**Markus Diefenthaler**

**Jefferson Lab**

# Nuclear Physics

## Further exploration of the Standard Model

Dark matter searches

Electroweak symmetry breaking

Deeper understanding of QCD

### Mission of Nuclear Physics

- Discover, explore, and understand all forms of nuclear matter.

## Frontiers in Nuclear Physics

- One of the enduring mysteries of the universe is the nature of matter—what are its basic constituents and how do they interact to form the properties we observe? The largest contribution by far to the mass of the matter we are familiar with comes from protons and heavier nuclei.
- Although the fundamental particles that compose nuclear matter—quarks and gluons—are themselves relatively well understood, exactly how they interact and combine to form the different types of matter observed in the universe today and during its evolution remains largely unknown. .

# Nobel Prizes in Physics related to Nuclear Physics

**Hideki Yukawa (1949)** “for his prediction of the existence of mesons on the basis of theoretical work on nuclear forces”

**But the quark-gluon origin of the nuclear binding force remains unknown.**

**Robert Hofstadter (1961)** “for his pioneering studies of electron scattering in atomic nuclei and for his thereby achieved discoveries concerning the structure of the nucleons”

**But the 3D quark-gluon structure of nucleons remains unknown.**

**Jerome Friedman, Henry Kendall, Richard Taylor (1990)** “for their pioneering investigations concerning deep inelastic scattering of electrons on protons and bound neutrons, which have been of essential importance for the development of the quark model in particle physics”

**But the role of gluons in protons and bound neutrons remains unknown.**

**David Gross, David Politzer, Frank Wilczek (2004)** “for the discovery of asymptotic freedom in the theory of the strong interaction”

**But the confinement aspect of the theory remains unknown.**

**Yoichiro Nambu (2008)** “for the discovery of the mechanism of spontaneous broken symmetry in subatomic physics ”

**But how dynamical chiral symmetry breaking shapes the mass and structure of quark-gluon systems remains unknown.**

# The dynamical nature of nuclear matter

**Nuclear Matter** Interactions and structures are inextricably mixed up

**Ultimate goal** Understand how matter at its most fundamental level is made

**Observed properties** such as mass and spin emerge out of the complex system

**To reach goal** precisely image quarks and gluons and their interactions

# Advances in Nuclear Physics

## Theory of the strong interaction

$$\begin{aligned} \frac{d\sigma}{dQ^2 dy d\vec{q}_T^2} = & \frac{4\pi^2\alpha^2}{9Q^2 s} \sum_{j,j_A,j_B} e_j^2 \int \frac{d^2\vec{b}_T}{(2\pi)^2} e^{iq_T \cdot \vec{b}_T} \\ & \times \int_{x_A}^1 \frac{d\xi_A}{\xi_A} f_{j_A/A}(\xi_A; \mu_{b_*}) \tilde{C}_{j/j_A}^{\text{CSS1, DY}}\left(\frac{x_A}{\xi_A}, b_*, \mu_{b_*}^2, \mu_{b_*}, C_2, a_s(\mu_{b_*})\right) \\ & \times \int_{x_B}^1 \frac{d\xi_B}{\xi_B} f_{j_B/B}(\xi_B; \mu_{b_*}) \tilde{C}_{j/j_B}^{\text{CSS1, DY}}\left(\frac{x_B}{\xi_B}, b_*, \mu_{b_*}^2, \mu_{b_*}, C_2, a_s(\mu_{b_*})\right) \\ & \times \exp\left\{-\int_{\mu_{b_*}^2}^{\mu_Q^2} \frac{d\mu'^2}{\mu'^2} \left[A_{\text{CSS1}}(a_s(\mu'); C_1) \ln\left(\frac{\mu_Q^2}{\mu'^2}\right) + B_{\text{CSS1, DY}}(a_s(\mu'); C_1, C_2)\right]\right\} \\ & \times \exp\left[-g_{j_A}^{\text{CSS1}}(x_A, b_T; b_{\text{max}}) - g_{j_B}^{\text{CSS1}}(x_B, b_T; b_{\text{max}}) - g_K^{\text{CSS1}}(b_T; b_{\text{max}}) \ln(Q^2/Q_0^2)\right] \\ & + \text{suppressed corrections.} \end{aligned}$$

# The Electron-Ion Collider: Frontier accelerator facility in the U.S.

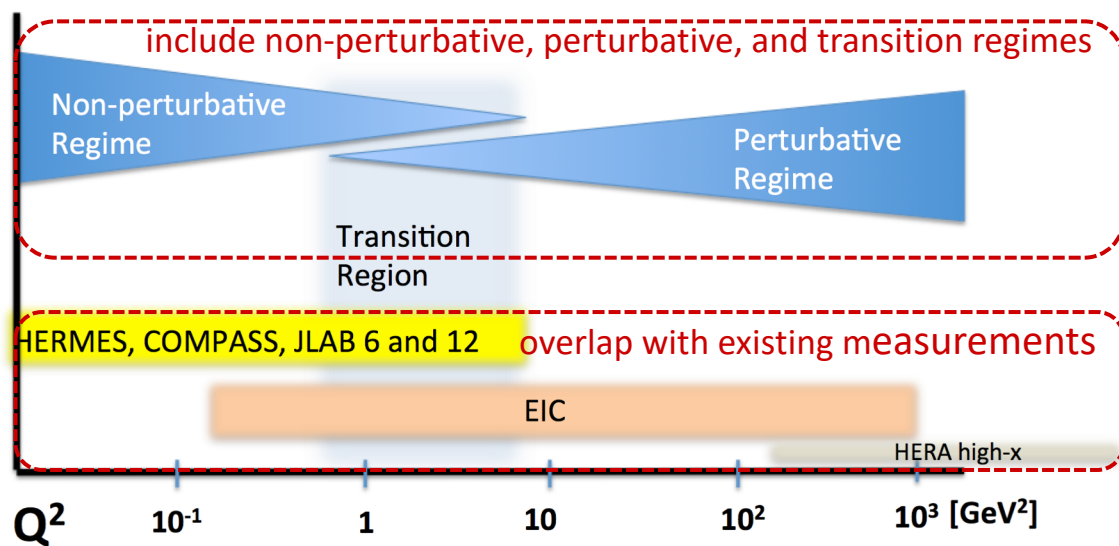

Department of Energy

## U.S. Department of Energy Selects Brookhaven National Laboratory to Host Major New Nuclear Physics Facility

JANUARY 9, 2020

**Brookhaven National Laboratory and Jefferson Lab will be host laboratories for the EIC Experimental Program. Leadership roles in the EIC project are shared.**

# EIC: Ideal facility for studying QCD

## Various beam energy

broad  $Q^2$  range for

- studying evolution to  $Q^2$  of  $\sim 1000 \text{ GeV}^2$
- disentangling non-perturbative and perturbative regimes
- overlap with existing experiments

## High luminosity

high precision

- for various measurements, e.g., multi-dimensional SIDIS analysis in five or more kinematic dimensions and multiple particles
- in various configurations

# EIC: Ideal facility for studying QCD

## Polarization

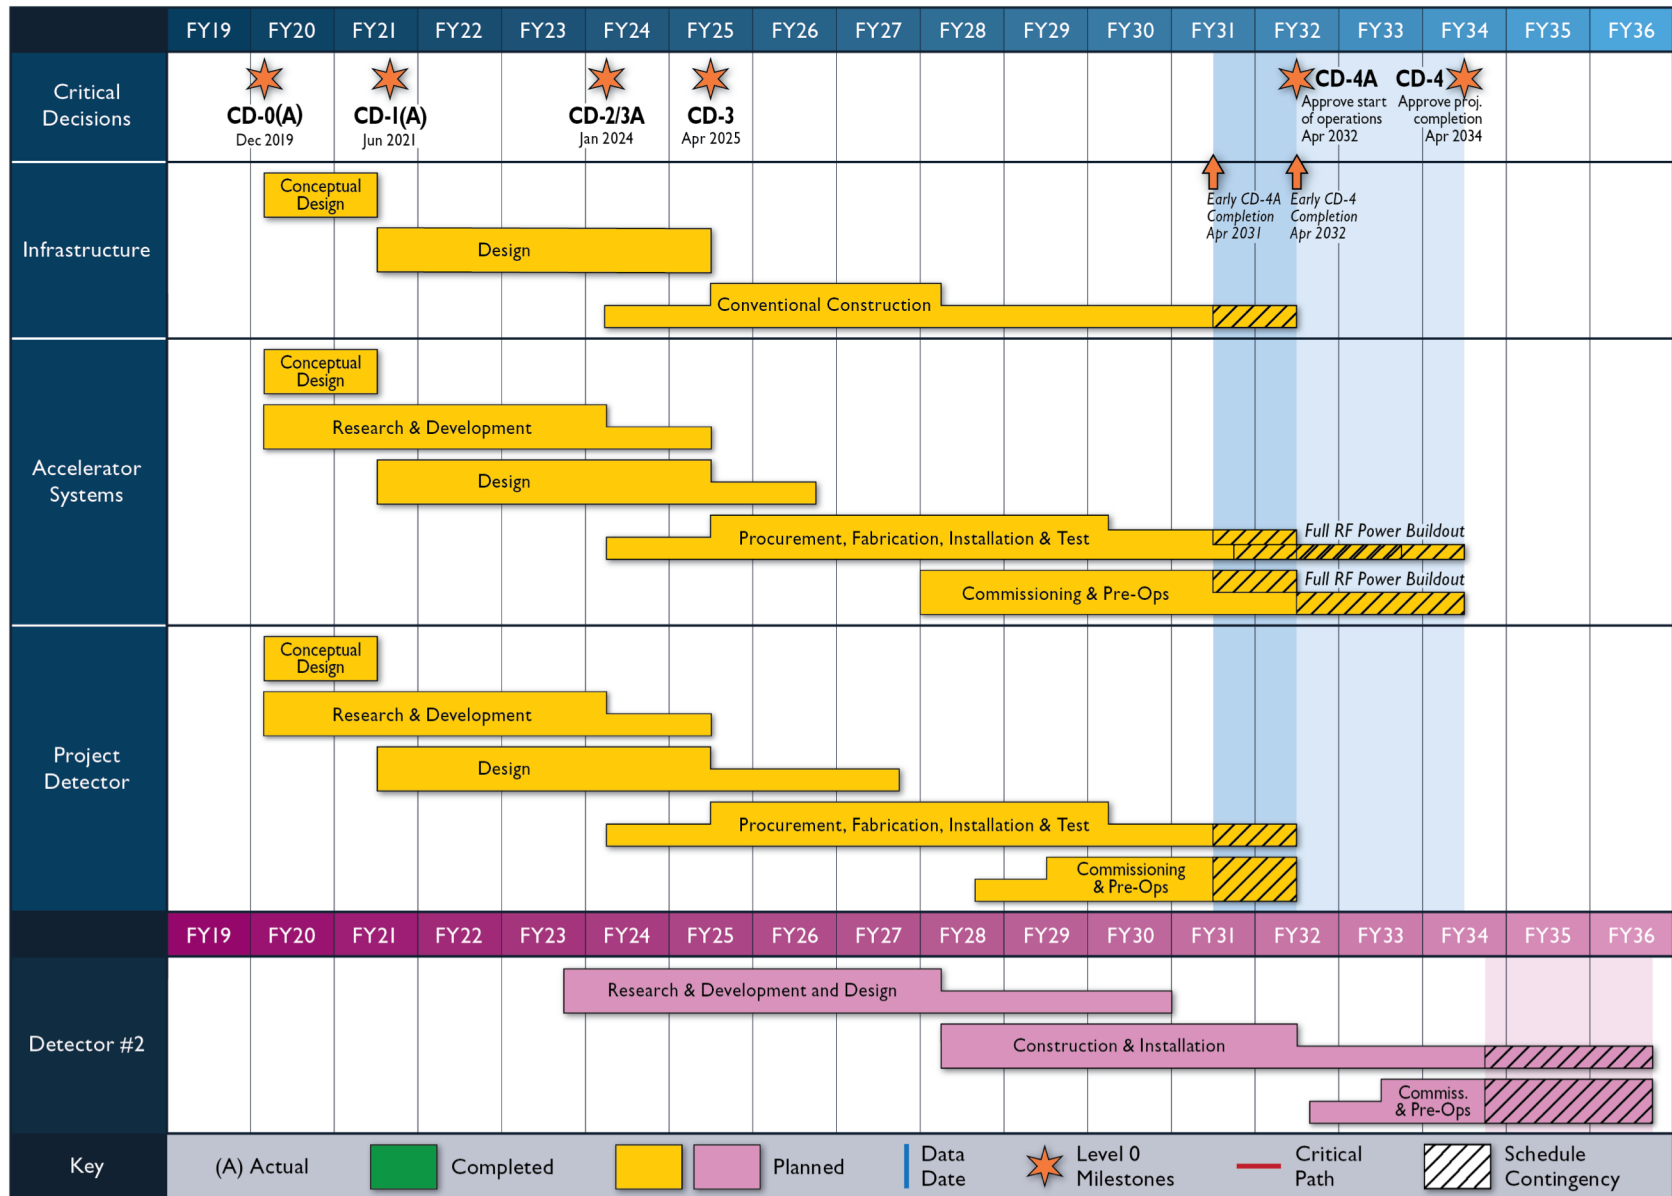

Understanding hadron structure cannot be done without understanding spin:

- polarized **electrons** and
- polarized **protons/light ions (d,  $^3\text{He}$ )** including tensor polarization for d

## Longitudinal and transverse and polarization of light ions (d, $^3\text{He}$ )

- 3D imaging in space and momentum
- spin-orbit correlations

## EIC Timeline: Operations start a decade from now

## EIC User Group (EICUG)

# Yellow Report Initiative by the EIC User Group

- The **EIC Yellow Report** describes the physics case, the resulting detector requirements, and the evolving detector concepts for the experimental program at the EIC: [arXiv:2103.05419](https://arxiv.org/abs/2103.05419)
- The studies leading to the EIC Yellow Report were commissioned and organized by the **EIC User Group**.
- The EIC Yellow Report has been important input to the successful DOE CD-1 review and decision.

## Next Priorities for the EIC User Group

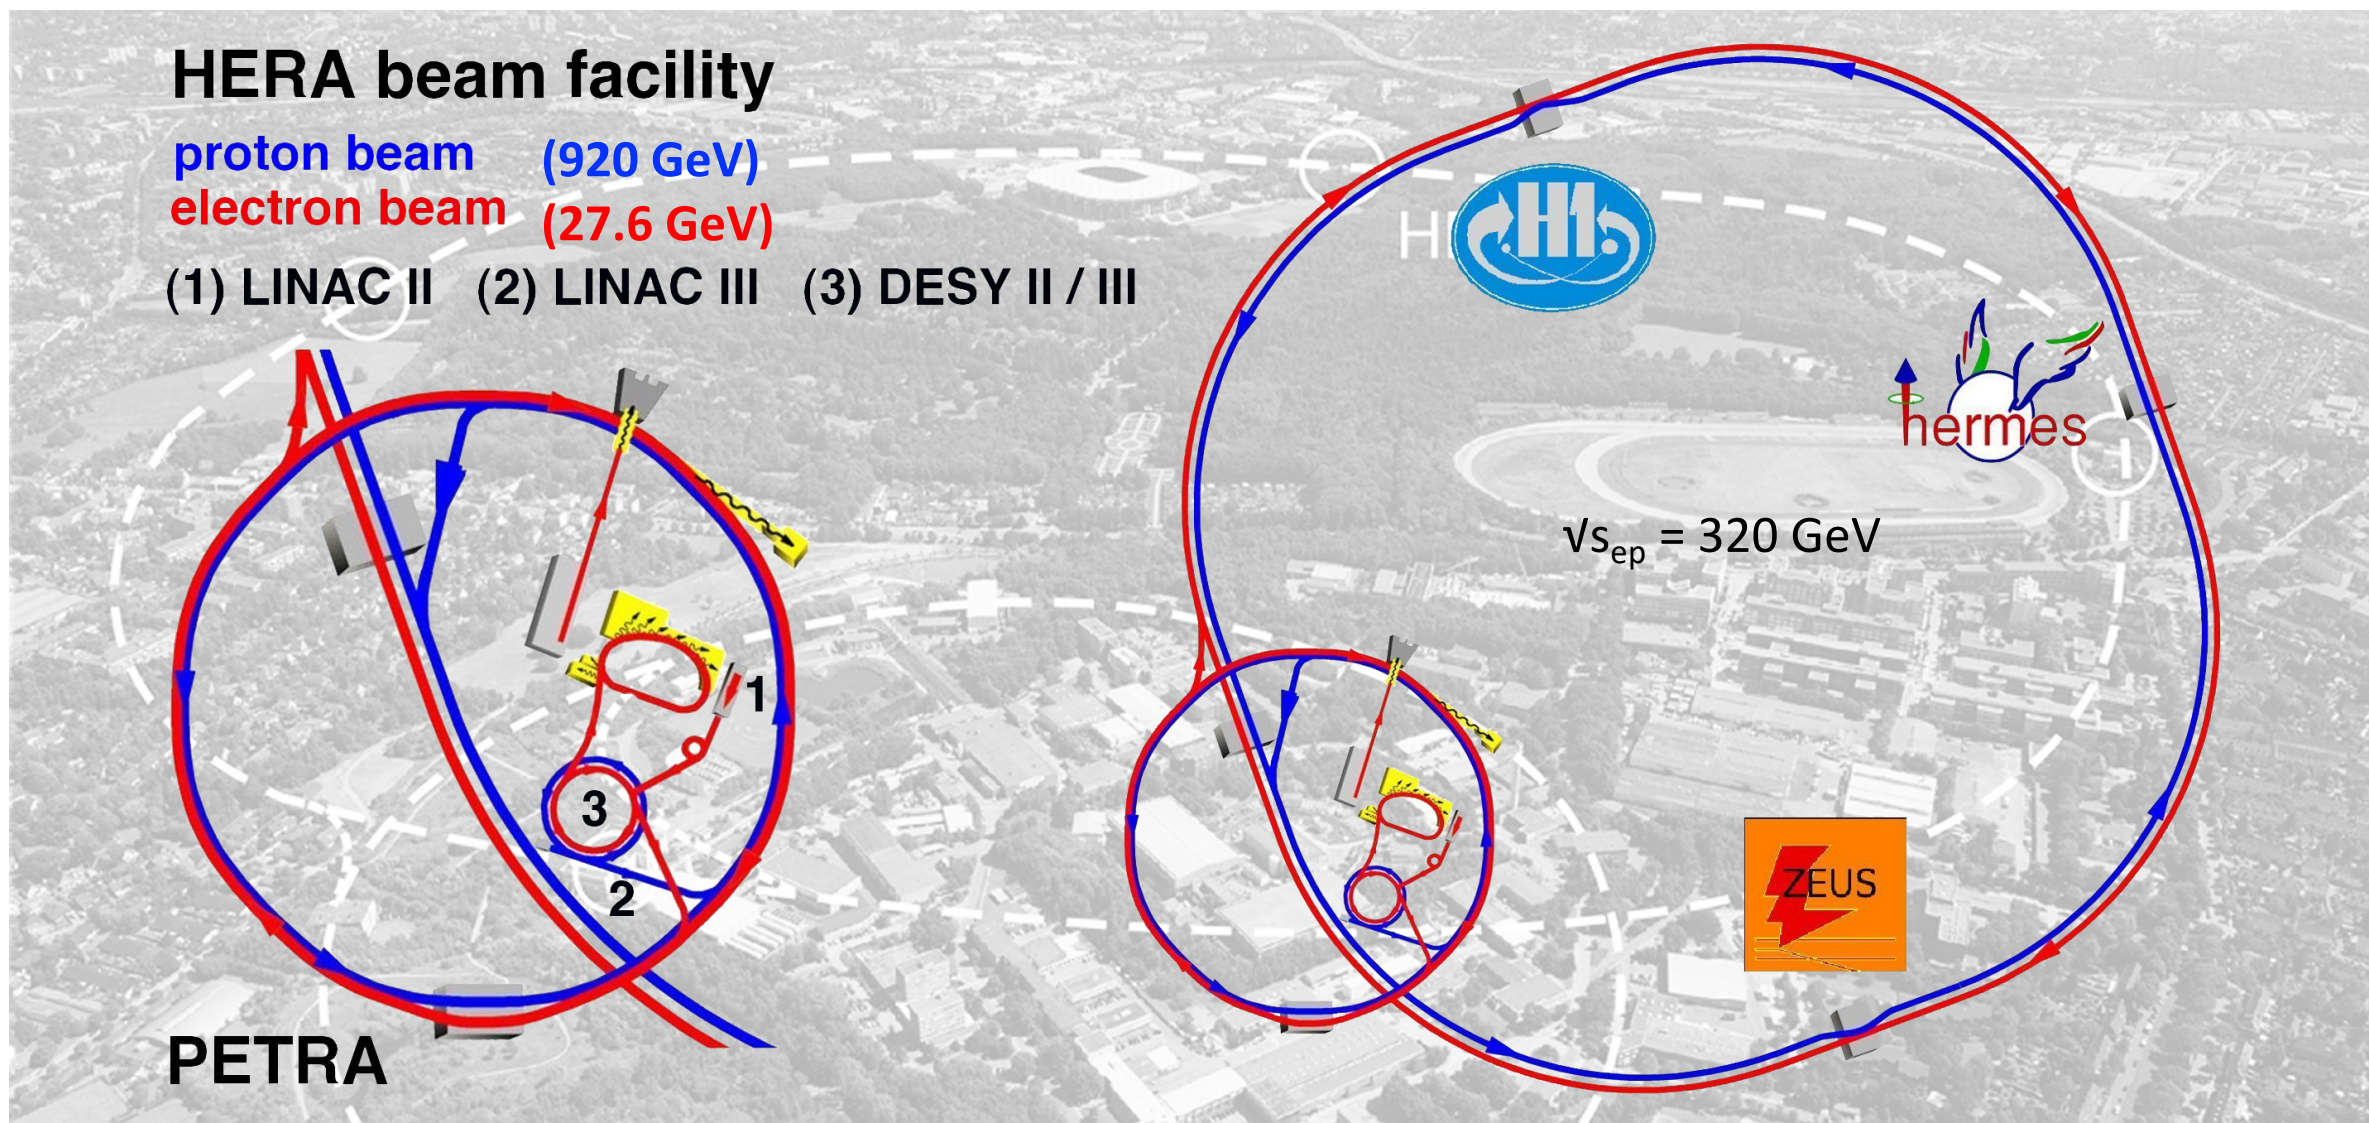

- Formation of the first EIC collaboration: **ePIC**.

# **Physics Event Generation**

## **Monte Carlo Event Generators for the EIC**

# Event Generators for the EIC

## Monte Carlo Simulation of

- electron-proton (ep) collisions,
- electron-ion (eA) collisions, both light and heavy ions,
- including higher order QED and QCD effects,
- including a plethora of spin-dependent effects.

**Common challenges**, e.g. with HL-LHC: **High-precision QCD measurements require high-precision simulations.**

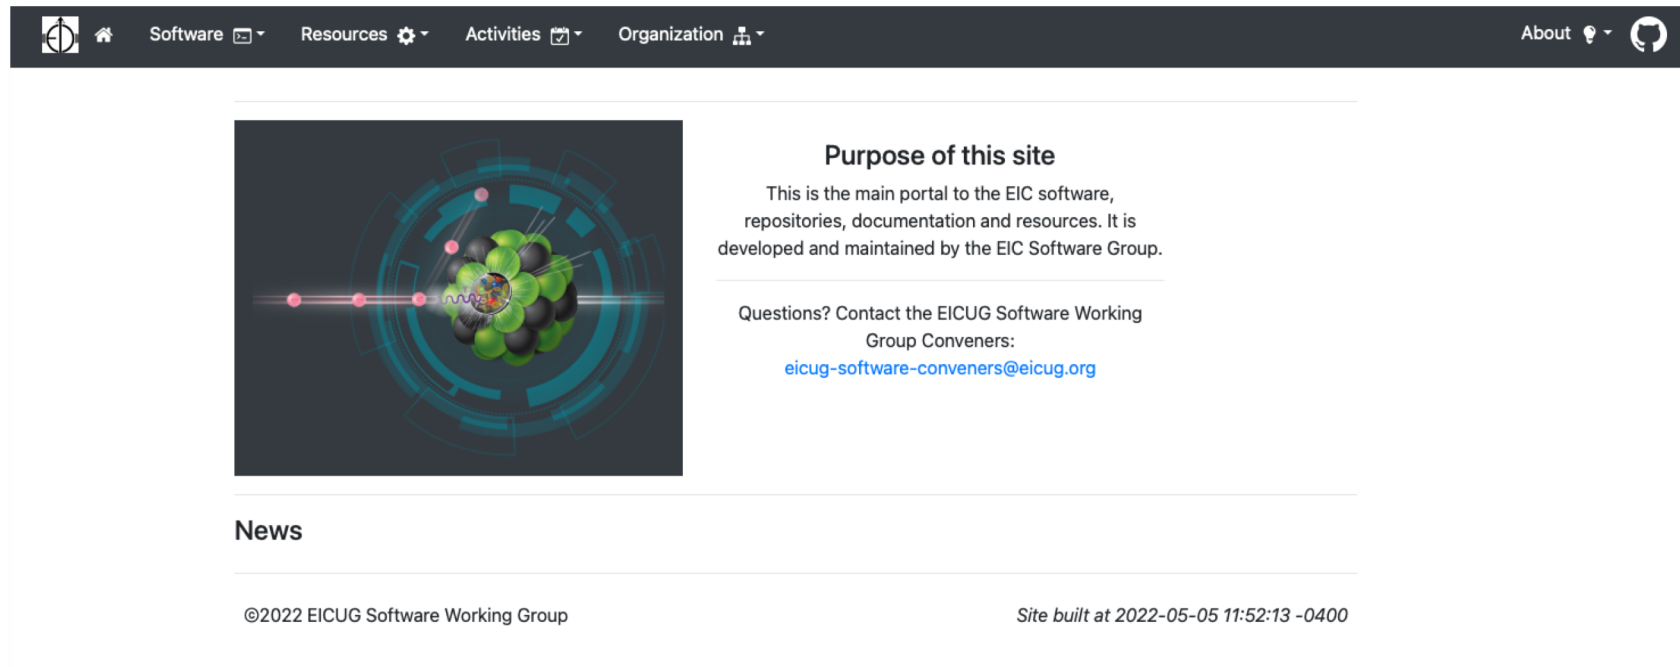

**Unique challenges** MCEGs for electron-**ion** collisions and **spin-dependent** measurements, including novel QCD phenomena (e.g., GPDs or TMDs).

# EIC R&D For Software & Computing

## EIC Software & Computing is in a very early life stage:

- Current focus on development of first EIC detector and further development of the EIC science program.
- EIC community asks for commonality and one software stack.
- Based on **EIC Software: Statement of Principles** and a **decision-making process involving the wider EIC community**, there is a **working prototype for a modular simulation and reconstruction toolkit**.
- Distributed Computing approach to supply resources for physics and detector studies.
- At the pre-requirements stage for production computing and software activities.

# Starting a MCEG Distribution based on HERA

Kolja Kauder (BNL)

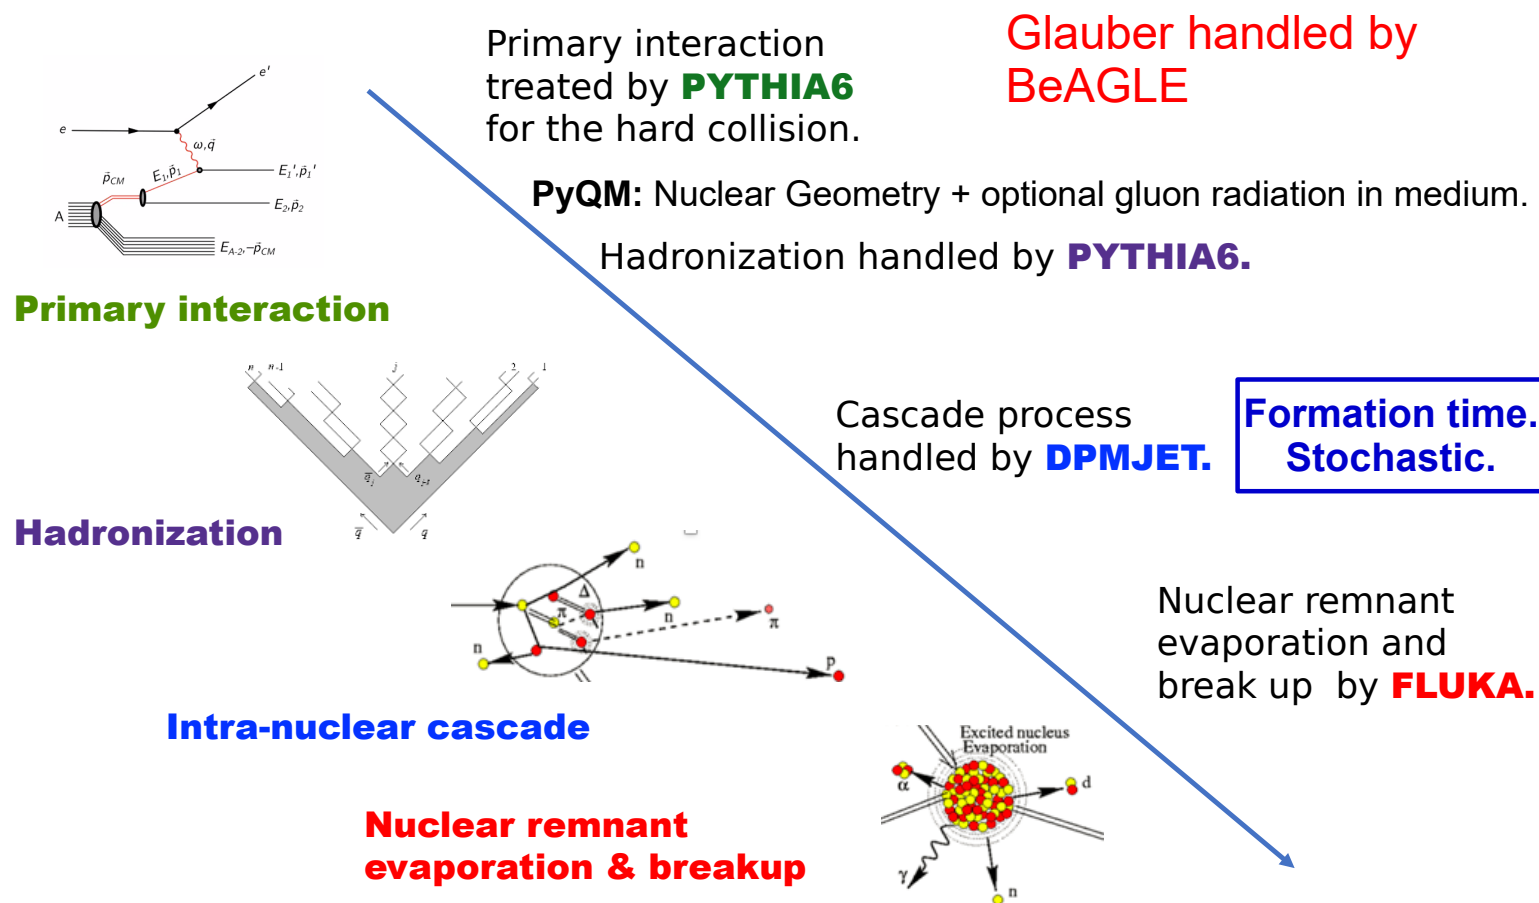

EIC community has been organized around its MCEGs needs already for several years:

## Starting from HERA

- **PYTHIA6 (modified)** General-purpose MCEG, including unpolarized DIS
- **DJANGO** MCEG for (un)Polarized DIS, including higher order QED and QCD effects
- **MILOU** MCEG for deeply virtual Compton scattering (DVCS)
- **PEPSI** MCEG for polarized DIS
- **RAPGAP** MCEG for DIS, including diffraction
- And a few others.

## New Developments

- **BeAGLE** Benchmark eA Generator for LEptoproduction
- **Sartre** MCEG for exclusive diffractive vector meson production in ep and eA
- Established **HepMC3 as standard** in the wider EIC community (thanks to Andrii Verbytskyi (MPP) for support).

## Some Nuclear Effects

	In BeAGLE
• Parton distribution functions	✓
• Parton saturation (CGC etc.)	
• Short-range correlations	✓ (GCF)
• "Fermi motion"	✓
• Partonic (or "dipole") MS	✓
• Partonic gluon radiation	✓
• Medium-modified hadronization	
• Formation times	✓
• Hadronic Cascade	✓
• Nuclear evaporation, breakup	✓
• Photonic de-excitation of $A^*$	✓

# Why has DIS been first missing in Pythia8

**MCEG community** focus of last two decades: LHC

## Problems with default parton shower for DIS (used in Pythia6)

- The parton shower has been developed for positron-electron annihilation and Drell-Yan.
- The parton shower is using a  $\hat{s}$  approach where  $\hat{s} = x_1 * x_2 * s$  at all scales. This works well for hadron-hadron collisions, e.g., for preserving the W/Z mass in the parton shower.
- When expanding the parton shower for electron-hadron scattering, one has to replace one incoming parton with an electron at  $x=1$ . The Bjorken- $x$  value of the event will be not preserved during the reconstruction of the initial state shower, as the introduction of the a transverse momentum will change the value of  $P * q$ . This also implies that the cross-section is changed.
- This was solved (for a single splitting) by a very specific handling of the initial and final state cascades and limiting the maximum allowed virtuality to  $W^2$  with additional rejection techniques.

Fig 4

# Status of ep simulations in Pythia8

(I. Helenius)

## DIS with Pythia

### Transition region missing ( $1 \text{ GeV}^2 < Q^2 < 10 \text{ GeV}^2$ )

#### New shower option: dipoleRecoil

[B. Cabouat and T. Sjöstrand, EPJC 78 (2018 no.3, 226)]

- No PS recoil for the scattered lepton
- Reasonable description of single-particle properties, such as transverse energy flow
- Results based on tune with the default global-recoil shower

#### DIRE plugin (to be included in PYTHIA 8.3)

[S. Höche, S. Prestel, EPJC 75 (2015) no.9, 461]

- Correct soft-gluon interference at lowest order
- Inclusive NLO corrections to collinear splittings
- Good agreement with HERA data for thrust  $T$

10

## Hard diffraction in photoproduction with PYTHIA

### Implemented from PYTHIA 8.235

[I.H., C. O. Rasmussen, Eur.Phys.J. C79 (2019) no.5, 413]

- Based on dynamical rapidity gap survival [C. O. Rasmussen, T. Sjöstrand, JHEP 1602 (2016) 142]
- Begin with factorized approach with diffractive PDFs (Ingelman-Schlein picture)
- Reject events where MPIs between resolved  $\gamma$  and p would destroy the rapidity gap

### Comparison to HERA diffractive dijet data

[H1: EPJC 51 (2007) 549, ZEUS: EPJC 55 (2008) 177]

- More MPI suppression towards higher  $W$ ,  $M_X$
- Natural explanation for observed factorization breaking in pp and  $\gamma p$

12

## Photoproduction with PYTHIA

### Photoproduction in PYTHIA 8

- Hard and soft QCD processes
- Mix of resolved and direct processes
- Photon PDFs from CJKL fit
- MPIs for the resolved processes  
⇒ Regulated with  $p_{T0}$  as in pp
- Applicable also for UPCs

### Inclusive hadron spectra from H1

- Resolved contribution dominates
- Good agreement with the data using  $p_{T0}^{\text{ref}} = 3.00 \text{ GeV}$  (pp:  $p_{T0}^{\text{ref}} = 2.28 \text{ GeV}$ )  
⇒ MPI probability reduced from pp

[H1: Eur.Phys.J. C10 (1999) 363-372]

11

## Exclusive vector meson production with PYTHIA

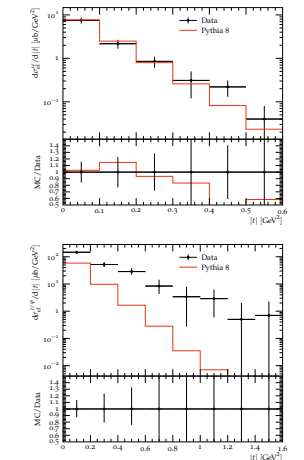

### Implemented from PYTHIA 8.240

[I.H., C. O. Rasmussen, in progress]

- Based on (pre-HERA) SAS parametrizations [G.A. Schuler, T. Sjöstrand, Phys.Rev. D49 (1994) 2257-2267]
- Includes  $\rho$ ,  $\omega$ ,  $\phi$  and  $J/\psi$  production via elastic scattering

### Comparison to HERA data

- Good agreement with low-mass mesons ( $\omega$ )
- Underestimate heavy-meson ( $J/\psi$ ) production  
⇒ Require improved parametrizations using HERA data

13

# Starting with MCEG validation using Rivet

Many thanks for **Christian Bierlich**, **Ilkka Helenius**, and **Simon Plätzer**!

**MCEG R&D** requires *easy* access to *data*:

- data := analysis description + data points

**HEP** existing workflow using Rivet.

**Ongoing activity with EIC-India and MCnet:**

- Comparison to published results using RIVET and understand differences.
- **Provide initial findings and results in publication (work in progress):**
  - Overview of where we stand in understanding HERA data with current physics and models implement in MCEGs.

# Pythia8+DIRE at low energy (studies by MD, S. Joosten (ANL), S. Prestel (LUND))

# Machine-Detector interface (MDI)

## Integrated interaction region and detector design to optimize physics reach

The aim is to get **~100% acceptance** for all final state particles, and measure them with good resolution.

### Experimental challenges:

- beam elements limit forward acceptance
- central Solenoid not effective for forward

Possible to get ~100% acceptance for the whole event.

# Accelerator and Beam Conditions Critical for EIC Simulations

- Accelerator and beam effects that influence EIC measurements

- Beam crossing angle,
- Crabbing rotation,
- Beam energy spread,
- Angular beam divergence,
- Beam vertex spread.

- Note for EIC Community <https://eic.github.io/resources/simulations.html>

- Profound consequences on measurement capabilities of the EIC and layout of the detectors,
- How to integrate these effects in EIC simulations.
- **Authors** J. Adam, E.-C.Aschenauer, M. Diefenthaler, Y. Furletova, J. Huang, A. Jentsch, B. Page.

**Beyond that** Include beam background estimates in simulations.

# Start building a MCEG community for the EIC

**P O E T I C 8**  
8th International Conference on Physics Opportunities at an Electron-Ion Collider  
**19-23 March 2018, University of Regensburg**

**Local Organizing Committee:**  
Gunnar Bali

# Summary from MCEG workshop series

**MCEG for ep** On a good path, but still a lot of work ahead.

- **General-purpose MCEGs**, HERWIG, PYTHIA, and SHERPA, will be significantly improved w.r.t. MCEGs at HERA time:
- Comparisons with HERA data and QCD predictions critical:
  - To learn where physics models need to be improved,
  - To complement MC standard tunes with first DIS/HERA tune.
- The existing general-purpose MCEG should be able to simulate NC and CC unpolarized observables also for eA. A precise treatment of the nucleus and, e.g., its breakup is needed.
- First parton showers and hadronization models for ep with spin effects, but far more work needed for polarized ep / eA simulations.
- Need to clarify the details about merging higher QED+QCD effects (in particular for eA).

**MCEG for eA** Less clear situation about theory and MCEG.

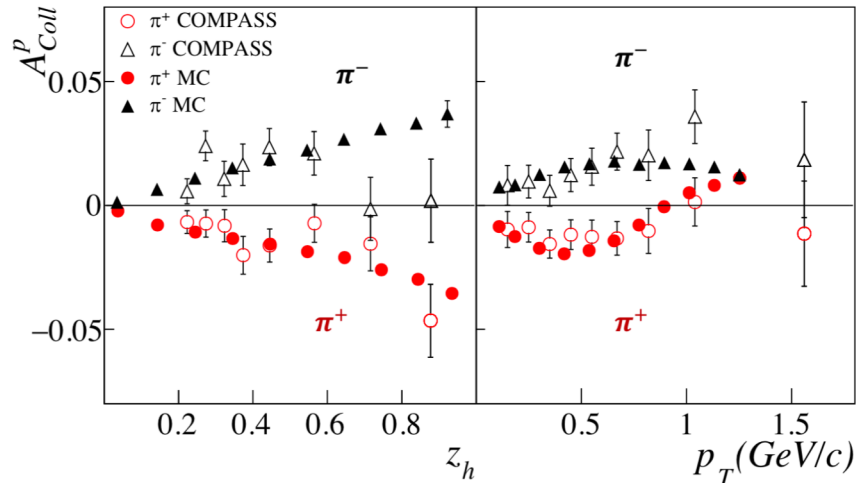

- **Pioneering projects**, e.g., BeAGLE, spectator tagging in ed, Sartre.
- **Active development**, e.g., eA adaptation of JETSCAPE, Mueller dipole formalism in Pythia8 (ala DIPSY).

# Recursive model for the fragmentation of polarized quarks

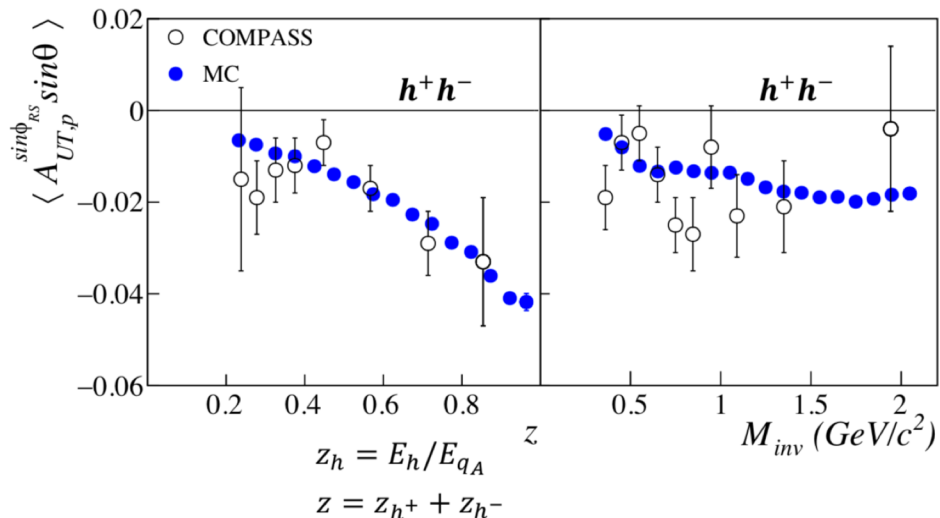

Albi Kerbizi (Trieste)

## COMPASS Collins SSA

- The string +  $^3P_0$  model for pseudo-scalar meson emission has been implemented in a stand alone MC code
- The comparison with experimental data on Collins and di-hadron asymmetries is very promising
- Other effects like Boer-Mulders or jet-handedness can be simulated
- The same results can be obtained with different choices for the  $\check{g}$  function acting on the spin-independent correlations between quark transverse momenta
- The choice  $\check{g} = 1/\sqrt{N_a(\varepsilon_h^2)}$  guarantees again LR symmetry and allows to simplify
  - the formalism and the analytical calculations
  - the improvement of the simulations (i.e. adding vector mesons) → ongoing
  - the interface with external event generators and in particular with PYTHIA → ongoing

## COMPASS di-hadron asymmetry

# AI/ML for EIC

AI/ML already has an important presence in EIC, being applied to detector design optimization, as well as applications such as streaming DAQ, and a **new** AI Working Group as part of SWG to explore and develop AI/ML's potential.

# Machine learning-based event generator for ep scattering (N. Sato et al.)

<a href="mailto:cfns_contact@stonybro...">cfns_contact@stonybro...</a>

Due to the COVID-19 virus, the MC4EIC workshop is being held online using Zoom.

We have taken live notes during the meeting, which will form the basis for a workshop report. This document will inform future discussions and become part of the Snowmass community planning process. The live notes are available as a [Google document](#), anyone can edit the live notes directly.

The MC4EIC workshop has been organized by the CTEQ collaboration and the EIC User Group and has been hosted by CFNS as a remote meeting from November 18-19.

Success of the EIC science program critically depends on precise theoretical predictions for electron-ion collisions. Parton showering programs serve as a backbone for such calculations in most particle physics experiments, and the EIC is no exception. Developing precision simulations will therefore be mandatory. It will require advancements in QCD theory and computational methods, as well as a close dialog between experimentalists and theorists.

To facilitate this dialog, we have brought together experts in various domains of QCD theory and experiment to discuss recent advances in the development of event generators, as well as needs and requirements for future progress.

This MC4EIC kick-off workshop will establish a foundation for an in-depth look at the MC event generators that are currently used or developed for the EIC. Questions that will be defined at the kick-off workshop will be addressed at the next workshop, tentatively to be held in Spring 2022.

MC4EIC is part of the [CFNS workshop/ad-hoc meeting series](#).

- Establish a foundation for in-depth look at event generators currently used or developed for the EIC.
- Understand precision level to be satisfied by event generators in order to match experimental analysis requirements.
- Highlight areas in need of cross-talk between theory and experiment.
- Establish benchmarks for MCEG development.

210 participants.

Will continue **November 16–18**

# Event Generators for the EIC

[arXiv:2203.11110](https://arxiv.org/abs/2203.11110)

Submitted to the US Community Study  
on the Future of Particle Physics (Snowmass 2021)

## Event Generators for High-Energy Physics Experiments

We provide an overview of the status of Monte-Carlo event generators for high-energy particle physics. Guided by the experimental needs and requirements, we highlight areas of active development, and opportunities for future improvements. Particular emphasis is given to physics models and algorithms that are employed across a variety of experiments. These common themes in event generator development lead to a more comprehensive understanding of physics at the highest energies and intensities, and allow models to be tested against a wealth of data that have been accumulated over the past decades. A cohesive approach to event generator development will allow these models to be further improved and systematic uncertainties to be reduced, directly contributing to future experimental success. Event generators are part of a much larger ecosystem of computational tools. They typically involve a number of unknown model parameters that must be tuned to experimental data, while maintaining the integrity of the underlying physics models. Making both these data, and the analyses with which they have been obtained accessible to future users is an essential aspect of open science and data preservation. It ensures the consistency of physics models across a variety of experiments.
