## **Baikal-GVD neutrino telescope: recent status**

*Thursday, August 31, 2023 2:45 PM (15 minutes)*

Baikal-GVD is recently the largest neutrino telescope operating in Northern Hemisphere. The detector consists of independent operational subarrays called clusters. The data collection is allowed by the design of the experiment while being in a construction phase. This contribution reviews the design and the basic characteristics of the Baikal-GVD. Some preliminary results on diffuse neutrino flux measurements with the partially completed detector will be presented.
