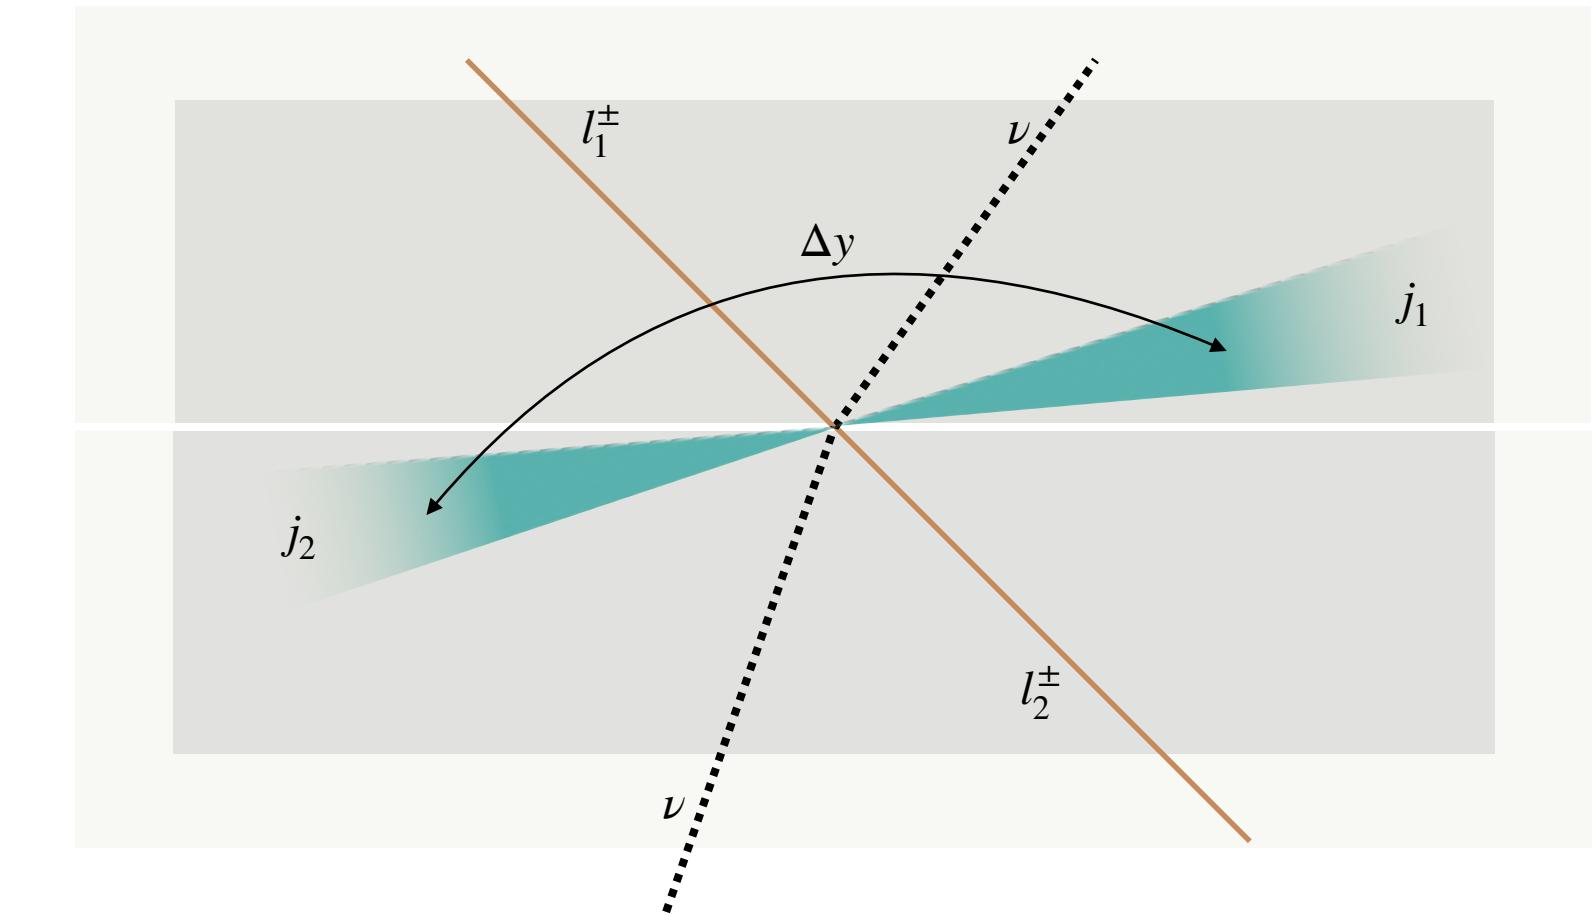

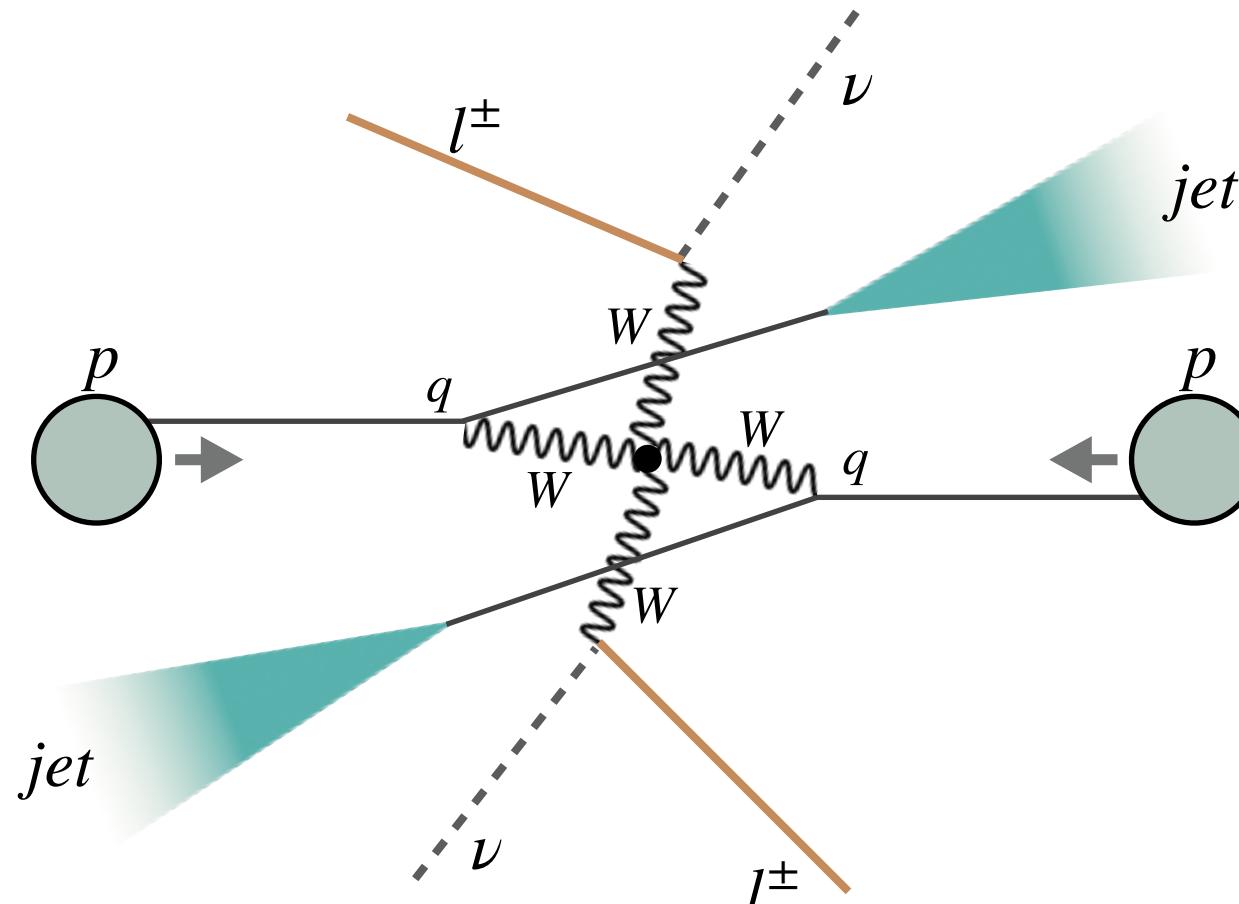

- In the Standard Model, the interactions involve a pair of  $W$  bosons

# Overview

## Vector boson scattering

- Two electroweak gauge bosons produced but with a distinct signature of two jets with a large dijet invariant mass  $m_{jj}$  and angular separation  $\Delta y_{jj}$
- Little hadronic activity in the rapidity gap (centrality)

## Triboson production

- Three electroweak gauge bosons produced in the hard scatter

Recent results in ATLAS covered today

Run 2 at  $\sim 140\text{fb}^{-1}$

VBS:  $W^\pm W^\pm jj$     $ZZjj$     $Z(l\bar{l})\gamma jj$     $Z(\nu\nu)\gamma jj$

Triboson:  $Z\gamma\gamma$     $W\gamma\gamma$     $WZ\gamma$

# $W^\pm W^\pm (\rightarrow 2l 2\nu) + \text{jets}$

## Golden channel of VBS

- No gg or qg initiating diagrams
- Largest electroweak to strong production ratio among other  $VV$
- Final state with 2 same-sign leptons
- Small background rates due to the same-sign leptons in the final state

## Cross-section measurement

- Dominant backgrounds from  $WZ$  and mis-identified leptons
- Signal extracted from a simultaneous maximum likelihood 2D fit in SR and 3 lepton  $WZ$ -QCD CR

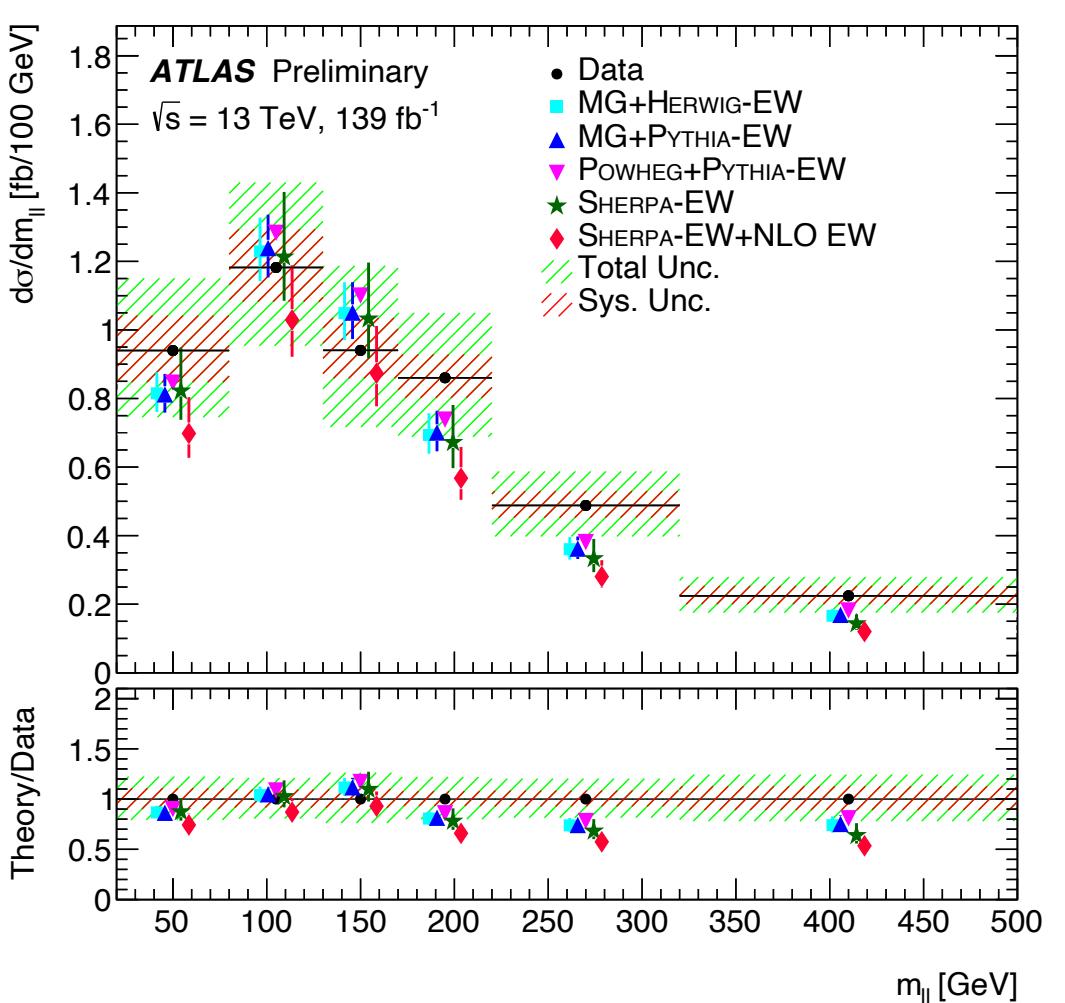

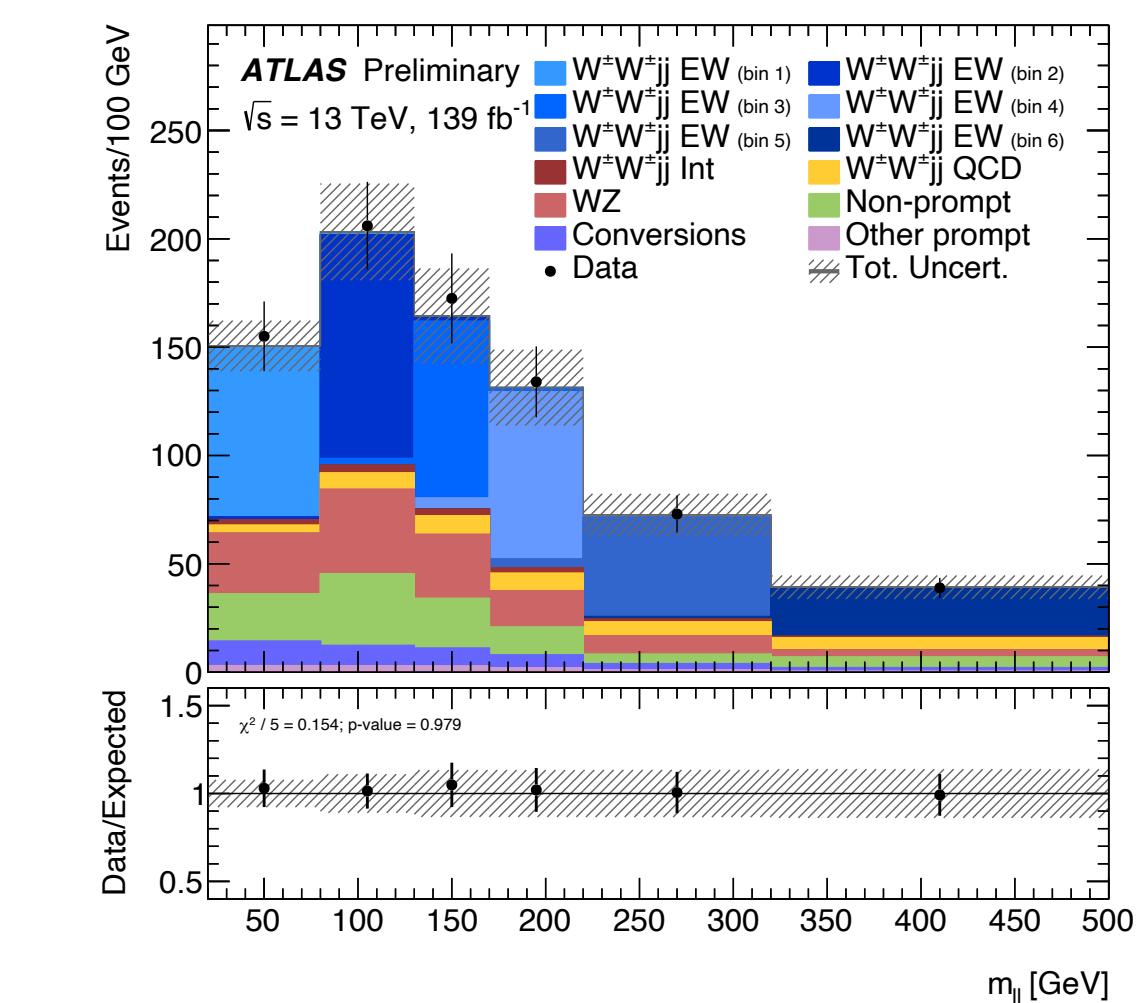

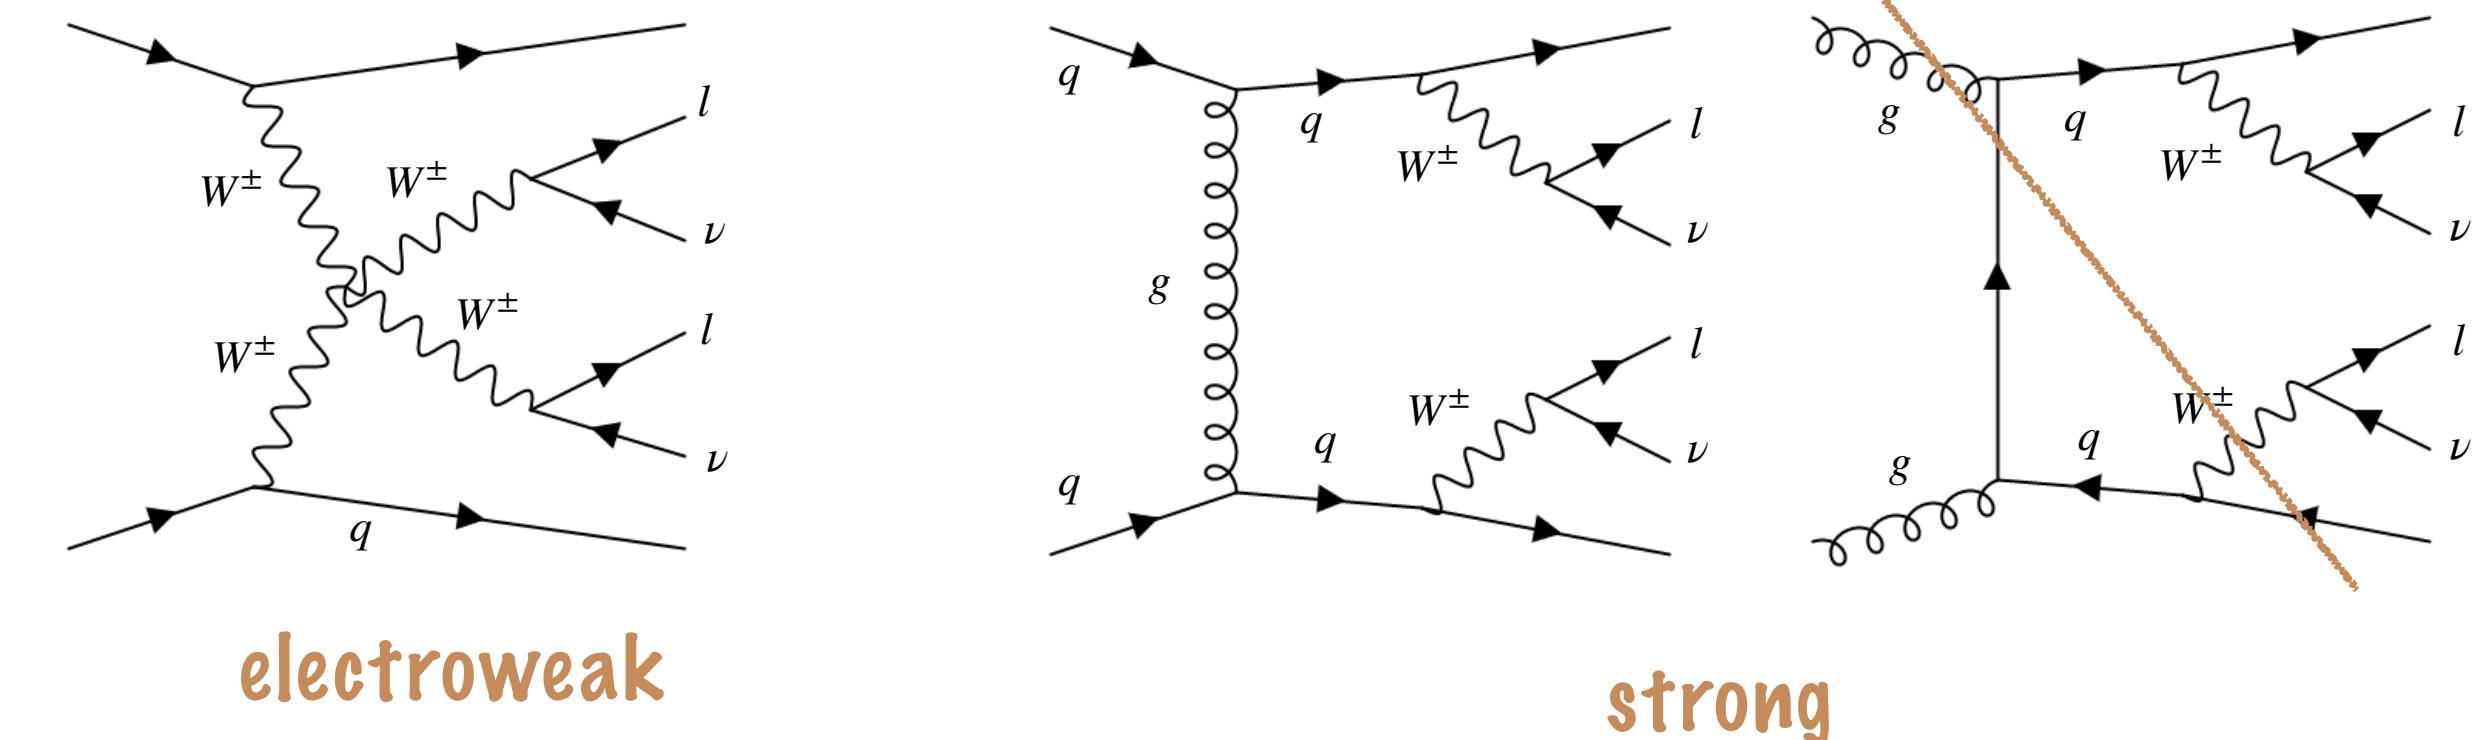

**$W^\pm W^\pm \text{ SR}$**

$$m_{jj} > 500 \text{ GeV}$$

$$\Delta y_{jj} > 2$$

**$WZ\text{-QCD CR}$**

$$m_{jj} > 200 \text{ GeV}$$

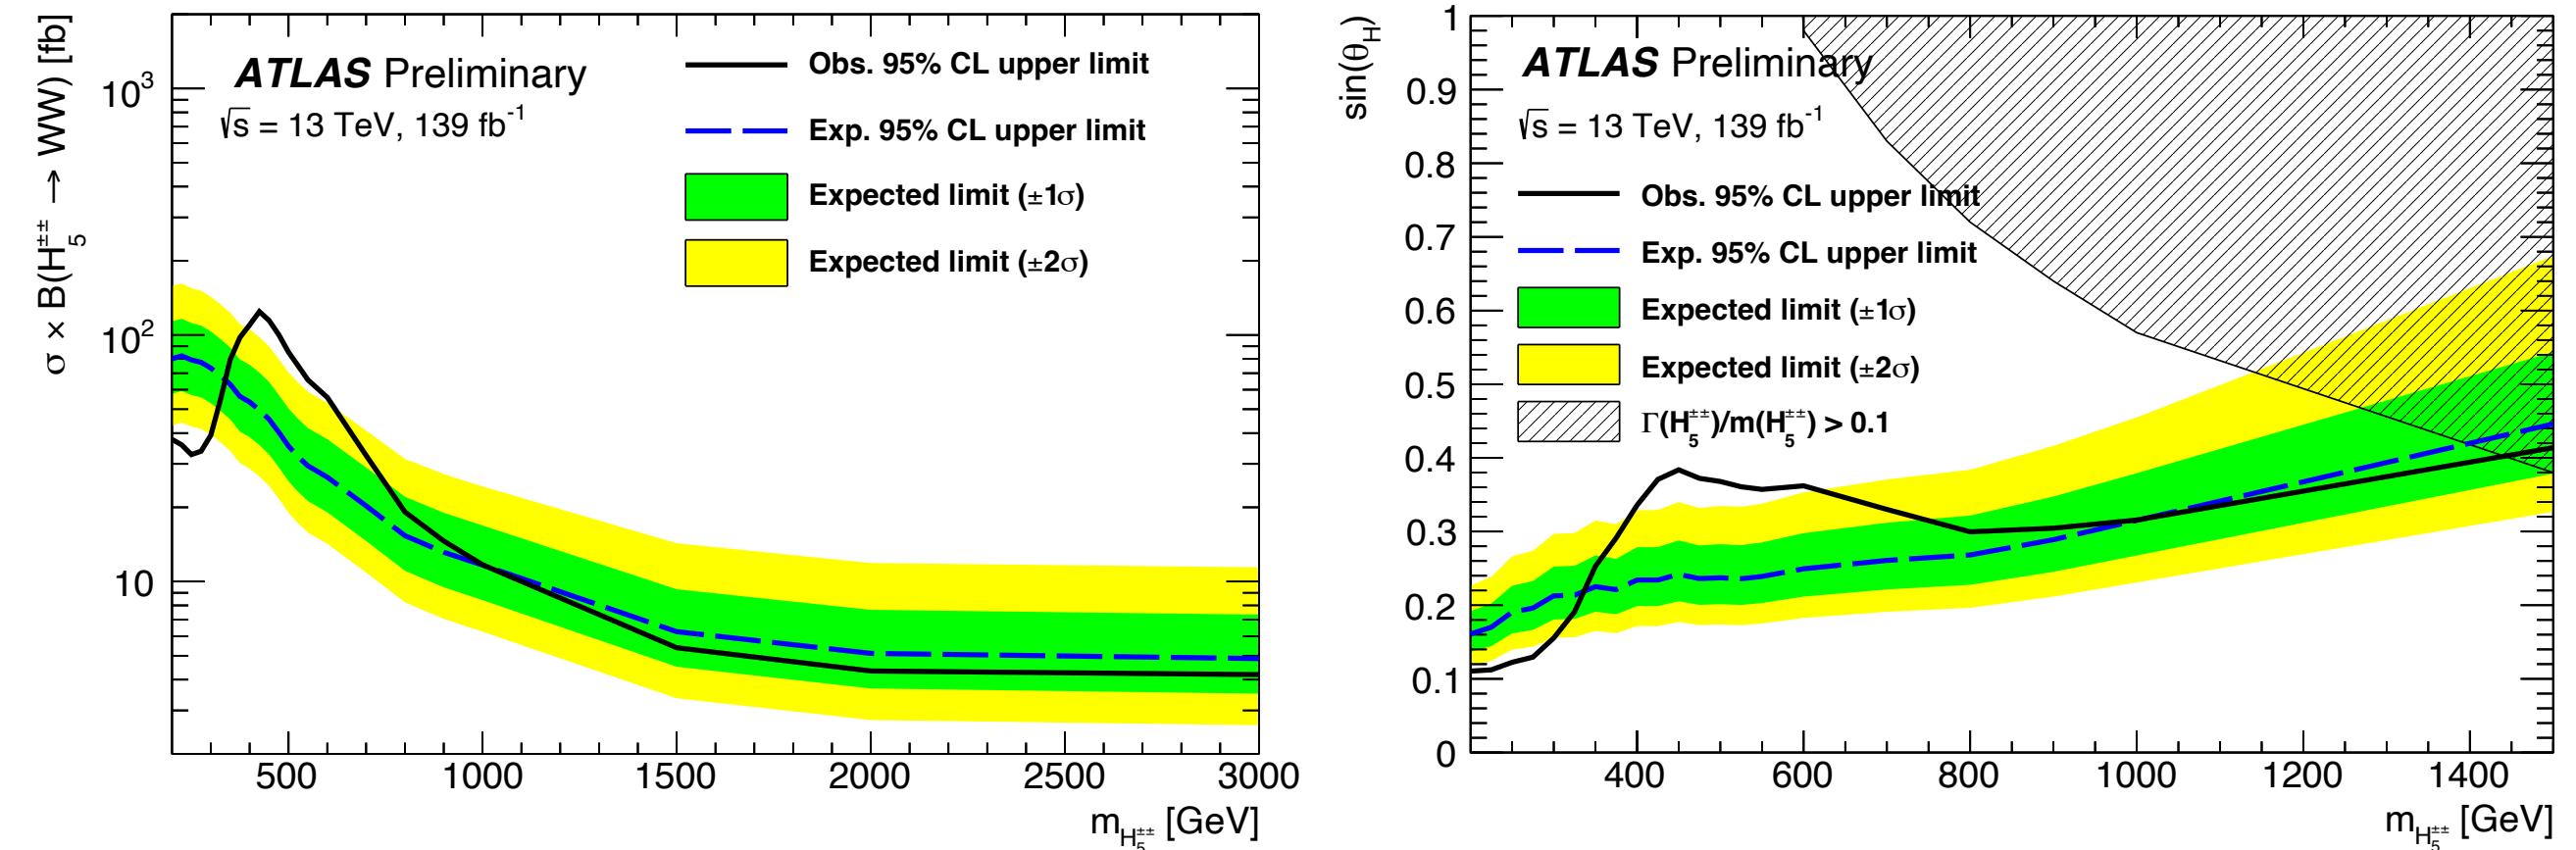

$$\Delta y_{jj} > 2$$

- Differential cross-section measured for electroweak (shown) and inclusive production (backup)
- Likelihood based unfolding for correction to particle level
- Leading uncertainty from data statistics

# $W^\pm W^\pm \rightarrow 2l2v + \text{jets}$

## Search for doubly charged Higgs

- Results interpreted to search for  $H^{\pm\pm}$  produced through vector boson fusion in the context of Georgi-Machacek model using  $m_{H^{\pm\pm}}$  and  $\sin\theta_H$  as model parameters
- Model independent upper limits at 95% CL on  $\sigma(H^{\pm\pm}) \times B(H^{\pm\pm} \rightarrow W^\pm W^\pm)$  extracted
- Largest excess observed for  $m_{H_5^{\pm\pm}} = 450$  GeV at  $2.5\sigma$
- $\sin\theta_H > 0.11\text{-}0.41$  are excluded for  $200 < m_{H_5^{\pm\pm}} < 1500$  GeV

## Search for aQGCs

- Results are interpreted within the EFT framework and limits are set on 8 Dim-8 operators
- Limits on a given Wilson coefficient are derived by setting all others to zero. Constraints are consistent with zero
- Limits are also obtained by removing EFT contributions above a certain energy scale  $E_c$  that violates unitarity (clipping) and restricting  $m_{WW} < E_c$ .  $E_c$  is evaluated using boson kinematics at parton level (before parton showering)

Coefficient	Type	No unitarisation cut-off [TeV $^{-4}$ ]	Lower and upper limit at the respective unitarity bound [TeV $^{-4}$ ]
$f_{M0}/\Lambda^4$	exp.	[-3.9, 3.8]	-64 at 0.9 TeV, 40 at 1.0 TeV
	obs.	[-4.1, 4.1]	-140 at 0.7 TeV, 117 at 0.8 TeV
$f_{M1}/\Lambda^4$	exp.	[-6.3, 6.6]	-25.5 at 1.6 TeV, 31 at 1.5 TeV

	obs.	[-0.63, 0.74]	—

# ZZ( $\rightarrow 4l$ ) + jets

- Two  $l^+l^-$  pairs with the smallest  $|m_{ll} - m_Z|$

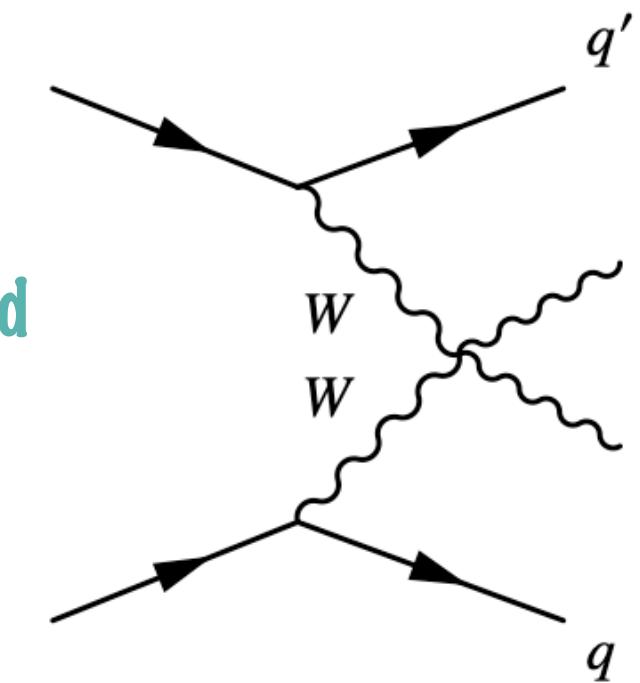

- $m_{4l} > 130$  GeV
- Differential cross-section measurement for inclusive production in two SRs based on 4l centrality

- VBS enhanced SR with  $\zeta < 0.4$
- VBS suppressed SR with  $\zeta > 0.4$

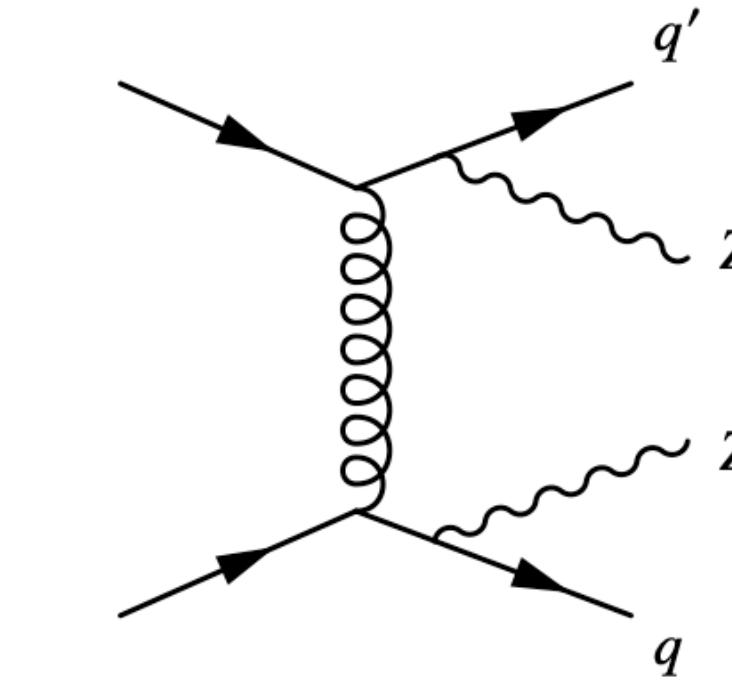

$$\zeta = \frac{y_{4l} - 0.5(y_{j_1} + y_{j_2})}{\Delta y_{jj}}$$

- Measurements sensitive to ZZ-QCD signal modelling
  - MadGraph predictions for strong production underestimate the cross-section in both SRs
  - Mis-modelling in Sherpa at high  $m_{jj}$  in VBS suppressed SR

sensitive to WWZ and WWZZ interactions

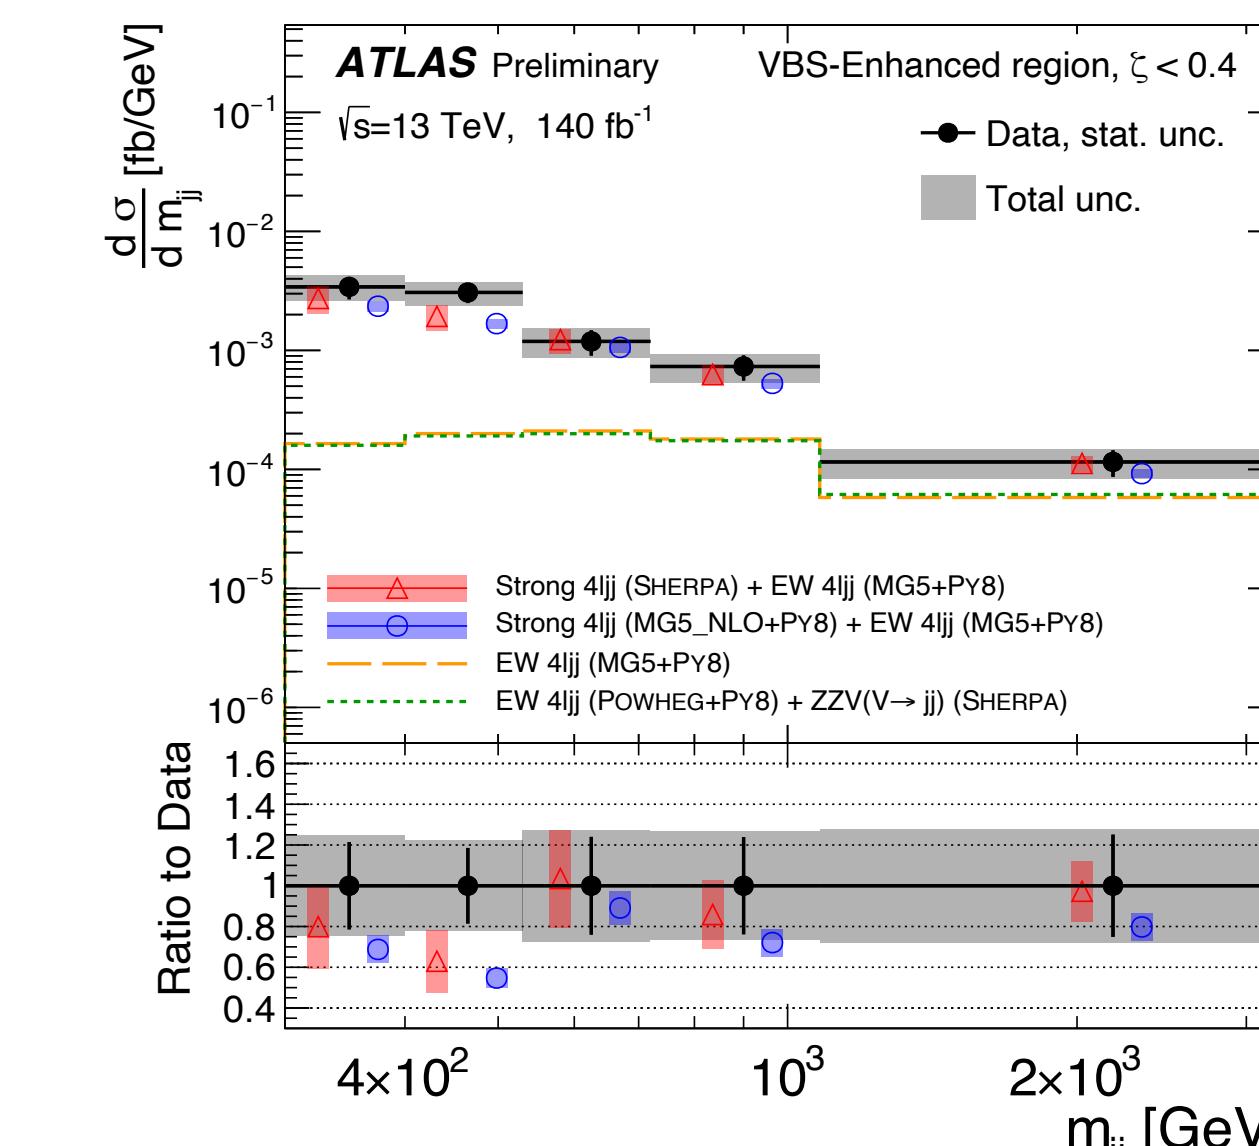

electroweak

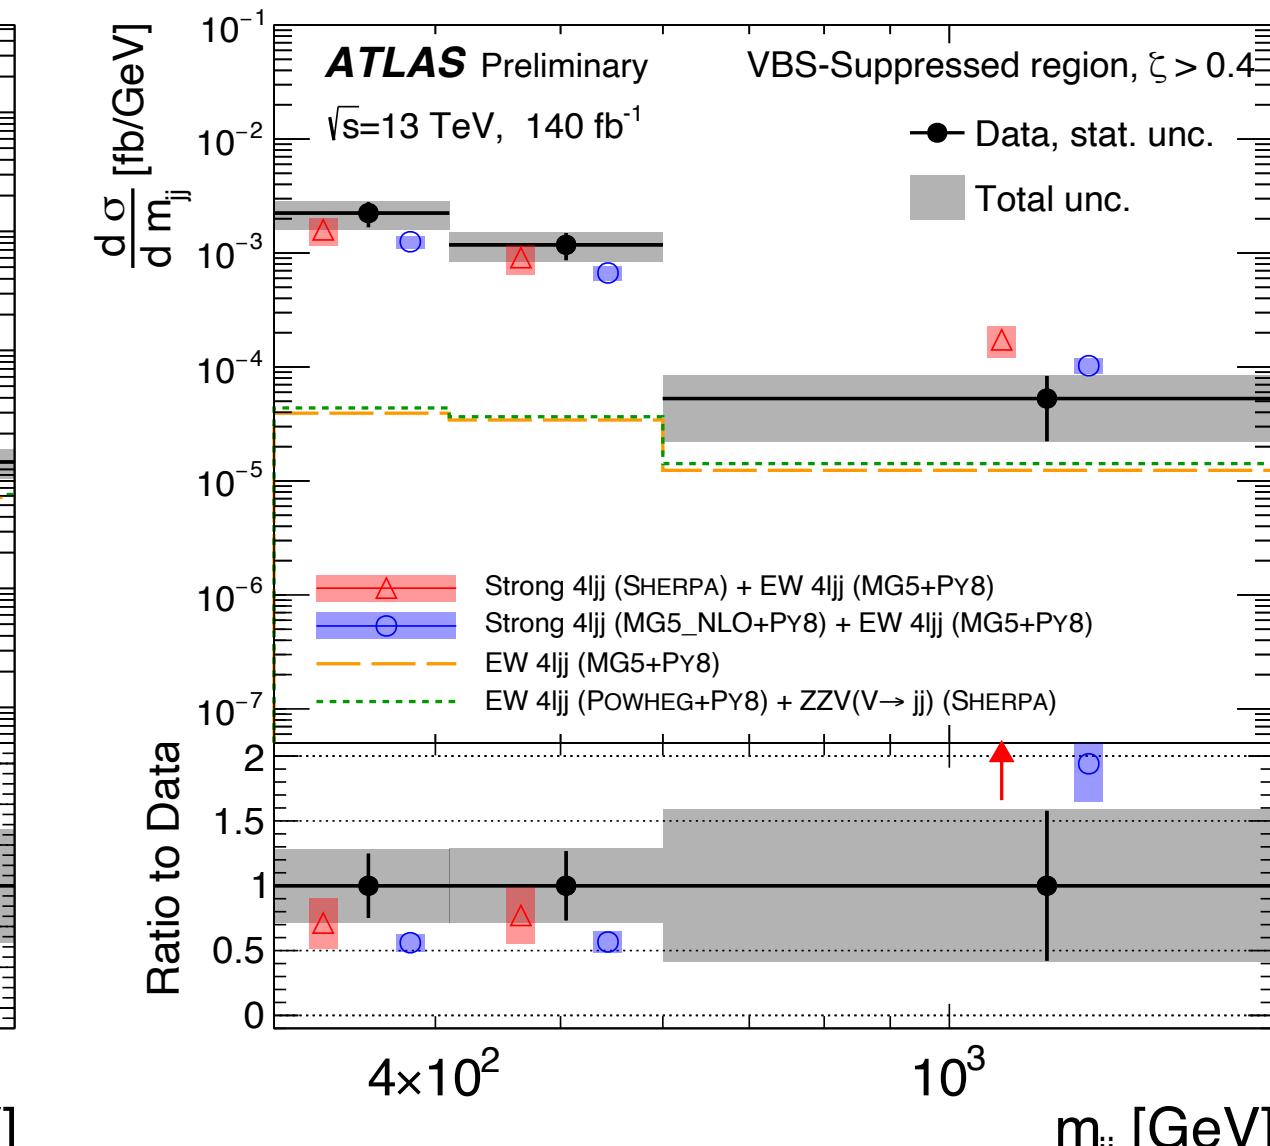

strong

sensitive to perturbative QCD calculations

VBS enhanced

VBS suppressed

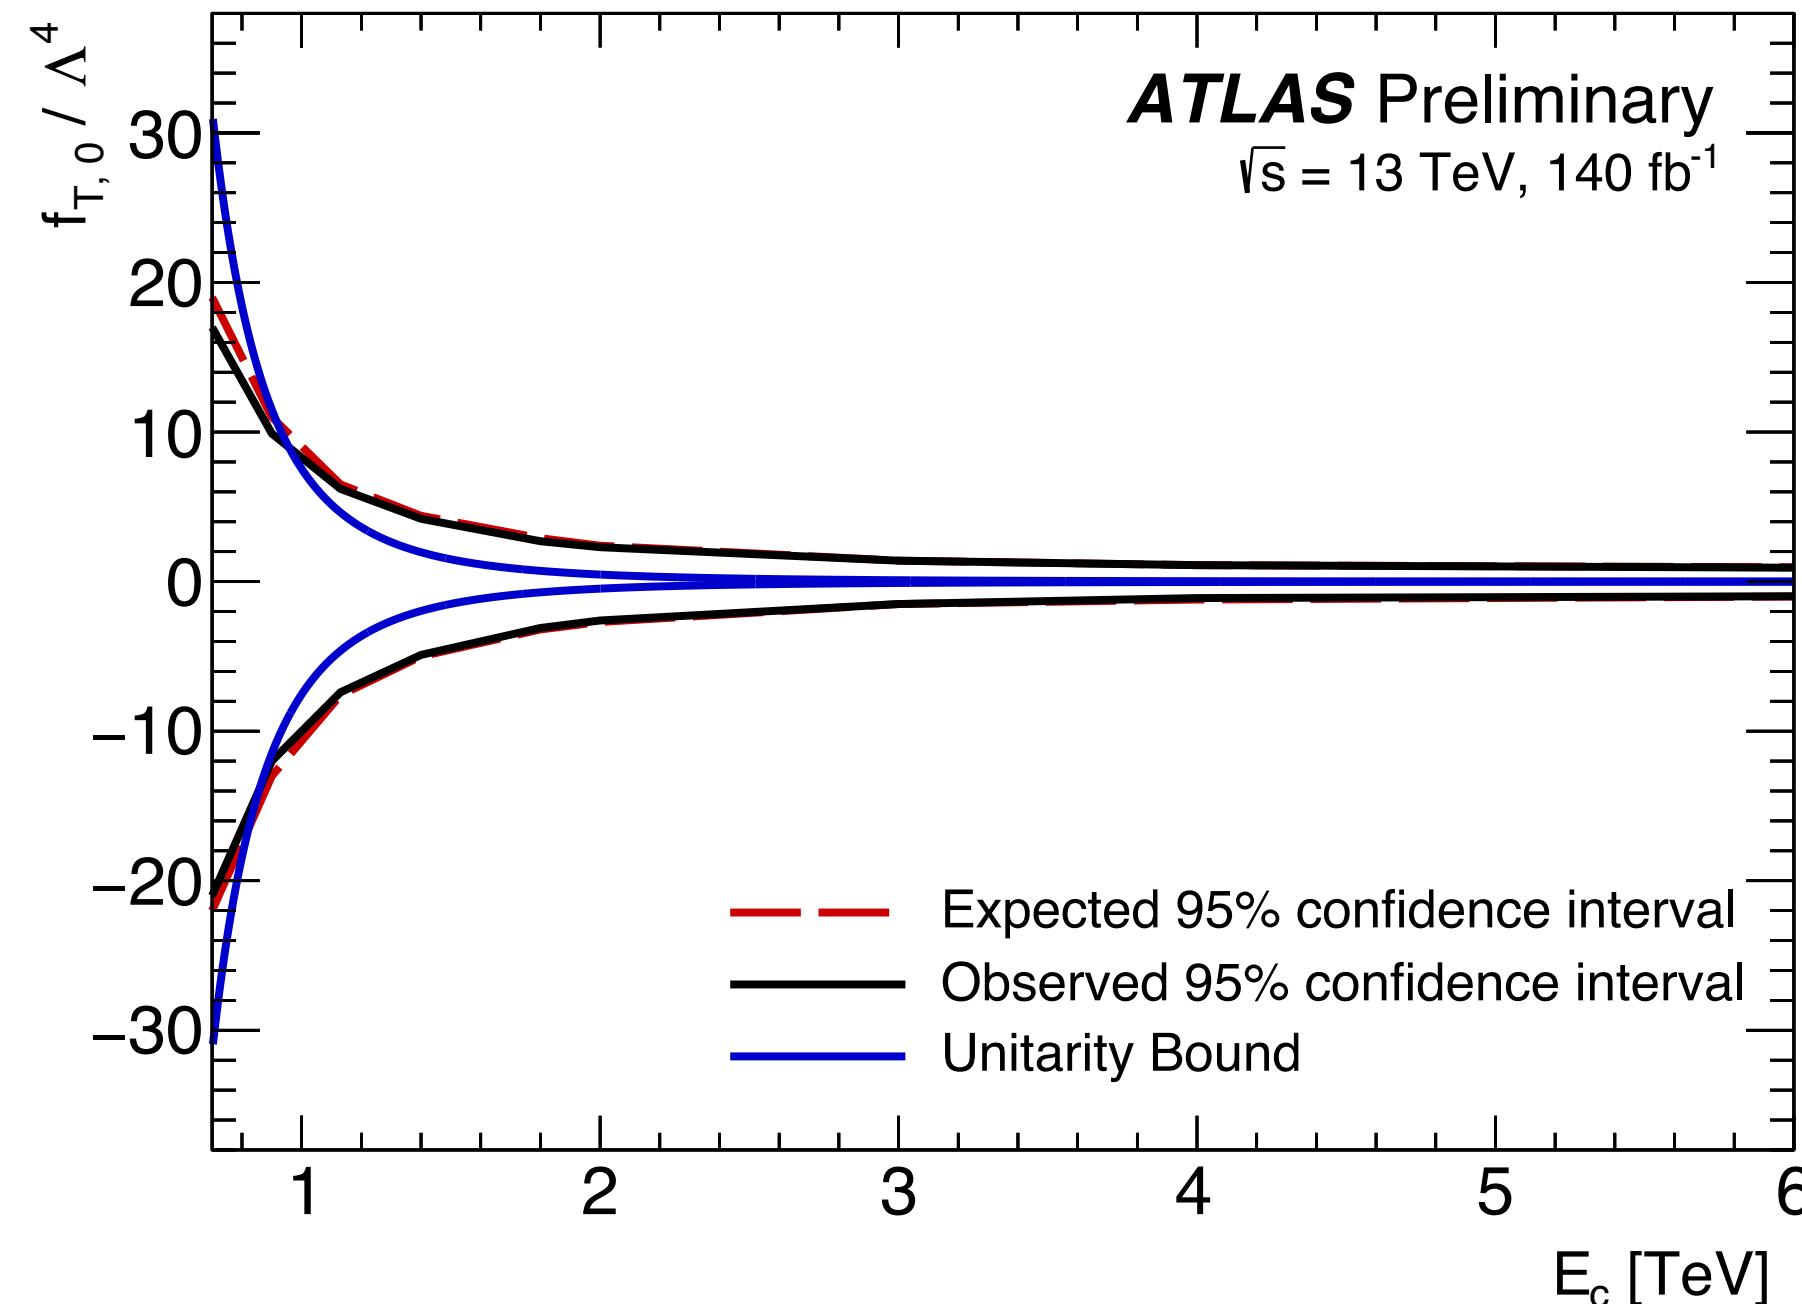

# ZZ( $\rightarrow 4l$ ) + jets

- A 2D fit of the differential cross-section as a function of  $m_{4l}$  and  $m_{jj}$  are used to set limits on Dim-6 and Dim-8 EFT operators

Wilson coefficient	$ \mathcal{M}_{d8} ^2$	95% confidence interval [TeV $^{-4}$ ]	
	Included	Expected	Observed
$f_{T,0}/\Lambda^4$	yes	[-0.98, 0.93]	[-1.0, 0.97]
	no	[-23, 17]	[-19, 19]
$f_{T,1}/\Lambda^4$	yes	[-1.2, 1.2]	[-1.3, 1.3]
	no	[-160, 120]	[-140, 140]
$f_{T,2}/\Lambda^4$	yes	[-2.5, 2.4]	[-2.6, 2.5]
	no	[-74, 56]	[-63, 62]
$f_{T,5}/\Lambda^4$	yes	[-2.5, 2.4]	[-2.6, 2.5]
	no	[-79, 60]	[-68, 67]
$f_{T,6}/\Lambda^4$	yes	[-3.9, 3.9]	[-4.1, 4.1]
	no	[-64, 48]	[-55, 54]
$f_{T,7}/\Lambda^4$	yes	[-8.5, 8.1]	[-8.8, 8.4]
	no	[-260, 200]	[-220, 220]
$f_{T,8}/\Lambda^4$	yes	[-2.1, 2.1]	[-2.2, 2.2]
	no	$[-4.6, 3.1] \times 10^4$	$[-3.9, 3.8] \times 10^4$
$f_{T,9}/\Lambda^4$	yes	[-4.5, 4.5]	[-4.7, 4.7]
	no	$[-7.5, 5.5] \times 10^4$	$[-6.4, 6.3] \times 10^4$

- Results are shown when pure Dim-8 contribution is included and excluded in the theoretical predictions
- Wilson coefficients are consistent with zero

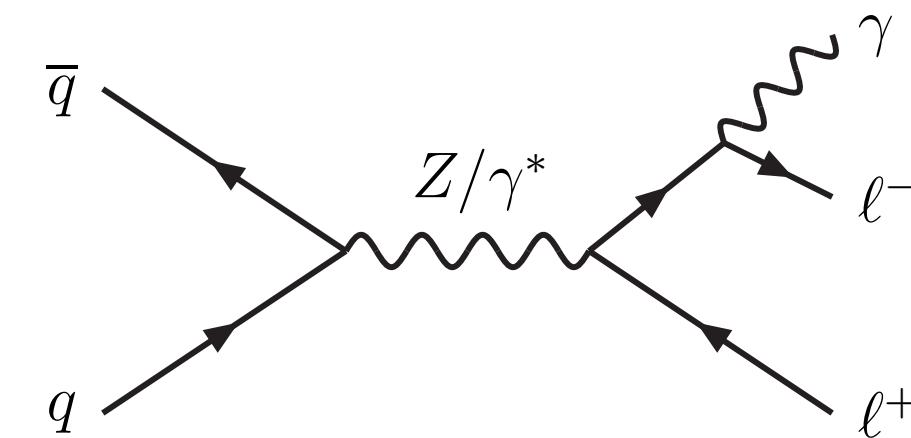

- Constraints are also placed after clipping: restricting the interference and pure Dim-8 contributions to have  $m_{4l} < E_c$
- 95% CL intervals degrade by a factor of 4-5 when the energy scale cut off is reduced from  $E_c = \infty$  to  $E_c = 1$  TeV

# Z $\gamma$ ( $\rightarrow 2\ell\gamma$ ) + jets

## First observation in ATLAS

- Probes neutral quartic gauge couplings but has a larger cross-section than ZZ
- Dominant background from Z $\gamma$ -QCD and non-prompt photons (jets misidentified as photons) from Z+jets
- FSR suppressed with  $m_{ll} + m_{ll\gamma} > 182$  GeV

- Differential cross-section extracted from a maximum likelihood fit in SR and CR

$\sigma$	Observed	Expected
Z $\gamma$ -EWK	$3.6 \pm 0.5$ fb	$3.5 \pm 0.3$ fb
Z $\gamma$	$16.8^{+2.0}_{-1.8}$ fb	$15.7^{+5.0}_{-2.6}$ fb

### Z $\gamma$ -EWK SR

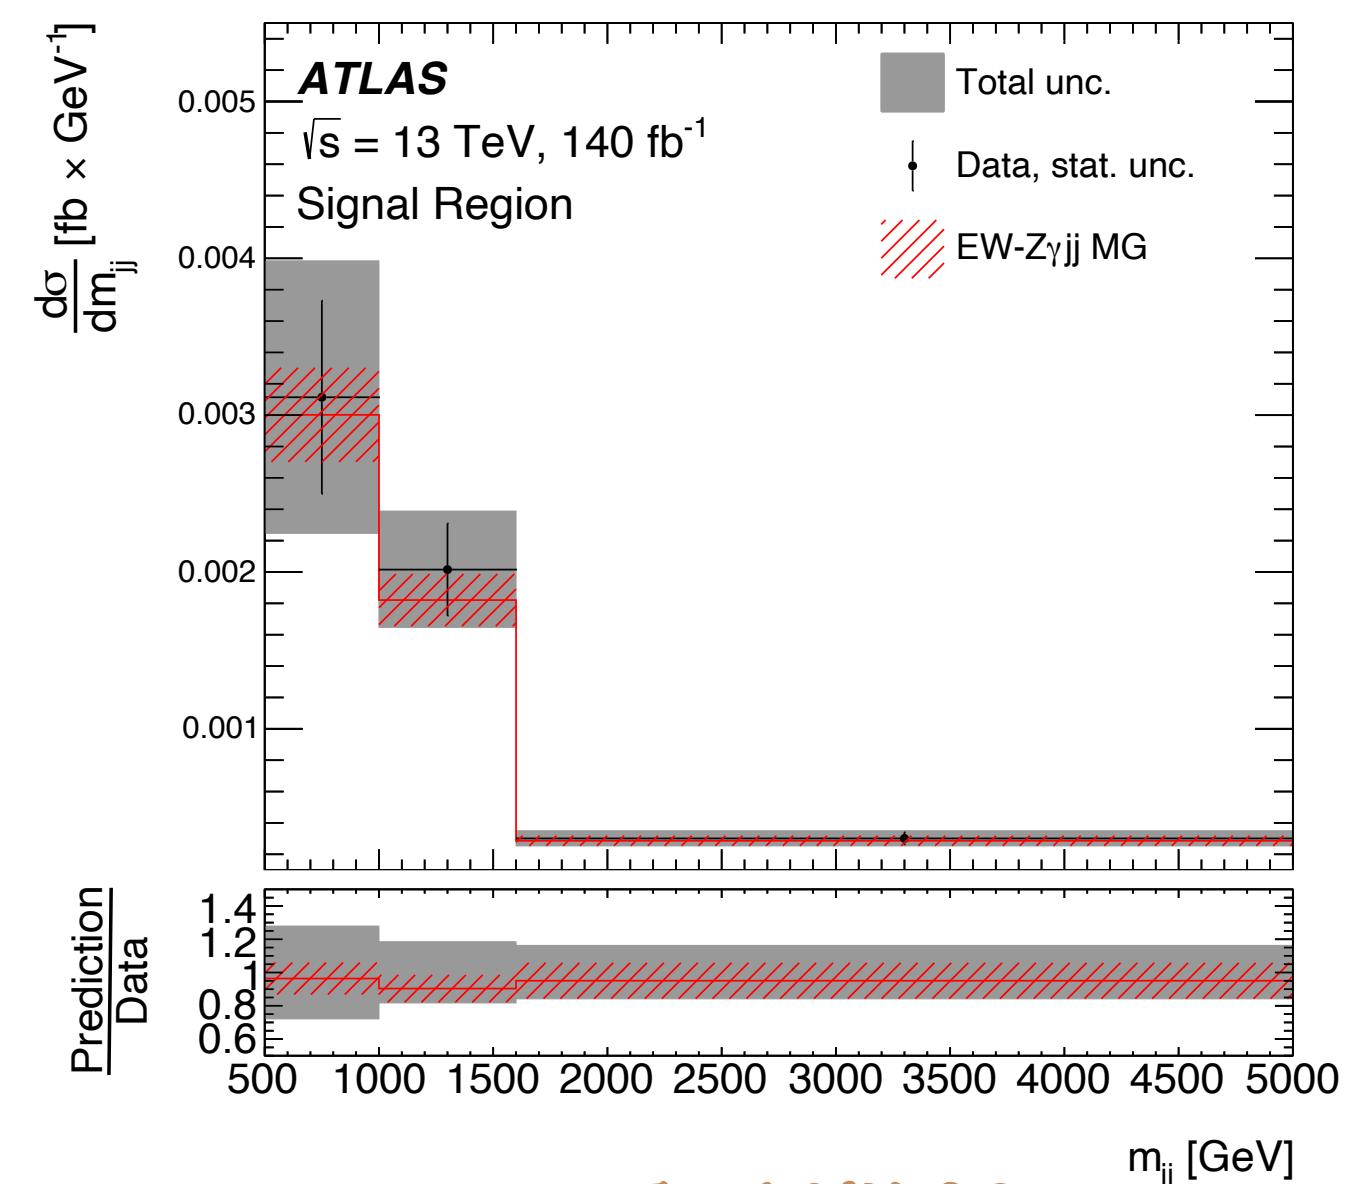

$$\begin{aligned} m_{jj} &> 500 \text{ GeV} \\ \zeta &< 0.4 \end{aligned}$$

### Inclusive Z $\gamma$ SR

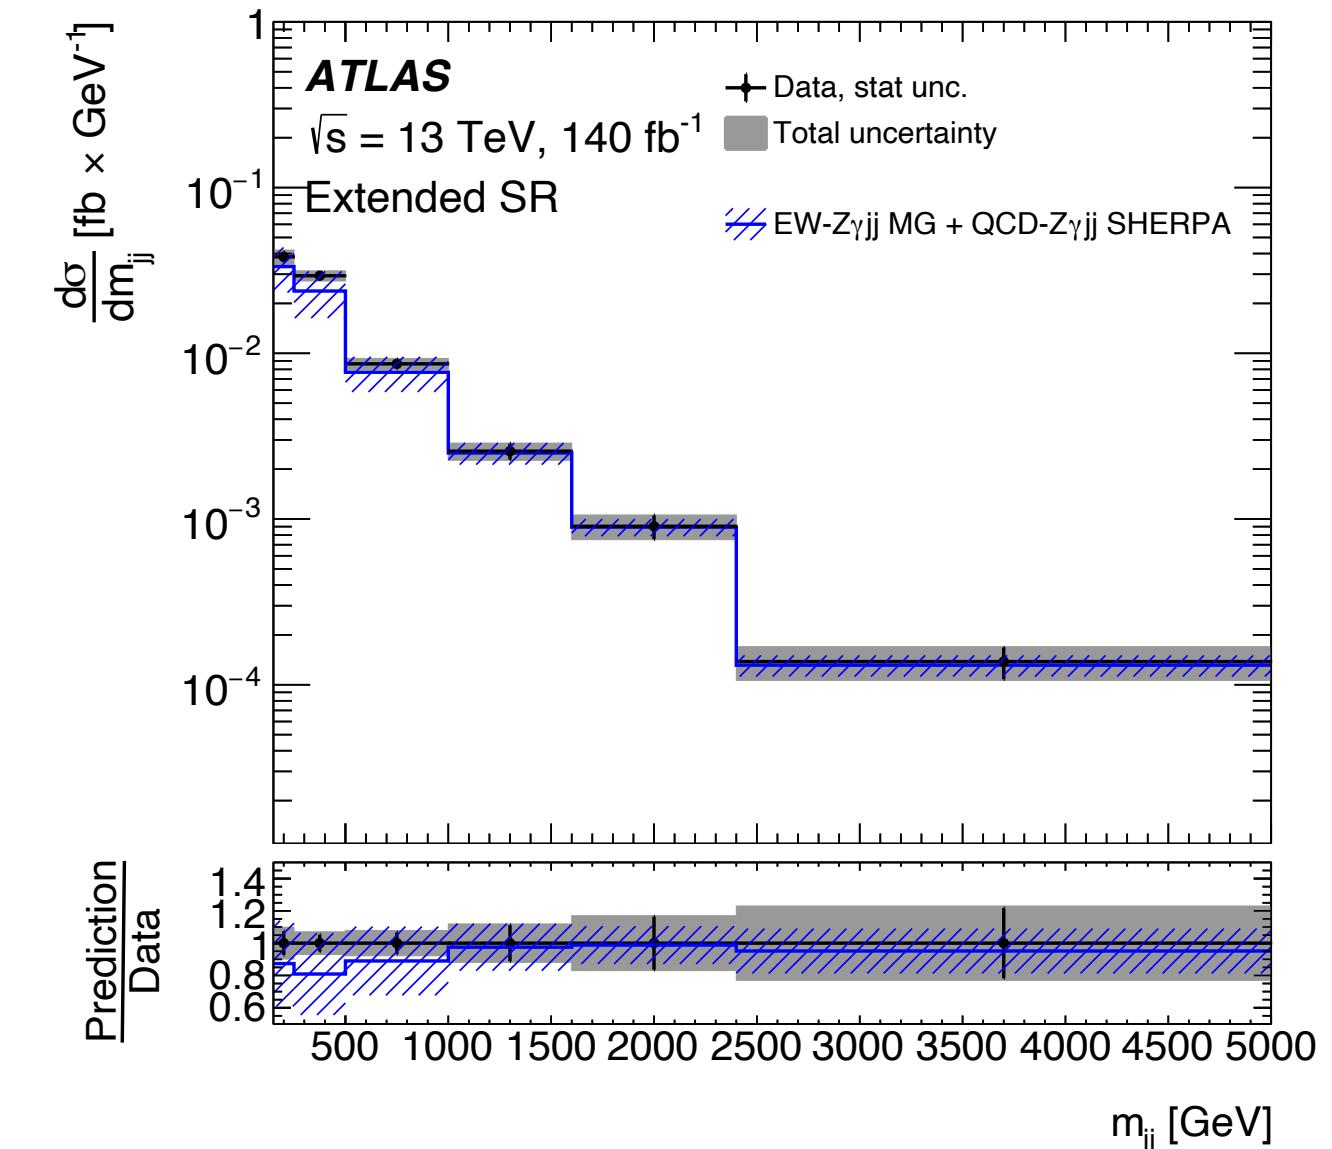

$$\begin{aligned} m_{jj} &> 150 \text{ GeV} \\ \zeta &< 0.4 \end{aligned}$$

### Z $\gamma$ -QCD CR

$$\begin{aligned} m_{jj} &> 500 \text{ GeV} \\ \zeta &> 0.4 \end{aligned}$$

Z $\gamma$ -EWK SR

Inclusive Z $\gamma$  SR

	Data stat.	MC stat.	Background	Reco	EW mod.	QCD mod.	Total
$\Delta\sigma_{EW}/\sigma_{EW}$ [%]	$\pm 9$	$\pm 1$	$\pm 1$	$\pm 4$	$+8$ $-6$	$\pm 2$	$\pm 13$
$\Delta\sigma_{Z\gamma}/\sigma_{Z\gamma}$ [%]	$\pm 3$	$\pm 1$	$\pm 2$	$+4$ $-3$	$+7$ $-6$	$\pm 9$	$+12$ $-11$

# Z $\gamma(\rightarrow 2\nu\gamma)$ + jets

## First observation at the LHC

- Probes neutral quartic gauge couplings but larger BR for  $Z \rightarrow \nu\bar{\nu}$  than  $Z \rightarrow l^+l^-$
- Final state with an energetic photon  $E_T^\gamma > 150$  GeV and large  $E_T^{\text{miss}} > 120$  GeV
- Dominant backgrounds from  $W\gamma$  and  $Z\gamma$ -QCD
- Signal extracted from a binned maximum likelihood fit using a BDT classifier response in the SR and  $m_{jj}$  in  $Z\gamma$ -QCD and  $W\gamma$  CRs

**Z $\gamma$  SR**  
 $m_{jj} > 300$  GeV  
 $\gamma$ -centrality  $< 0.6$

**Z $\gamma$ -QCD CR1**  
 $m_{jj} < 300$  GeV  
 $\gamma$ -centrality  $< 0.6$

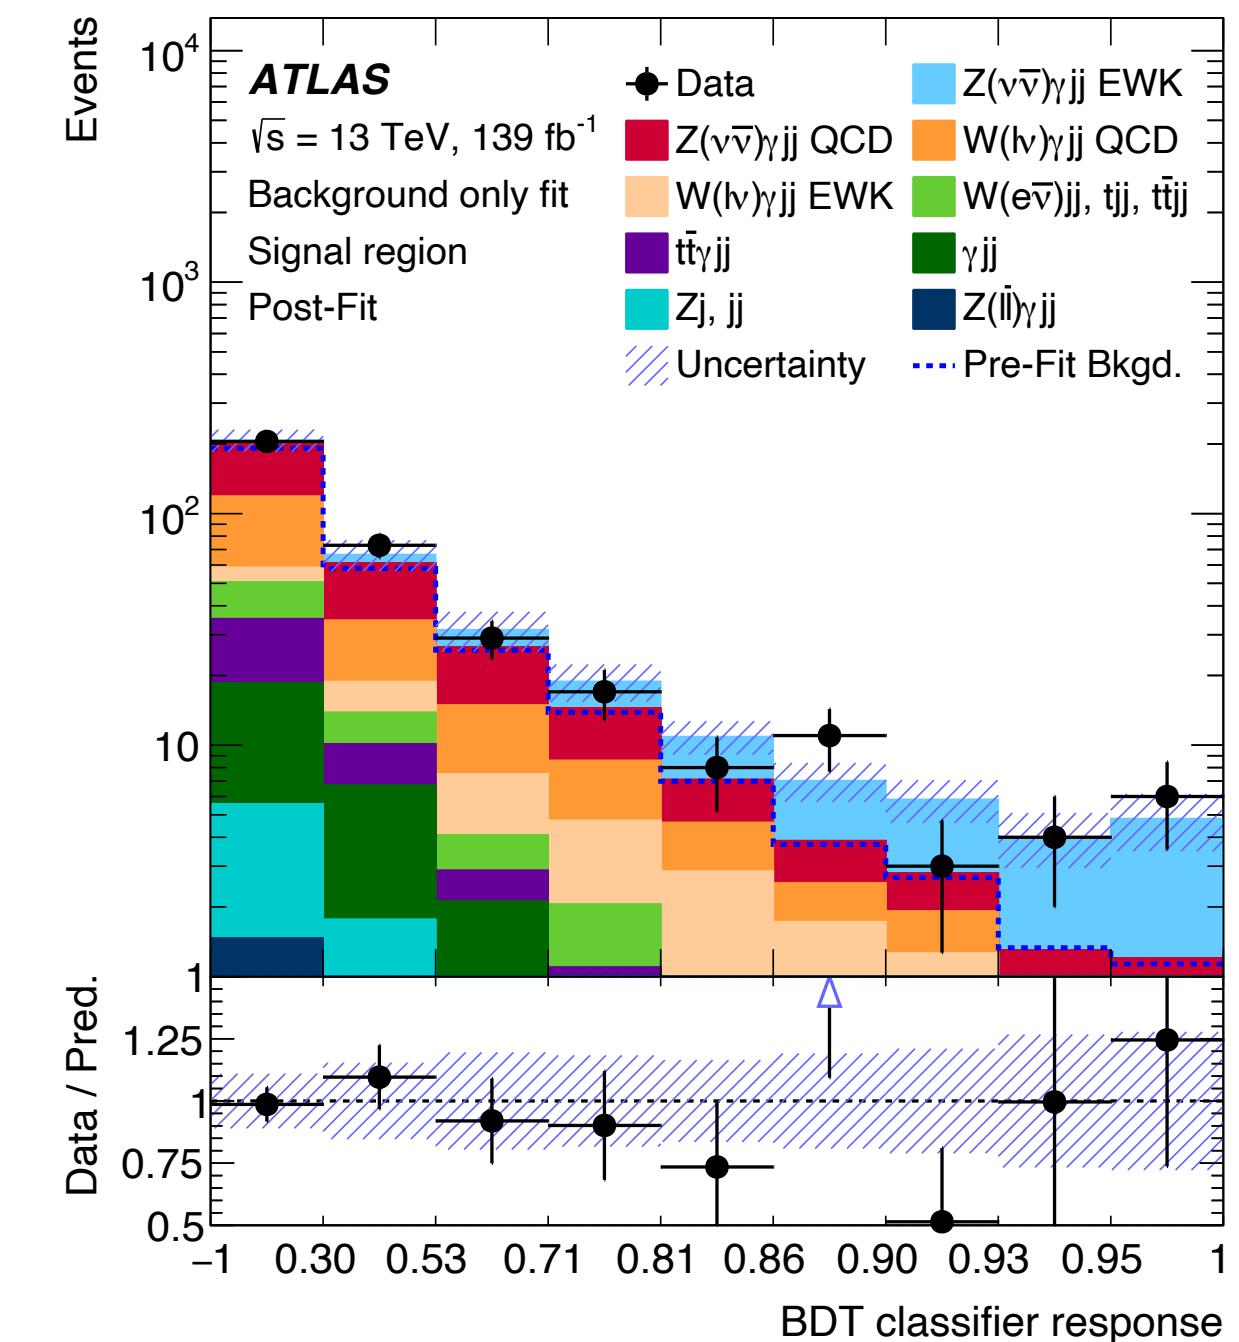

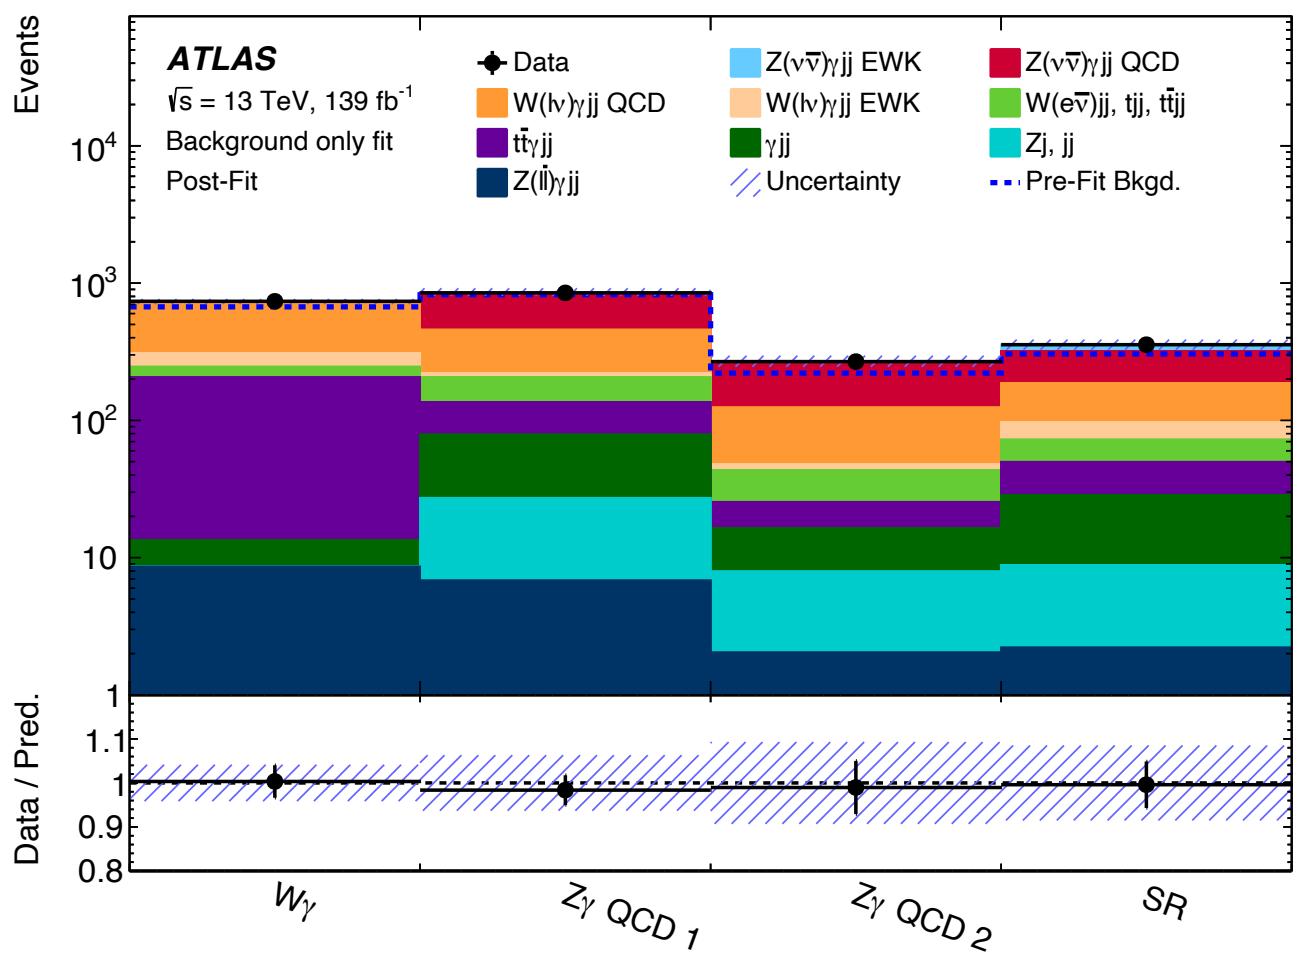

**Z $\gamma$ -QCD CR2**  
 $m_{jj} > 300$  GeV  
 $\gamma$ -centrality  $> 0.6$

**W $\gamma$ -QCD CR**  
 $m_{jj} > 300$  GeV  
 $\gamma$ -centrality  $> 0.6$   
1 lepton unlike SR

- Measured cross-section in agreement with SM predictions

$$\sigma_{fid} = 0.77^{+0.34}_{-0.30} \text{ fb}$$

Observed with  $3.2\sigma$  ( $3.7\sigma$  expected)

# Z $\gamma(\rightarrow 2\nu\gamma)$ + jets

- Combination with a previous ATLAS measurement: **Observed with  $6.3\sigma$**

Eur. Phys. J. C 82 (2022) 105

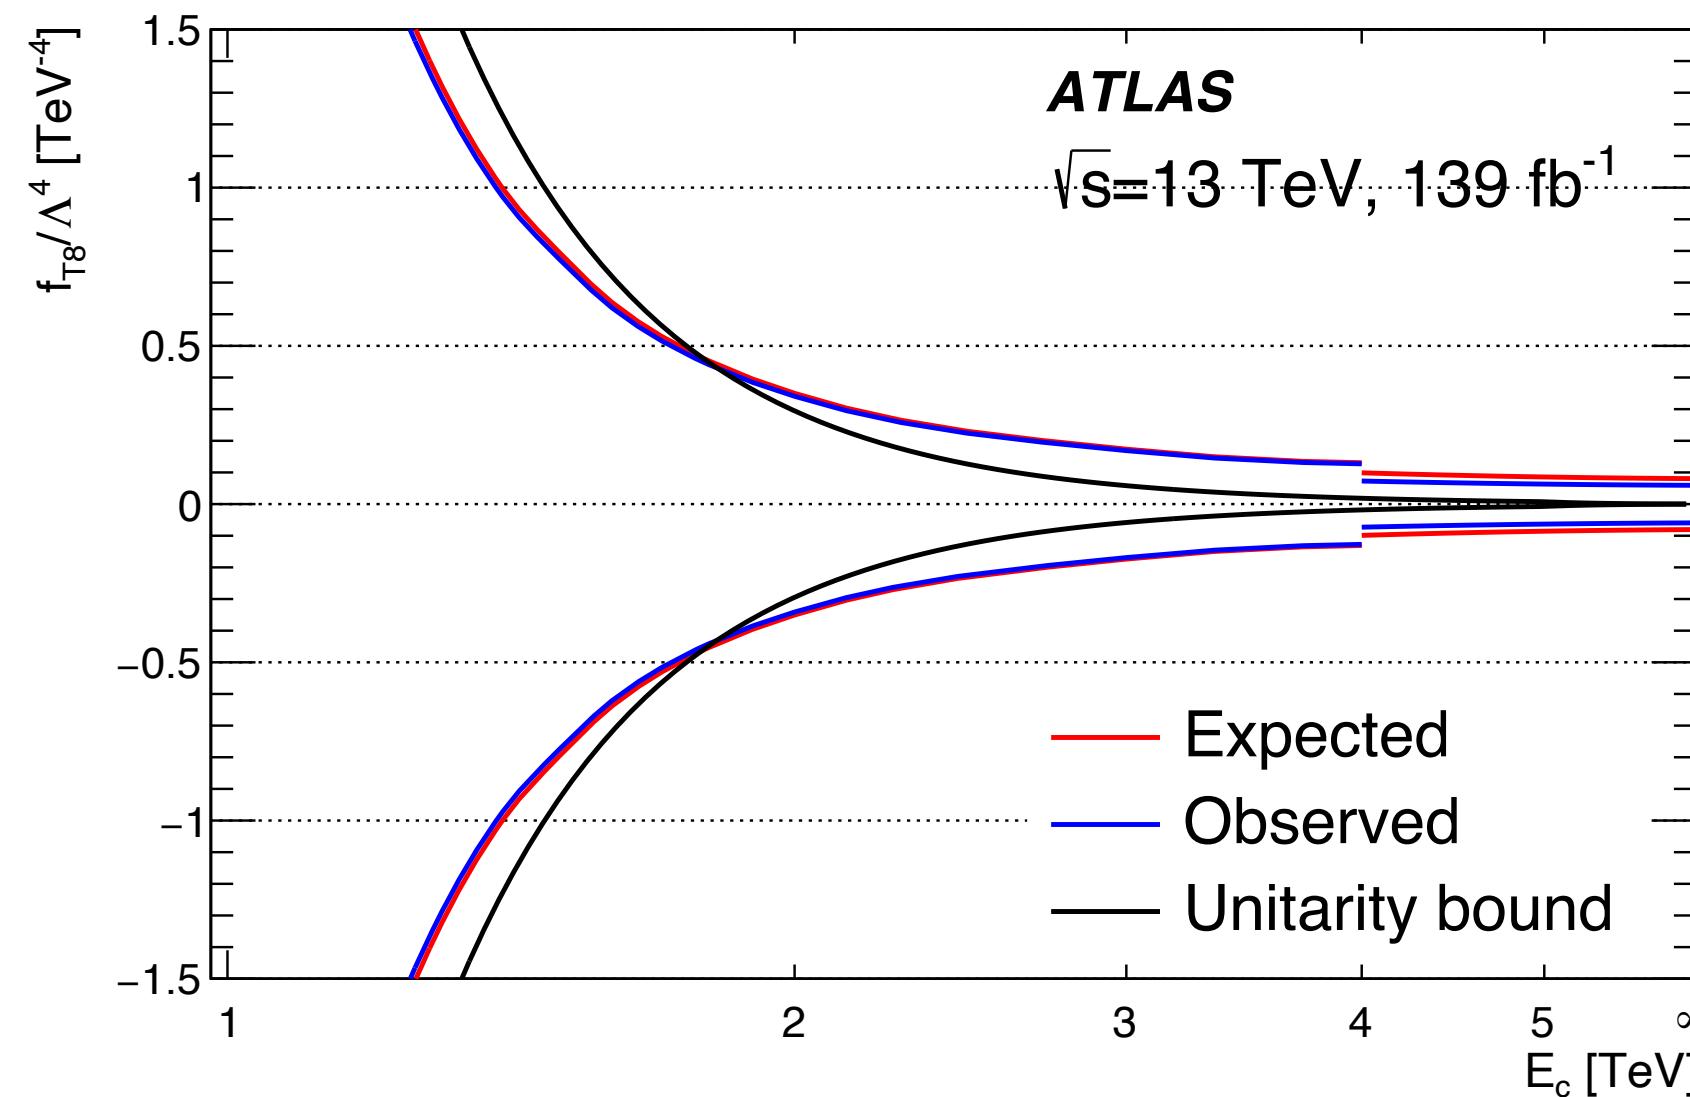

$15 < E_T^\gamma < 110 \text{ GeV}$   
**Not sensitive to aQGC search**  
**Observed with  $5.2\sigma$**   
started as a search for BSM Higgs decays

**This analysis**  
 $E_T^\gamma > 150 \text{ GeV}$   
**Sensitive to aQGC search**  
**Observed with  $3.2\sigma$**

POI	$15 < E_T^\gamma < 110 \text{ GeV}$	$E_T^\gamma > 150 \text{ GeV}$	Combination
$\mu_{Z\gamma\text{EWK}}$	$0.78 \pm 0.33$	$1.04 \pm 0.23$	$0.96 \pm 0.18$
$\mu_{Z\gamma\text{QCD}}$	$1.21 \pm 0.37$	$1.02 \pm 0.41$	$1.17 \pm 0.27$
$\mu_{W\gamma}$	$1.02 \pm 0.22$	$1.01 \pm 0.20$	$1.01 \pm 0.13$

Combination increases the overall sensitivity to electroweak Z $\gamma$ +jets

- Limits set on EFT Dim-8 operators.
- EFT contributions are suppressed above  $E_c$ . Parton level simulated events are scanned (before parton showering) and events with  $m_{ll\gamma\gamma} > E_c$  are suppressed.
- Constraints are significantly stronger than any previous LHC results on neutral aQGCs.

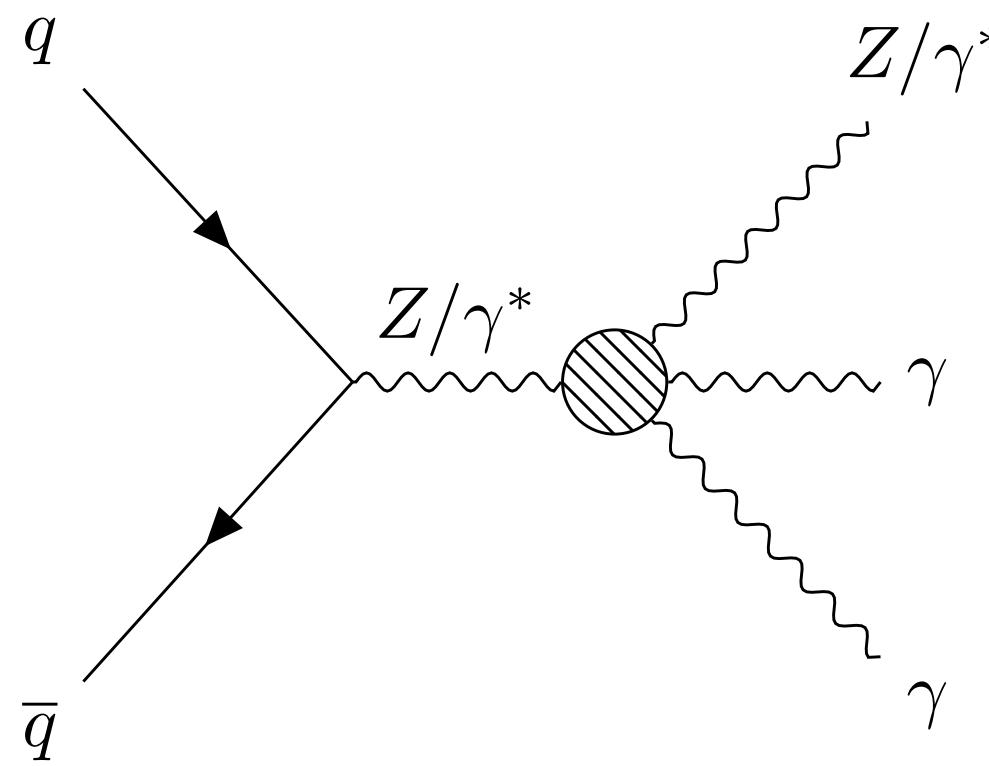

# Z<sub>ggg</sub> → 2l<sub>ggg</sub>

## First observation at the LHC (rejecting FSR)

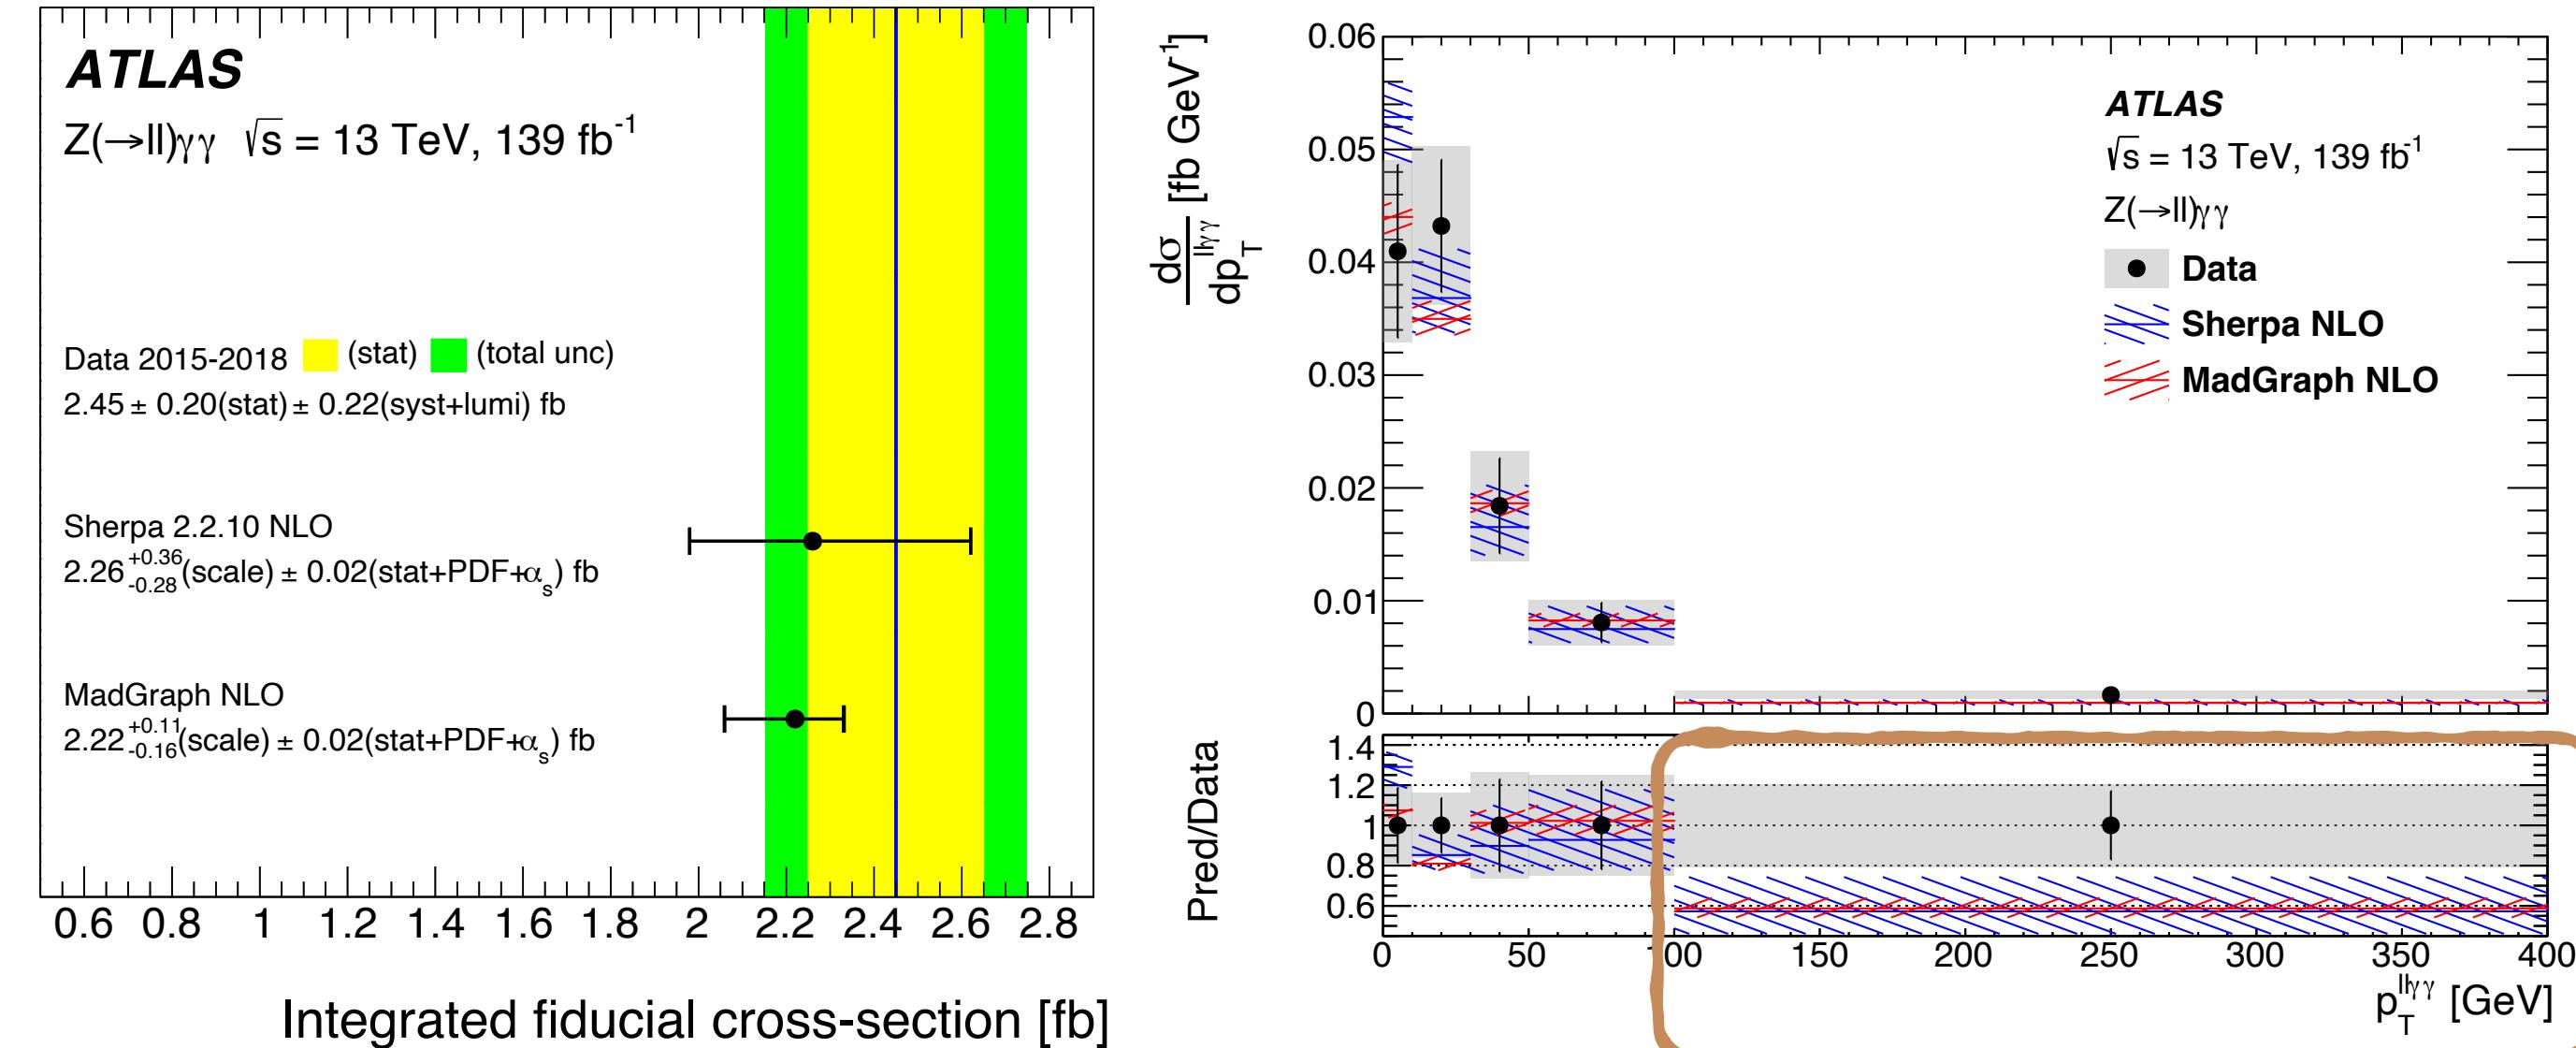

- A Z candidate and two photons with at least  $\Delta R = 0.4$
- FSR contributions suppressed
- Dominant background is non-prompt photons.  
Background estimated from data. Largest source of systematic uncertainty
- Results consistent with SM predictions

## Not allowed in SM

ZZ<sub>ggg</sub>, Z<sub>ggg</sub> and g<sub>ggg</sub> interactions possible via aQGCs

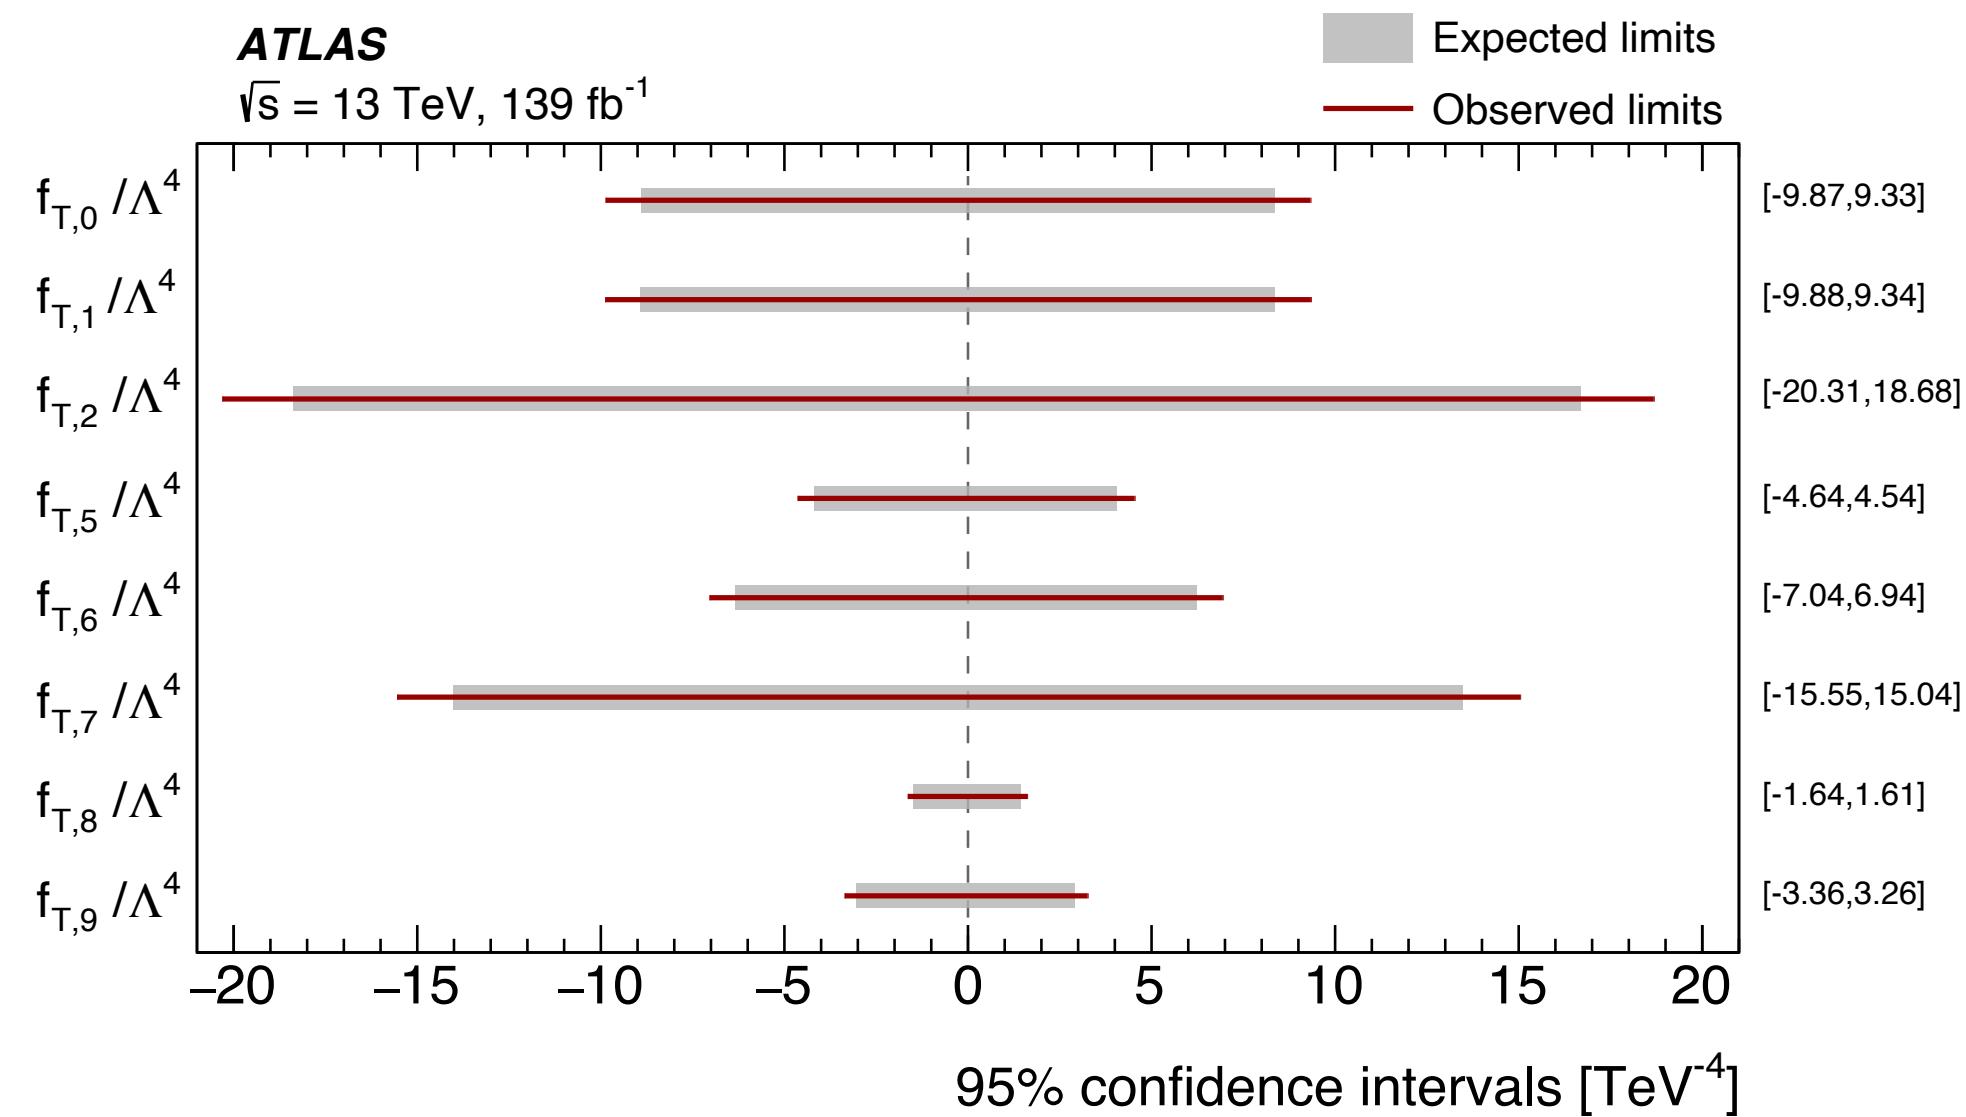

- Limits set on 8 Wilson coefficients of Dim-8 EFT operators.
- Constraints on 4 of the operators are two orders of magnitude more restrictive than the previous ATLAS result using 8 TeV
- Results are also obtained with clipping technique applied (backup)

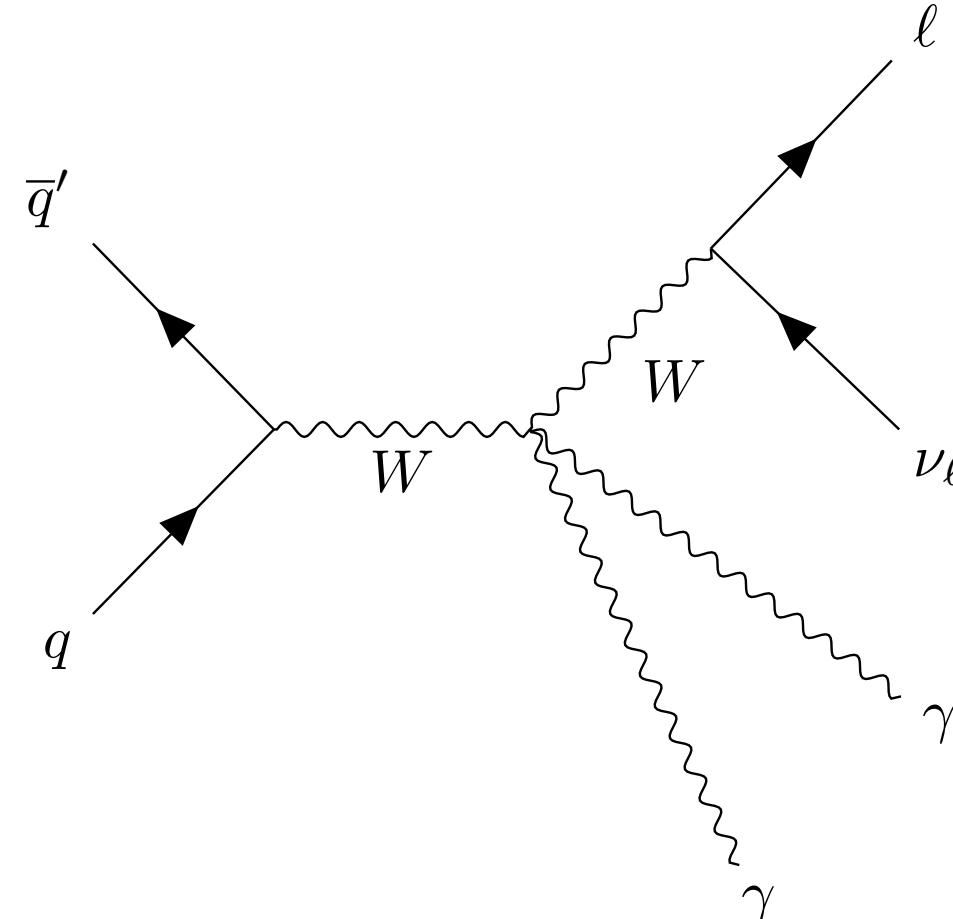

high pT region

Limited accuracy in QCD modelling in the presence of jets

# W $\gamma\gamma \rightarrow l\nu\gamma\gamma$

## First observation at the LHC

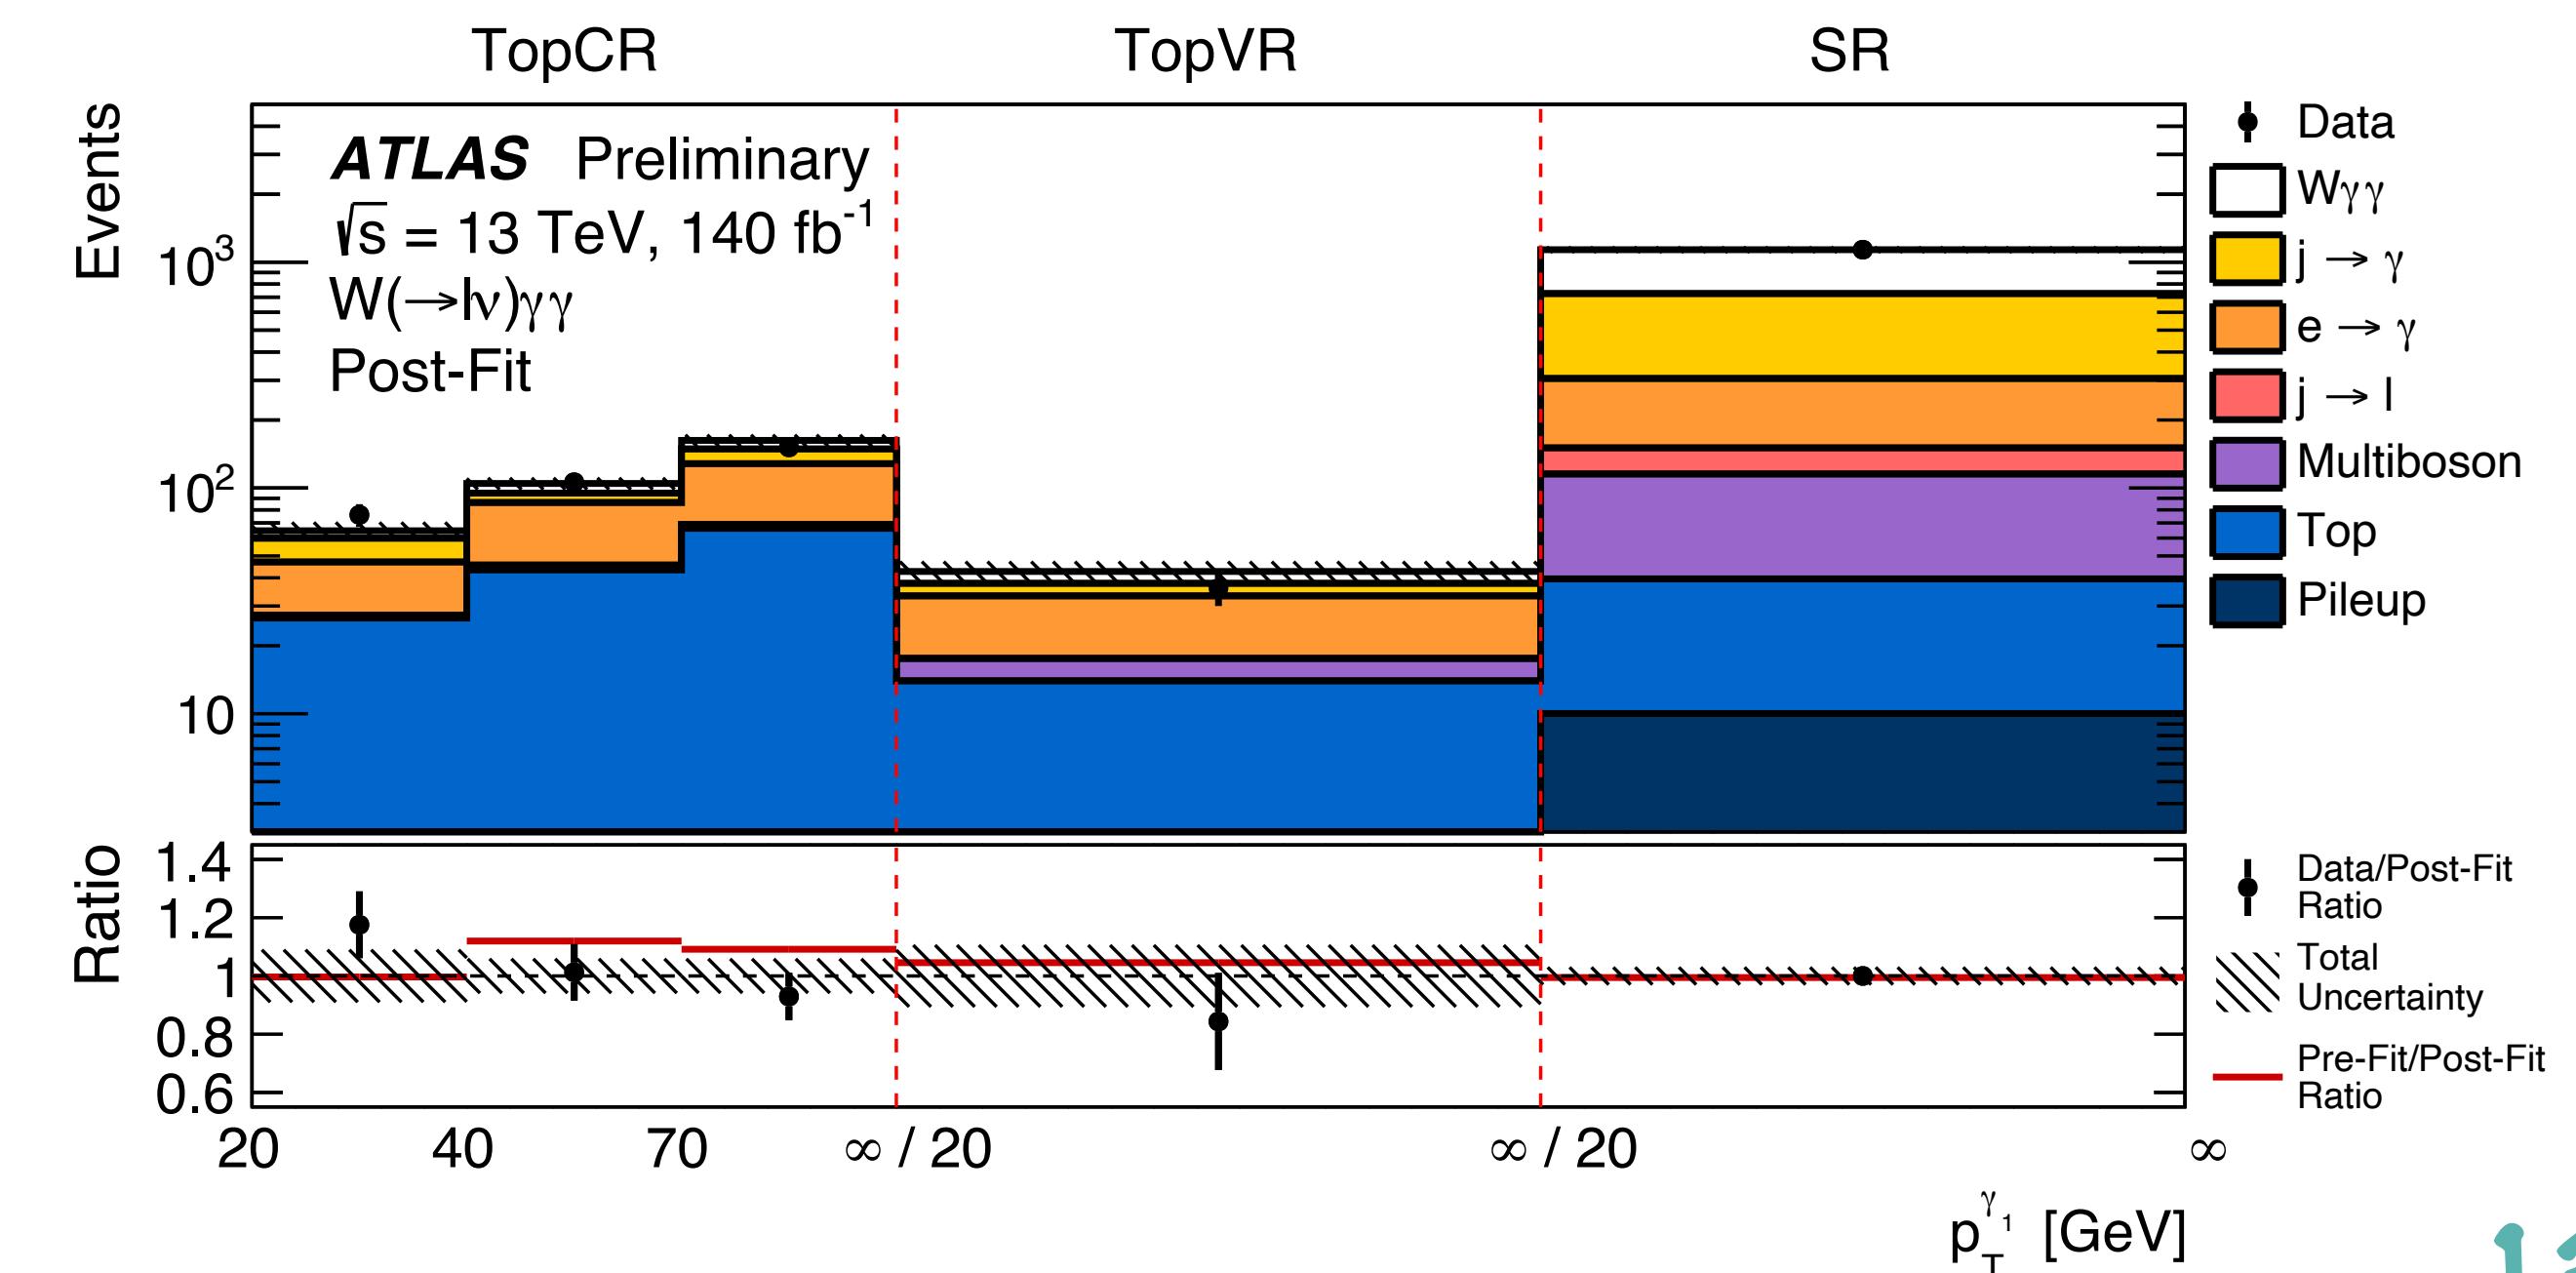

- Measured cross-section in agreement with SM predictions

$$\sigma_{fid} = 12.2^{+2.1}_{-2.0} \text{ fb}$$

**Observed with  $5.6\sigma$  ( $5.6\sigma$  expected)**

- Leading uncertainty source is the data-driven background estimates

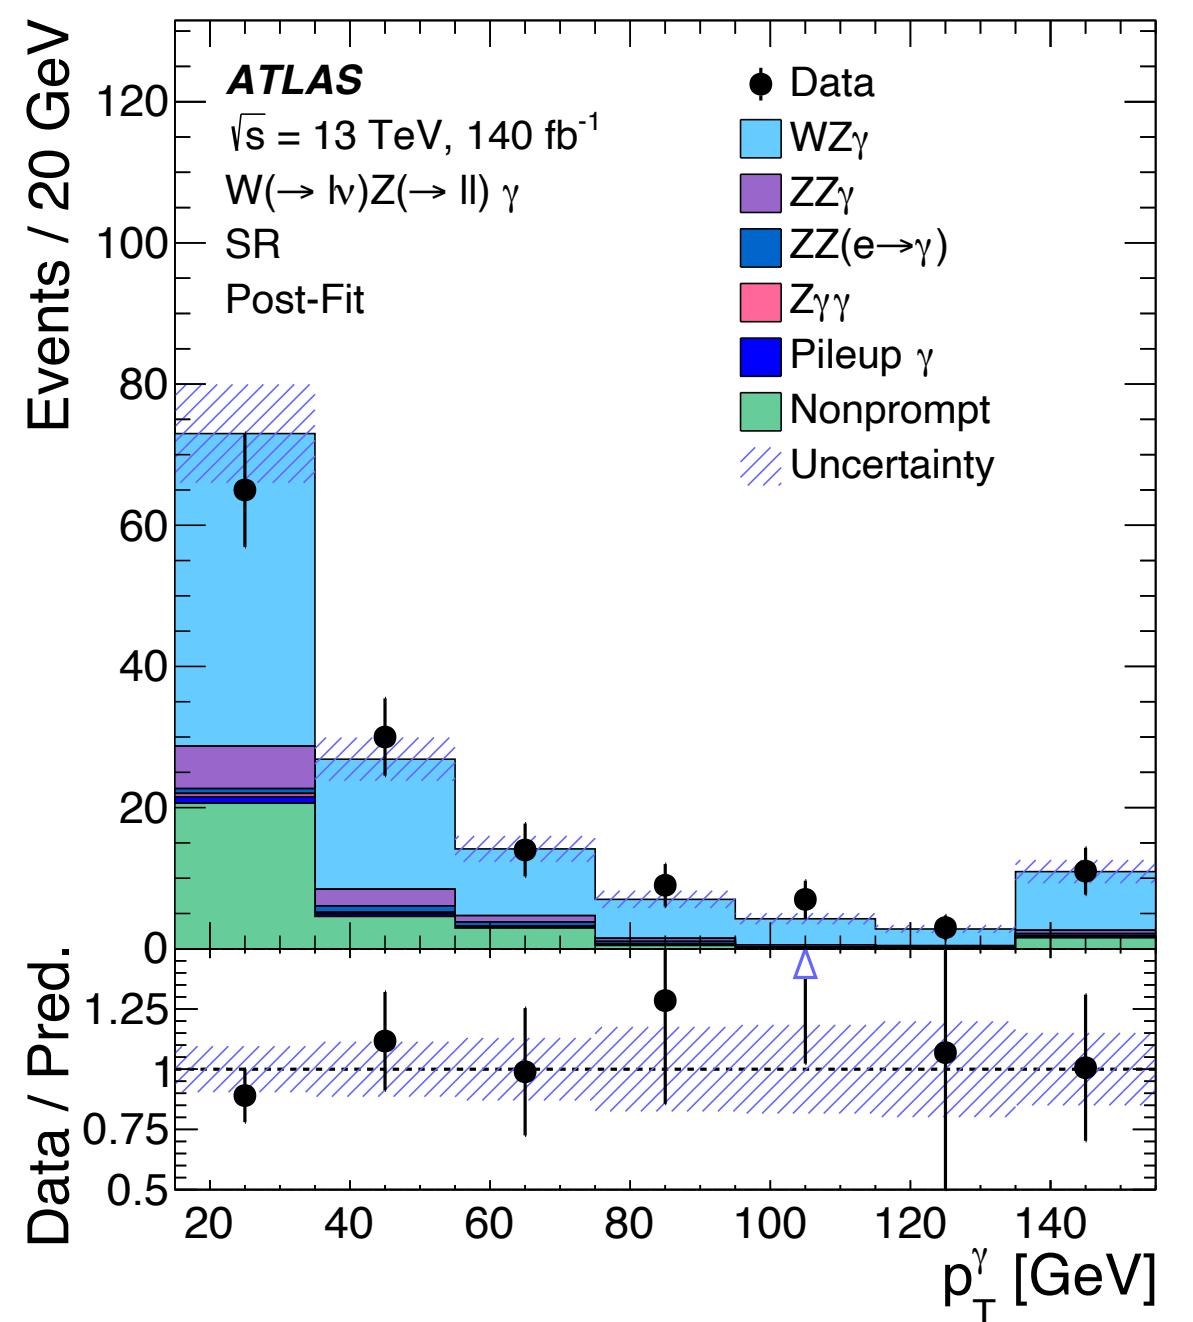

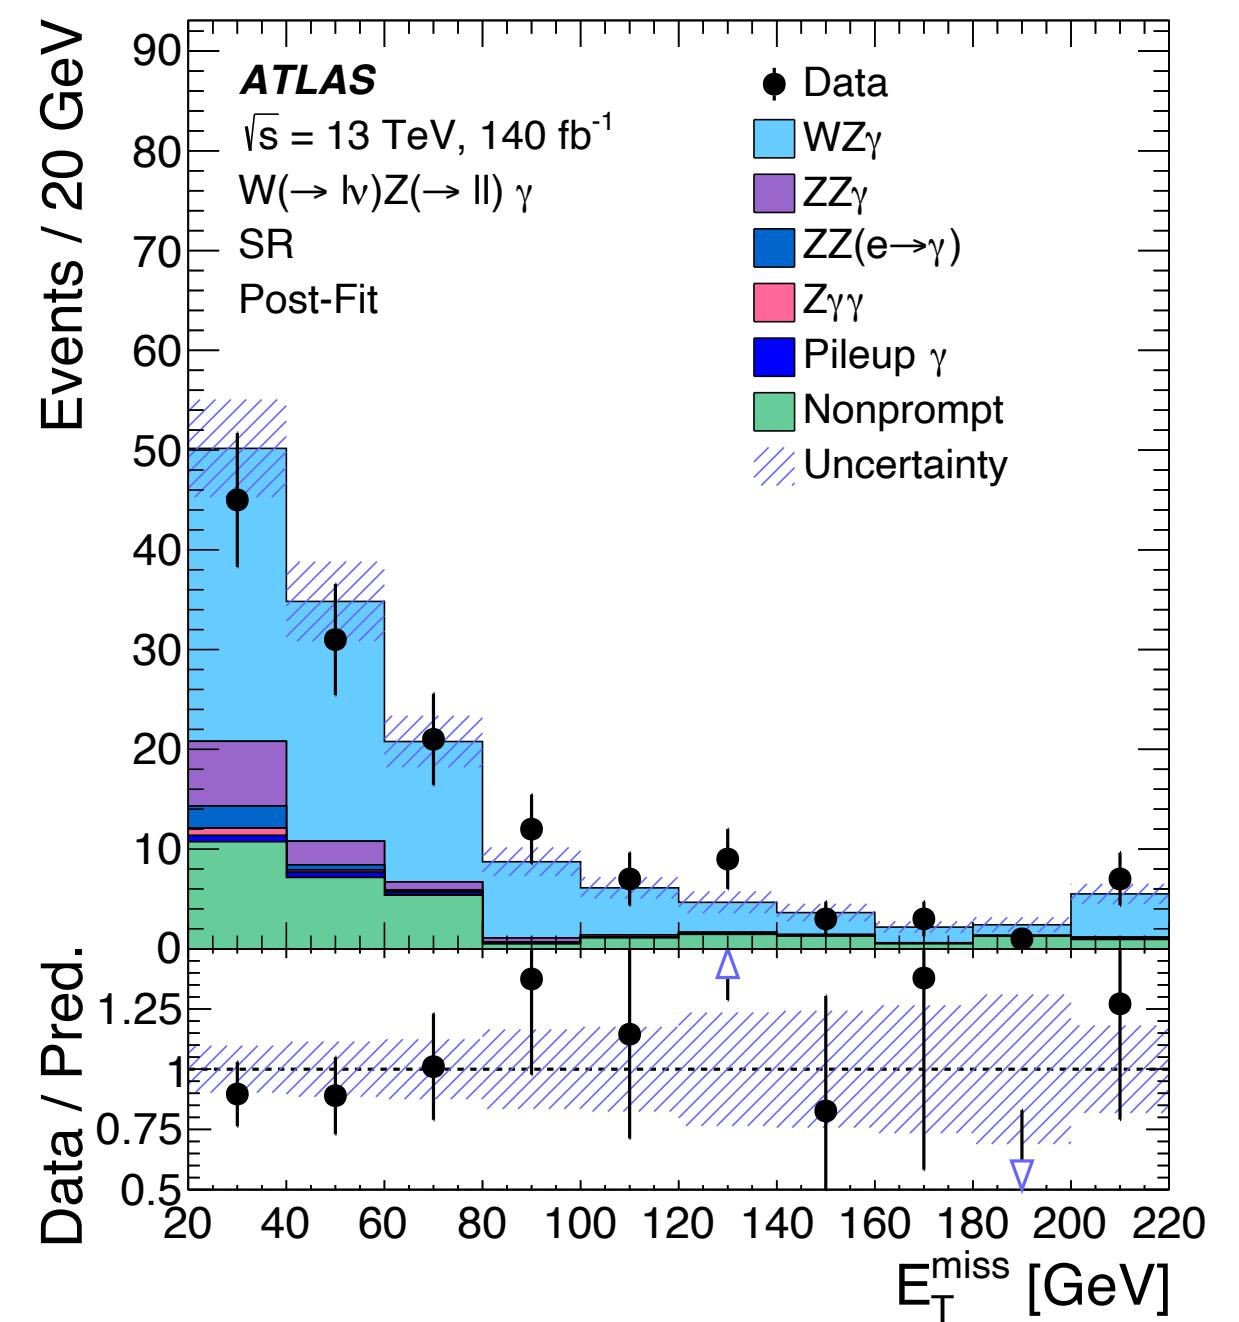

- A  $W$  boson candidate with  $m_{T,W} > 40$  GeV and  $E_T^{\text{miss}} > 25$  GeV
- $Z\gamma$  veto with  $m_{l\gamma\gamma}, m_{l\gamma_1}, m_{l\gamma_2} \notin [82,100]$  GeV
- b-jet veto to suppress top backgrounds
- Major background from non-prompt ( $j \rightarrow \gamma$ ) and fake photons ( $e \rightarrow \gamma$ ). Data-driven estimates
- Signal obtained from a binned maximum likelihood fit.
- Top background constrained in  $\geq 1$  b-jet CR simultaneously with SR. Validated in low  $E_T^{\text{miss}}$  region with  $\geq 1$  b-jet.

# WZ $\gamma \rightarrow 3l\nu\gamma$

## First observation at the LHC

- Selections applied on  $p_T^l$ ,  $p_T^\gamma$ , and  $E_T^{\text{miss}}$
- Z candidate with  $m_{ll}$  closest to  $m_Z$
- $m_{ll} > 81$  GeV suppresses FSR
- $|m_{e,\gamma} - m_Z| > 10$  GeV to reduce  $e \rightarrow \gamma$
- Dominant background is non-prompt leptons and photons
- Signal extracted from a maximum likelihood fit in SR and  $ZZ\gamma$  CR and  $ZZ(e \rightarrow \gamma)$  CR
- $ZZ\gamma$  and  $ZZ$  normalizations obtained from the CRs
- Leading uncertainty is limited data statistics
- Systematic uncertainty dominated by statistical uncertainty in non-prompt background estimation

- Measured cross-section agrees with SM predictions within  $1.5\sigma$

$$\sigma_{fid} = 2.01 \pm 0.34 \text{ fb}$$

Observed with  $6.3\sigma$  (5.0 $\sigma$  expected)

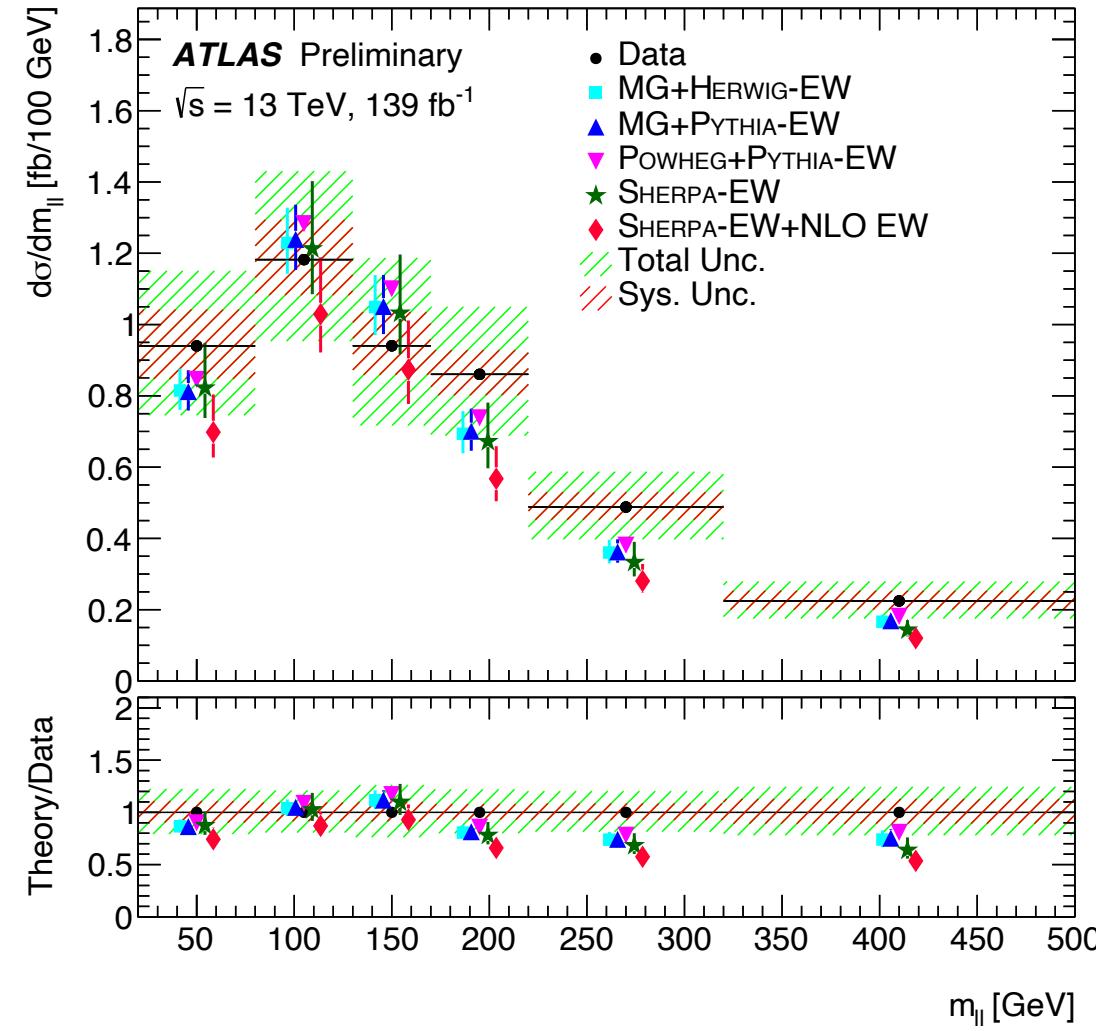

# Summary

- Multiboson interactions with tree level sensitivity to quartic gauge couplings serve as a powerful tool to stringently test SM predictions
- Probes extreme phase spaces which became experimentally accessible for the first time in LHC Run 2
- Most of these processes have been observed in Run 2 with some already in the measurement phase
- Many exciting first observations in ATLAS!
- All results are compatible with SM predictions so far
- Results are interpreted in the context of EFT and limits are set on Dim-6 and Dim-8 operators
- LHC will continue to test SM with better sensitivities to new physics in Run 3 and beyond!
