Duda, J. Kosse, M. Schaer, N. Vallis, R. Zennaro (PSI), L. Bandiera, M. Soldani, A. Sytov (INFN/Ferrara), A. Bacci, M. Rossetti Conti (INFN/Milano), Y. Enomoto (KEK), P. Martyshkin

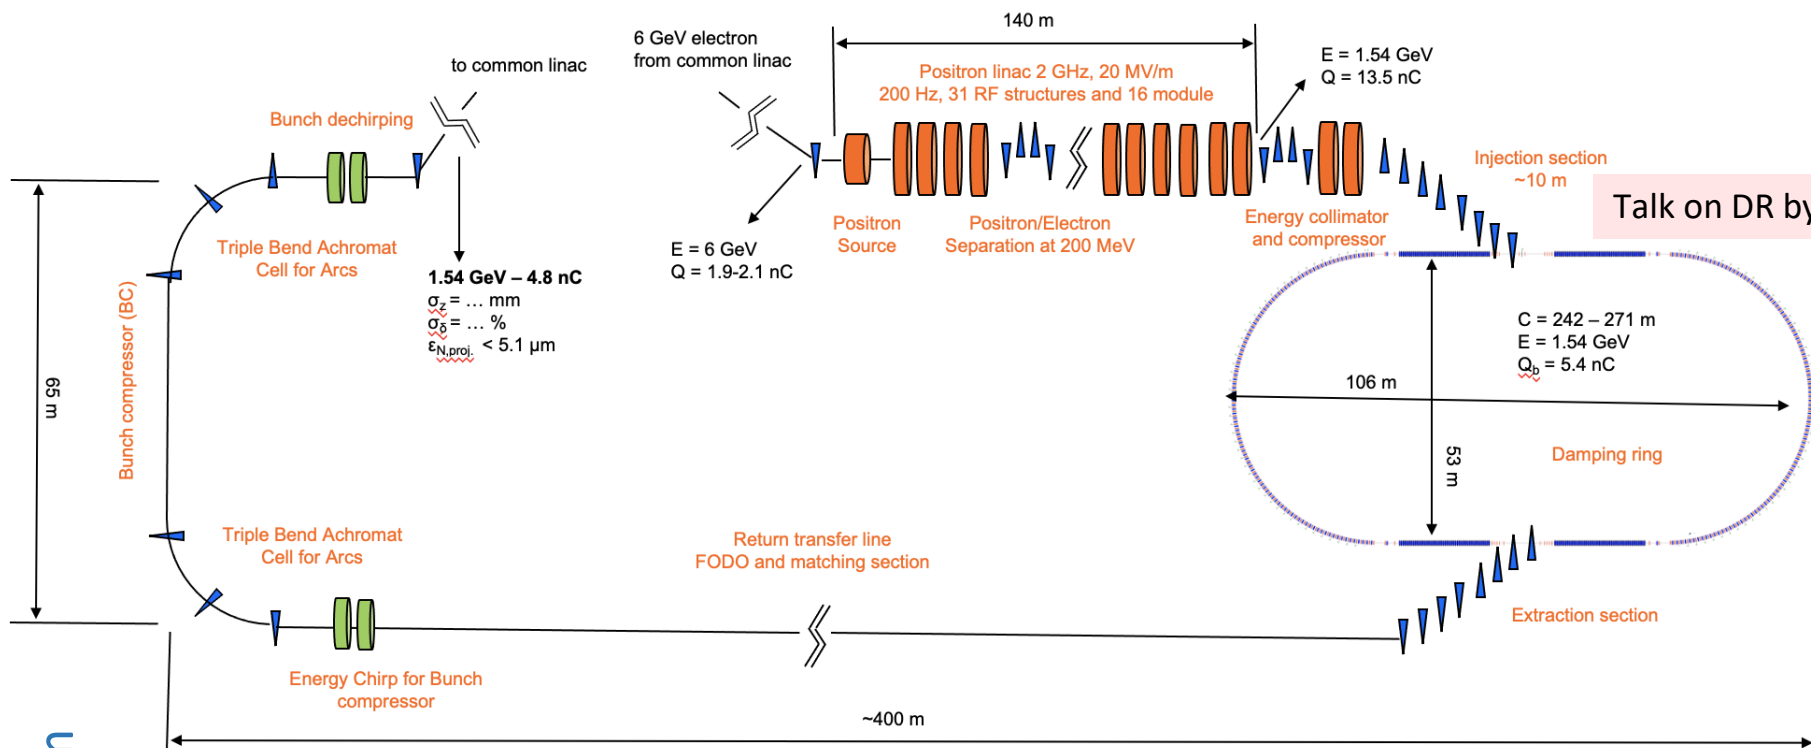

This work was done under the auspices of CHART (Swiss Accelerator Research and Technology) Collaboration, <https://chart.ch> - **CHART Scientific Report 2022**: <https://chart.ch/reports/>

FCCIS: 'This project has received funding from the European Union's Horizon 2020 research and innovation programme under the European Union's Horizon 2020 research and innovation programme under grant agreement No 951754.'

FCC-ee pre-injector layout (positron source)

Talk on DR by C. Milardi (LNF)

e^- drive beam

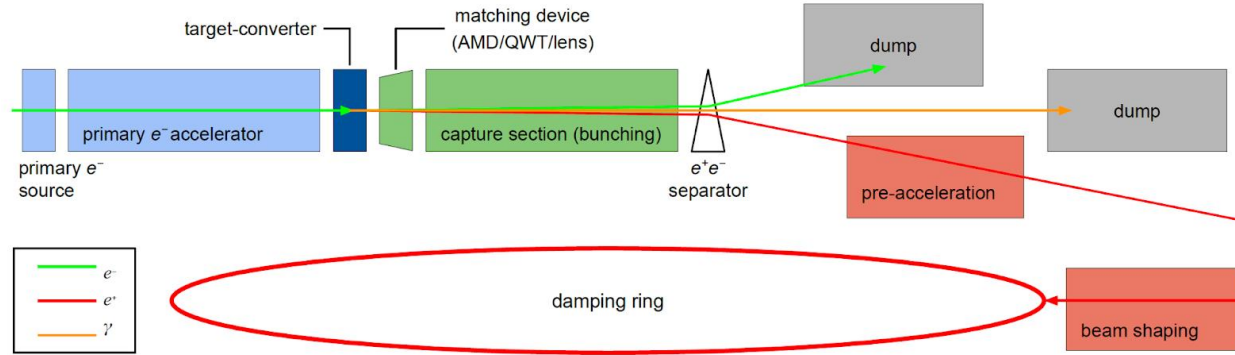

Beam energy	6 GeV
Bunch charge	~ 5.6 nC (max)
Bunch length	1 mm
Bunch transverse size	$\gtrsim 0.5$ mm

Nb of bunches per pulse	2
Bunch separation	25 ns
Repetition rate	200 Hz
Beam power	~ 13.3 kW (max)

FCC-ee positron source: requirements

Positron source basic scheme

Accepted e⁺ yield is a function of **primary beam characteristics** + **target + capture system** + **DR acceptance**

To estimate the accepted yield:
 energy window cut: $(1540 \pm 58.5) \text{ MeV} \rightarrow (\pm 3.8\% \text{ @ } 1.54 \text{ GeV})$
 time window cut: $40^\circ \text{ RF } (\sim 16.7 \text{ mm/c @ } 2 \text{ GHz})$

The complete filling for Z running => Requirement $\sim 2.75 \times 10^{10} \text{ e}^+/\text{bunch}$ (4.4 nC) at the linac end
or 5.4 nC accepted in the DR

$$N_{e^-}/\text{bunch} \times \eta_{Accepted}^{e^+} \geq 5.4 \text{ nC/bunch} \times 2.5$$

$$\eta_{Accepted}^{e^+} = \frac{N_{DR \text{ accepted}}^{e^+}}{N_{Primary}^{e^-}}$$

*A safety margin of 2.5 is currently applied for the whole studies.

All the studies are focused on the operation scheme: 6 GeV, 2 bunches/pulse, 200 Hz rep. rate

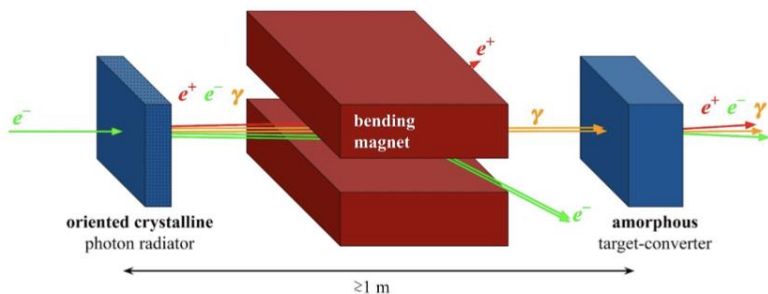

→ positron flux of $\sim 1.1 \times 10^{13} \text{ e}^+/\text{s}$ ($\times 2.5$). Demonstrated at SLC (a world record for existing accelerators): $\sim 6 \times 10^{12} \text{ e}^+/\text{s}$

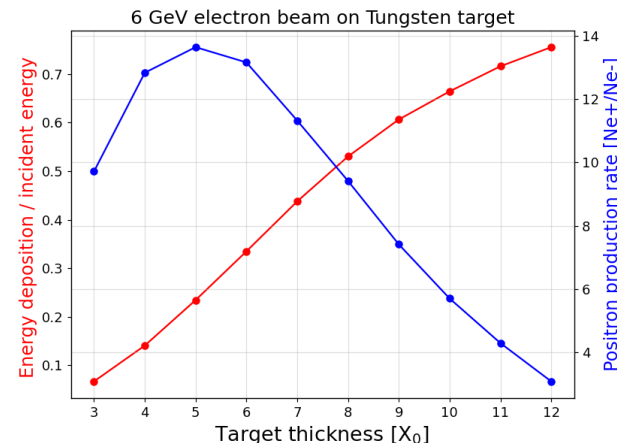

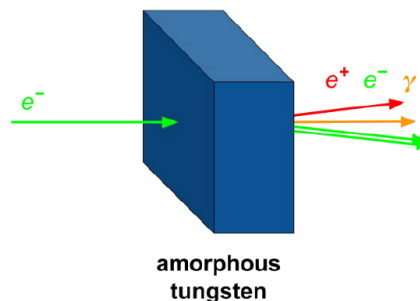

FCC-ee positron source: positron production

Schemes under consideration now

- Conventional scheme: bremsstrahlung and pair conversion (mainly studied until now)
- Hybrid scheme (crystal-based positron source) use the intense radiation emitted by high-energy (some GeV) electrons channeled along a crystal axis => channeling radiation.

Conventional target

Crystal-based target Hybrid scheme

Target thickness	5 X0 17.5 mm
Production rate	~14 Ne ⁺ /Ne ⁻
PEDD*	f(e ⁻ beam)
Deposited power	f(e ⁻ beam)

The final choice will be done based on the simulated performances

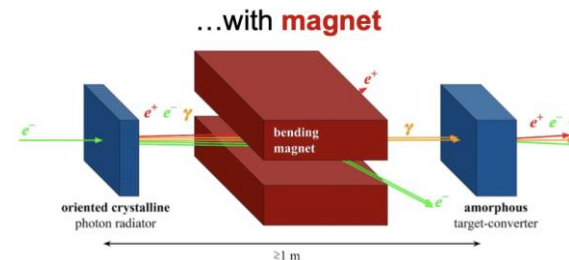

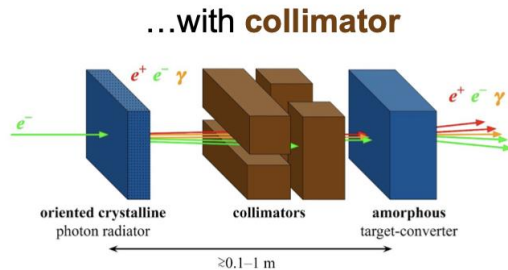

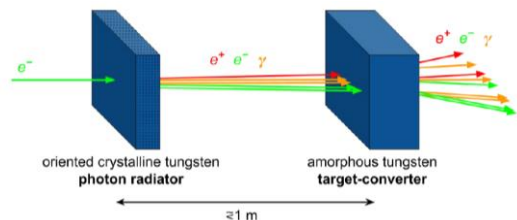

Studies on the target-converter shape in progress (tapered target, rod target, granular target)

*According to SLC experience, $W_{74}Re_{26}$ material has a PEDD limit of **35 J/g** (safe value to avoid target failure)

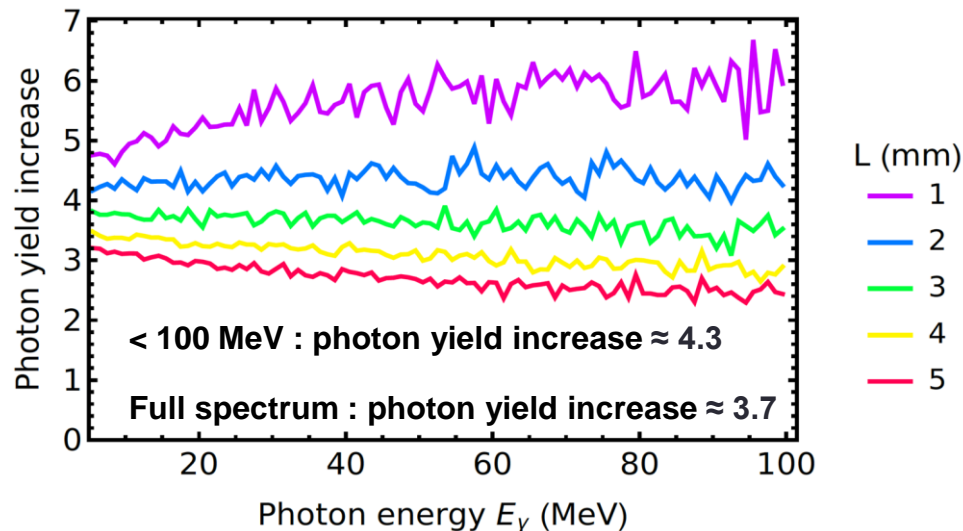

Hybrid scheme: positron production optimization for FCC-ee (in progress)

→ Comparable e^+ production rate but lower thermal load

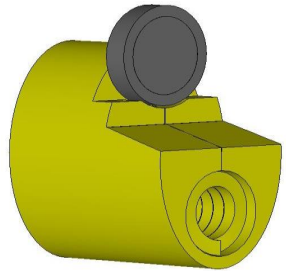

→ Capture simulations in progress

L. Bandiera et al., *Eur. Phys. J. C* (2022) 82:699

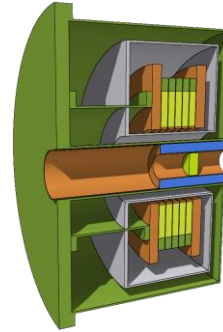

Positron capture: matching device

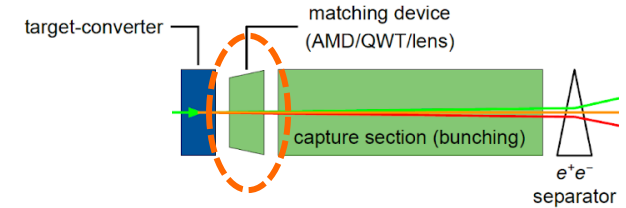

Matching device => a fast phase space rotation to transform the small size and high divergence in big sizes and low divergence beam.

Flux Concentrator (FC)
Originally designed by BINP (P. Martyshkin). Starting collaboration with KEK and CERN.

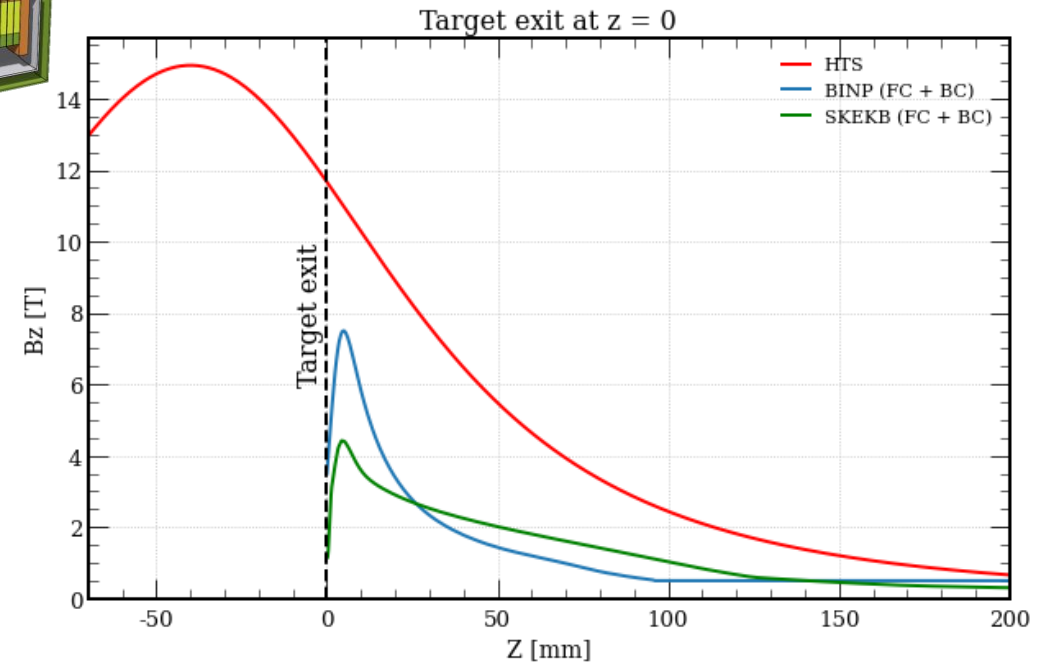

High-Temperature Superconducting (HTS) solenoid designed by PSI (J. Kosse, B. Auchmann and M. Duda)

FC: lower peak field and aperture, fixed target position, challenging power source working at 200 Hz, **robust and reliable solution...**

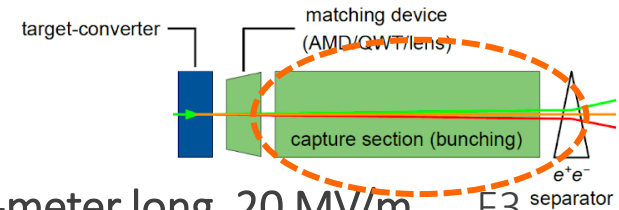

HTS solenoid: higher peak field and aperture, flexibility on the field profile and target position, DC operation, **innovative solution in application for e^+ capture...**

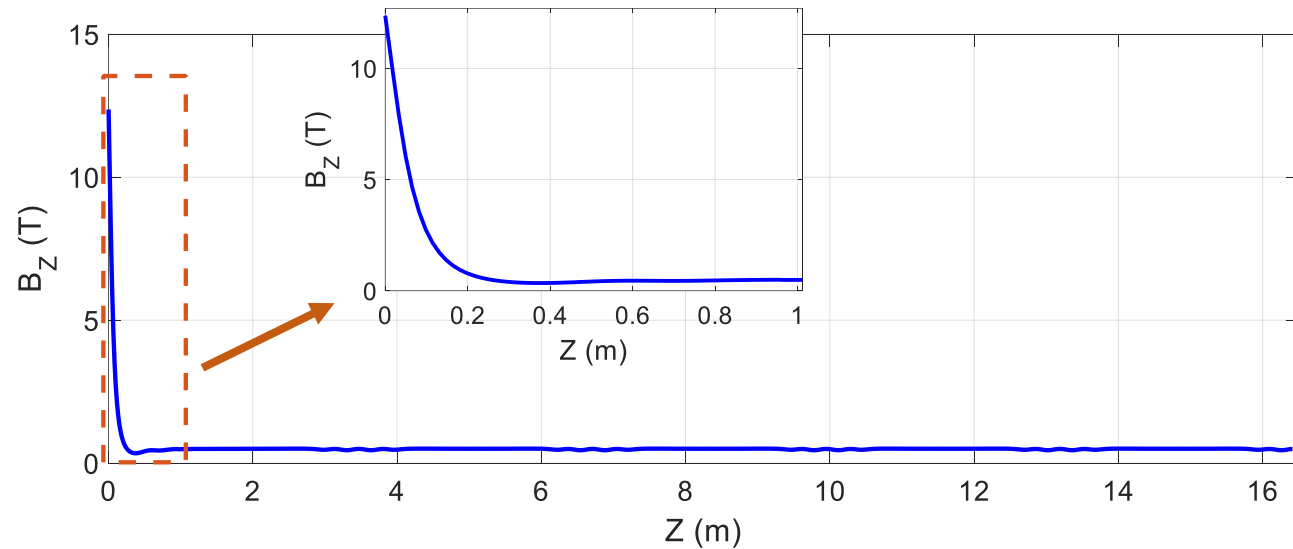

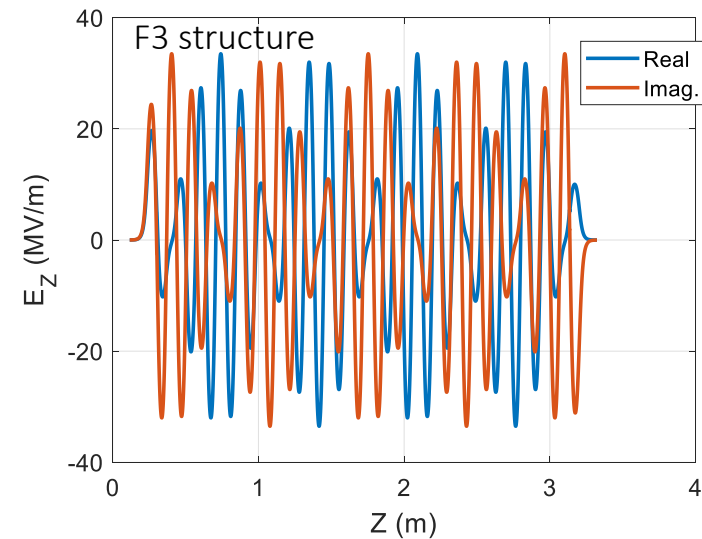

Positron capture: capture linac

The capture linac is encapsulated inside a solenoid with the axial magnetic field of ~ 0.5 T

- **Baseline structure: large-aperture ($\Phi = 60$ mm) TW L-band @ 2 GHz, $9\pi/10$, 3-meter long, 20 MV/m.** structure designed by H. Pommerenke and A. Grudiev (CERN). 5 RF structures are used to accelerate the e^+ beam up to ~ 200 MeV.
- **Baseline solenoid configuration: 0.5 T NC solenoid.** Configuration designed by M. Schaer, R. Zennaro (PSI). For simplification, 0.5 T uniform NC field used (as the difference in final results was found to be small).

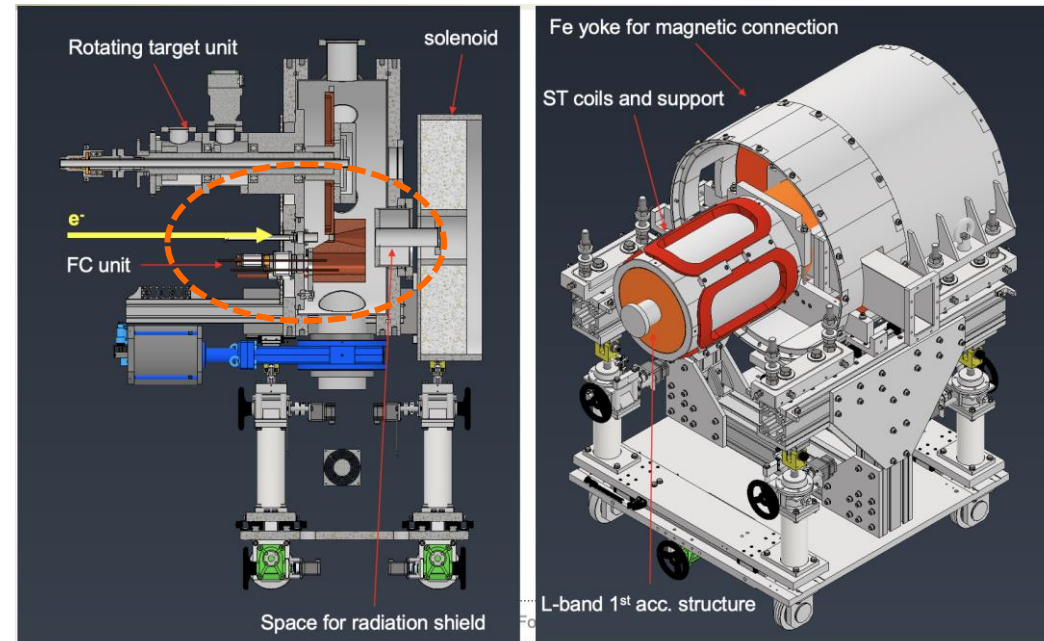

FC-based positron capture system (I)

- FCC-ee FC original design is made by BINP. *Very simple model (not realistic in terms of ohmic loss and high-power requirement for the pulsed power supply). Needs more realistic simulations.*
- FC-based capture system successfully works at SuperKEKB → starting point for the FCC-ee capture system studies. FC is currently considered as a baseline for the ILC e^- -driven and CLIC positron sources.

Compared to SuperKEKB FC, high rep. rate (up to 300 Hz) and ideally higher max. field value/aperture are requested for the future collider projects.

Make use of the SuperKEKB experiences and join the effort on the FC design between FCC/ILC/CLIC collaborations to arrive to a more realistic model.

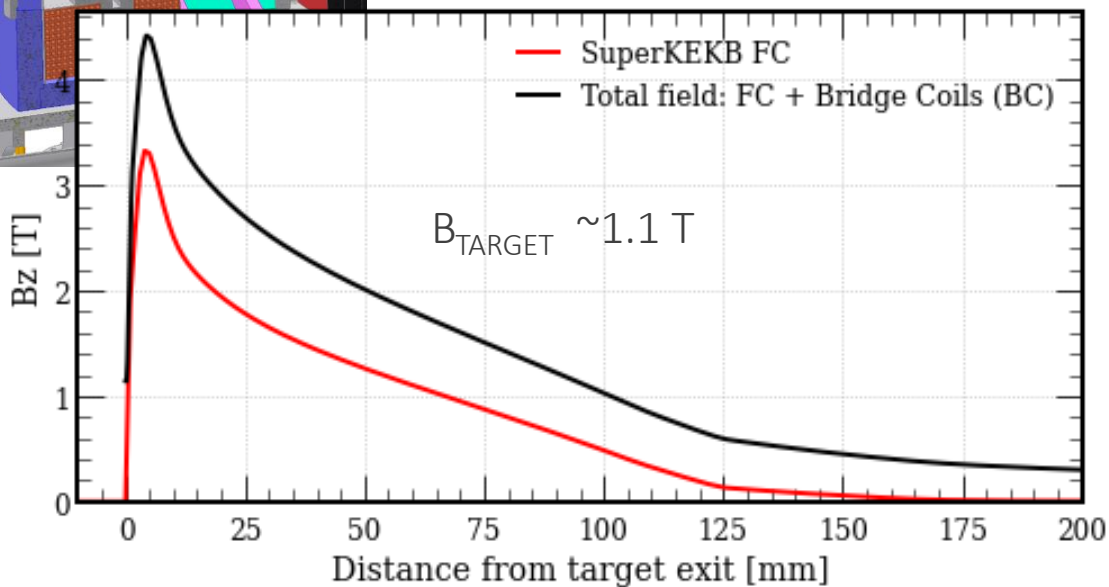

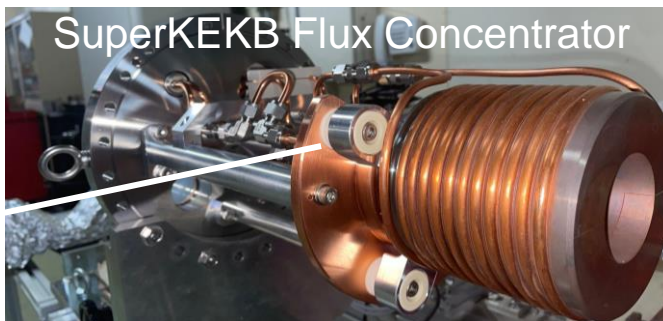

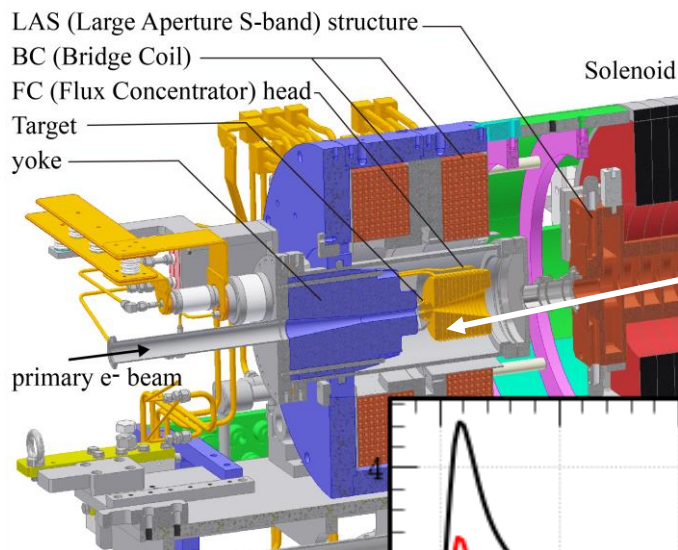

Prototype of the positron source for ILC

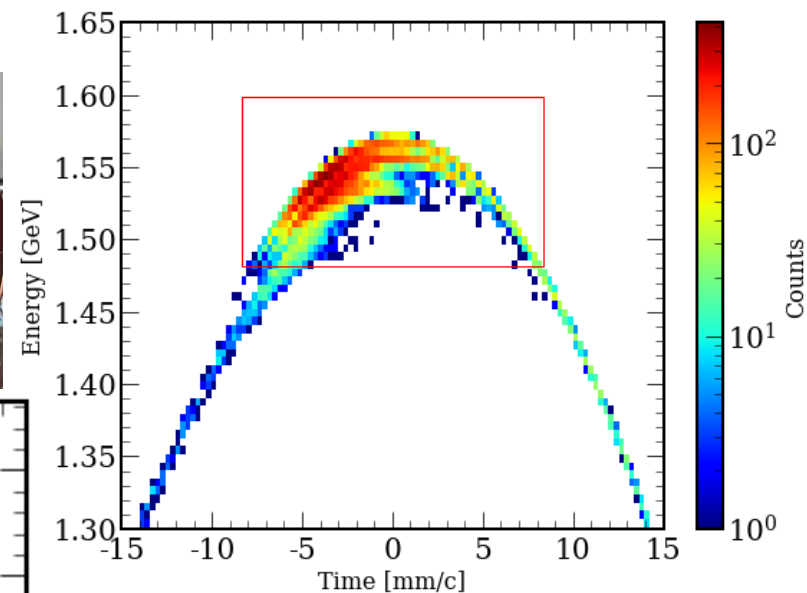

FC-based positron capture system (II)

Application of the SuperKEKB FC to the FCC-ee positron source

@ 1.54 GeV (DR entrance)

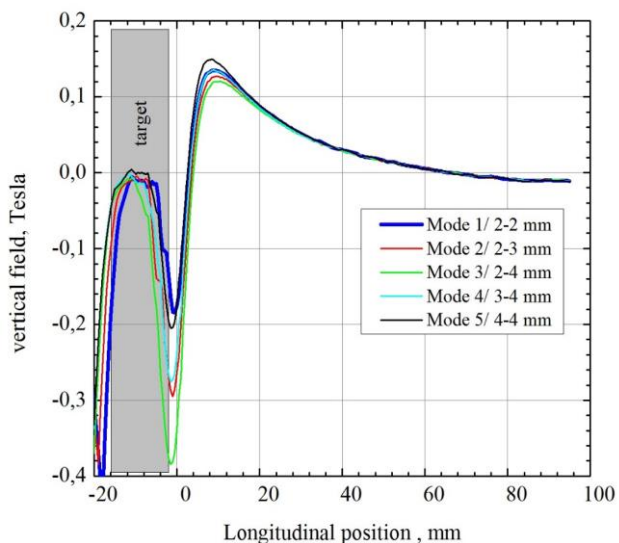

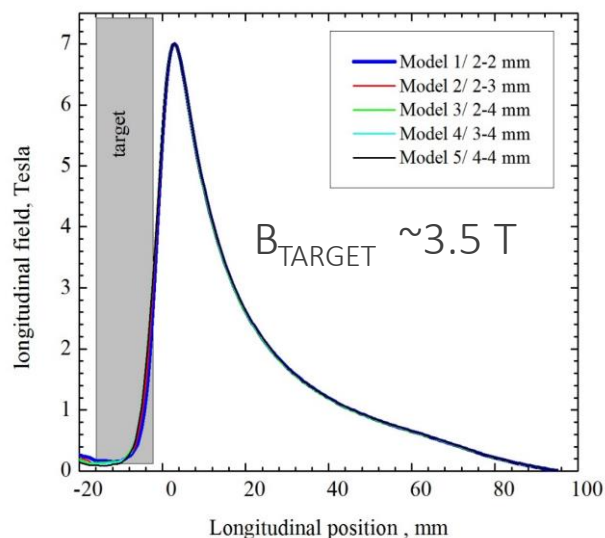

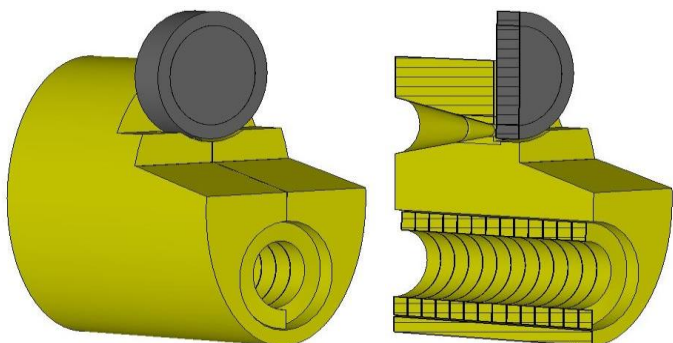

Accepted e^+ yield @ DR	2.7
Norm. emittance [mm*rad]	11.9
Energy spread (RMS) [%]	1.1
Bunch length (RMS) [mm]	2.6

FC-based positron capture system (III)

In the FCC CDR, the baseline for the capture system is based on the BINP FC

Parameter [unit]	Value
Target diameter [mm]	90
Target thickness [mm]	15.8
Gap between target and FC [mm]	2
Grooving gap between target side face and FC body [mm]	2
Elliptical cylinder size [mm]	120×180
Total length [mm]	140
Conical part length [mm]	70
Min cone diameter [mm]	8
Maximm cone diameter [mm]	44
Cone angle [deg.]	25
Cylindrical hole diameter [mm]	70
Coil turns [-]	13
Current profile pulse length [μs]	25
Peak field [T]	7
Peak transverse field [mT]	135–157
Gap between coil turns [mm]	0.4
Gap between coil and FC body [mm]	1
Turns size	9.6×14 mm

Simulation results update (capture linac)

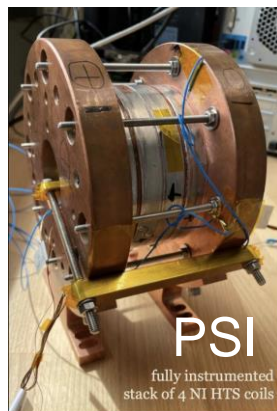

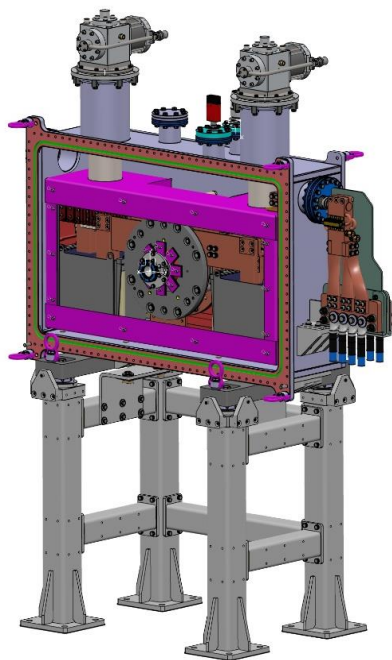

Accepted e ⁺ yield @ DR	4.4
Norm. emittance [mm*rad]	12.2
Energy spread (RMS) [%]	1.2
Bunch length (RMS) [mm]	2.9

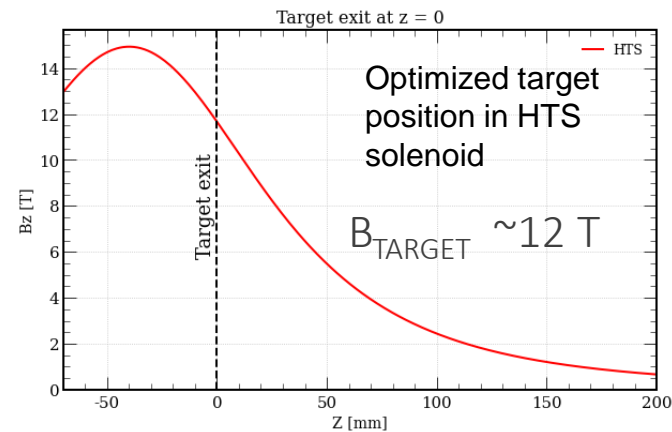

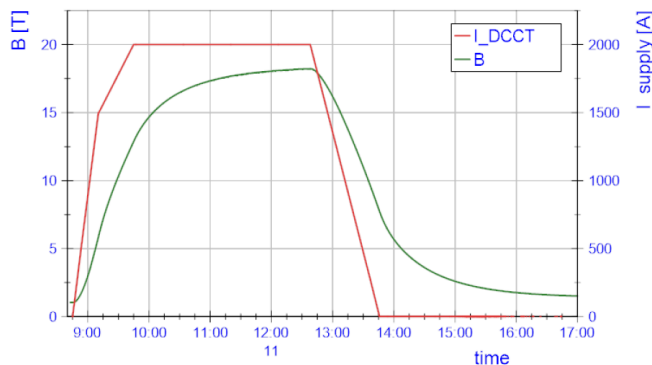

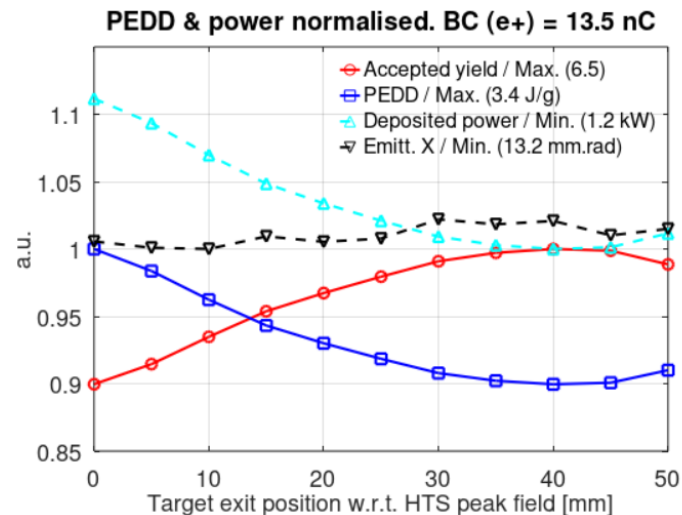

HTS-based positron capture system

We consider the same HTS solenoid design and cryostat aperture as for P^3 e^+ production experiment at PSI (72 mm)

HTS solenoid integrated in the cryostat

18.2 T @15K@2kA reached for stack of 4 coils

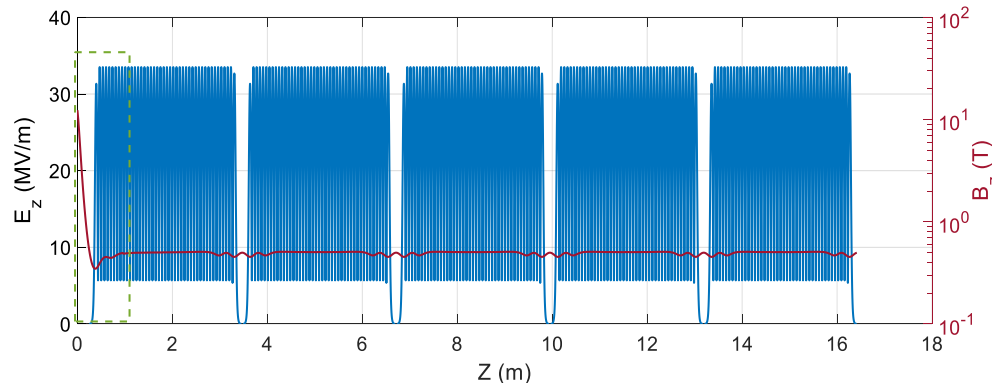

- High peak field ($\sim 15 \text{ T}$, $\sim 12 \text{ T}$ at target exit)
- Large aperture ($\Phi = 30\text{-}40 \text{ mm}$)
- Flexible target position (can be placed inside the bore)
- DC operation

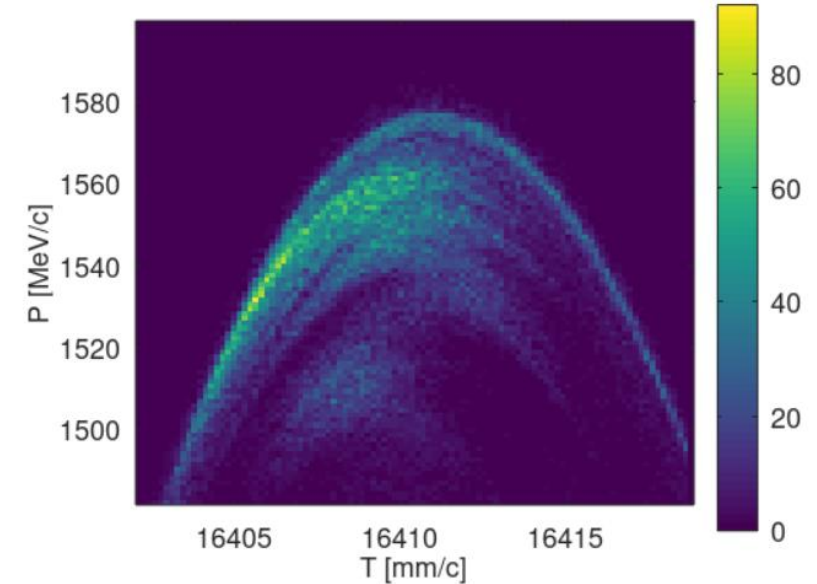

Current baseline: positron capture system –version 1

Capture system -version 1

- Positron production: conventional scheme (e^- beam size on target = 1 mm rms)
- Matching device is based on the SC solenoid (5 HTS coils, 72 mm bore including shielding). Min beam aperture (w/o significant yield loss): 30- 32 mm (Maximum shielding thickness: ~ 21 mm)
- Capture linac is based on the F3 RF structures
- NC long solenoid $B = 0.5$ T (realistic conventional design based on short coils)

@ 1.54 GeV (DR entrance)

Accepted e^+ yield @ DR	6.5
Norm. emittance [mm*rad]	13.7
Energy spread (RMS) [%]	1.4
Bunch length (RMS) [mm]	2.9

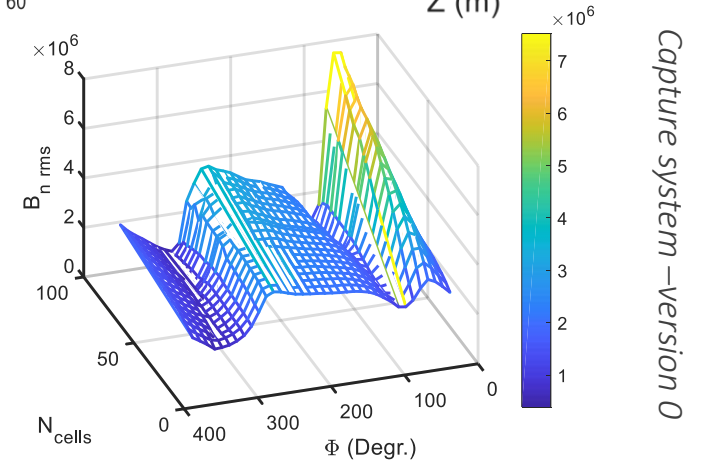

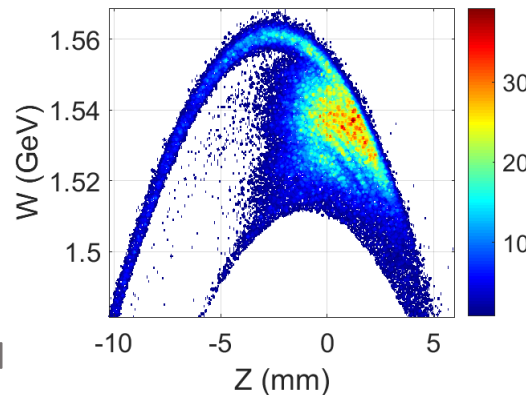

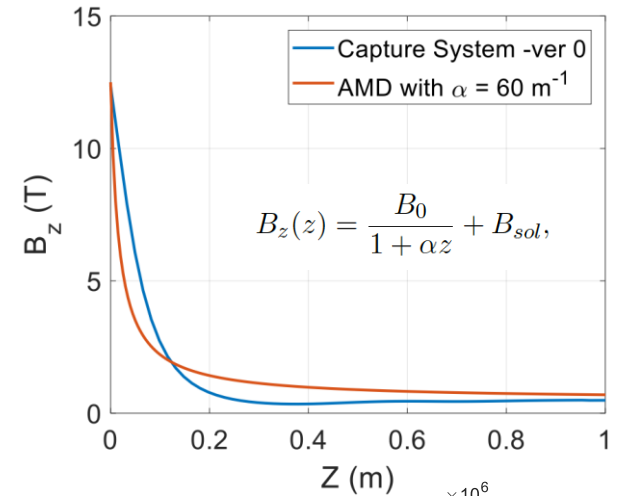

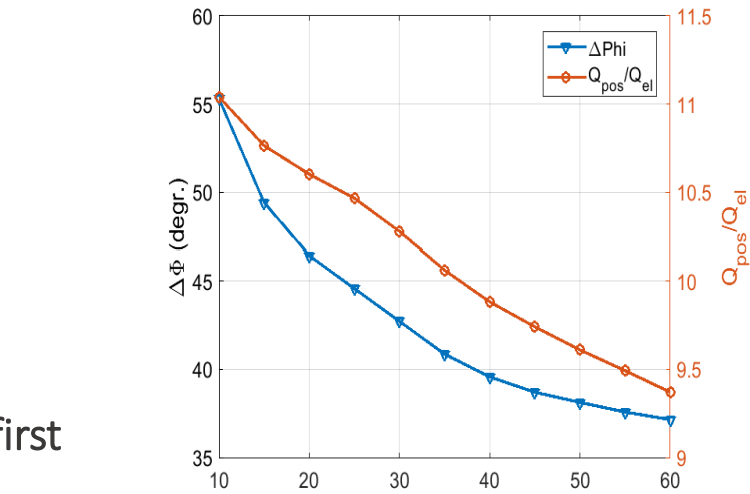

Optimization studies toward better performance

Target and capture system studies are in progress to provide the optimized positron bunch 6D phase space matched to the positron linac and DR

- Overall parameter scanning (target thickness, distances, etc.)
- Matching device field profile
- RF structure length
- Distance between the target and the first RF structure
- Overall optimization (GIOTTO, etc.)
- ...

GIOTTO results:
 $\Delta W/W (1\sigma) = 0.99 \%$,
 $\Delta Z (1\sigma) = 2.4 \text{ mm}$
Beam size (1σ) = 8.7 mm
Acc. Yield = 7
 $\epsilon_{n \text{ rms } x,y} = 9.6 \cdot 10^3 \text{ mm} \cdot \text{mrad}$

Radiation load studies and status of target design

Currently, the radiation load and target design studies focused exclusively on the HTS solenoid-based system (capture system –version 1)

Dedicated talk by R. Mena Andrade (CERN)

FLUKA model of the FCC-ee positron source to assess

Heat load on the target/HTS solenoid/capture linac/solenoid

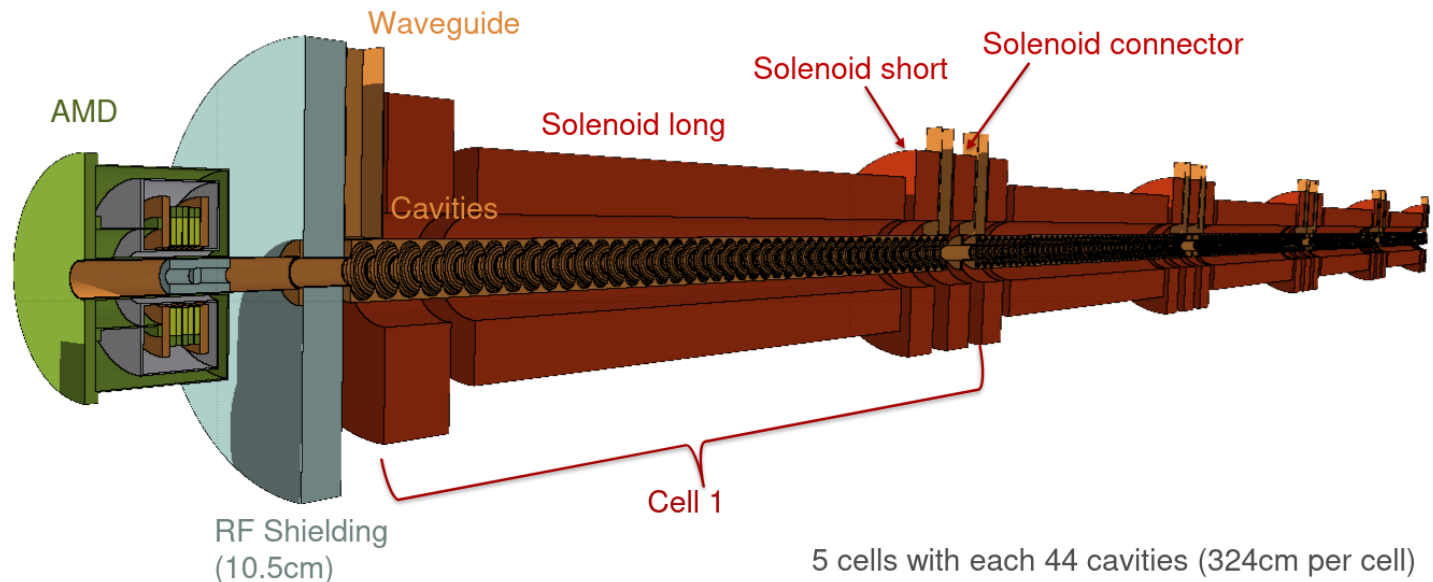

- Total deposited power
- Power density

Long term radiation effects

- Dose
- Displacement per atom (DPA)

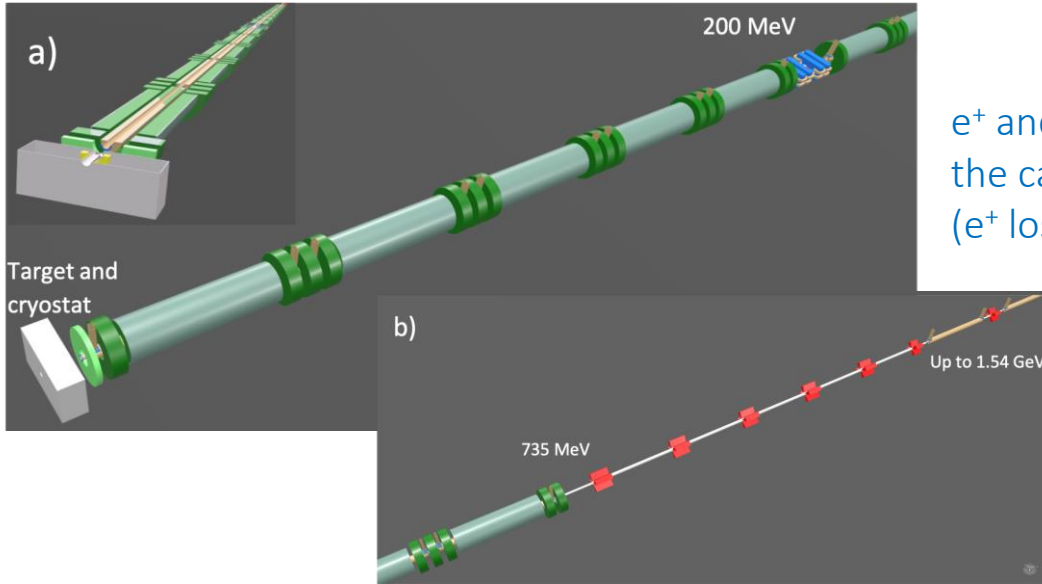

→ Design feasibility and mechanical integration

→ Reliability of the positron source system

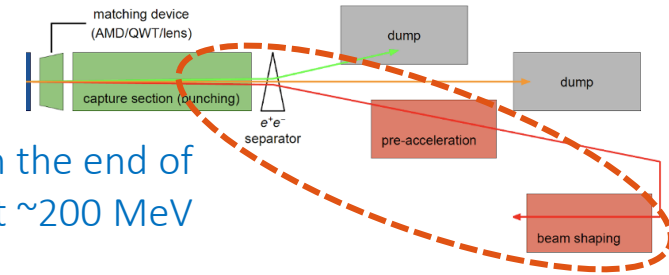

Positron linac up to 1.54 GeV

e^+ and e^- bunches are separated in the end of the capture system by a chicane at ~ 200 MeV (e^+ losses limited to $\sim 15\%$)

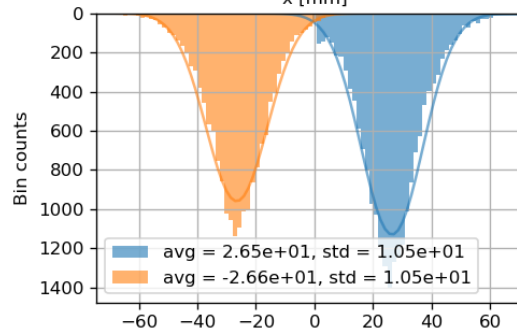

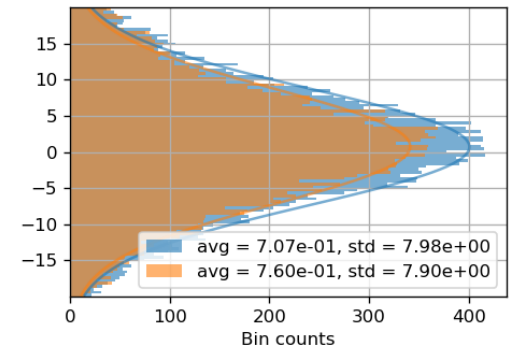

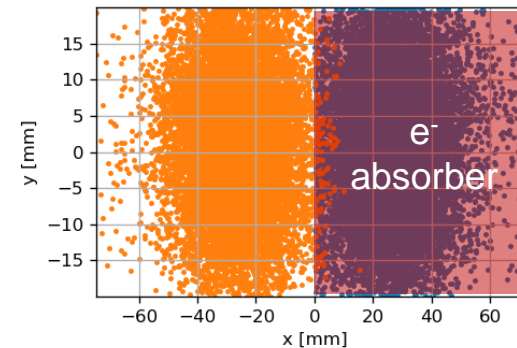

The solenoid focusing is used until ~ 735 MeV of e^+ beam energy.

After the matching section at ~ 735 MeV, the e^+ beam passes to a quadrupole focusing.

ECS is used to increase the number of e^+ within the DR energy acceptance ($\pm 3.8\%$).

Vacuum chamber dimensions

e^+/e^- distributions before e^- absorber (chicane center)

Summary of the simulation results

Drive beam parameters	Alternative FC-based capture system		Capture system –v1
Matching device	BINP FC	SuperKEKB FC	HTS solenoid
Matching device aperture	2a=8-44mm	2a=7-52mm	2a _{min} =30 mm (bore 72mm)
Matching device peak magnetic field (@Target) [T]	7.5 (3.5)	4.4 (1.1)	15 (12)
e- beam bunch charge [nC] / e- beam power [kW]	3.1 / 7.4	5 / 12	2.1 / 5
Target deposited power [kW] / PEDD [J/g]	1.7 / 11.1	2.9 / 18.3	1.2 / 3.1
Positron yield @CS [Ne ⁺ /Ne ⁻]	4.9	3.3	8
Positron yield @DR [Ne⁺/Ne⁻]	4.4	2.7	6.5
Normalized emittance (rms) [mm.rad]	12.2	11.9	13.7
Energy spread (rms) [%]	1.2	1.1	1.4
Bunch length (rms) [mm]	2.9	2.6	2.9
e+ beam bunch charge [nC]	13.5		

Conclusions and outlook

- The studies on the FCC-ee positron source are well advanced: positron production, HTS technology feasibility for matching device, capture linac (RF structures and solenoid). So far, no showstoppers found that prevent a SC solenoid matching device. Studies ongoing.
- FC-based capture system requires a realistic model capable to work at the FCC-ee operation parameters. Collaborative work is very essential.
- Two capture system layouts (based on the FC and SC solenoid) will be eventually compared in detail in terms of the performance and cost for the mid-term project review.
- Positron linac has a robust design with full tracking simulations from production target to damping ring using the realistic field maps.
- Thermal and radiation load studies: FLUKA model is available for capture system –version 1. Still to be developed for the FC-based capture system.
- Design and integration of the production target are under investigations and to be studied for both schemes.

Polarization	No/Yes***	Yes/(No*)	Yes	No	No	No

* The parameters are given for the electron-driven positron source being under consideration.

** Electron beam energy at the end of the main electron linac taking into account the losses in the undulator.

*** Polarization is considered as an upgrade option.

Linear Collider projects: high request for polarization, requested intensity should be produced in “one shot”.

Circular Collider projects: polarization is under discussion, requirements are relaxed due to stacking and top-up injection
