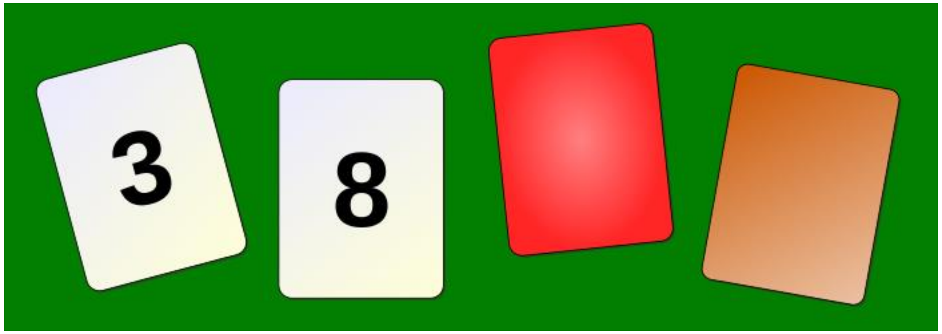
Lógica (“formal” e “da batata”)

Ou como decidir que experiências fazer.

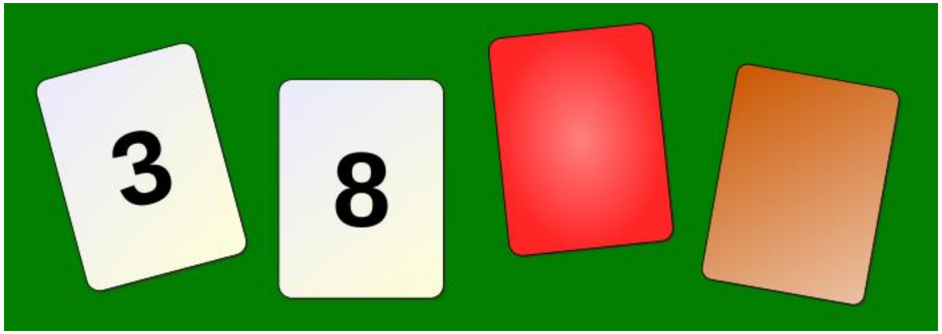
Wason selection task

- "You are shown a set of four cards placed on a table, each of which has a number on one side and a colored patch on the other side. The visible faces of the cards show 3, 8, red and brown. **Which card(s) <u>must</u> you turn over in order to test the truth** of the proposition that **if a card shows an even number on one face, then its opposite face is red?**"



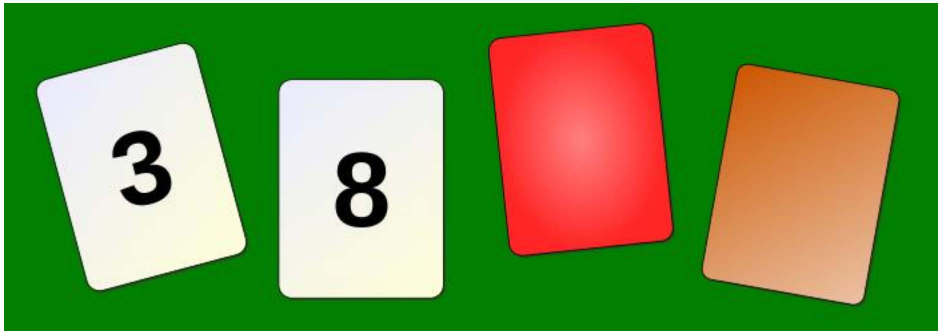
Wason selection task

- “Há quatro cartas na mesa, cada uma com um número num lado e uma cor no outro. Podemos ver um 3, um 8, uma vermelha, e uma castanha. **Que carta(s) <u>têm</u> que ser viradas de forma a testar a veracidade** da proposição que **se uma carta tem um número par de um lado, então a cor do outro lado é vermelho?”**



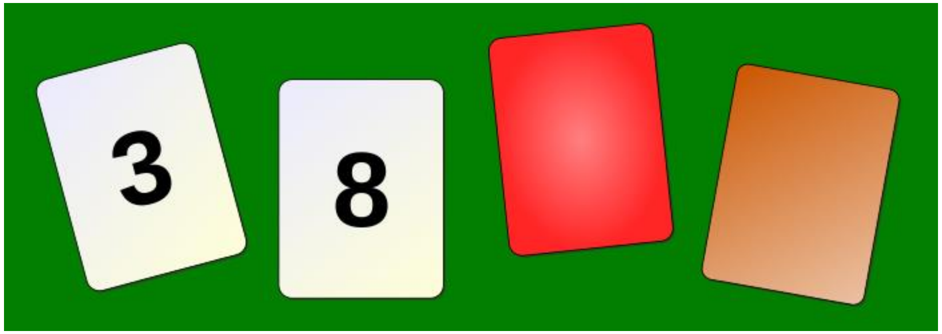
Trocado por miúdos

- Como testar a ideia que “**par ⇒ vermelho**”?



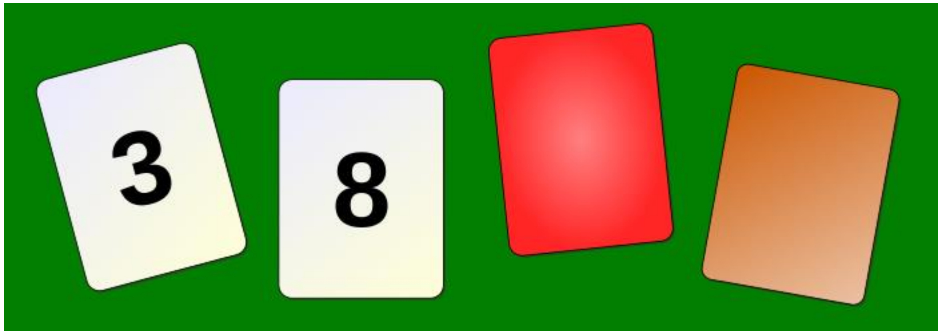
Lógica (formal)

- A ⇒ B
- Ou seja:
  par ⇒ vermelho



Lógica (formal)

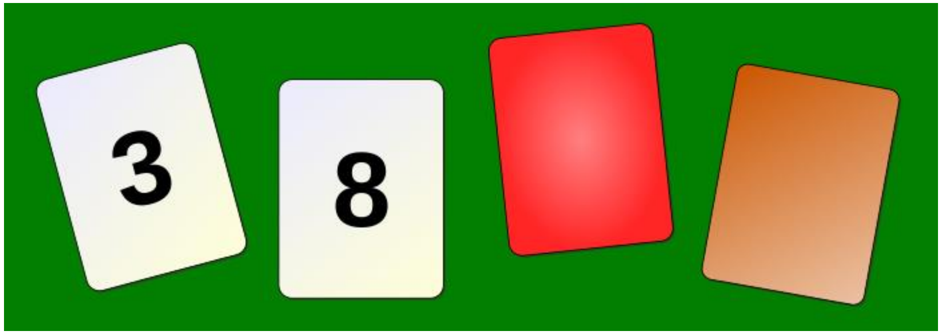
- $A \Rightarrow B \Leftrightarrow \neg B \Rightarrow \neg A$.
- Ou seja:
  par ⇒ vermelho ⇔ não-vermelho ⇒ não-par.



Lógica (da batata)

- par ⇒ vermelho
  ⇔
  não-vermelho ⇒ não-par.

- O que é que a regra implica para cada uma das cartas?



Respeitar a incerteza

A importância da incerteza

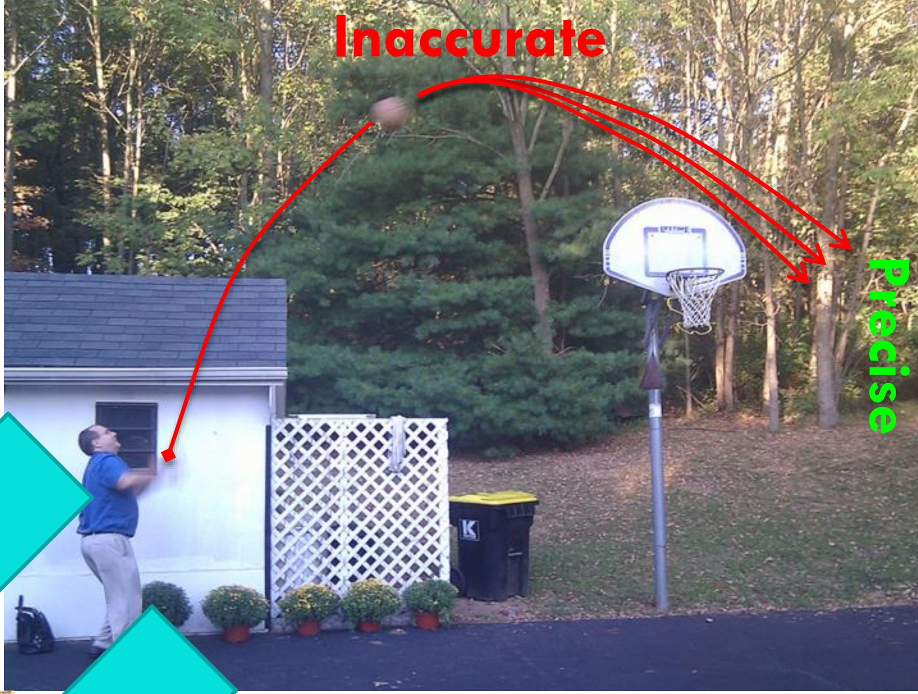
Erros não são incertezas

Two words on *error and uncertainty*

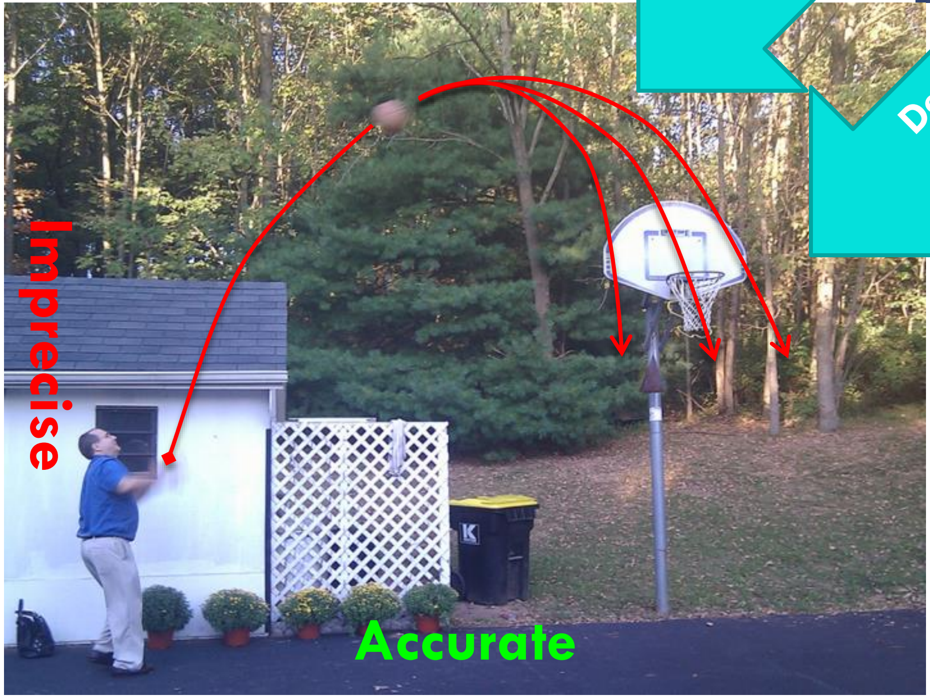
- **Error:** the result of a **bias** or **mistake.**
- **Uncertainty:** the degree to which some thing is not known.

- ***It's a mistake to call errors uncertainties.***
- E.g., experimentalists correct for systematic effects (biases).
  - Corrections come with added uncertainty.



Correct bias

Decrease precision



"Água mole em pedra dura..."

Ou o preço de pesquisar coisas novas.

An offer you can’t refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.

An offer you can't refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
  - What's the probability of that happening by chance?

An offer you can't refuse

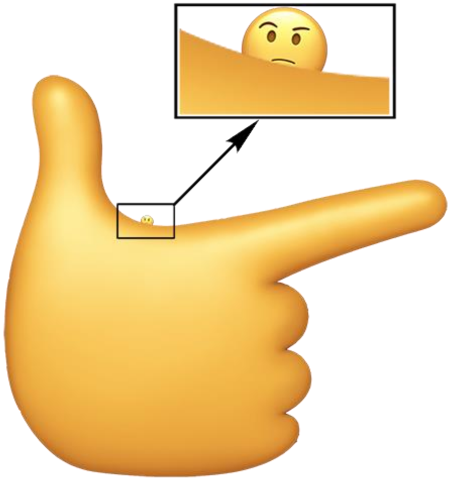
- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
  - What's the probability of that happening at random?

- Surely you should send me $1000 to invest for you.
  - **Right?**

An offer you can't refuse

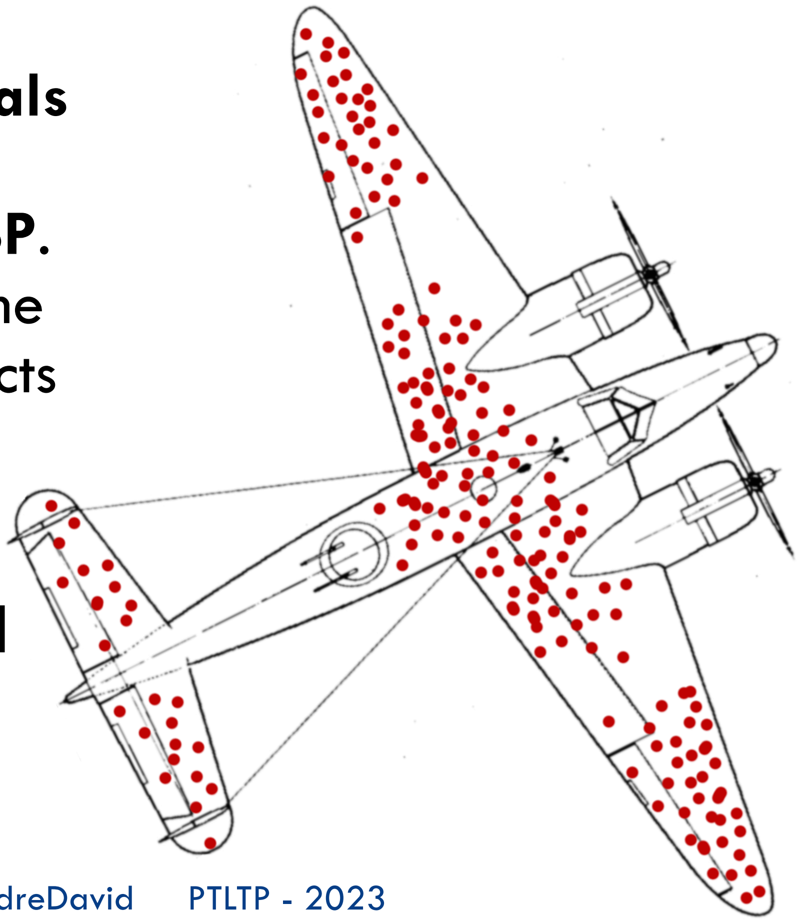
- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
  - What's the probability of that happening at random?

- Surely you should send me $1000 to invest for you.
  - **Right?**

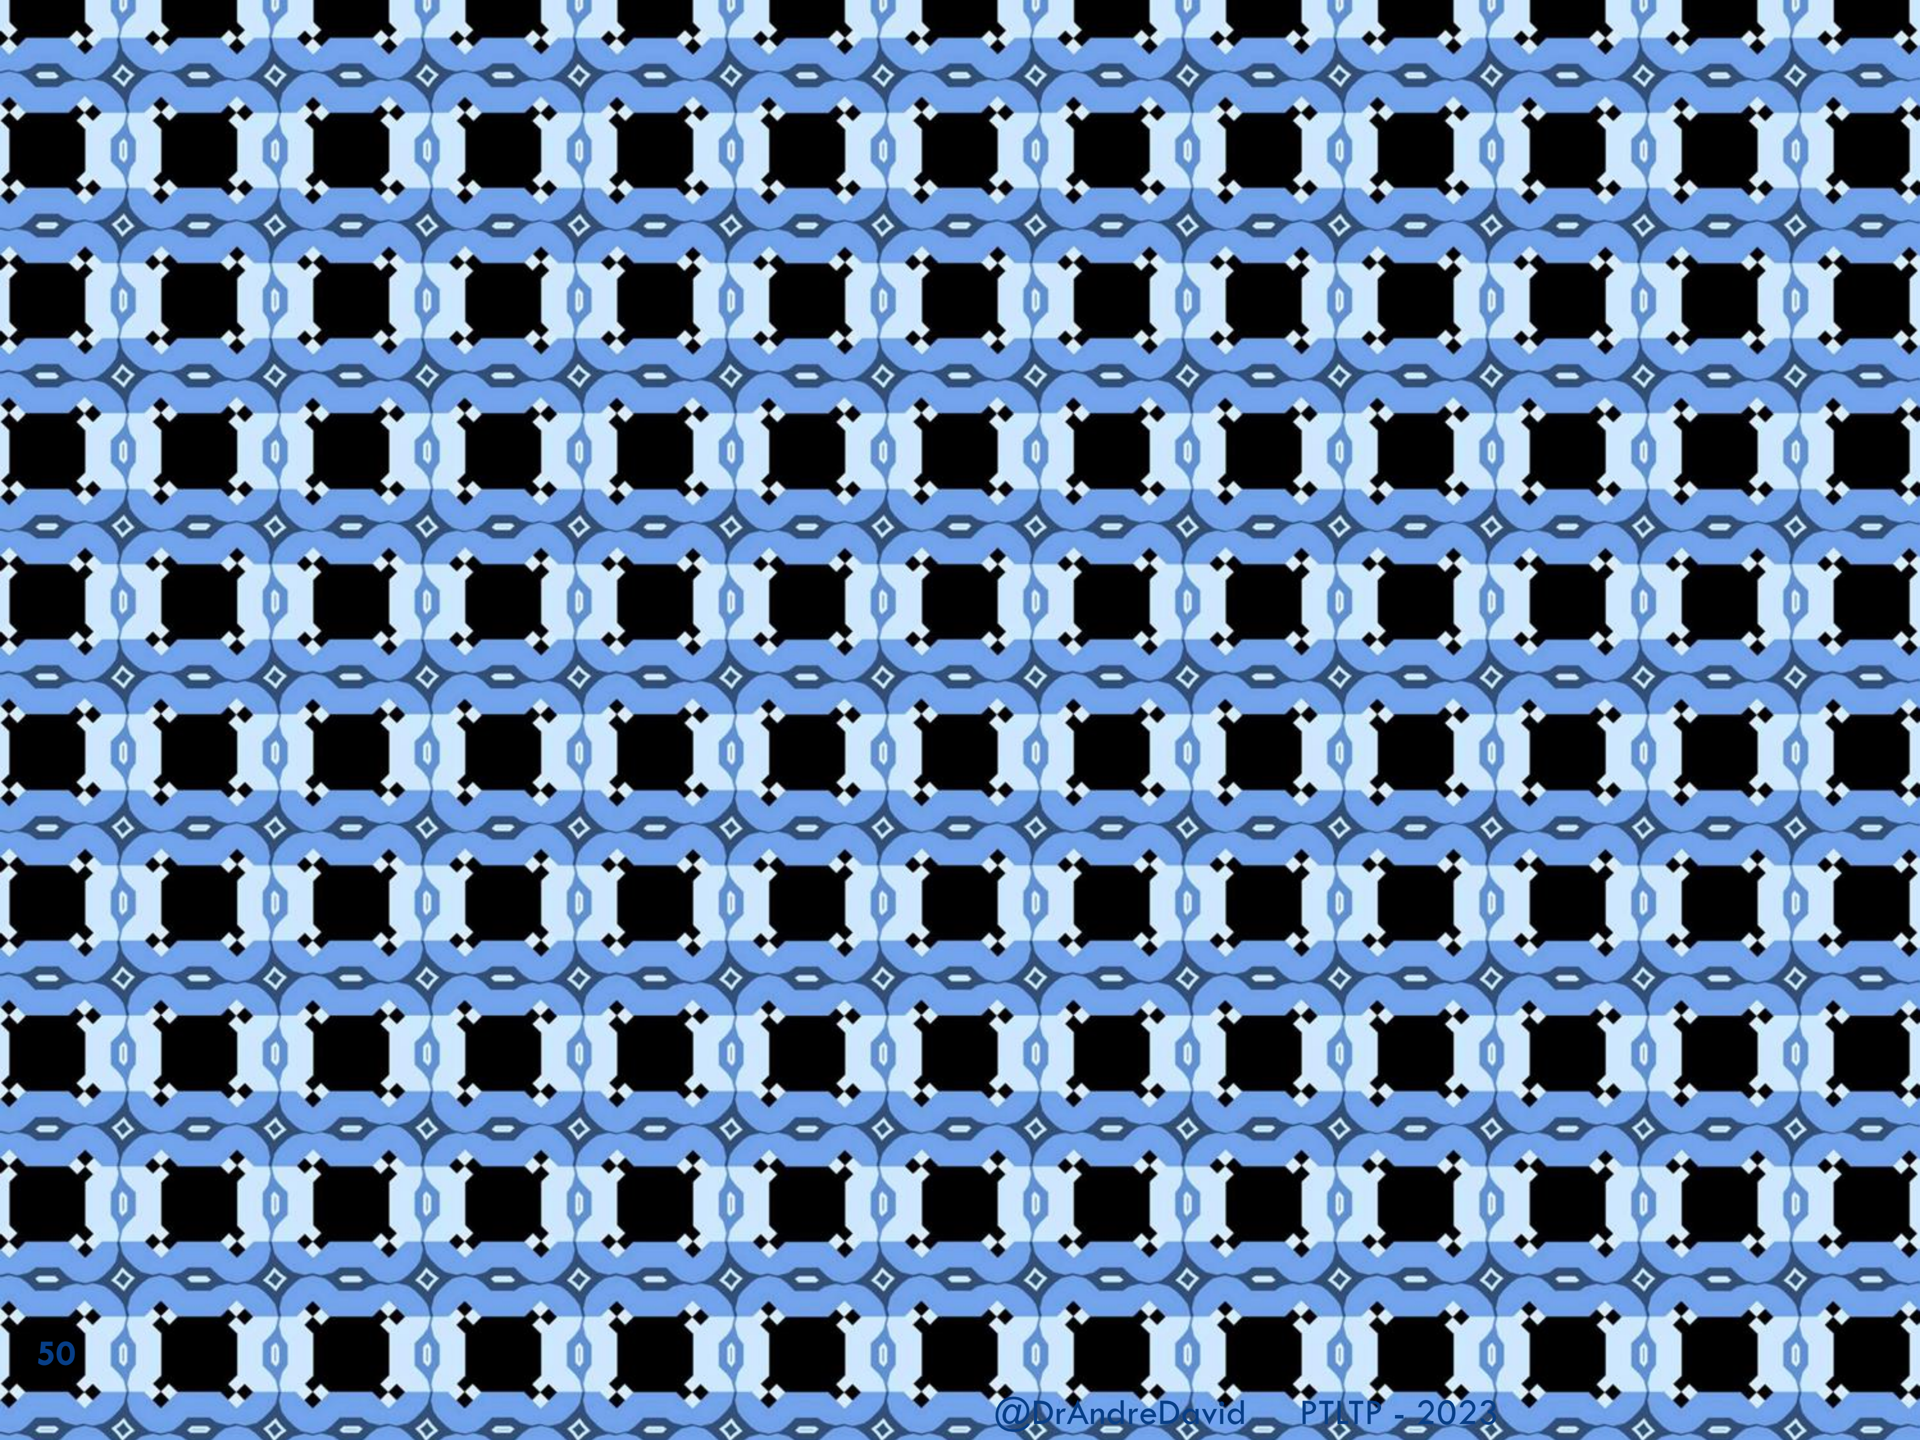


What is the denominator/context?

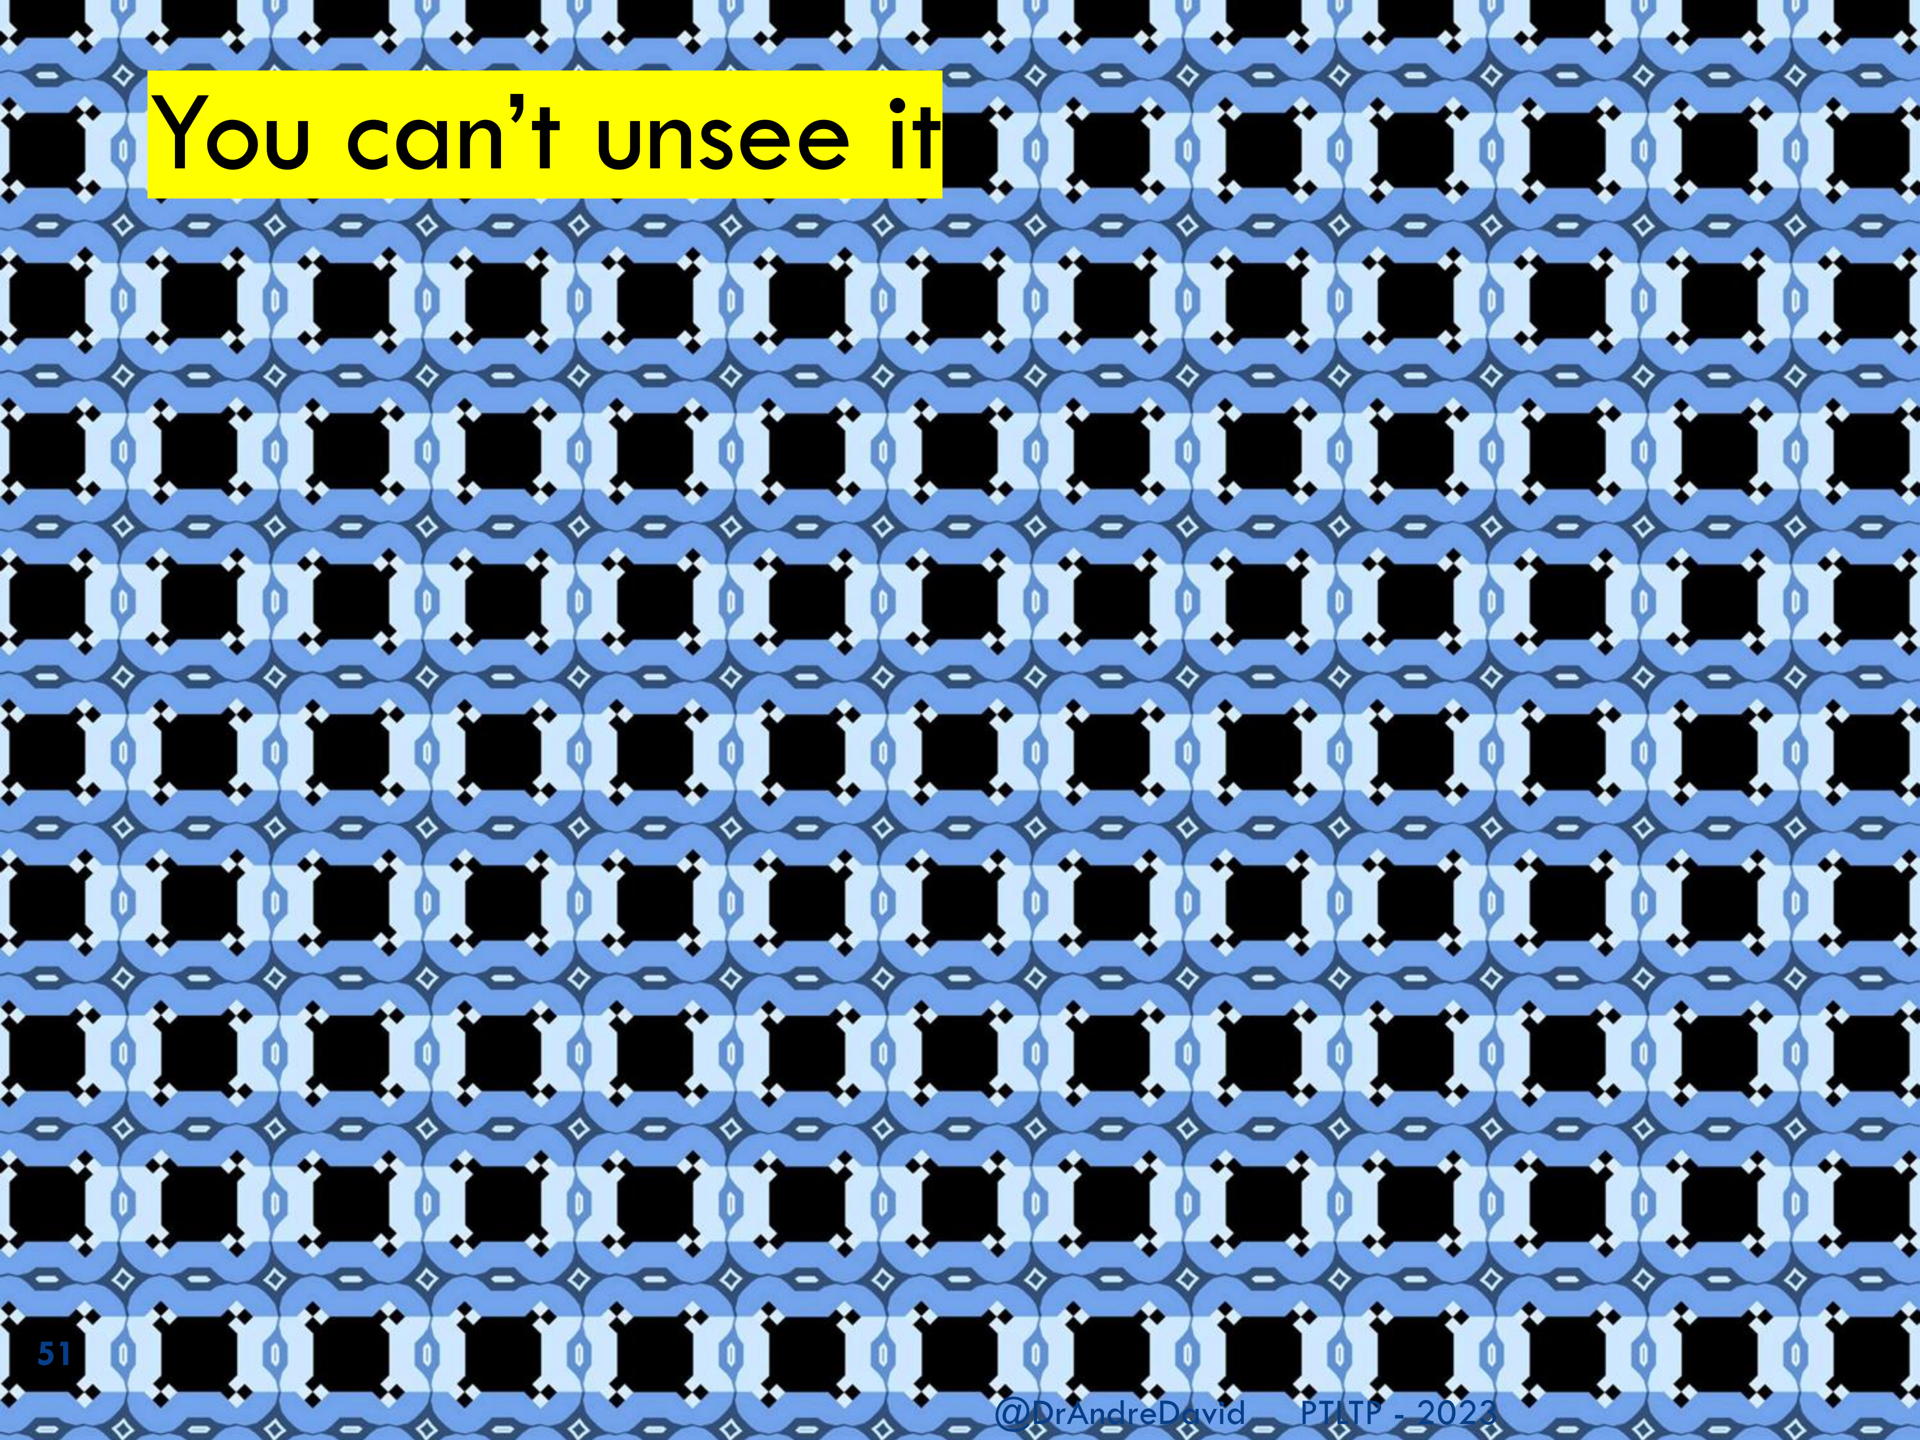
- Survivorship bias.
  - "the parapsychology researcher Joseph Banks Rhine **believed he had identified the few individuals from hundreds of potential subjects who had powers of ESP.** His calculations were based on the improbability of these few subjects guessing"



- **Important when reporting and story-telling.**



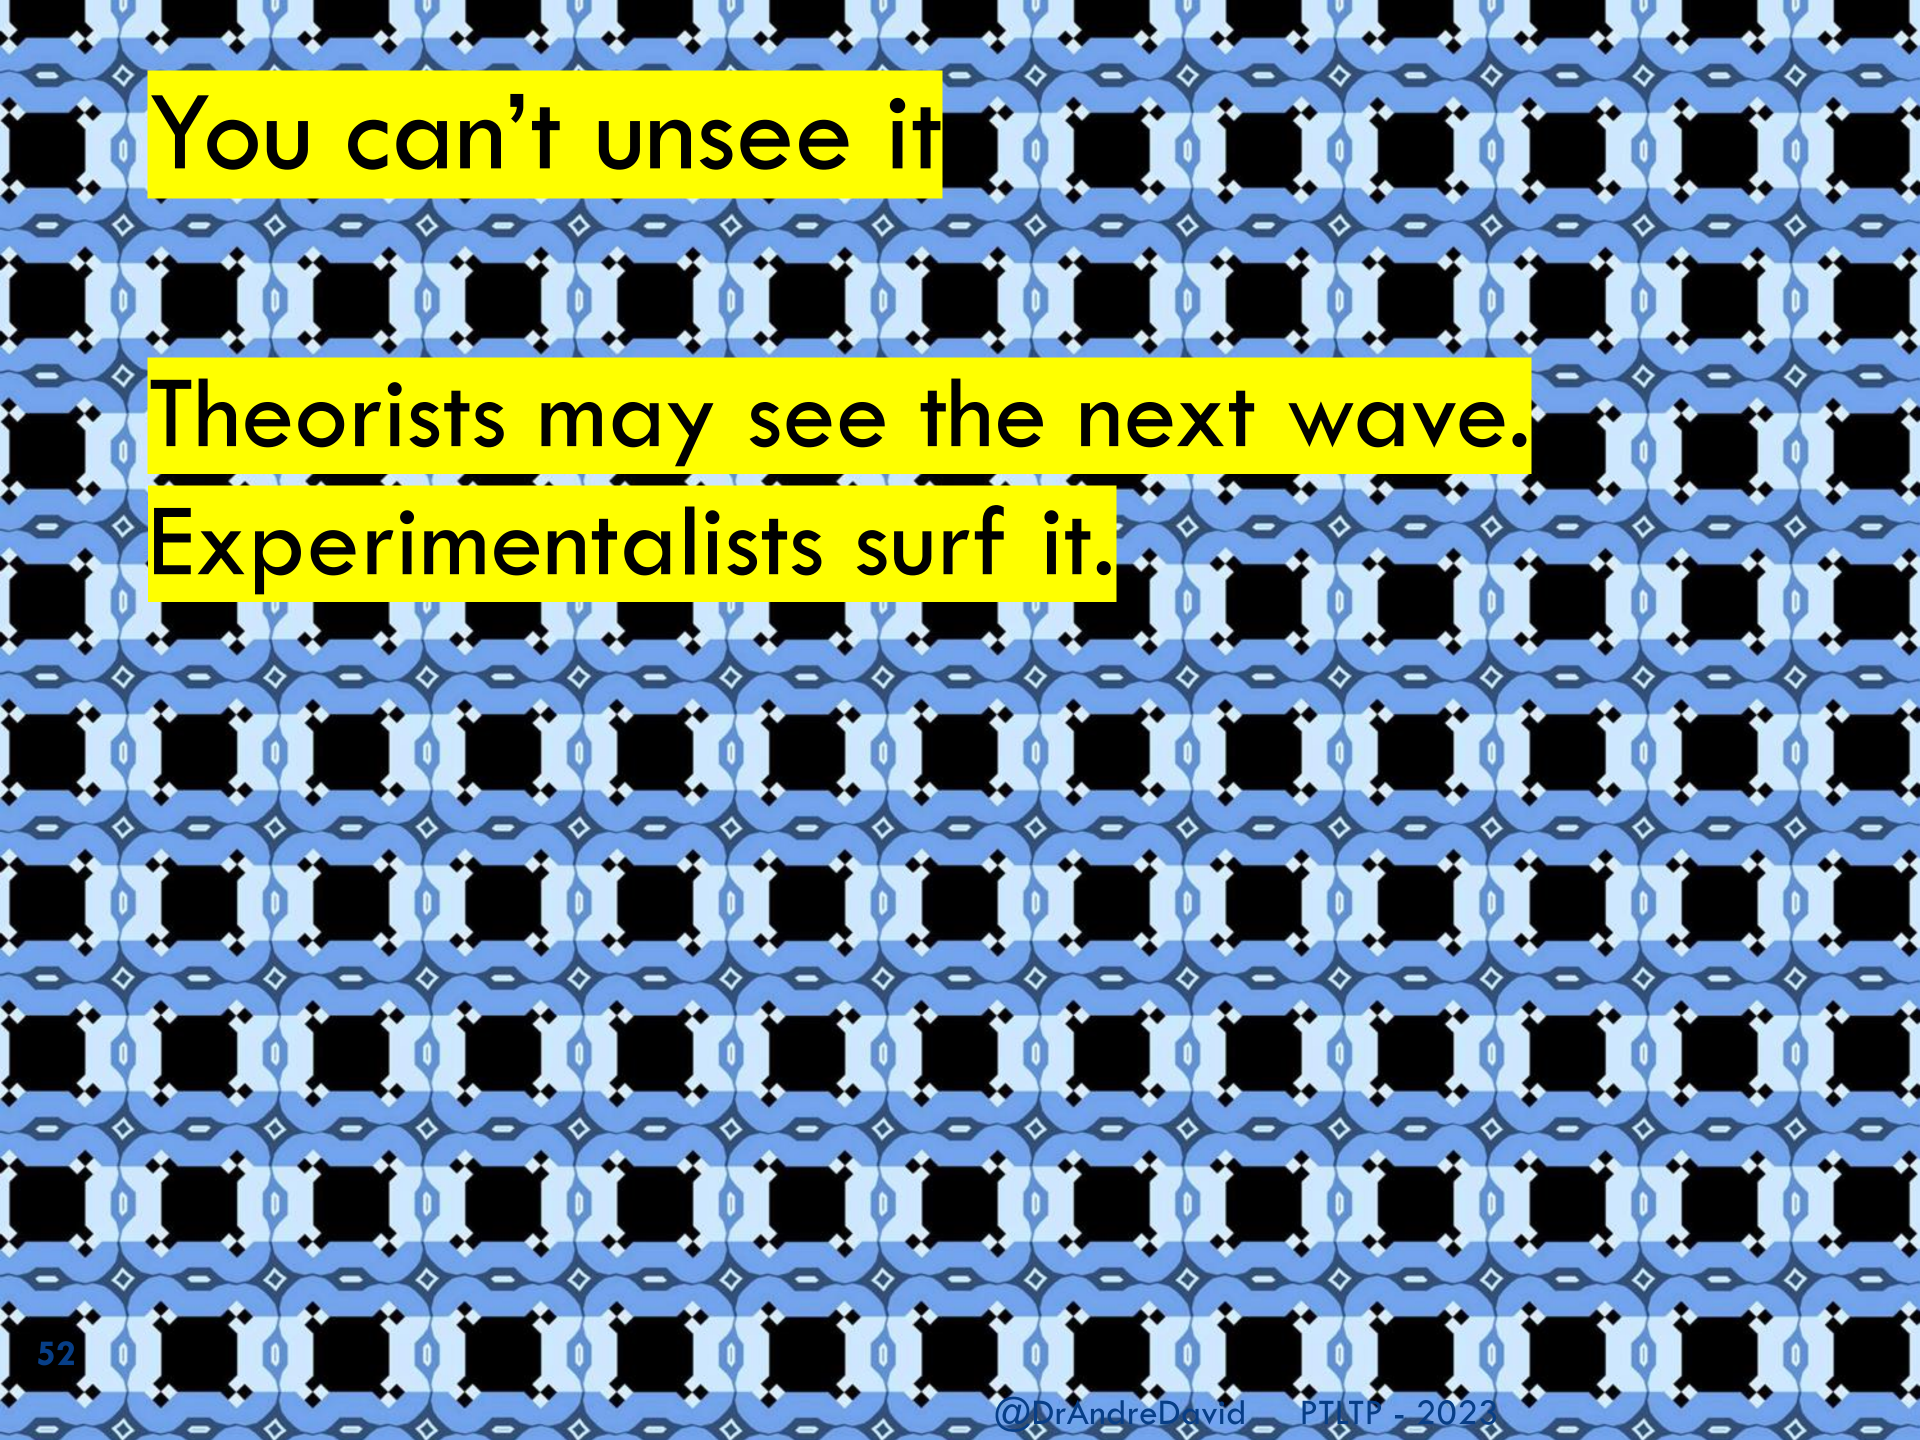
You can't unsee it

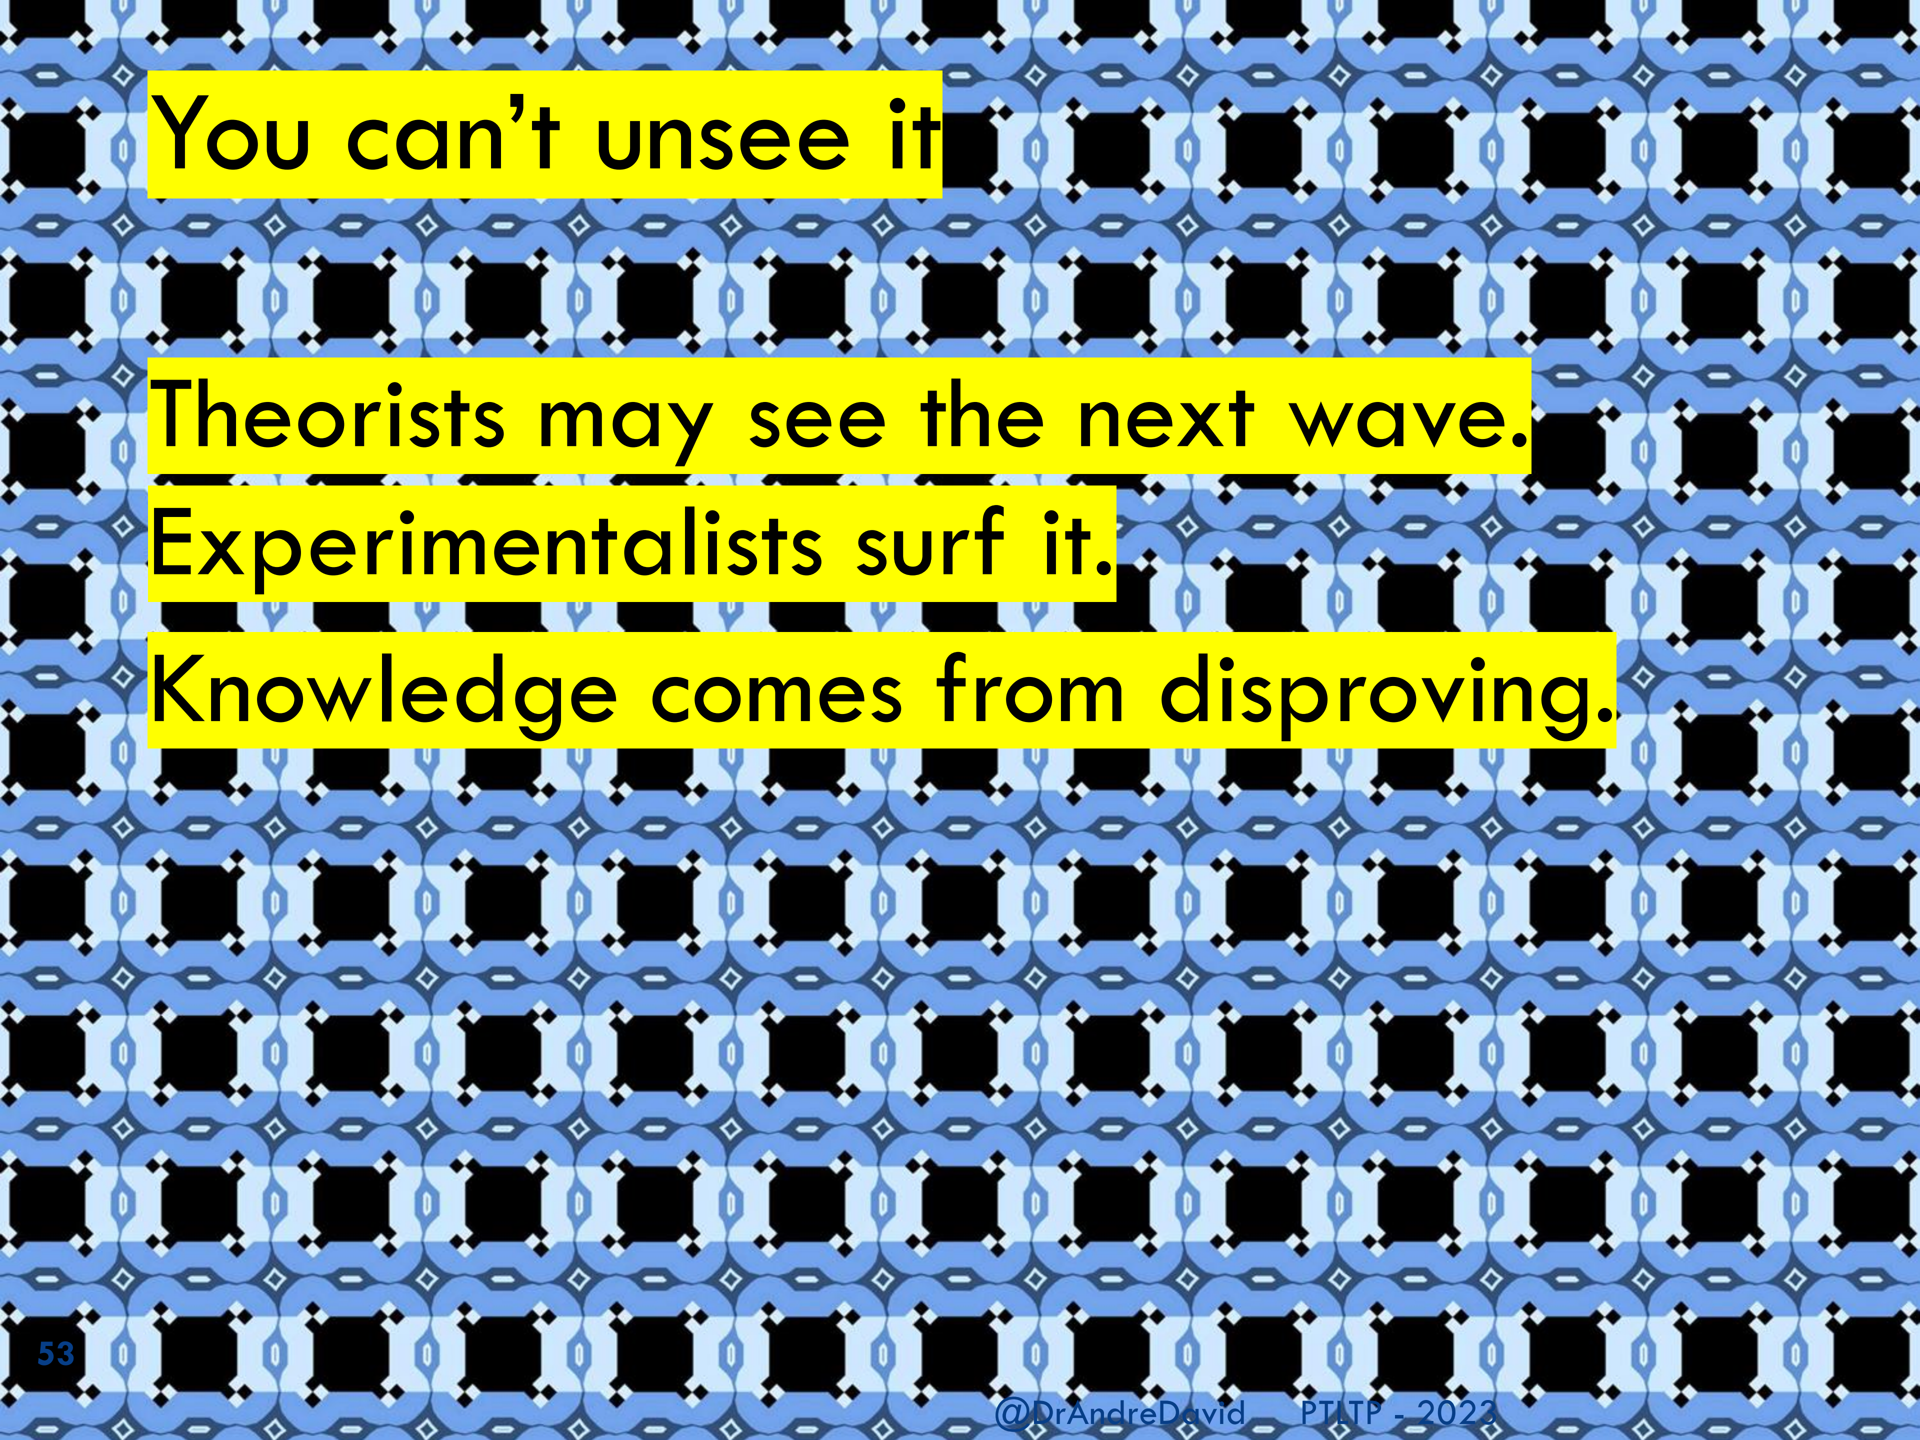


You can’t unsee it

Theorists may see the next wave.

Experimentalists surf it.





You can’t unsee it

Theorists may see the next wave.

Experimentalists surf it.

Knowledge comes from disproving.

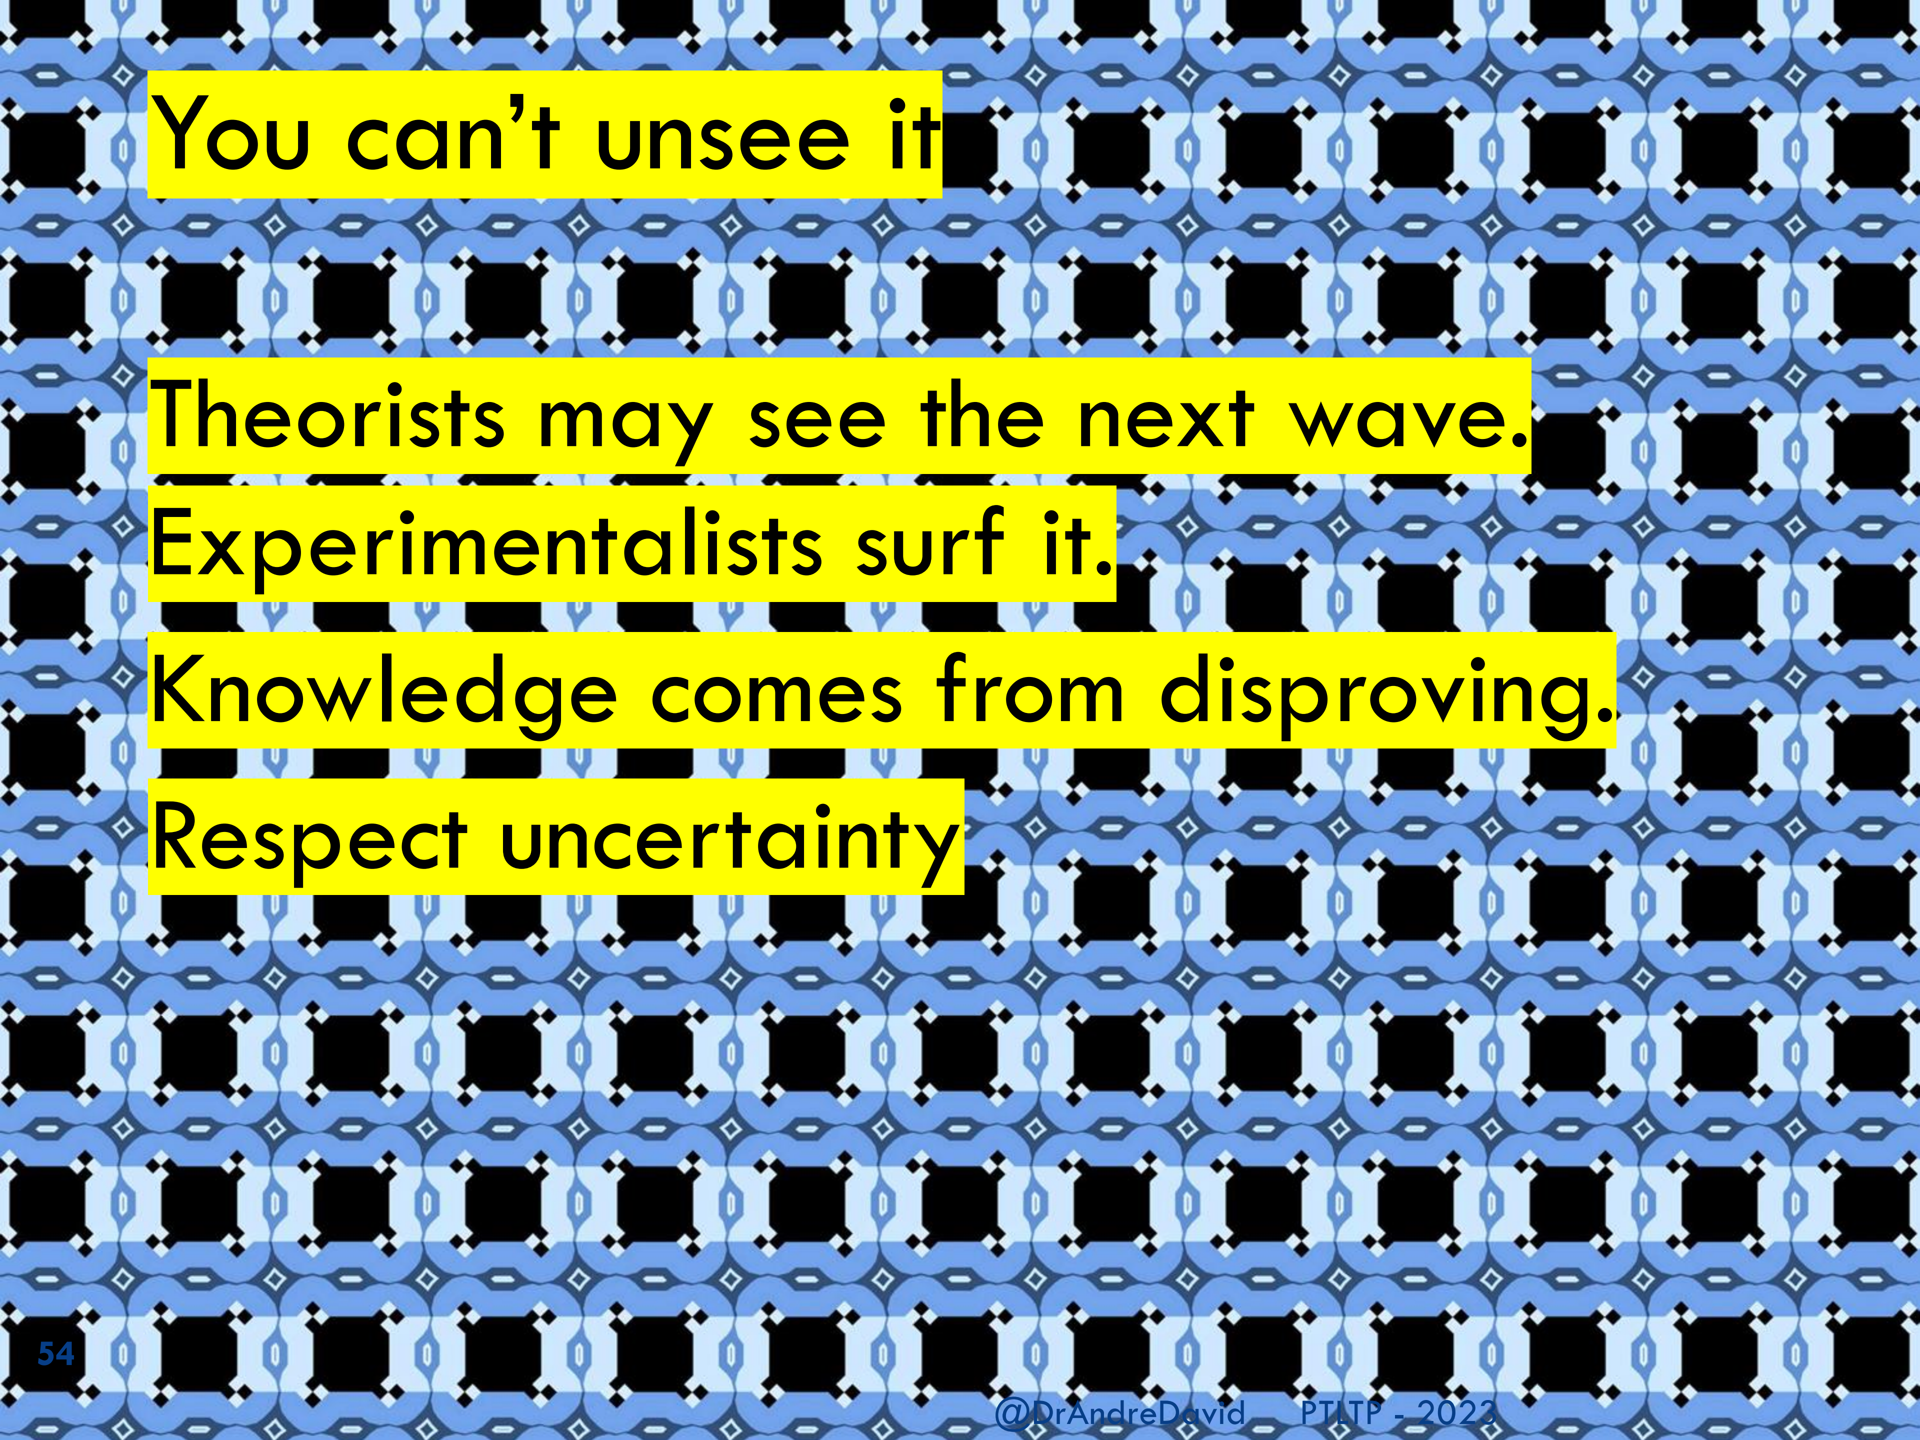
You can't unsee it

Theorists may see the next wave.

Experimentalists surf it.

Knowledge comes from disproving.

Respect uncertainty



You can’t unsee it

Theorists may see the next wave.

Experimentalists surf it.

Knowledge comes from disproving.

Respect uncertainty.

Don’t mistake error for uncertainty.

You can't unsee it

Theorists may see the next wave.
Experimentalists surf it.
Knowledge comes from disproving.
Respect uncertainty.
Don't mistake error for uncertainty.
The harder you look, the more you find.
What is the denominator?

The experimental method

falsifying theories since the dawn of reason

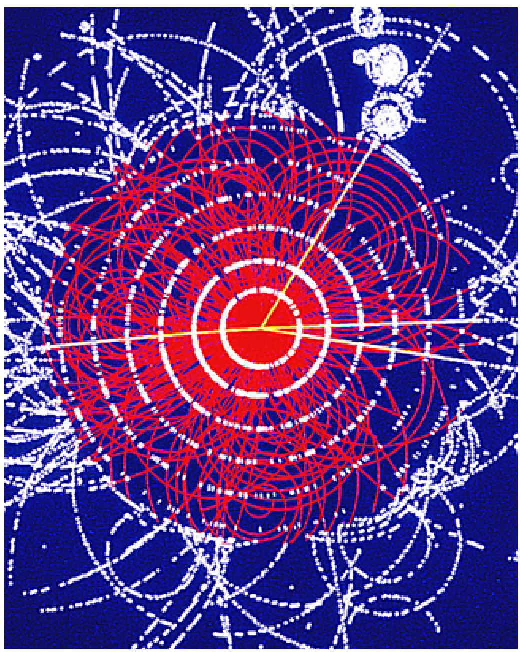
Who Should Be TIME's Person of the Year 2012?

As always, TIME's editors will choose the Person of the Year, but that doesn't mean readers shouldn't have their say. Cast your vote for the person you think most influenced the news this year for better or worse. Voting closes at 11:59 p.m. on Dec. 12, and the winner will be announced on Dec. 14.

THE CANDIDATES

The Higgs Boson

By Jeffrey Kluger | Monday, Nov. 26, 2012



SSPL/GETTY IMAGES

Simulation of a Higgs-Boson decaying into four muons, CERN, 1990.

What do you think?

Should **The Higgs Boson** be TIME's Person of the Year 2012?

Definitely No Way

VOTE

Take a moment to thank this little particle for all the work it does, because without it, you'd be just inchoate energy without so much as a bit of mass. What's more, the same would be true for the entire universe. It was in the 1960s that Scottish physicist Peter Higgs first posited the existence of a particle that causes energy to make the jump to matter. But it was not until last summer that a team of researchers at Europe's Large Hadron Collider — Rolf Heuer, Joseph Incandela and Fabiola Gianotti — at last sealed the deal and in so doing finally fully confirmed Einstein's general theory of relativity. The Higgs — as particles do — immediately decayed to more-fundamental particles, but the scientists would surely be happy to collect any honors or awards in its stead.

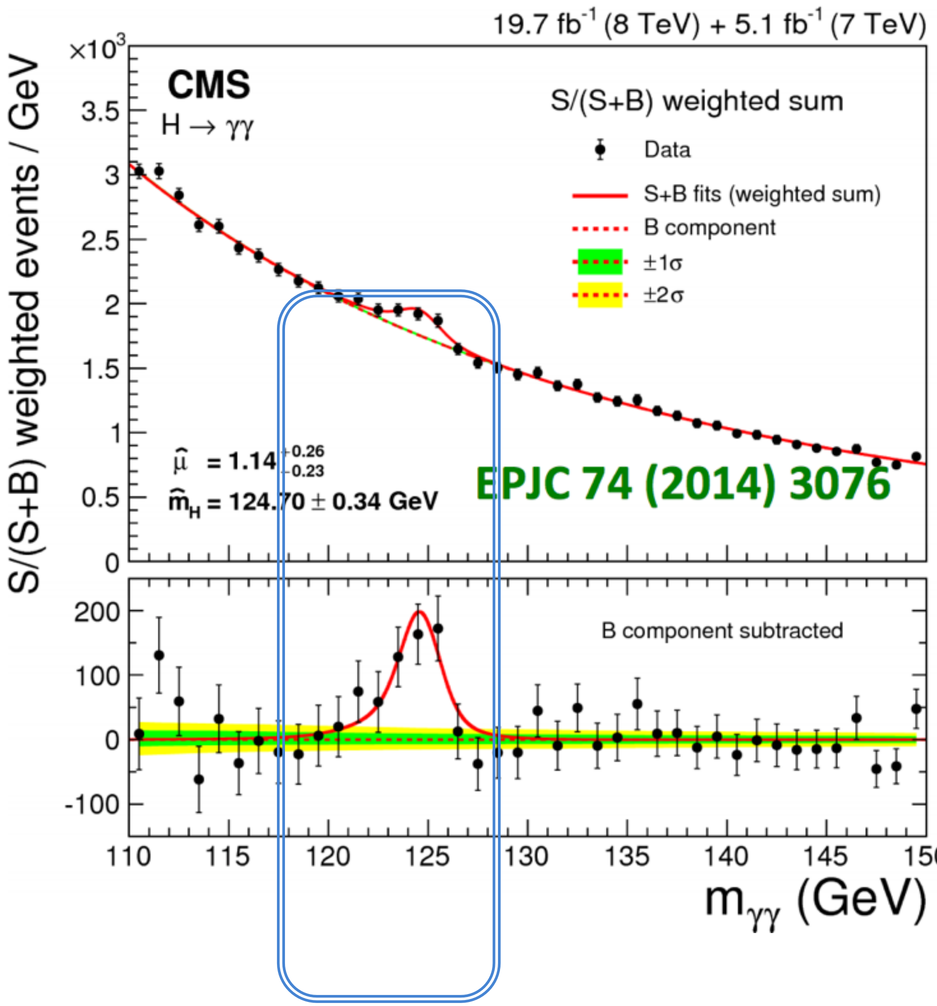
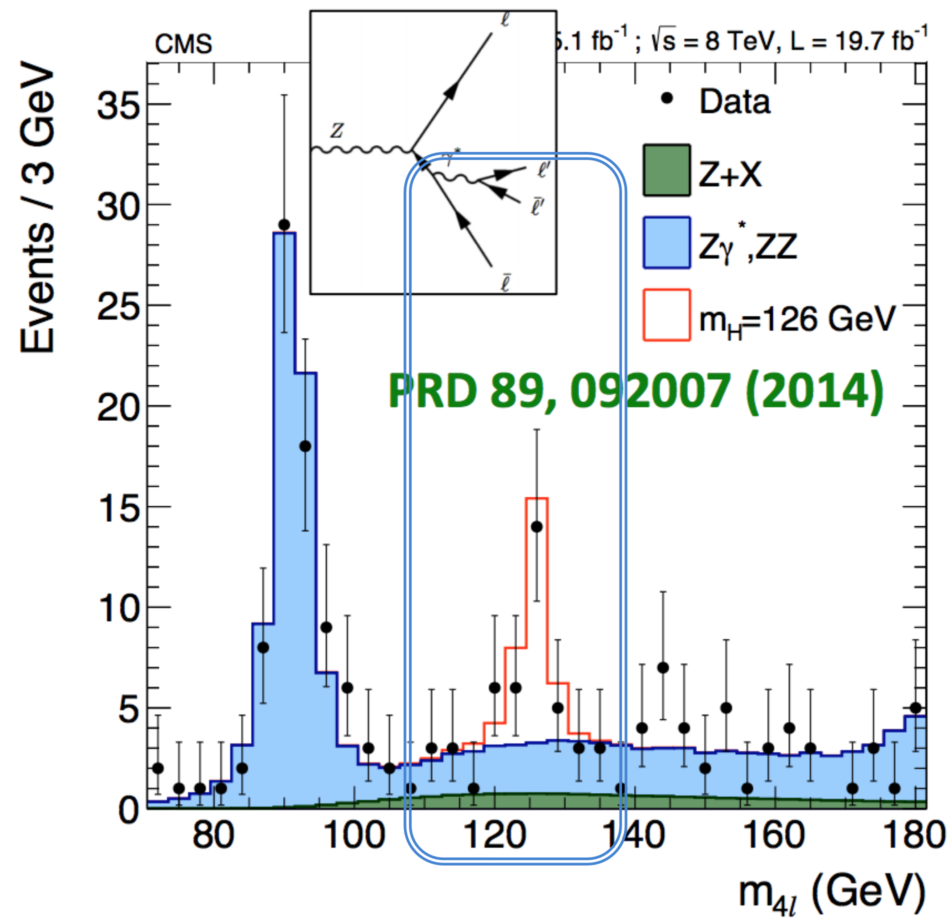
What is the Higgs boson mass?

Something that the SM does not predict.

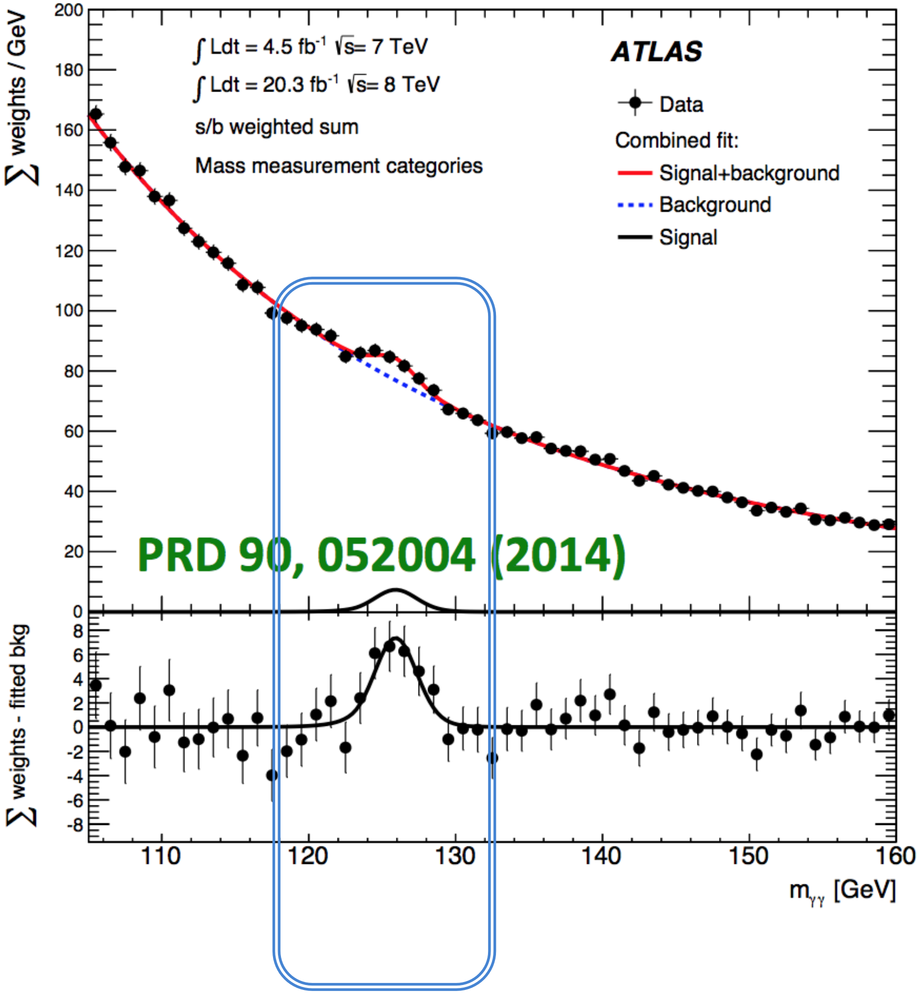
Something we can measure!

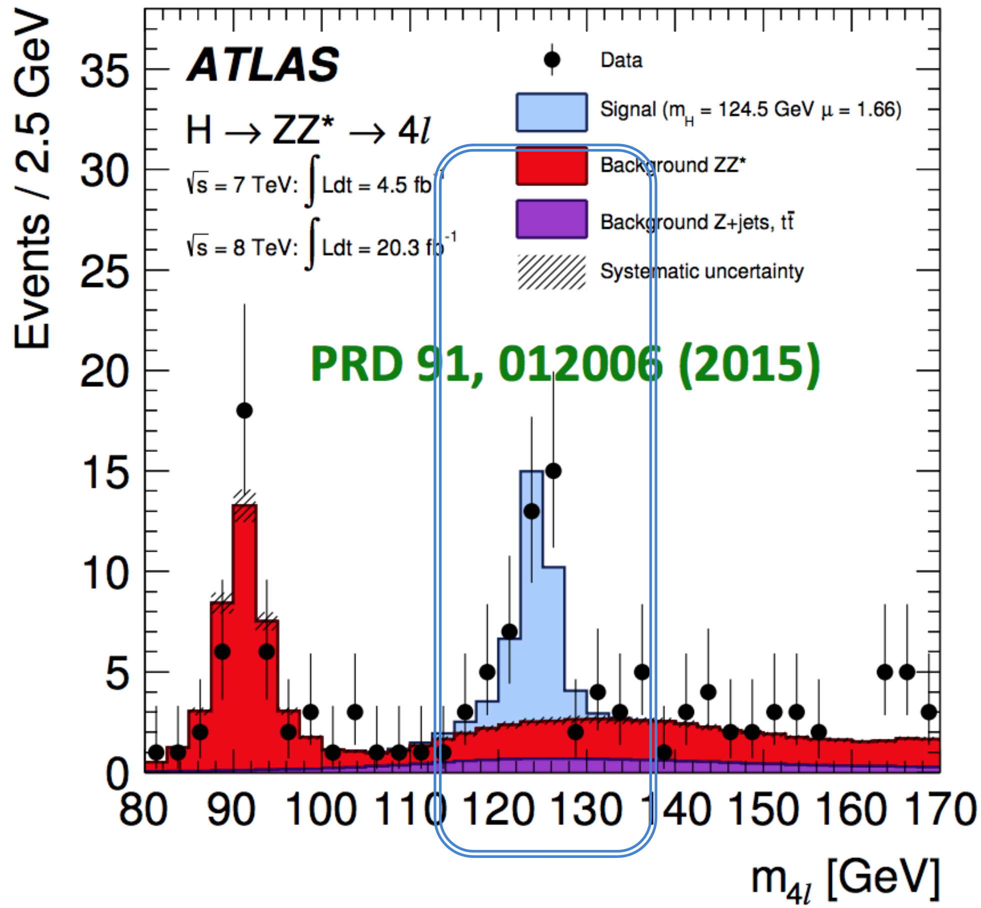
Mass peaks: mass measurements





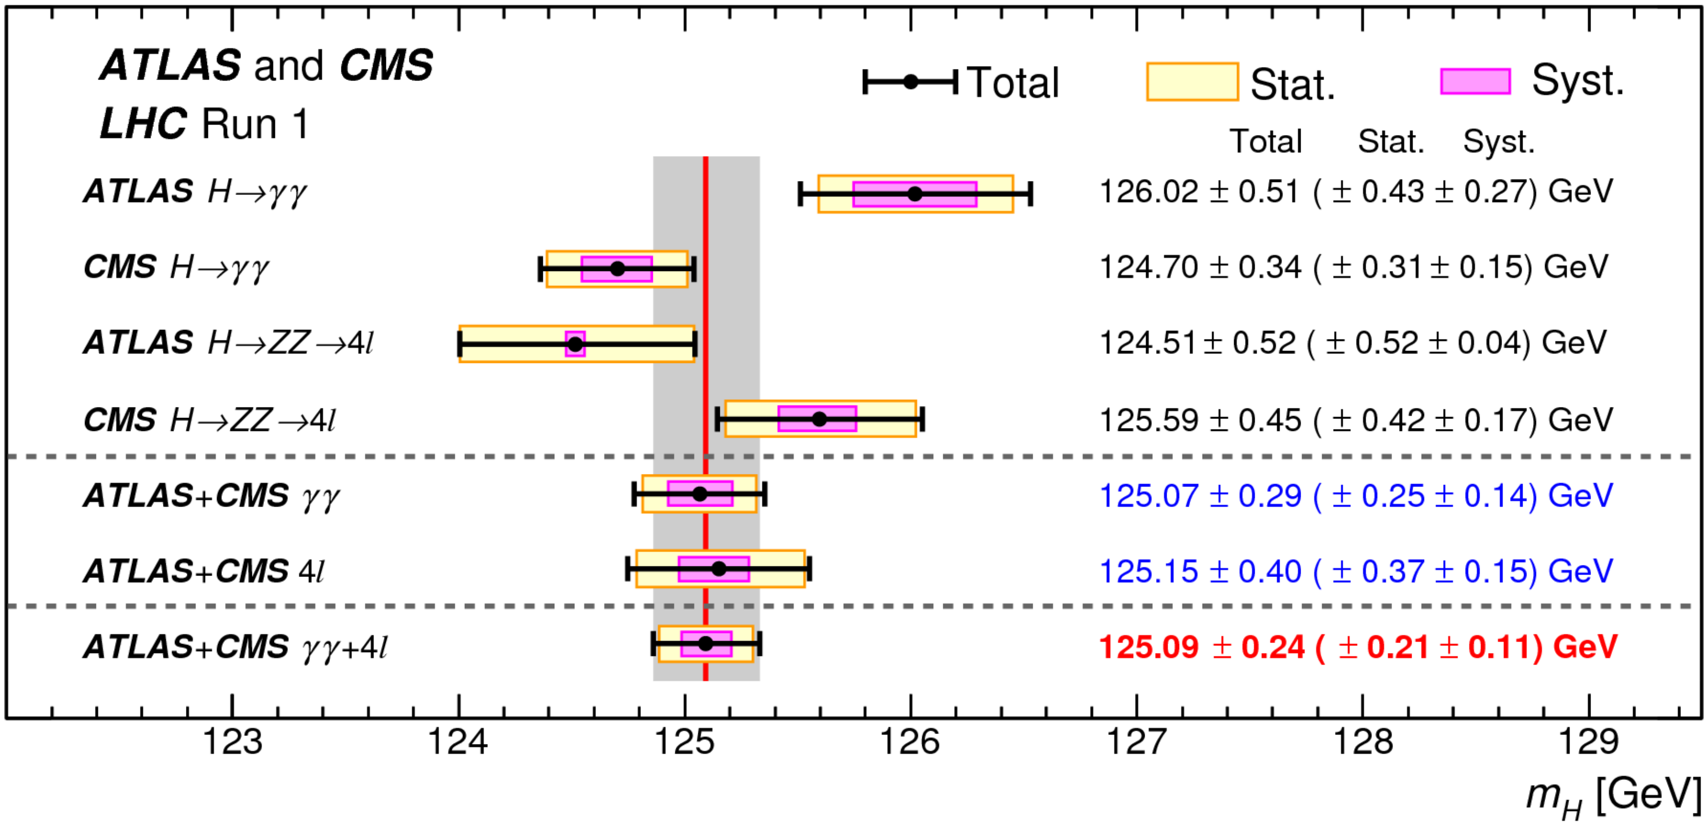
Mass peaks: mass measurements





Combined LHC mass measurement

[arXiv:1503.07589]



Combined LHC mass measurement

[arXiv:1503.07589]

$$m_H = 125.09 \pm 0.21\ (\text{stat})$$
$$\pm 0.11\ (\text{scale})$$
$$\pm 0.02\ (\text{other})$$
$$\pm 0.01\ (\text{theory}^*)$$
$$\text{GeV}$$

Stat. uncertainty dominates overall.

Energy scale syst. can be improved.

Run 2 will reduce uncertainty !

For the record

- ~5150 authors.
- Found that there are two:
  - Archana Sharma (both CMS)
  - Andrea Bocci
  - Muhammad Ahmad
  - F. M. Giorgi (one CMS, one ATLAS)

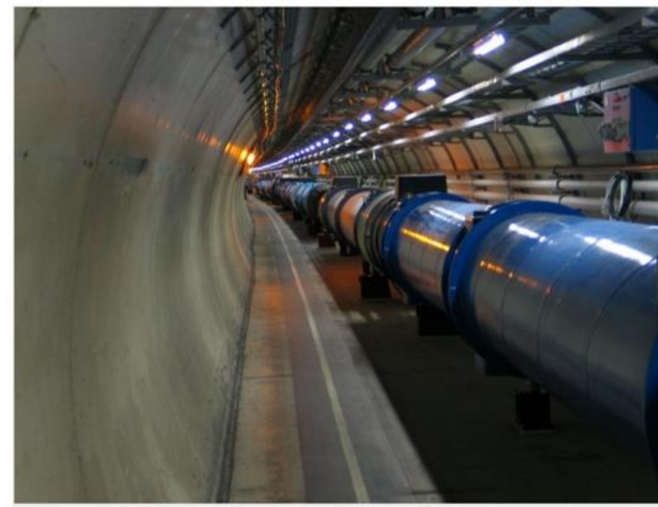
NATURE | NEWS

Physics paper sets record with more than 5,000 authors

Detector teams at the Large Hadron Collider collaborated for a more precise estimate of the size of the Higgs boson.

Davide Castelvecchi

15 May 2015



CERN

Thousands of scientists and engineers have worked on the Large Hadron Collider at CERN.

A physics paper with 5,154 authors has — as far as anyone knows — broken the record for the largest number of contributors to a single research article.

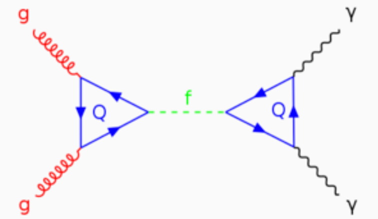
750 GeV diphoton excess

From Wikipedia, the free encyclopedia

The **750 GeV diphoton excess** in particle physics was an anomaly in data collected at the Large Hadron Collider (LHC) in 2015, which could have been an indication of a new particle or resonance.[8][9] The anomaly was absent in data collected in 2016, suggesting that the diphoton excess was a statistical fluctuation.[1][2] In the interval between the December 2015 and August 2016 results, the anomaly generated considerable interest in the scientific community, including about 500 theoretical studies.[10] The hypothetical particle was denoted by the Greek letter Ϝ (pronounced digamma) in the scientific literature, owing to the decay channel in which the anomaly occurred.[3] The data, however, were always less than five standard deviations (sigma) different from that expected if there was no new particle, and, as such, the anomaly never reached the accepted level of statistical significance required to announce a discovery in particle physics.[11] The digamma was refuted in August 2016 publications.

Digamma



Possible production and decay mechanism of the digamma resonance at LHC.

Composition	Elementary particle
Statistics	suspected bosonic
Status	Refuted; absent in August 2016 data[1][2]
Symbol	Ϝ,[3] Ϝ(750),[4] ϕ,[5] X,[6] η_{zy}[7]
Discovered	Resonance of mass ≈750 GeV decaying into two photons could have been seen by CERN in 2015[8][9] (though sufficient statistical significance never reached)
Mass	≈ 750 GeV/c^2 (CMS + ATLAS)[8][9]
Decay width	< 50 GeV/c^2[8][9]
Decays into	two photons (hinted in 2015 data;[8][9] absent in 2016 data[1][2]) two Z-bosons (predicted) one photon + one Z-boson (predicted) two W bosons (predicted) two gluons (predicted)

December 2015 data [edit]

On December 15, 2015, the ATLAS and CMS collaborations at CERN presented results from the second operational run of the Large Hadron Collider (LHC) at the center of mass energy of 13 TeV, the highest ever achieved in proton-proton collisions. Among the results, the invariant mass distribution of pairs of high-energy photons produced in the collisions showed an excess of events compared to the Standard Model prediction at around 750 GeV/c^2. The statistical significance of the deviation was reported to be 3.9 and 3.4 standard deviations (locally) respectively for each experiment.

The excess could have been explained by the production of a new particle (the digamma) with a mass of about 750 GeV/c^2 that decayed into two photons. The cross-section at 13 TeV centre of mass energy required to explain the excess, multiplied by the branching fraction into two photons, was estimated to be

$$\sigma(pp \to F) \times \mathrm{Br}(F \to \gamma\gamma) \approx 5\,\mathrm{fb}$$

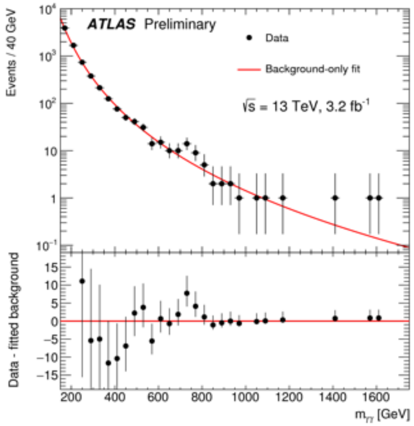
(fb=femtobarns)

This result, while unexpected, was compatible with previous experiments, and in particular with the LHC measurements at a lower centre of mass energy of 8 TeV.

August 2016 data [edit]

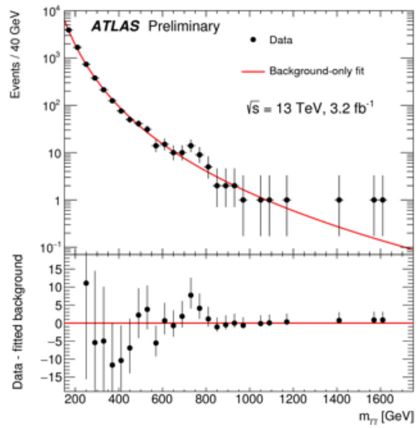
Analysis of a larger sample of data, collected by ATLAS and CMS in the first half 2016, did not confirm the existence of the Ϝ particle, which indicates that the excess seen in 2015 was a statistical fluctuation.[1][2]

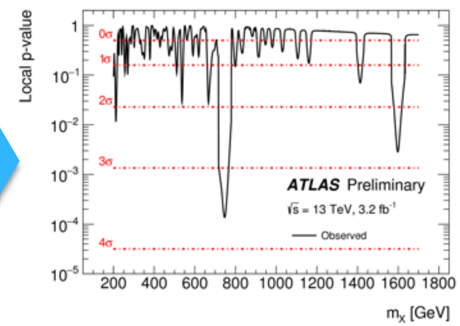
Diphoton resonances

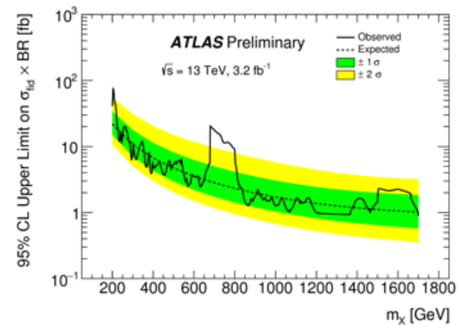


>90% prompt-prompt, $\sigma_m/m \sim 1\%$

Diphoton resonances







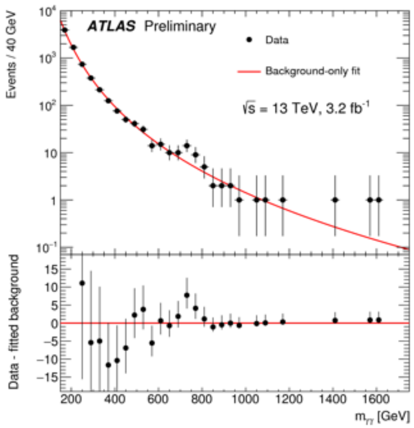
>90% prompt-prompt, $\sigma_m/m \sim 1\%$

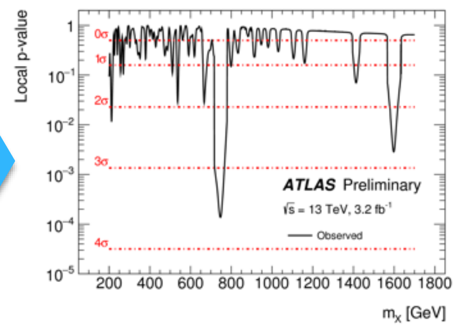
For $m_X = 750$ GeV

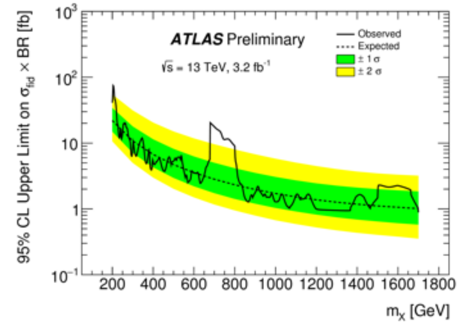
$3.6\sigma \rightarrow$ **2.0σ after LEE**

($3.9\sigma \rightarrow 2.3\sigma$ for $\Gamma = 6\%$)

Diphoton resonances





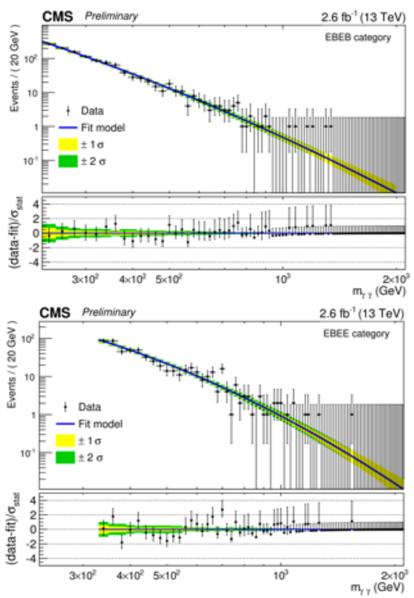


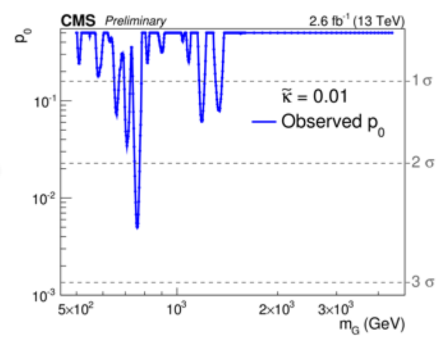
>90% prompt-prompt, σ_m/m ~1%

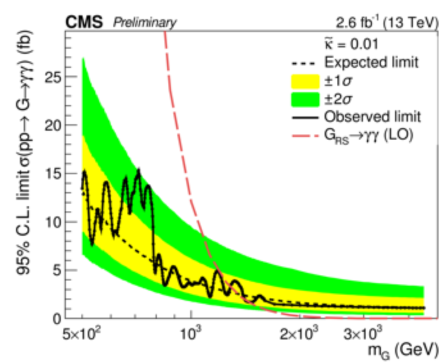
For m_X = 750 GeV

3.6σ → **2.0σ after LEE**

(3.9σ → 2.3σ for Γ = 6%)







For m_G = 760 GeV

2.6σ → **1.2σ after LEE**
