Broadband imaging of CxR bunch length monitor

- Types of CxR under investigation
 - CTR – Coherent Transition Radiation
 - CSR – Coherent Synchrotron Radiation
- Experimental work at MAX IV
- Machine learning
- Simulation work

Broadband imaging of CxR bunch length monitor

$$\frac{dI_{bunch}^i}{dr} \approx N_e^2 \int_{\Delta\omega} \frac{d^2 I_e^i}{d\omega dr} |F_z(\rho(z), \omega)|^2 d\omega$$

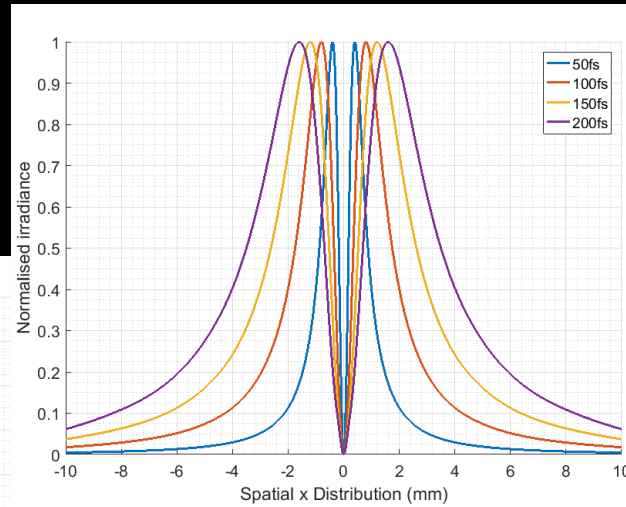

Bunch Image

No. of e⁻

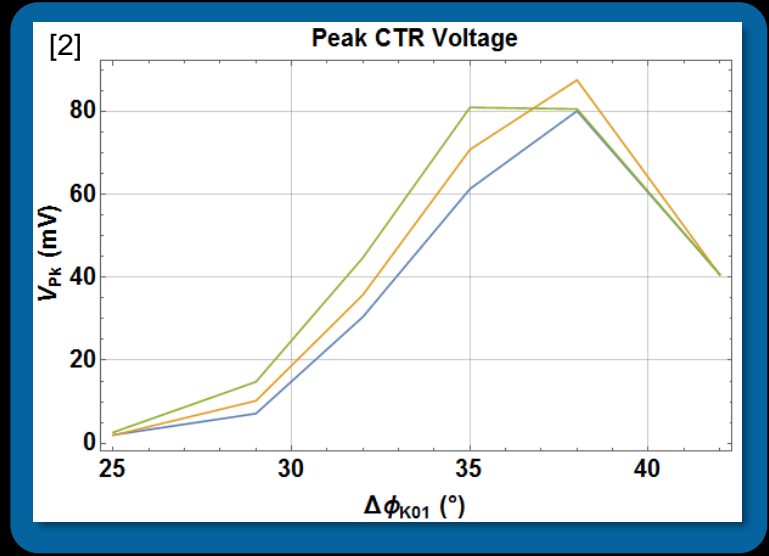

Bandwidth

Single e⁻ Spectral Image

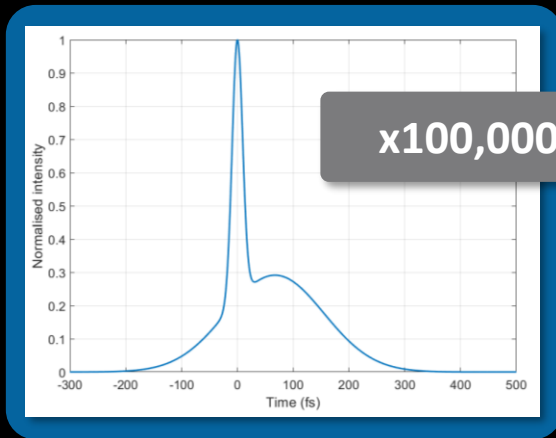

Bunch Form Factor

Broadband imaging of CxR bunch length monitor

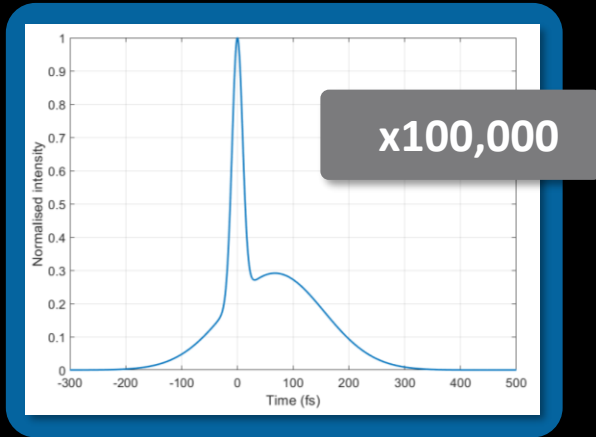

Broadband imaging of CxR bunch length monitor

- Machine Learning simulations
- Generated 100,000 double Gaussians with varying amplitudes, offsets, and widths
- Simulated CTR image for each
- Verified physics by fixing certain parameters and checking model outputs, ensuring phase couldn't be predicted

Broadband imaging of CxR bunch length monitor

6.7% RMSE

1.0% RMSE

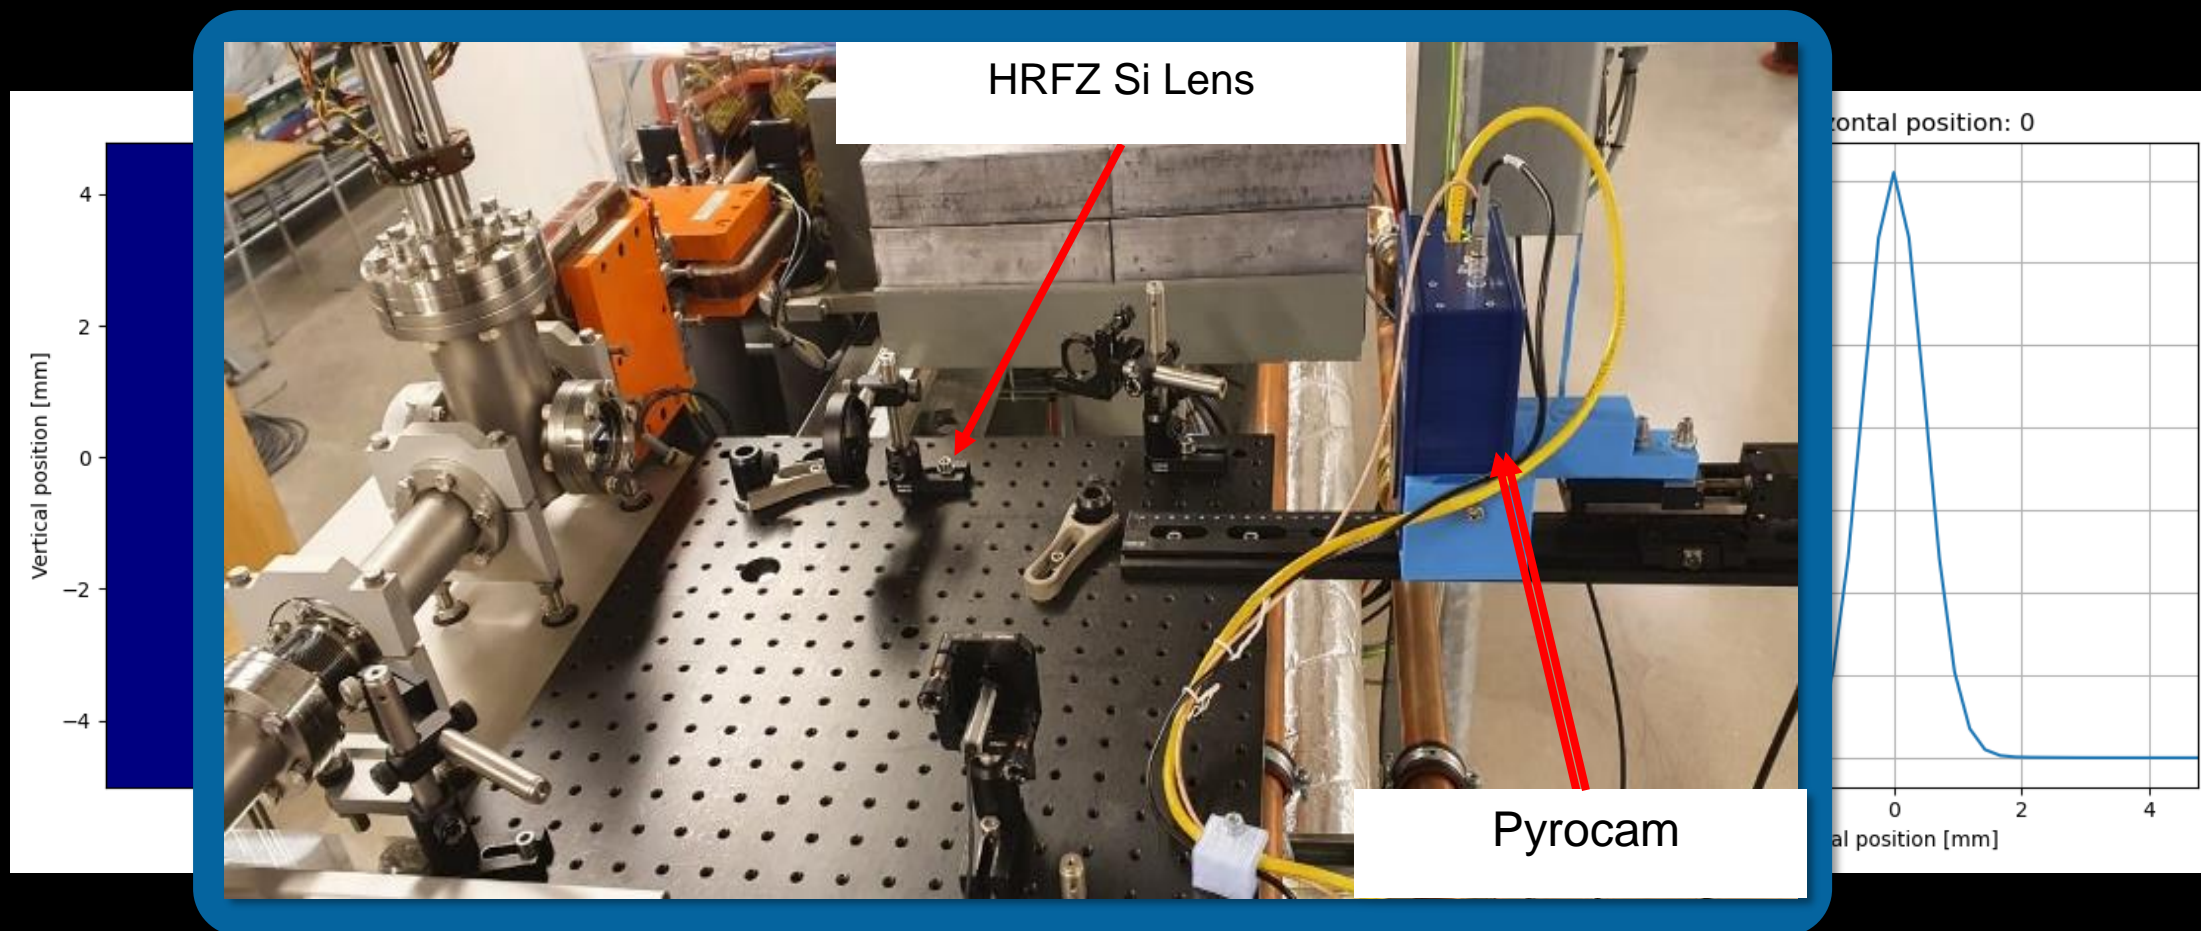

6.2% RMSE

17.2% RMSE

Broadband imaging of CxR bunch length monitor

EuPRAXIA-DN Project

- CxR bunch length monitor
 - CTR imaging set up currently in place in MAX IV and operational as a compression monitor
 - ML analysis of simulated CTR images model capable of predicting bunch profiles at high level of accuracy (no phase), and will be tested on experimental data in the near future
 - SR simulations of CSR version of monitor are underway

This is the existing PhD project of Catherine Swain. This will be the basis for the project in EuPRAXIA-DN.

Target: high resolution plus integration with wider diagnostics!

Virtual Diagnostics

- Potential applications:
1. User facilities
 2. Medical accelerators
 3. High power machines

Project Overview

Fellow	Host institution	PhD enrolment	Start date	Duration [months]	Deliverables
DC4	ULIV	ULIV	9	36	D10, D11
Project Title and WP(s) to which it is related: Ultra-short Bunch Length Measurements with fs Resolution (WP3)					
Objectives: Investigate non-invasive single-shot method of measuring detailed longitudinal profile information with DBEAM. Study optimum accelerator integration (M5, m27) so the monitor can operate online and non-invasively. Integrate machine learning techniques and combine with existing diagnostics to develop “virtual diagnostics” for EuPRAXIA.					
Expected Results: Monitor prototype with demonstrated fs resolution (D10, PDE, m33), virtual diagnostics concept demonstrated and published (D11, PDE m45).					
Secondment(s): DBEAM ₁₂ (monitor development and optimization, various), INFN ₄ (test with beam, m30).
