

DIS2023: XXX International Workshop on Deep-Inelastic Scattering and Related Subjects

Contribution ID: 130

Type: **Parallel talk**

A detector for top energy DIS

Tuesday 28 March 2023 11:20 (10 minutes)

The Large Hadron-electron Collider and the Future Circular Collider in electron-hadron mode [1] will make possible the study of DIS in the TeV regime providing electron-proton (nucleus) collisions with per nucleon instantaneous luminosities around 10^{34} (10^{33}) $\text{cm}^{-2}\text{s}^{-1}$. Here we describe the current detector design for such experiments [1,2] and the key developments needed, included in the 2021 ECFA detector research and development roadmap [3], particularly concerning machine-detector interface and large acceptance tracking and calorimetry, and the technological choices to be taken in order to fulfil the demands of their physics programmes.
