

Poetry in Orbit: MultiMessenger Astrophysics with the Probe Of Extreme Multi-Messenger Astrophysics (POEMMA)

Science Goals:

- **Discover the origin of Ultra-High Energy Cosmic Rays**
Measure Spectrum, composition, Sky Distribution at Highest Energies ($E_{CR} > 20 \text{ EeV}$) using stereo air fluorescence technique

- **Observe Neutrinos from Transient Astrophysical Events**
Measure beamed Cherenkov light from upward-moving EAS from τ -leptons source by ν_τ interactions in the Earth ($E_\nu > 20 \text{ PeV}$)

PERFORMANCE AND SCIENCE REACH OF THE PROBE OF ... PHYS. REV. D 101, 023012 (2020)

UHECRs: $E > 20$ EeV

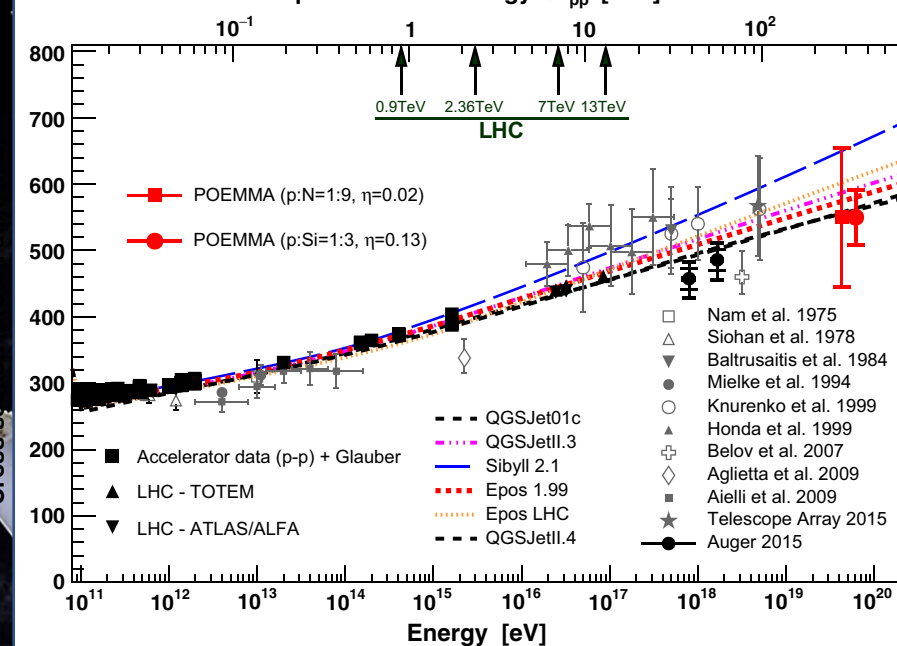

FIG. 23. Left: Skymap of nearby starburst galaxies from Refs. [35,103] weighted by radio flux at 1.4 GHz, the attenuation factor accounting for energy losses incurred by UHECRs through propagation, and the exposure of POEMMA. The map has been smoothed using a von Mises-Fisher distribution with concentration parameter corresponding to a search radius of 15.0° as found in Ref. [35]. The color scale indicates \mathcal{F}_{src} , the probability density of the source sky map, as a function of position on the sky. The white dot-dashed line indicates the supergalactic plane. Right: Same as at left for nearby galaxies from the 2MRS catalog [105] and weighting by K-band flux corrected for Galactic extinction.

VHE ν 's: $E > 20$ PeV

Equivalent c.m. energy \sqrt{s}_{pp} [TeV]

Proton-air cross section measurement at $\sqrt{s} \approx 300$ TeV

Energies and rates of the cosmic-ray particles

Where is the end of the Cosmic Ray Spectrum?

What is the flux and composition at the highest energy scales?

POEMMA: UHECR Exposure History:

POEMMA Science goals:

primary

- Discover the origin of **Ultra-High Energy Cosmic Rays via high-statistics**
Measure Spectrum, composition, Sky Distribution at Highest Energies ($E_{CR} > 20 \text{ EeV}$)
Requires very good angular, energy, and X_{max} resolutions: *stereo fluorescence*
High sensitivity UHE neutrino measurements via stereo fluorescence measurements
- Observe Neutrinos from Transient Astrophysical Events
Measure beamed Cherenkov light from upward-moving EAS from τ -leptons source by ν_τ interactions in the Earth ($E_\nu > 20 \text{ PeV}$)
Requires tilted-mode of operation to view limb of the Earth & $\sim 10 \text{ ns}$ timing
Allows for tilted UHECR air fluorescence operation, higher GF but degraded resolutions

secondary

- study fundamental physics with the most energetic cosmic particles: CRs and Neutrinos
- search for super-Heavy Dark Matter: *photons and neutrinos* : PhysRevD.101.023012 , PhysRevD.104.083002
- study Atmospheric Transient Events, survey Meteor Population, ...

POEMMA Science goals:

primary

- Discover the origin of Ultra-High Energy Cosmic Rays via high-statistics
Measure Spectrum, composition, Sky Distribution at Highest Energies ($E_{CR} > 20$ EeV)
Requires very good angular, energy, and X_{max} resolutions: *stereo fluorescence*
High sensitivity UHE neutrino measurements via stereo fluorescence measurements
- Observe **Neutrinos from Transient Astrophysical Events**
Measure beamed Cherenkov light from upward-moving EAS from τ -leptons source by ν_τ interactions in the Earth ($E_\nu > 20$ PeV)
Requires tilted-mode of operation to view limb of the Earth & ~ 10 ns timing
Allows for tilted UHECR air fluorescence operation, higher GF but degraded resolutions

secondary

- study fundamental physics with the most energetic cosmic particles: CRs and Neutrinos
- search for super-Heavy Dark Matter: *photons and neutrinos* : PhysRevD.101.023012 , PhysRevD.104.083002
- study Atmospheric Transient Events, survey Meteor Population, ...

POEMMA Science goals:

Mission Lifetime: 3 years (5 year goal)

Orbits: 525 km, 28.5° Inc

Orbit Period: 95 min

Satellite Separation: ~25 km – 1000+ km

Satellite Position: 1 m (knowledge)

Pointing Resolution: 0.1°

Pointing Knowledge: 0.01°

Slew Rate: 8 min for 90°

Satellite Wet Mass: 3860 kg

Power: 1250 W (w/contig)

Data: < 1 GB/day

Data Storage: 7 days

Communication: S-band

Clock synch (timing): 10 nsec

Operations:

- Each satellite collects data autonomously
- Coincidences analyzed on the ground
- View the Earth at near-moonless nights, charge in day and telemeter data to ground
- ToO Mode: dedicated com uplink to re-orient satellites if desired

Flight Dynamics/Propulsion:

- 300 km \Rightarrow 25 km SatSep
- Puts both in CherLight Pool
- $\Delta t = 3$ hr: 8 – 15 times
- $\Delta t = 24$ hr: 90 times

Dual Manifest Atlas V

**Stereo Viewing of UHECRs $E \gtrsim 20$ EeV
via Fluorescence: 10's of μ sec timescale**

**Dark, quasi-moon less nights:
Fluorescence Duty Cycle: 11%
Cherenkov Duty Cycle: 20%**

**Upward τ -lepton EAS $E \gtrsim 20$ PeV
via Cherenkov: ~ 10 nsec timescale**

6/22/23

POEMMA - ASAPP 2023

14

50 EeV simulated event

see [PhysRevD.101.023012](https://arxiv.org/abs/1902.023012)

Stereo Geometric Reconstruction

- Intersection of EAS-detector planes defines the EAS trajectory
- Requires minimum opening angle between planes $\gtrsim 5^\circ$
- With track selection \rightarrow 80% reconstruction efficiency
- $\text{FoV}_{\text{PIX}} = 0.084^\circ$ coupled with small RMS spot size allows for precise determination

Stereo Reconstructed Zenith Angle Resolution

Stereo Reconstructed Azimuth Angle Resolution

Significant increase in **exposure with all-sky coverage**

Uniform sky coverage to *guarantee the discovery of UHECR sources*

Spectrum, Composition, Anisotropy: $E_{CR} > 20 \text{ EeV}$

Very good **energy ($< 20\%$), angular ($\lesssim 1.2^\circ$), and composition ($\sigma_{X_{max}} \lesssim 30 \text{ g/cm}^2$) resolutions**

6/22/23

Auger-inspired Composition Evolution Model

16

Significant increase in **exposure with all-sky coverage**

Uniform sky coverage to *guarantee the discovery of UHECR sources*

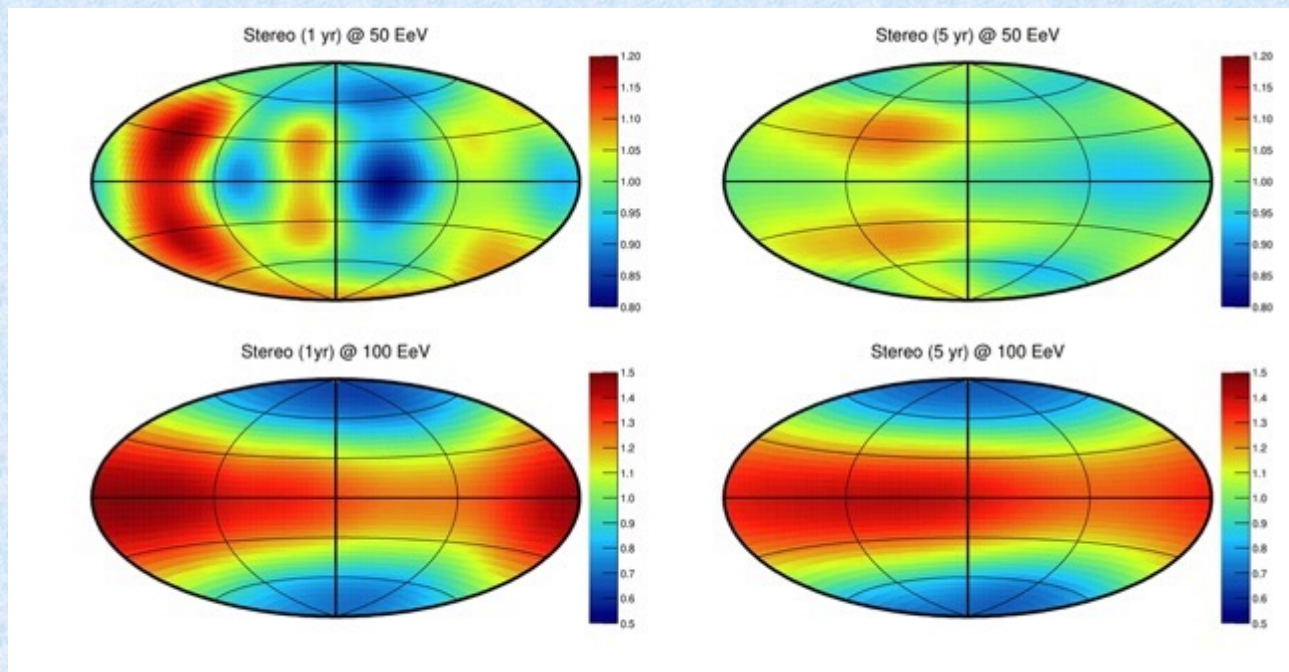

FIG. 13: POEMMA's UHECR sky exposures in declination versus right ascension. The color scale denoting the exposure variations in terms of the mean response taking into account the positions of the sun and the moon during the observation cycle.

15° Angular Spread, 10% StarBurst Fraction

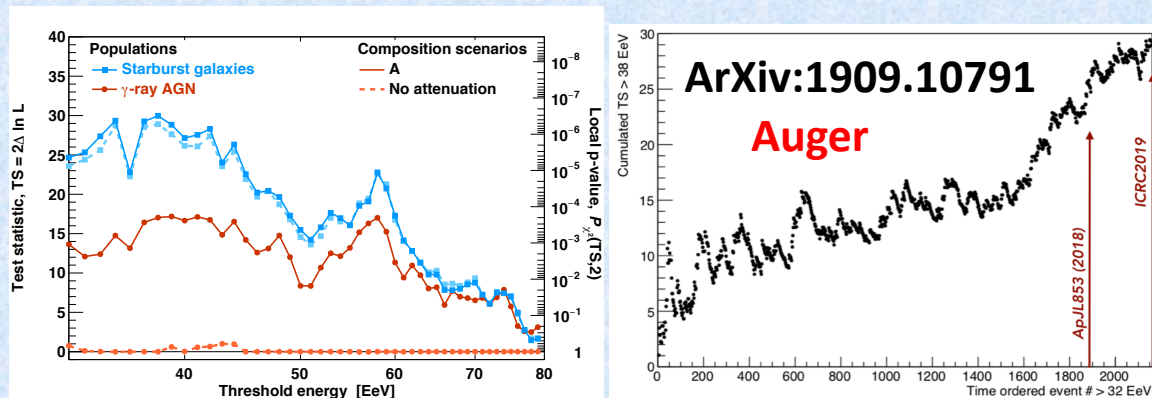

Figure 11: Left: Maximum likelihood-ratio as a function of energy threshold for the models based on SBGs and γ AGNs. The results are shown in the attenuation (full line) and no-attenuation (dashed line) scenarios. Right: Cumulated test statistics for $E_{thr} = 38$ EeV as a function of the time ordered number of events (for the SBG-only model). The number of events at the time of [39] and of this conference are indicated by the red arrows.

TABLE II. TS values for scenarios with $\Theta = 15^\circ$.

Catalog	f_{sig}	TS	σ
SBG	5%	6.2	2.0
	10%	24.7	4.6
	15%	54.2	7.1
	20%	92.9	9.4
2MRS	5%	2.4	1.0
	10%	8.7	2.5
	15%	20.0	4.1
	20%	35.2	5.6
Swift-BAT AGN	5%	10.4	2.8
	10%	39.6	6.0
	15%	82.4	8.8
	20%	139.3	11.6

FIG. 24. TS profile for 1400 events for a particular scenario using the starburst source sky map in Fig. 23. In the scenario pictured here, the fraction of events drawn from the source sky map is $f = 10\%$ (left) and 20% (right), and the angular spread is $\Theta = 15^\circ$.

FIG. 23. Left: Skymap of nearby starburst galaxies from Refs. [35,103] weighted by radio flux at 1.4 GHz, the attenuation factor accounting for energy losses incurred by UHECRs through propagation, and the exposure of POEMMA. The map has been smoothed using a von Mises-Fisher distribution with concentration parameter corresponding to a search radius of 15.0° as found in Ref. [35]. The color scale indicates \mathcal{F}_{src} , the probability density of the source sky map, as a function of position on the sky. The white dot-dashed line indicates the supergalactic plane. Right: Same as at left for nearby galaxies from the 2MRS catalog [105] and weighting by K-band flux corrected for Galactic extinction.

Effectively comes for free in stereo UHECR mode

Assumptions:

- CC ν_e : 100% E_ν in EAS
- CC ν_μ & ν_τ : 20% E_ν in EAS ($\gamma c \tau_\tau \approx 5000$ km)
- NC ν_e & ν_μ & ν_τ : 20% E_ν in EAS

UHECR Background Probabilities (1 event in 5 years):

- Auger Spectrum (100% H): < 1%
- TA Spectrum (100% H): $\approx 4\%$

For $E_\nu \gtrsim 1$ PeV, σ_{CC} & σ_{NC} virtually identical for ν & $\bar{\nu}$

S. Bottai and S. Giurgola, UHE and EHE neutrino induced taus inside the Earth, Astroparticle Physics. 18(6), 539-549 (Mar., 2003).

- $\Delta t = 24$ hr: 90 times

C. Guepin et al.,
JCAP 2019, 03, 021

Avionics on each POEMMA satellite
allow for slewing : 90° in 500 sec

Cosmic ν flux dominates over ATM background ~ 100 TeV
Note: ATM ν flux has a minimal tau neutrino component at high energies.

High-Energy Astrophysical Events generates neutrinos (ν_e, ν_μ) and 3 neutrino flavors reach Earth via neutrino oscillations.

POEMMA designed to observe neutrinos with $E > 20$ PeV through Cherenkov signal of EASs from Earth-emerging tau decays.

nuPyProp: JCAP2023.01.041

Avionics on each POEMMA satellite slewing (90° in 500 sec) allows to follow source.

Mary Hall Reno, University of Iowa

6

Short Bursts:

- 500 s to slew to source after alert
- 1000 s burst duration
- Source celestial location optimal
- Two independent Cher measurements
 - 300 km SatSep
- 20 PE threshold:
 - AirGlowBack < 10^{-3} /year

17% hit for ignoring $\tau \rightarrow \mu$ channel

One orbit sky exposure assuming slewing to source position

IceCube, ANTARES, Auger Limits for NS-NS merger GW170817

Long Bursts:

- **3 to 24+hr to move SatSep to 50 km**
- Burst duration $\gtrsim 10^5$ s (models in plot)
- Average Sun and moon effects
- Simultaneous Cher measurements
 - 50 km SatSep
- **10 PE threshold (time coincidence):**
 - AirGlowBack < 10^{-3} /year

PHYS. REV. D **102**, 123013 (2020)

BNS Merger
at 5 Mpc

FIG. 7. Left: sky plot of the expected number of neutrino events as a function of galactic coordinates for POEMMA in the long-burst scenario of a BNS merger, as in the Fang and Metzger model [22], and placing the source at 5 Mpc. Point sources are galaxies from the 2MRS catalog [78]. Middle: same as at left for IceCube for muon neutrinos. Right: same as at left for GRAND200k. Areas with gray point sources are regions for which the experiment is expected to detect less than one neutrino.

sGRB at
40 Mpc

FIG. 8. Left: sky plot of the expected number of neutrino events as a function of galactic coordinates for POEMMA in the best-case short-burst scenario of an sGRB with moderate EE, as in the KMMK model [17], and placing the source at 40 Mpc. Point sources are galaxies from the 2MRS catalog [78]. Middle: same as at left for IceCube for muon neutrinos. Right: same as at left for GRAND200k. Areas with gray point sources are regions for which the experiment is expected to detect less than one neutrino.

TONIA M. VENTERS *et al.*

PHYS. REV. D **102**, 123013 (2020)

TABLE IV. Average expected numbers of neutrino events above $E_\nu > 10^7$ GeV detectable by POEMMA for several models of transient source classes assuming source locations at the GC and at 3 Mpc. The horizon distance for detecting 1.0 neutrino per ToO event is also provided. Source classes with observed durations $> 10^3$ s are classified as long bursts. Those with observed durations $\lesssim 10^3$ s are classified as short bursts. Models in boldface type are those models for which POEMMA has $\gtrsim 10\%$ chance of observing a ToO during the proposed mission lifetime of 3–5 years. Models in italics are the same but for a mission lifetime of 10 years.

Long bursts				
Source class	No. of ν 's at GC	No. of ν 's at 3 Mpc	Largest distance for 1.0 ν per event	Model reference
TDEs	1.4×10^5	0.9	3 Mpc	Dai and Fang [18] average
TDEs	6.8×10^5	4.7	7 Mpc	Dai and Fang [18] bright
TDEs	2.7×10^8	1.7×10^3	128 Mpc	Lunardini and Winter [19] $M_{\text{SMBH}} = 5 \times 10^6 M_\odot$ Lumi scaling model
<i>TDEs</i>	<i>7.7×10^7</i>	<i>489</i>	<i>69 Mpc</i>	<i>Lunardini and Winter [19] Base scenario</i>
Blazar flares	NA ^a	NA ^a	47 Mpc	RFGBW [20]—FSRQ proton-dominated advective escape model
IGRB reverse shock (ISM)	1.2×10^5	0.8	3 Mpc	Murase [16]
IGRB reverse shock (wind)	2.5×10^7	174	41 Mpc	Murase [16]
BBH merger	2.8×10^7	195	43 Mpc	Kotera and Silk [21] (rescaled) Low fluence
BBH merger	2.9×10^8	2.0×10^3	137 Mpc	Kotera and Silk [21] (rescaled) High fluence
BNS merger	4.3×10^6	30	16 Mpc	Fang and Metzger [22]
BWD merger	25	0	38 kpc	XMMD [23]
Newly born Crablike pulsars (p)	190	0	109 kpc	Fang [24]
Newly born magnetars (p)	2.5×10^4	0.2	1 Mpc	Fang [24]
Newly born magnetars (Fe)	5.0×10^4	0.3	2 Mpc	Fang [24]
Short bursts				
Source class	No. of ν 's at GC	No. of ν 's at 3 Mpc	Largest distance for 1.0 ν per event	Model reference
sGRB extended emission (moderate)	1.1×10^8	800	90 Mpc	KMMK [17]

^aNot applicable due to a lack of known blazars within 100 Mpc.

FIG. 9. The Poisson probability of POEMMA observing at least one ToO versus mission operation time for several modeled source classes. Featured source models are TDEs from Lunardini and Winter [19], BNS mergers from Fang and Metzger [22], BBH mergers from Kotera and Silk [21], and sGRBs with moderate EE from KMMK [17].

Summary

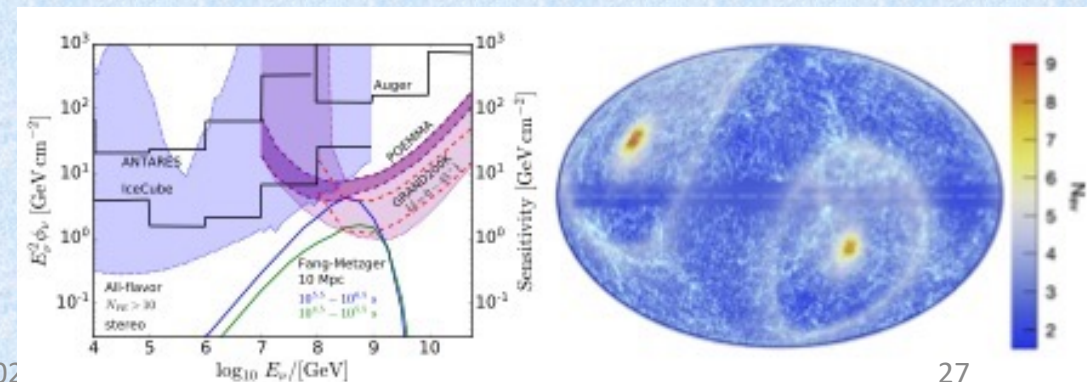

POEMMA will make high-statistics UHECRs above 20 EeV with the goal of discovering the source(s) of UHECRs

- **POEMMA stereo fluorescence measurements provides excellent Angular, Energy, and Composition (x_{Max}) resolutions over the full sky.**
- **Ability to tilt POEMMA telescopes increases UHECR aperture at the highest energies, albeit with reduced EAS measurement performance.**
- **POEMMA Stereo fluorescence also provides exceptional UHE all-flavor UHE neutrino sensitivity**

POEMMA will have unique VHE tau-neutrino sensitivity above 20 PeV to transient neutrino sources using EAS optical Cherenkov:

- **The ability to quickly slew to a neutrino ToO provides remarkable sensitivity above 20 PeV**

1. Combination of optical Cherenkov and geomagnetic radio EAS measurement techniques.
2. Lightweight, deployable optics
3. Low power (< 1 mW) FEE for SiPM readout : needed for neutrino surveyor (\sim Mpixel) mission.
4. **SiPM use in fluorescence telescopes.**
5. **Cosmic Ray EAS measurements in rarified atmosphere using 'over-the-Earth-limb' viewed cosmic rays via Cherenkov (and other?) as well as ToO neutrino measurements.**

Air fluorescence yield dominated by lines below 500 nm.

- Need to constrain wavelength to minimize dark-sky background via near-UV passing only filters (Fujifilm S3 filter shown).
- As with Cherenkov EAS SiPM operation, dark-sky background rejection leads to high PE thresholds (> 10) even with $10 \mu s$ time-over-threshold requirement with $1 \mu s$ sampling.
- SiPM use allows for significant reduction of mass for meter-size focal planes as compared to that needed for MAPMTs.

Over-the-limb CR measurements (optical Cherenkov, radio) can be also done in the bulk of the EAS and muon tail!

Plots by Austin Cummings (PennState)

Conclusion and future ...

POEMMA Benefited from being a NASA POEMMA Probe study:

- review determined *No new technology needed*, could benefit from technology developments.
- **NASA Probe implementation may allow POEMMA proposal in 2nd NASA Probe AO (2025+)**
- **SnowMass CF7 UHECR whitepaper (arXiv:2205.05845) recommends proceeding with the development of POEMMA as one of the next generation UHECR experiments (along with GCOS and GRAND).**
- Rich portfolio of POEMMA science papers helped perception (at least within NASA community) that a mission like POEMMA, using UHECR, UHE & VHE neutrinos, probes unique and interesting high-energy astrophysics phenomena.

6/22/23

<https://heasarc.gsfc.nasa.gov/docs/nuSpaceSim/> end-to-end space-based neutrino detection simulation of optical and radio EAS signals *allows for the development of combined radio and optical Cherenkov neutrino instruments that leverage the advantage of each method*

- *Optical Cherenkov is sensitive to neutrinos 2 – 3 orders of magnitude lower in energy than the radio*
- *Radio has 100% duty cycle*
- *Two combined would allow for lower background events*

Tool to develop the space-based cosmic neutrino missions:

- **Space-based Neutrino Surveyor (POEMMA360) using near limb-viewing Cherenkov telescope with $\Delta\phi = 360^\circ$, and would be self-triggering for neutrino transients events while having significant sky coverage to follow-up external ToO alerts.**
- **Space-based ToO Cherenkov Telescope(s) with modest, few degree FoV, $A_{\text{eff}} \gtrsim 1 \text{ m}$, and ability to quickly slew to follow-up external ToO alerts, could be a SmallSat format.**

Two 4 meter F/0.64 Schmidt telescopes: 45° FoV

Primary Mirror: 4 meter diameter

Corrector Lens: 3.3 meter diameter

Focal Surface: 1.6 meter diameter

Optical Area_{EFF}: ~6 to 2 m²

Hybrid focal surface (MAPMTs and SiPM)

3 mm linear pixel size: 0.084° FoV

Lightweight Deployable Optics

Imaging $\sim 10^4$ away from diffraction limit

1996: Spartan 207: 14-m diameter 'inflatable' antenna

Larger optical collecting area for fluorescence and optical Cherenkov translates to lower energy threshold for detecting EAS and/or increasing geometry factor or azimuthal coverage.

High-Energy Astrophysical Events generates neutrinos (ν_e, ν_μ) and 3 neutrino flavors reach Earth via neutrino oscillations.

EAS from Earth-emergent muons dominant below 10 PeV

PHYS. REV. D **103**, 043017 (2021)

Fig. 8. The cumulative sum of the NightGlow Background (NGB) using the measurements of Hamamatsu ultra-bialkali PMT. The bandpass of a Schott BG3 filter is also shown. The thicker magenta line highlighting the transmission for $\lambda \leq 600$ nm and the thinner line for $\lambda > 600$ nm.

Recovery of transmission above 700 nm for BG3 is problematic for use with SiPMs for fluorescence light detection

FIG. 17. Preliminary estimate of the X_{\max} resolution of POEMMA in stereo mode. The contributions from the photoelectron statistics and angular resolution are shown in blue and gray, respectively. The total resolution, obtained by adding both contributions in quadrature, is shown in red for two cuts on the maximum zenith angle.
