CMB and Lyman-alpha constraints on dark matter decays to photons

Monday 28 August 2023 15:00 (15 minutes)

Dark matter energy injection in the early universe modifies both the ionization history and the temperature of the intergalactic medium.

In this work, we improve the CMB bounds on sub-keV dark matter and extend previous bounds from Lyman- α observations to the same mass range, resulting in new and competitive constraints on axion-like particles (ALPs) decaying into two photons.

The limits depend on the underlying reionization history, here accounted self-consistently by our modified version of the publicly available DarkHistory and CLASS codes. Future measurements such as the ones from the CMB-S4 experiment

may play a crucial, leading role in the search for this type of light dark matter candidates.
