

Discovering the origin of matter with LXe $0\nu\beta\beta$ detectors: nEXO and beyond

TAUP 2023

Vienna, Aug 30, 2023

Samuele Sangiorgio, LLNL
for the nEXO collaboration

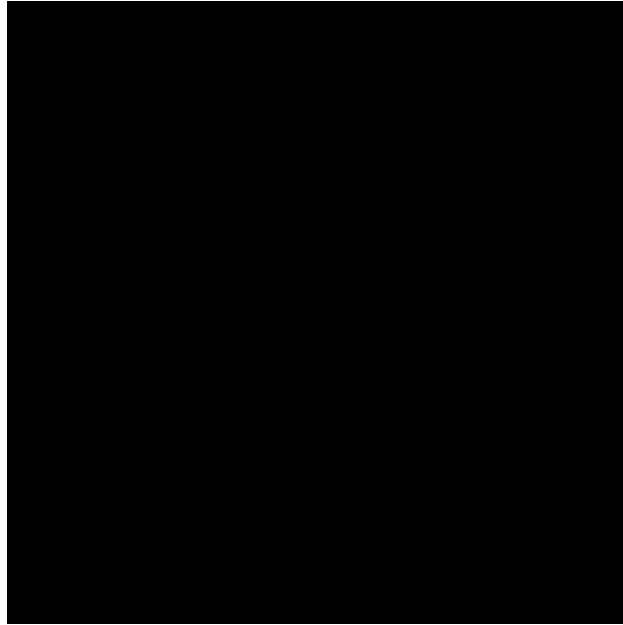

$0\nu\beta\beta$: a key to unlock new physics

Why does our Universe
look like this...

Galaxies, stars, planets, life, all
made only of matter

... and not like this?

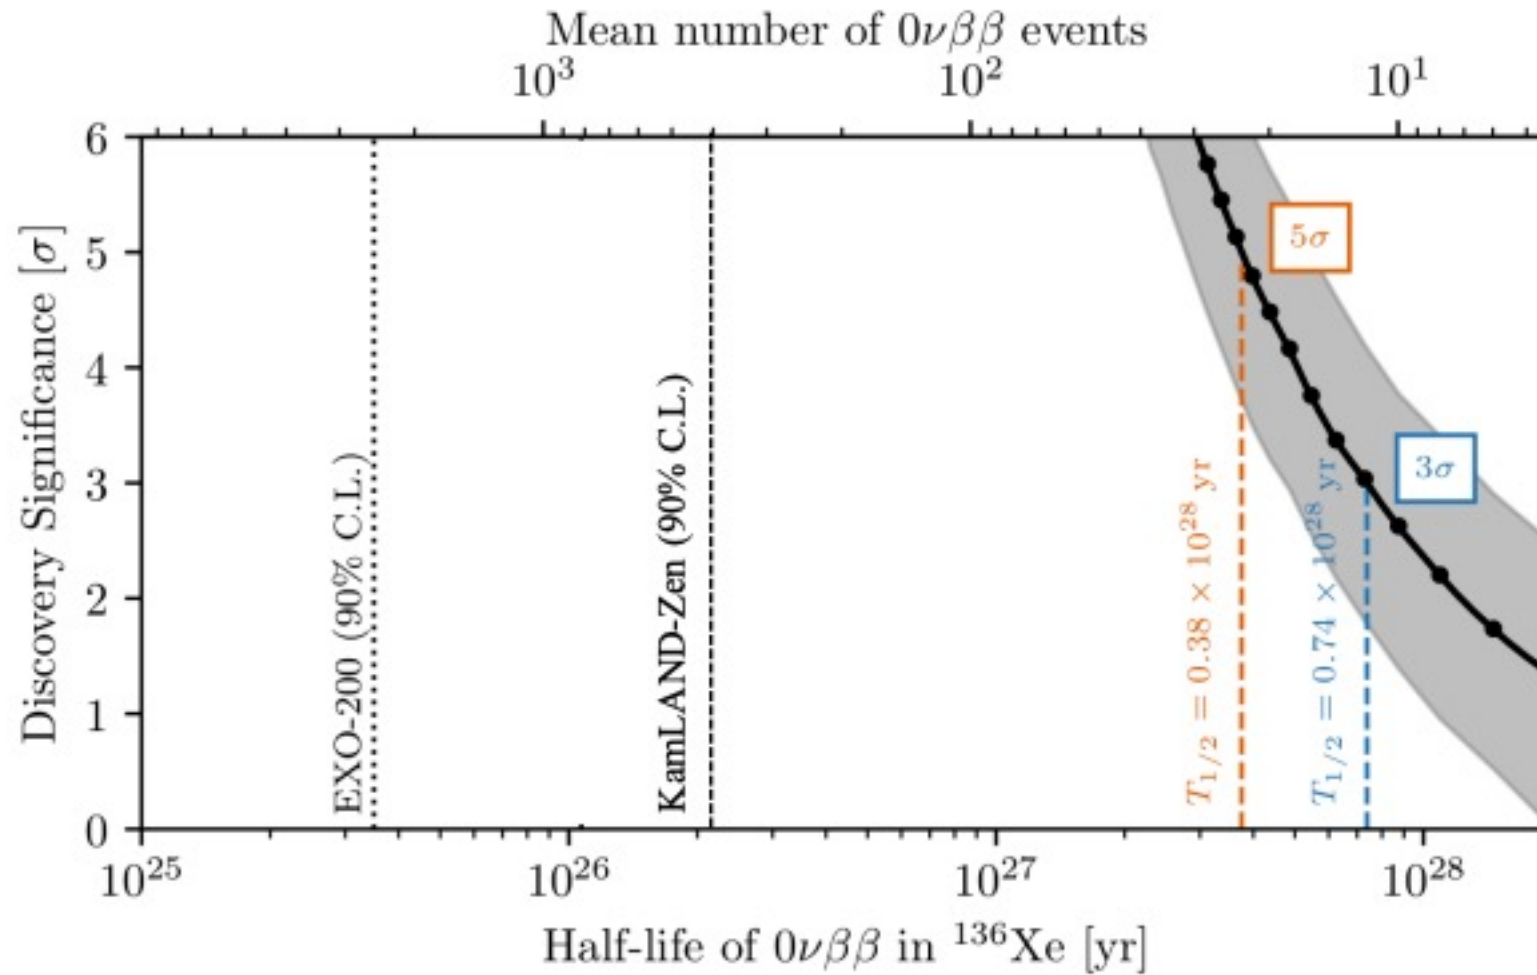

Empty Universe made only of
left-over energy from matter-
antimatter annihilation

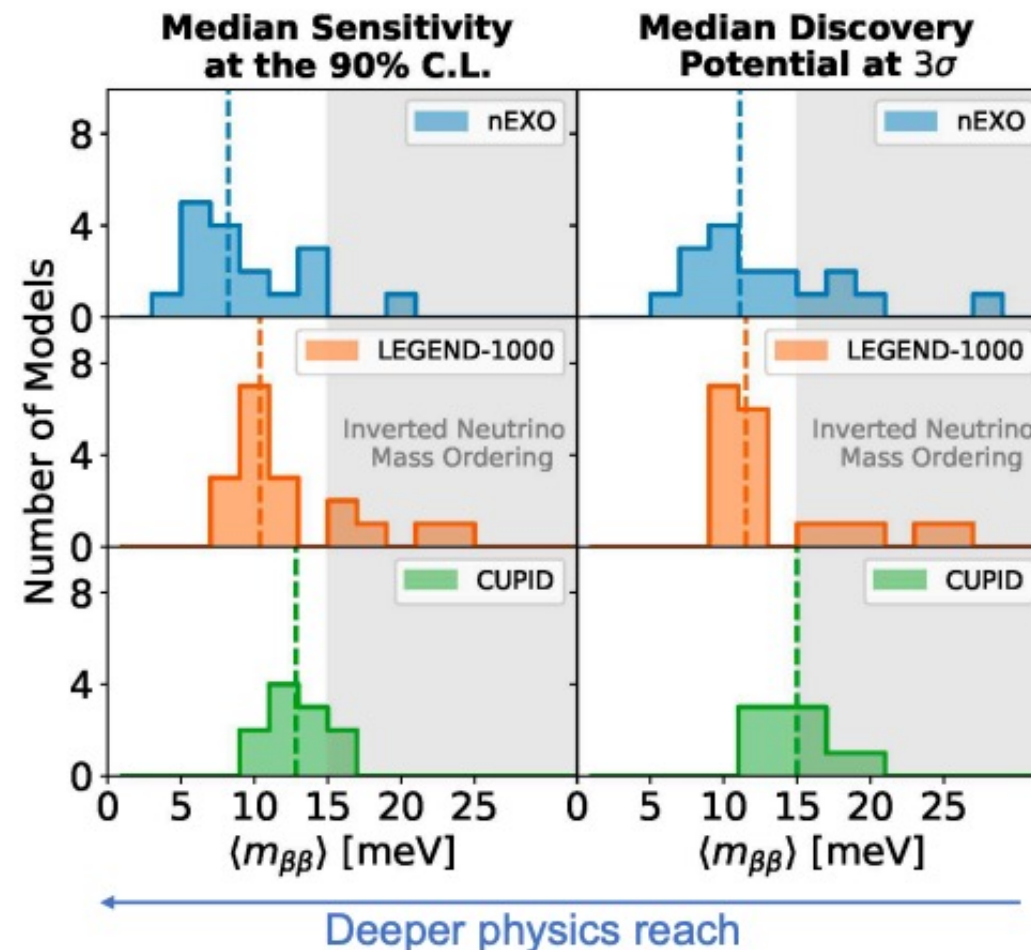

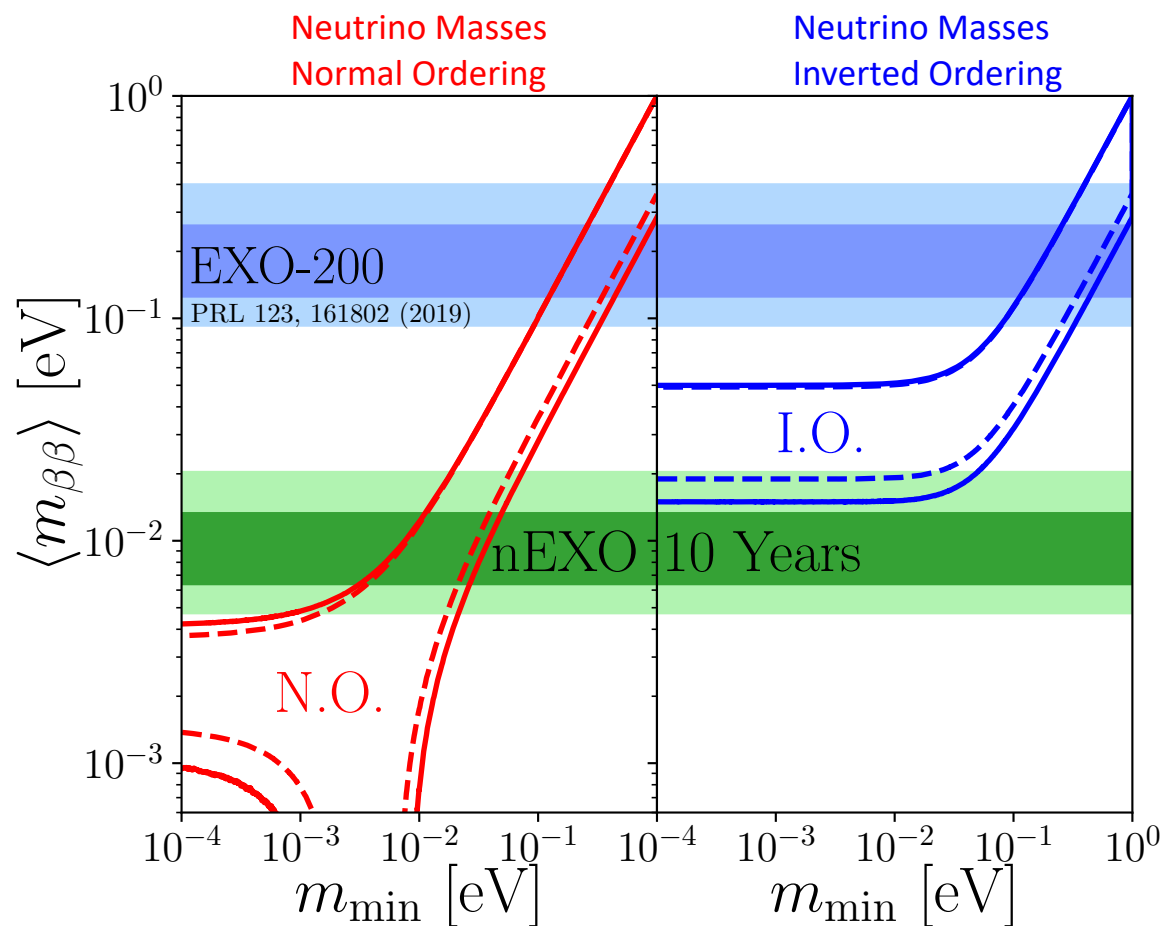

- What generated the matter/antimatter asymmetry?
- What physics is beyond the standard model?
- Is lepton number violated?
- Are neutrinos Majorana particles?
- What is the neutrino mass?

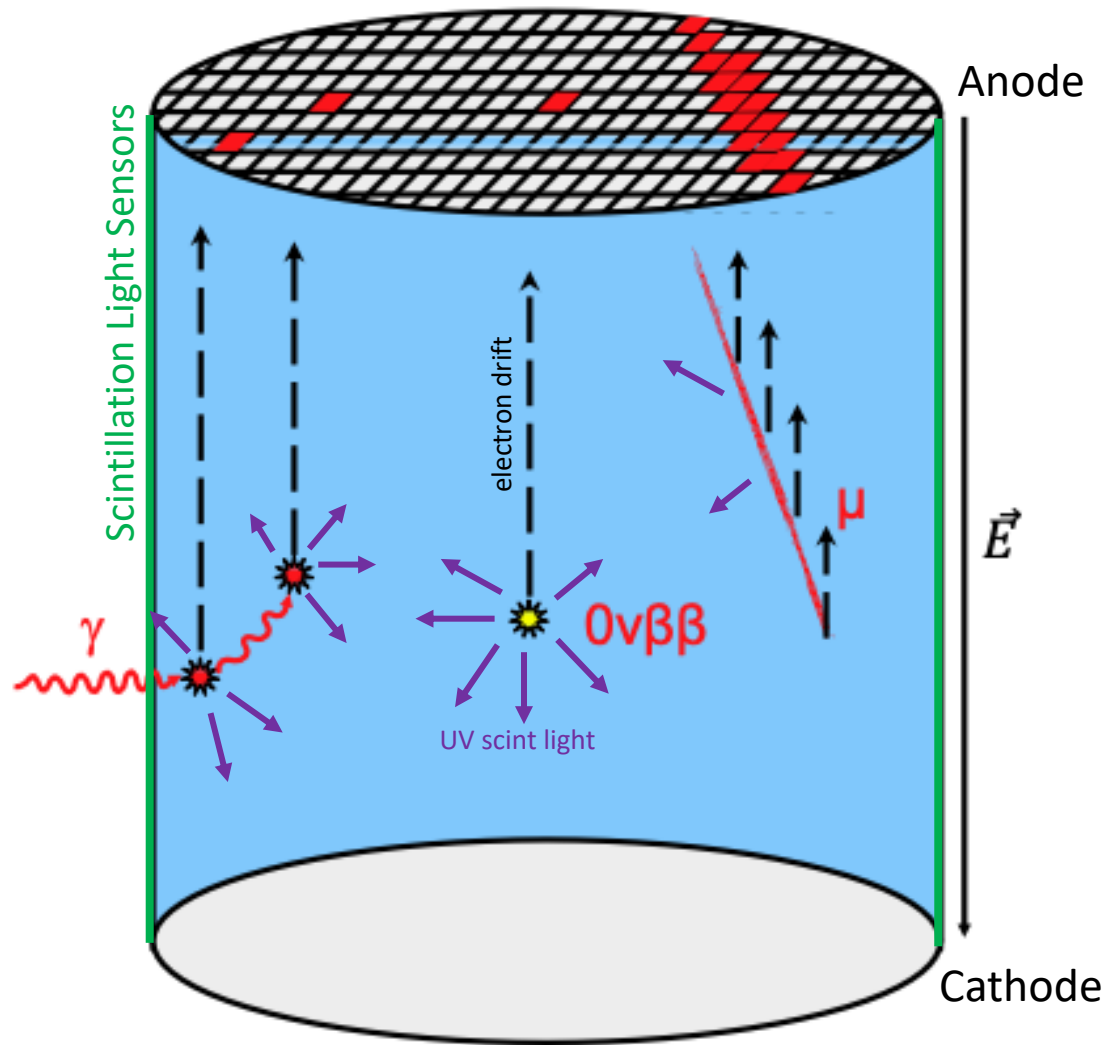

$0\nu\beta\beta$

Majorana Neutrino Physics Reach of nEXO

$0\nu\beta\beta$ Search in a LXe Time Projection Chamber (TPC)

- Single phase LXe TPC measuring
 - Ionization
 - Scintillation
- Multi-parameter Event Reconstruction:
 - Energy ($< 1\% \sigma E/E$)
 - Position
 - Topology (SS vs MS)
- nEXO designed for 5 tonne of LXe enriched to 90% in the ^{136}Xe $\beta\beta$ isotope

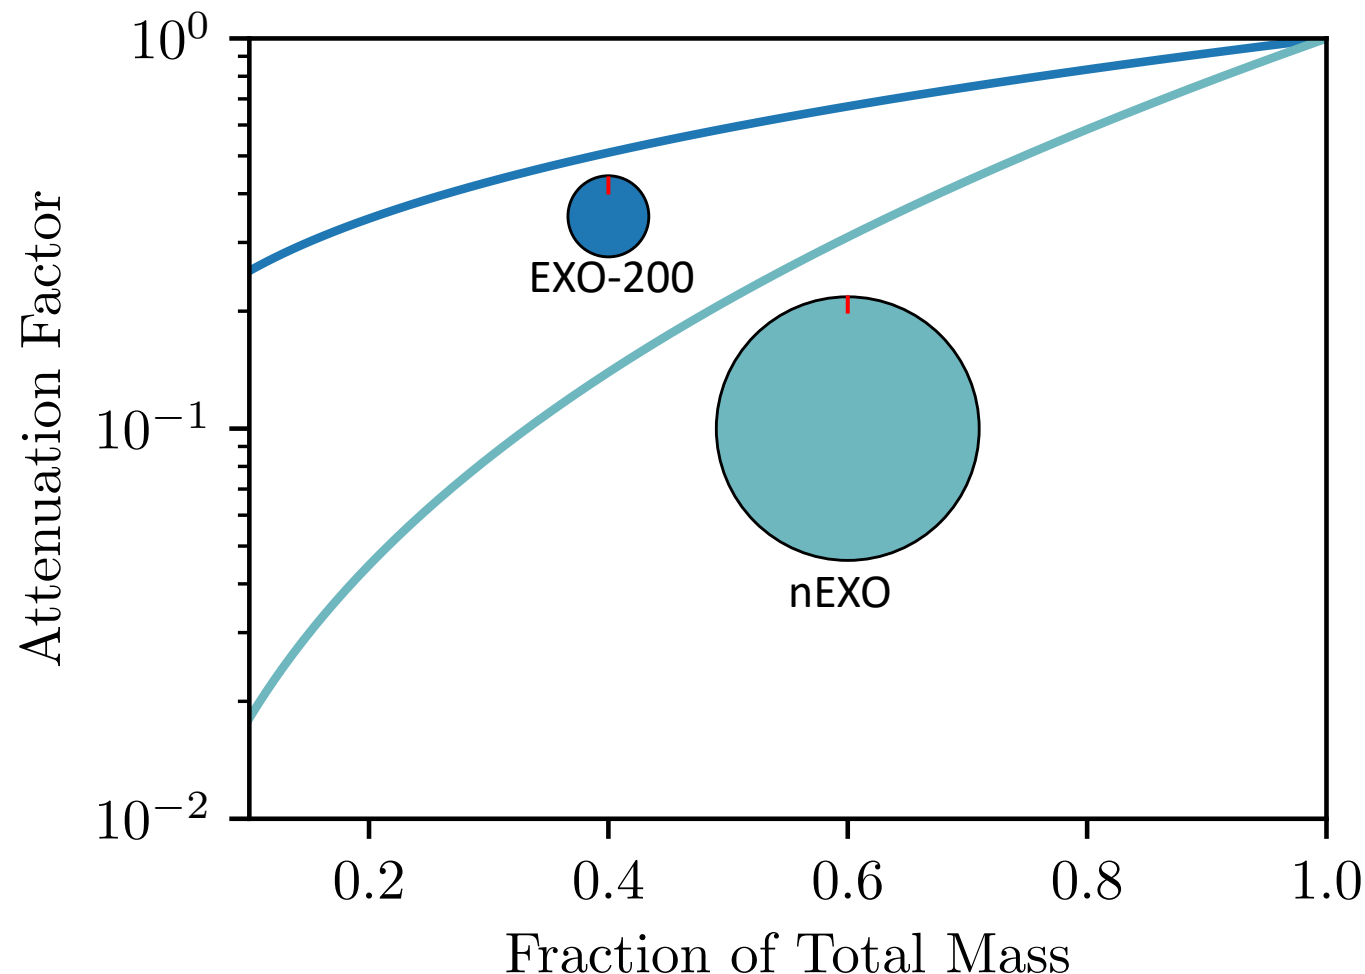

Benefits of Homogenous Detector

- All backgrounds come from surrounding materials and surfaces
→ extremely quiet inner region

LXe mass (kg)	Diameter or length (cm)
5000	130
150	40
5	13

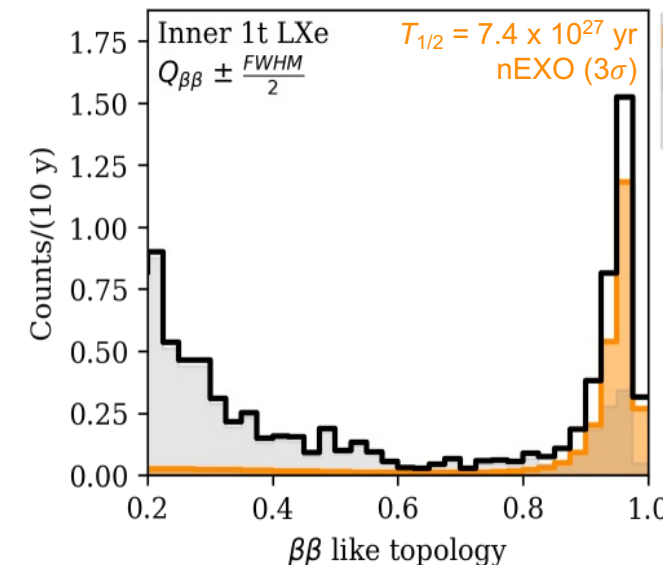

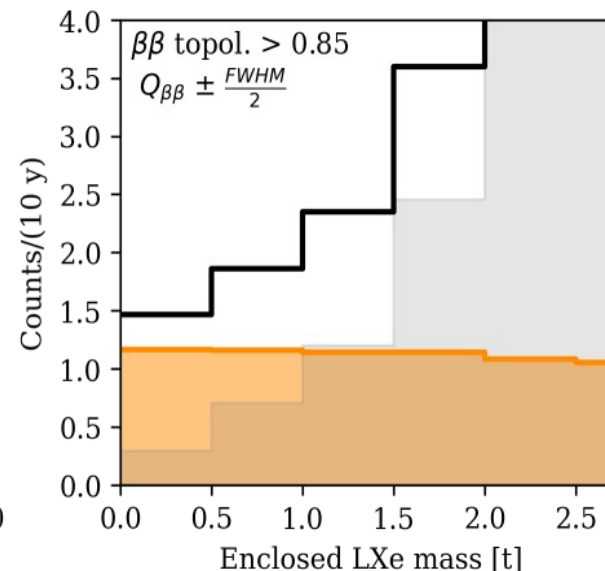

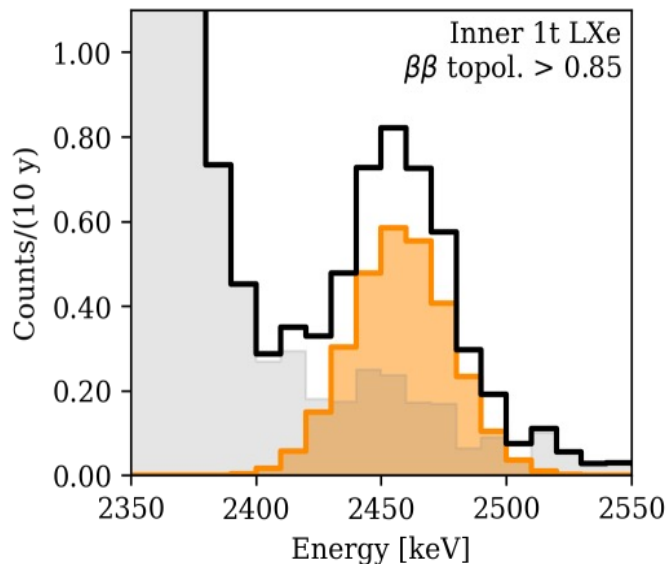

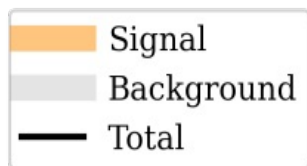

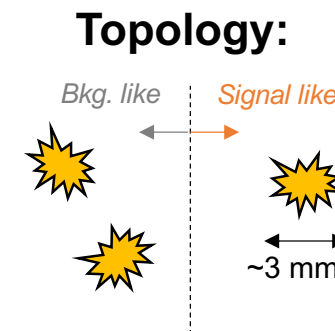

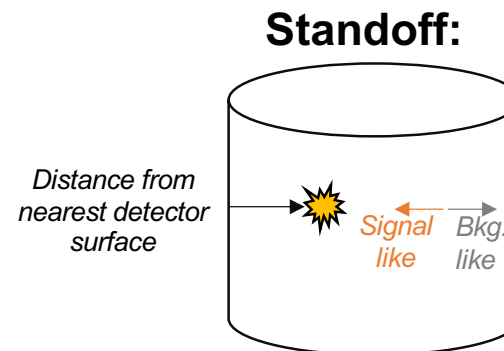

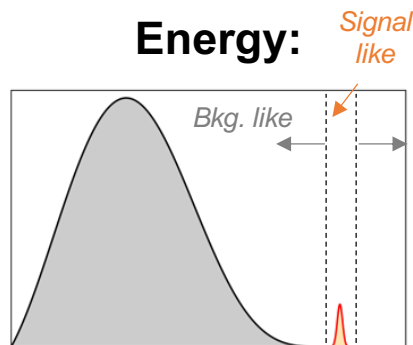

2.5 MeV γ attenuation length 8.7cm

- Liquid xenon is continuously purified
- Discovery self-confirmation thru use of non-enriched xenon
- Intrinsically scalable

nEXO Signal and Background

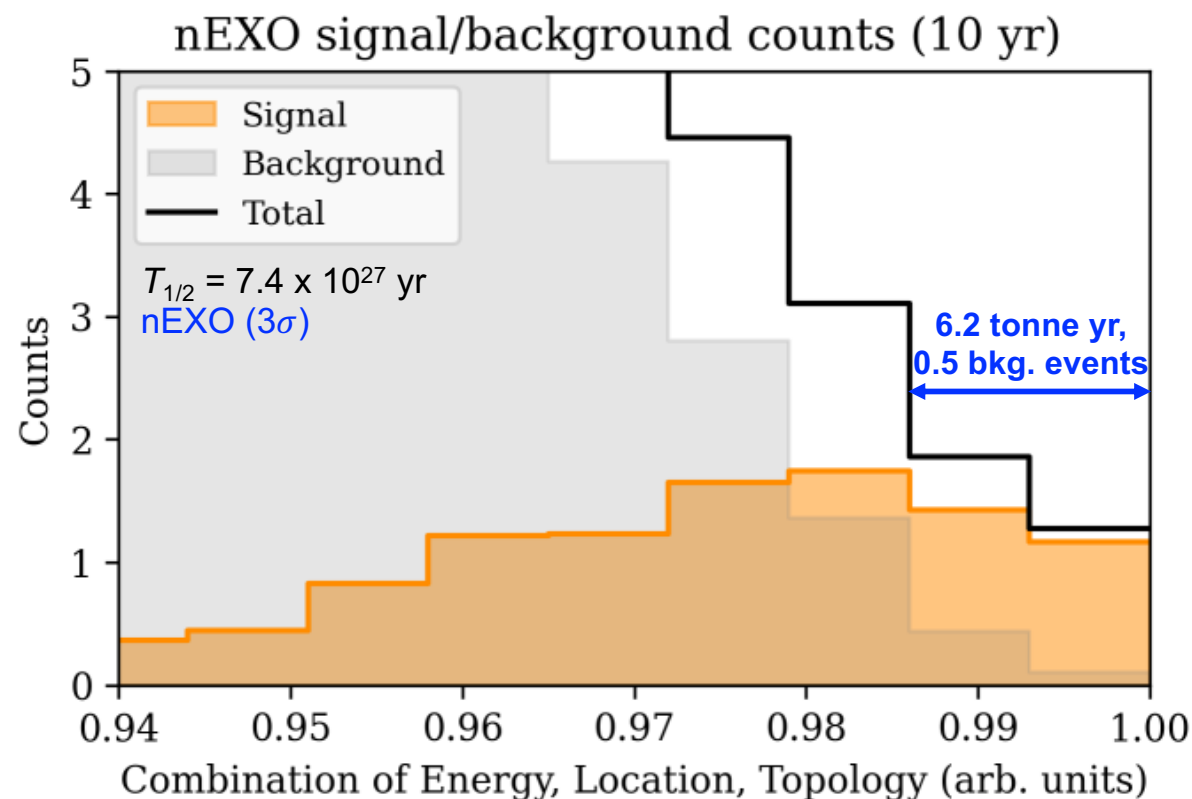

- nEXO measures multiple parameters for each event to be able to robustly identify a $0\nu\beta\beta$ signal
- As a fully homogeneous detector, it precisely measures backgrounds in situ
 - No internal materials (other than Xe), making nEXO uniquely robust against unknown backgrounds

C. Hardy: Optimizing Energy Reconstruction for nEXO

- Likelihood fit allows optimal weighting between signal and background combining energy, topology, and standoff over full 3D parameter space
 - Arranging the 3D bins into 1D, ordered by signal-to-background ratio, helps visualize the signal and background separation in nEXO

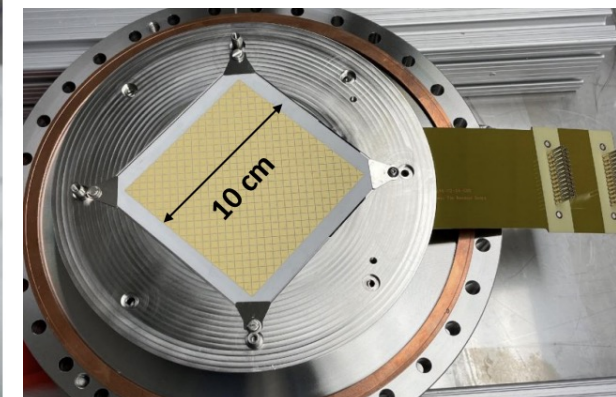

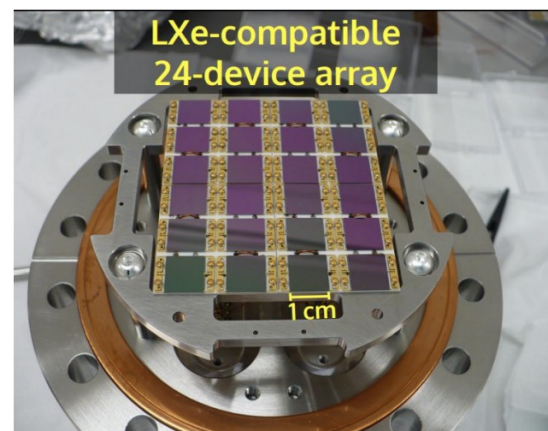

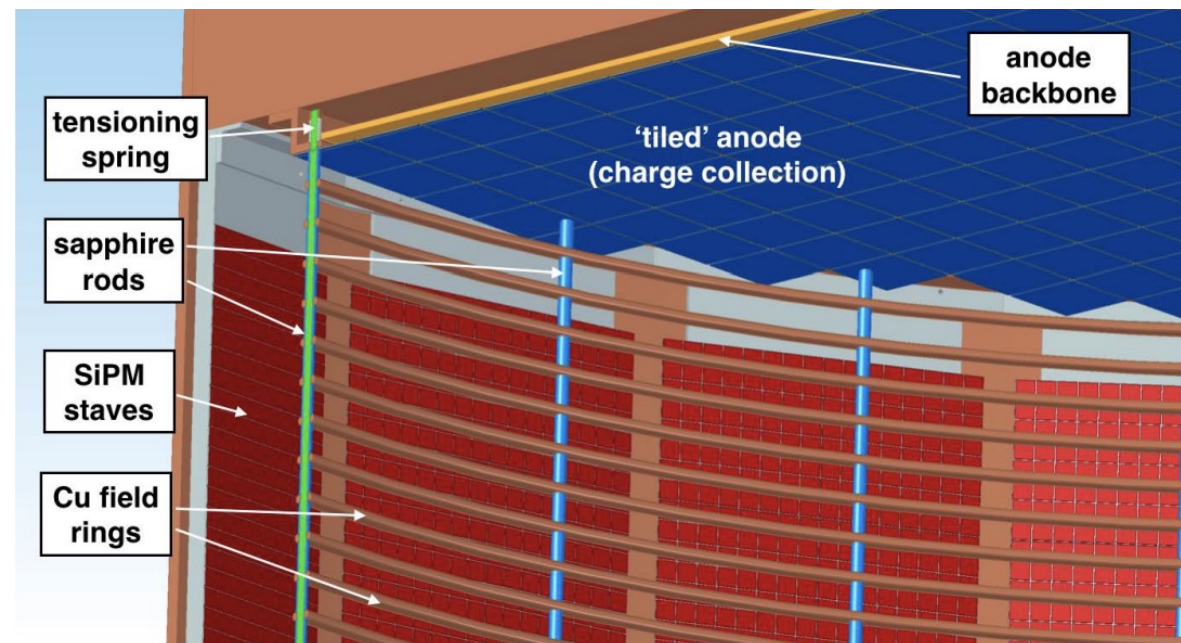

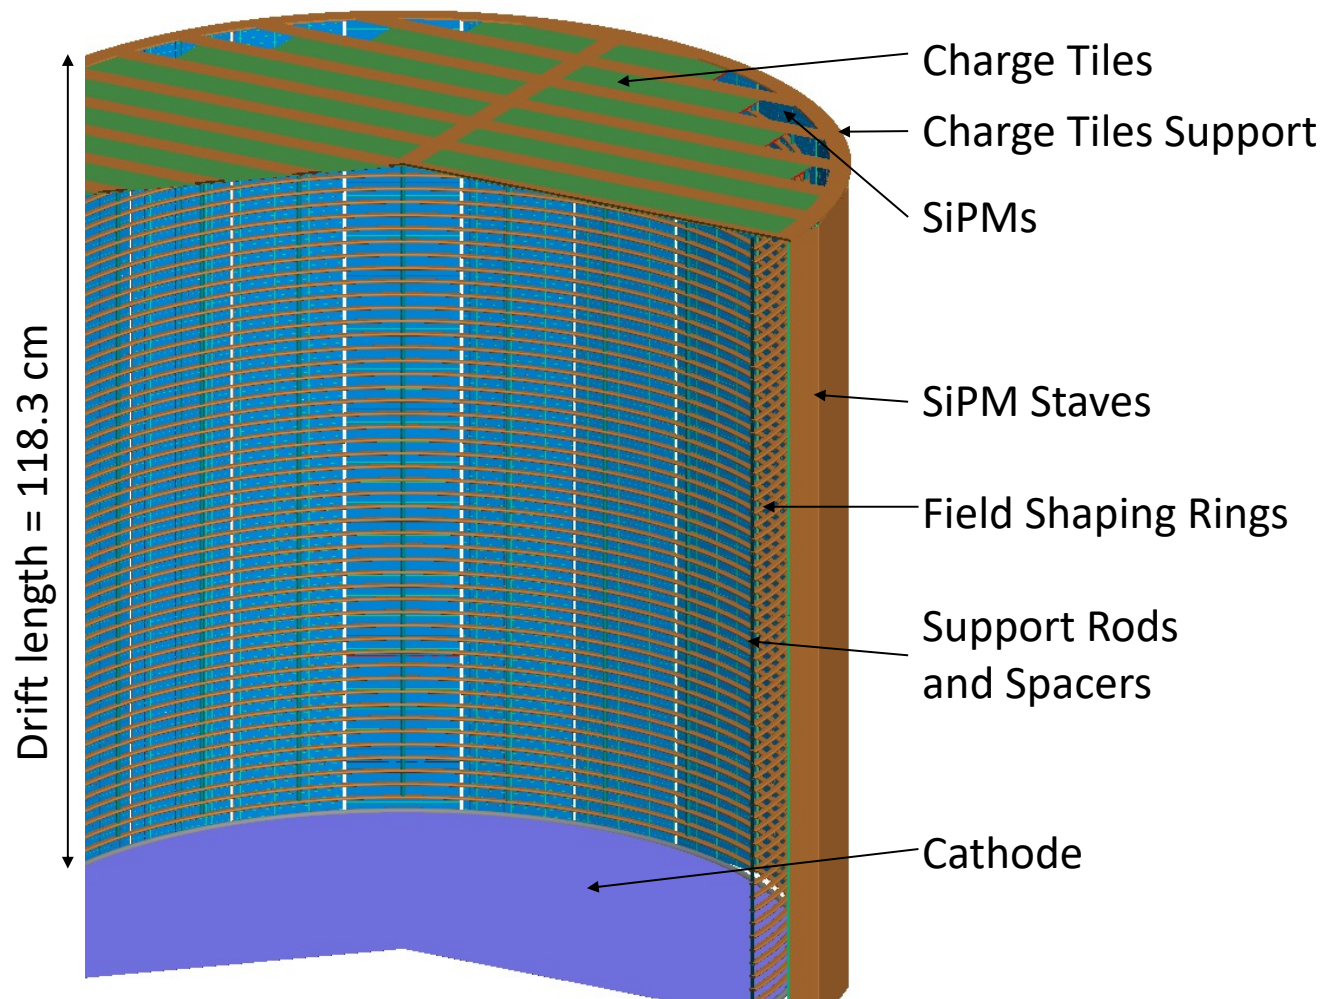

*nEXO is a background free
experiment in its full 3D
parameter space*

0 ← **Background-like**

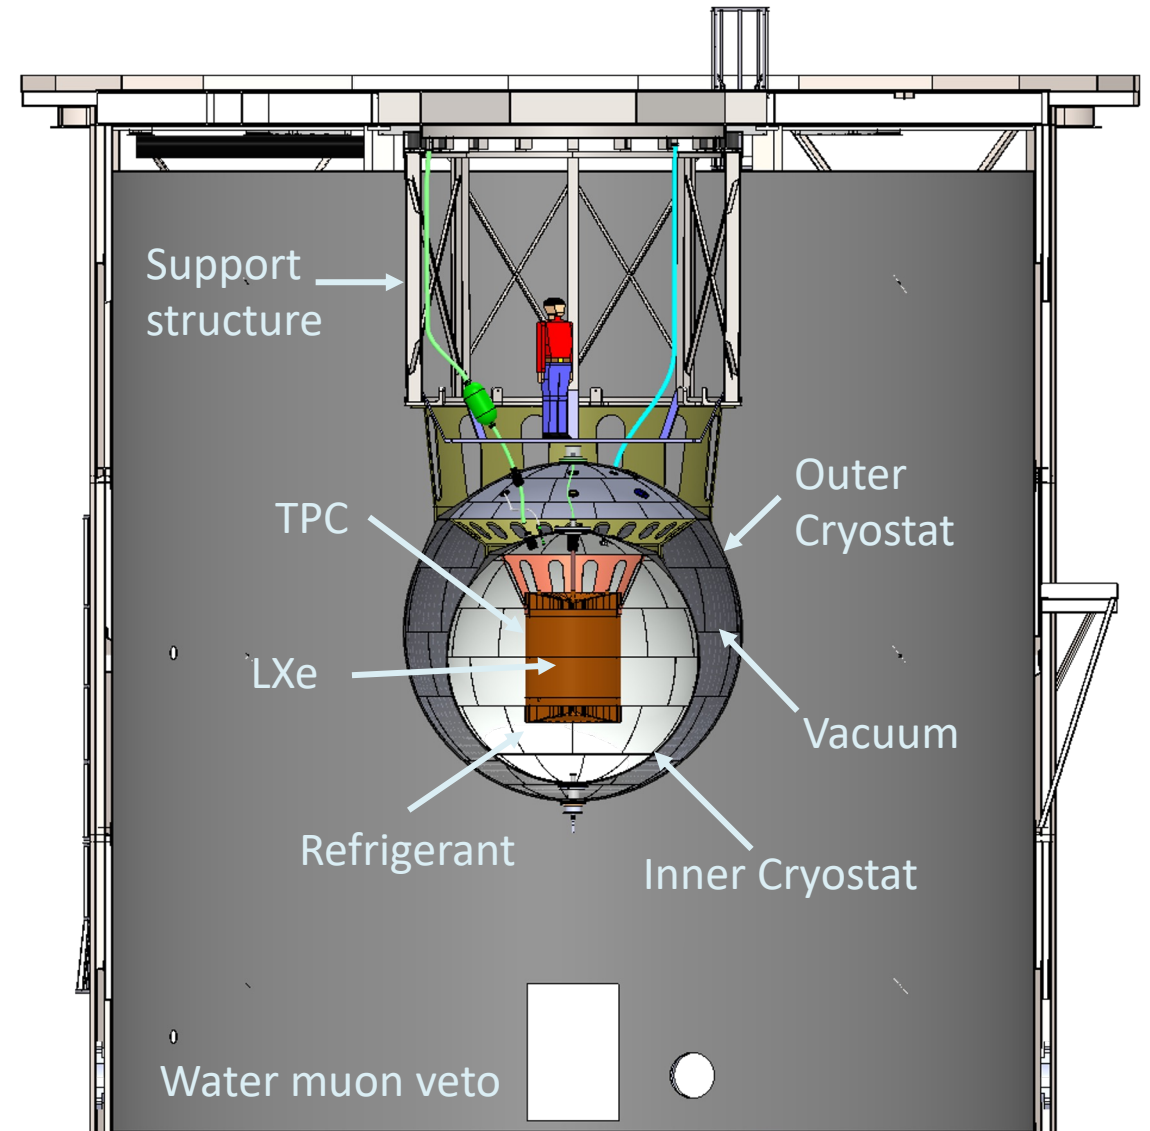

Signal-like → 1

Combine energy,
topology, and standoff
(preserving correlations)

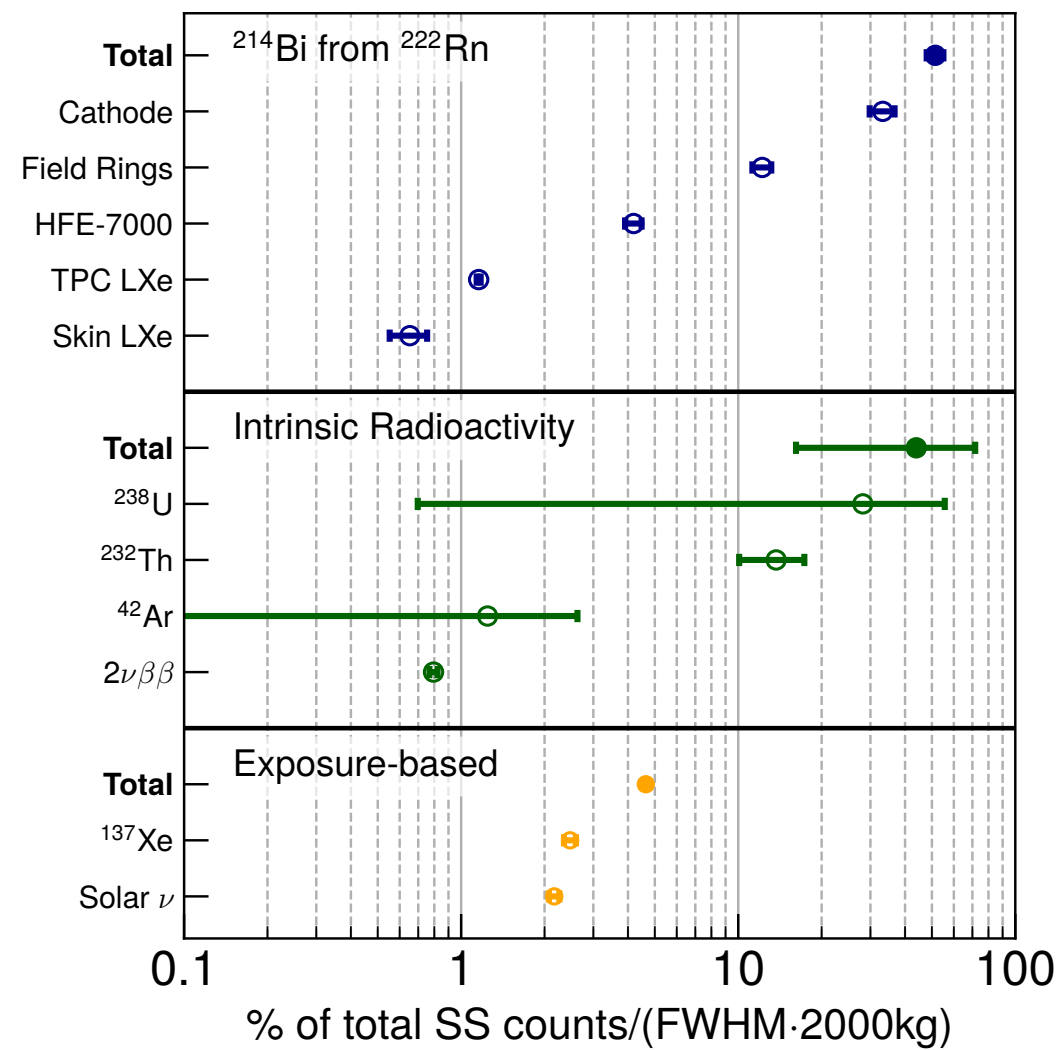

nEXO TPC Conceptual Design

- Depth: 6010 m.w.e.
- Layered shielding:
 - Water Cherenkov muon veto
 - Refrigerant (HFE)
- Advanced integration with SNOLAB facility

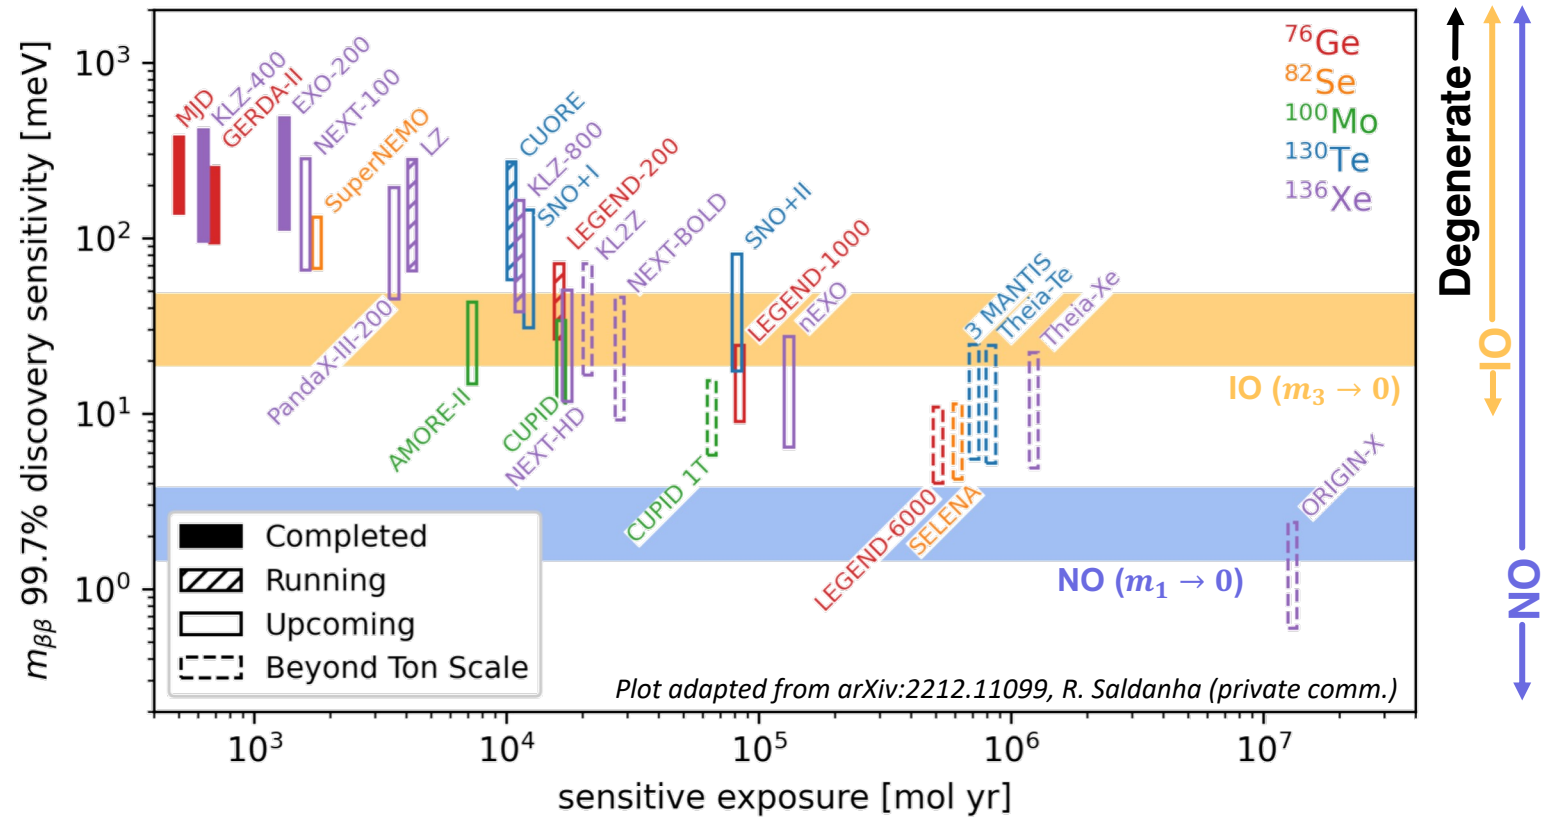

- > ~95% of the background comes from gamma emissions from/on materials outside of the TPC LXe
- Background estimate from detailed MC simulations based on materials with measured radioactivity
 - Approach validated by EXO-200 experience

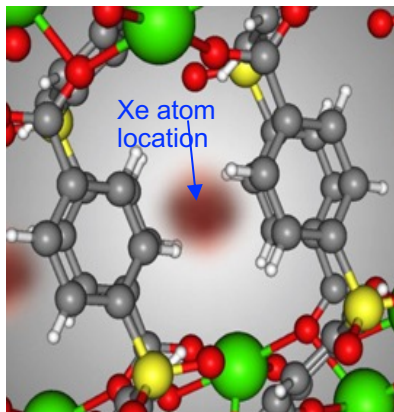

The Ultimate $0\nu\beta\beta$ Experiment: ORIGIN-X

- Xe TPC technology is inherently scalable
- Benefit of self-shielding
- **Observing Rare Interactions with a GigaTonne Xenon (ORIGIN-X) experiment: a ktonne Xe experiment for $0\nu\beta\beta$.**
A. Avasthi, et al, Phys. Rev. D 104, 112007 (2021)
- Xenon is present in the atmosphere at 87 ppb (~ 0.2 Gt total)
- Current production is a parasitic process in air liquefaction for steel industry
→ inelastic supply limited to 50-100 tons/year globally, subject to high volatility
 - Sufficient for nEXO
 - Limiting factor for much larger detectors

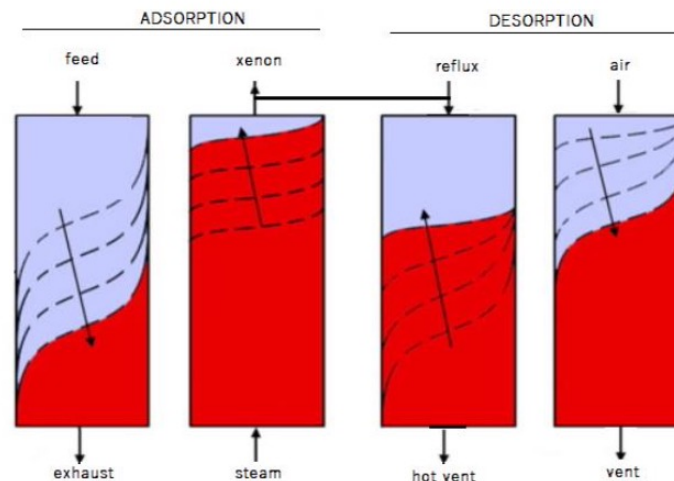

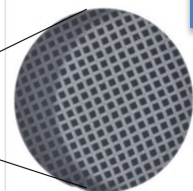

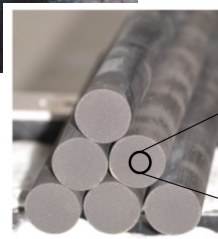

Not part of nEXO project

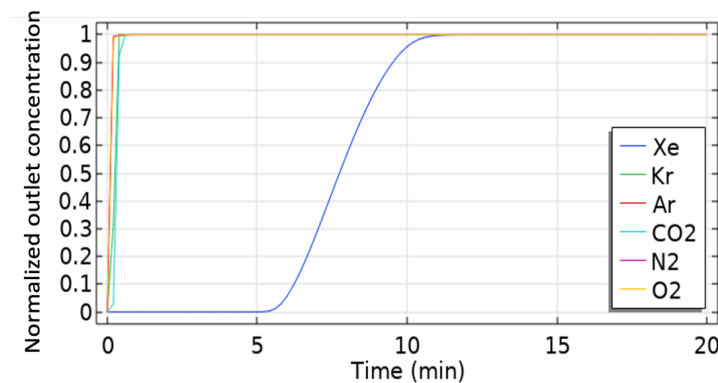

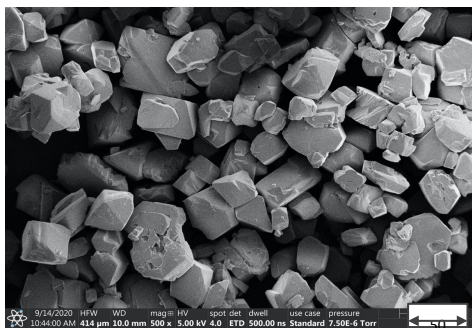

R&D at LLNL on Xenon Separation for Future kTonne Experiment

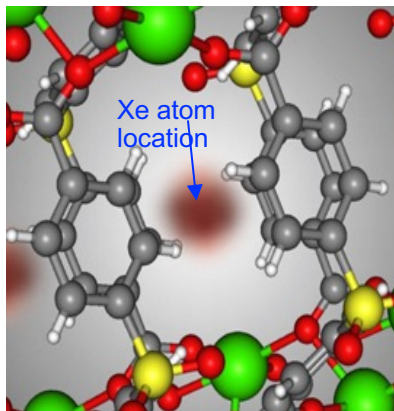

Highly-selective, stable
Xe-adsorbing material

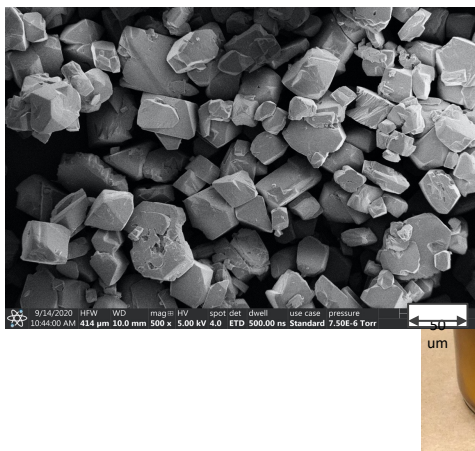

Rapid Intensified TSA Cycle

R&D at LLNL on Xenon Separation for Future kTonne Experiment

Workshop on Xenon Detector $0\nu\beta\beta$ Searches: Steps Towards the Kilotonne Scale

October 25-27 2023

SLAC National Accelerator Laboratory

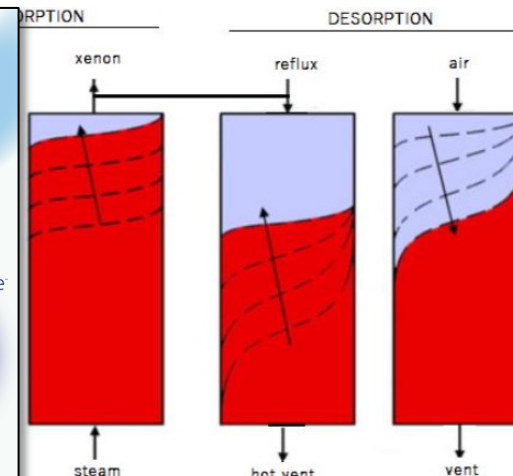

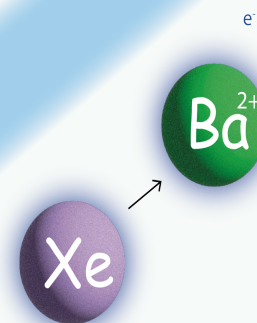

Contacts: krishan.mistry@uta.edu, rogersl@anl.gov

<https://indico.slac.stanford.edu/event/8015>

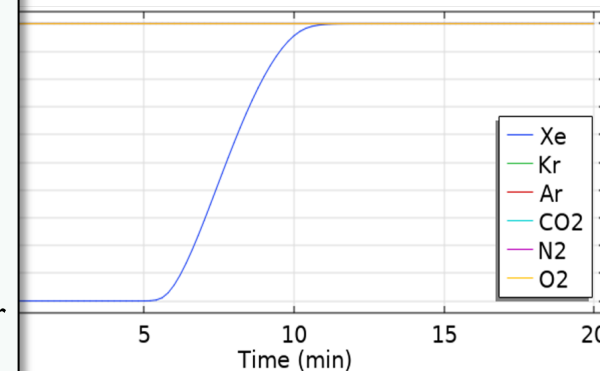

Workshop Topics

- Challenges towards a program reaching the kTonne scale
- Future light and charge readout
- Novel TPCs: additives, new concepts and more!
- Daughter tagging and ion transport
- Physics program of a kTonne detector

Intensified TSA Cycle

Conclusions

- nEXO project officially started, preparations for DOE's CD-1 (conceptual design) review ongoing
- nEXO sensitivity arises from:
 - Homogenous/monolithic detector
 - Multiparametric analysis
 - Extensive radioassay campaign and material selection
- Beyond nEXO, the ultimate $0\nu\beta\beta$ experiment may be feasible:
 - Leveraging Xe TPC scalability
 - R&D ongoing to address Xe acquisition challenges

A worldwide effort of 9 countries, 33 institutions, ~200 collaborators

nEXO Signal and Background

- “Background free” region corresponds to a “simple” region in 3D (although correlations prevent any set of rectangular projections from fully capturing the signal/background separation)

Combination of Energy, Location, Topology (arb. units)
