## The technology roadmap of the XGIS instrument for the THESEUS mission and other mission opportunities

*Wednesday 21 June 2023 15:45 (25 minutes)*

We describe the design and the expected performances of the X/Gamma-ray Imaging Spectrometer (XGIS) which is a GRBs and transients monitor developed and studied for the THESEUS mission now in Phase 0 evaluation for the selection of ESA M7. XGIS is capable of covering an unprecedented wide energy band (2 keV - 10 MeV), with imaging capabilities and location accuracy  $<15$  arcmin up to 150 keV over a Field of View of 2sr, a few hundreds eV energy resolution in the X-ray band ( $<30$  keV) and timing resolution down to a few  $\mu$ s. XGIS exploits the coupling between Silicon Drift Detectors (SDD) with crystal scintillator bars and a very low-noise distributed front-end electronics (ORION ASICs). The XGIS particular configuration also allows 3D position sensitive detection which also enables hard x-ray polarimetric capability. Here we also describe the possible improvements that can be applied to this technology in order to further improve the performance of the instrument. Thanks to its modular design, the XGIS instrument can be easily rescaled/reshaped and adapted for fitting the available resources and specific scientific objectives of future high-energy astrophysics missions, and especially those aimed at fully exploiting GRBs and high-energy transients for multi-messenger astrophysics and fundamental physics.

### Eligibility for "Best presentation for young researcher" prize

**Primary authors:** Dr AMATI, Lorenzo (INAF - OAS Bologna); VIRGILLI, Enrico (Istituto Nazionale di Astrofisica - INAF OAS Bologna)

**Presenter:** VIRGILLI, Enrico (Istituto Nazionale di Astrofisica - INAF OAS Bologna)

**Session Classification:** Direct hard-X-ray and  $\gamma$ -ray measurements

**Track Classification:** Instrumentation and missions for hard X-ray and  $\gamma$ -ray direct measurements in space
