

CLIC_ILD_CDR TPC Tracking

Mark Thomson
University of Cambridge

Very Much Work in Progress: ALL VERY PRELIMINARY

★ **Preliminaries:**

- **All run with OverlayTiming processor**
 - full bunch train of gamma gamma to hadrons background
- **Main questions**
 - limitations of LEP TPC reconstruction
 - what is true limitation

★ Try to reconstruct full bunch train

- Only gamma-gamma background
- 1.8E6 TPC hits
- **Underestimate of true occupancy**
- LEP tracking code gives up
 - even with mods, to common blocks need < 100000 hits
- non-negligible voxel occupancy in inner parts of TPC
- Reconstruction strategies
 - divide TPC into two halves in z
 - run CurlKillerProcessor
 - ignore inner part of TPC for track PatRec

Raw TPC xy profile

★ **For example:**

($z > 0$, multiplicityCut=2)

- Only 10 % of hits used in Patrec
- LEPTracking runs ~ few minutes
- 700 TPC tracks
- but, inner part of TPC not used

Raw TPC Radial profile

- ★ **For example (slicing in z):**
 (0 < z < 500, multiplicityCut=5, binW=5)
 - 25 % of hits used in Patrec
 - 450 TPC tracks
 - inner part of TPC partly used
 - no feel for efficiency etc.

Raw TPC Radial profile
