I. DATA REPRESENTATIONS & SYMMETRIES

II. ANOMALY DETECTION

III. GENERATIVE MODELING

III. FAST INFERENCE

VI. SUMMARY & OUTLOOK

- ▶ High-level (expert) variables
- ▶ Ordered list of particles
- ▶ Images
- ▶ Set of particles
- ▶ Graph of particles
- ▶ Lorentz scalars/vectors
- ▶ Shallow neural network, boosted decision tree, ...
- ▶ 1D convolutional neural network, recurrent neural network
- ▶ 2D convolutional neural network
- ▶ Deep set (energy flow network)
- ▶ Graph neural network
- ▶ Lorentz-equivariant network

- ▶ After “particle-flow reconstruction,” can think of event as a collection of points in momentum space
- ▶ For jets (localized clusters of particles), dimensionality
($N_{\text{particles}} \sim 100, 4 + M$)
- ▶ Variable jet length requires:
 - ▶ Preprocessing into another rep. (tab. data, jet images, ...)
 - ▶ Truncation to fixed size
 - ▶ Graph NN

▶ Tabular data: use physics knowledge to preprocess jet information into a set of high-level features

▶ Substructure variable:

▶ jet mass

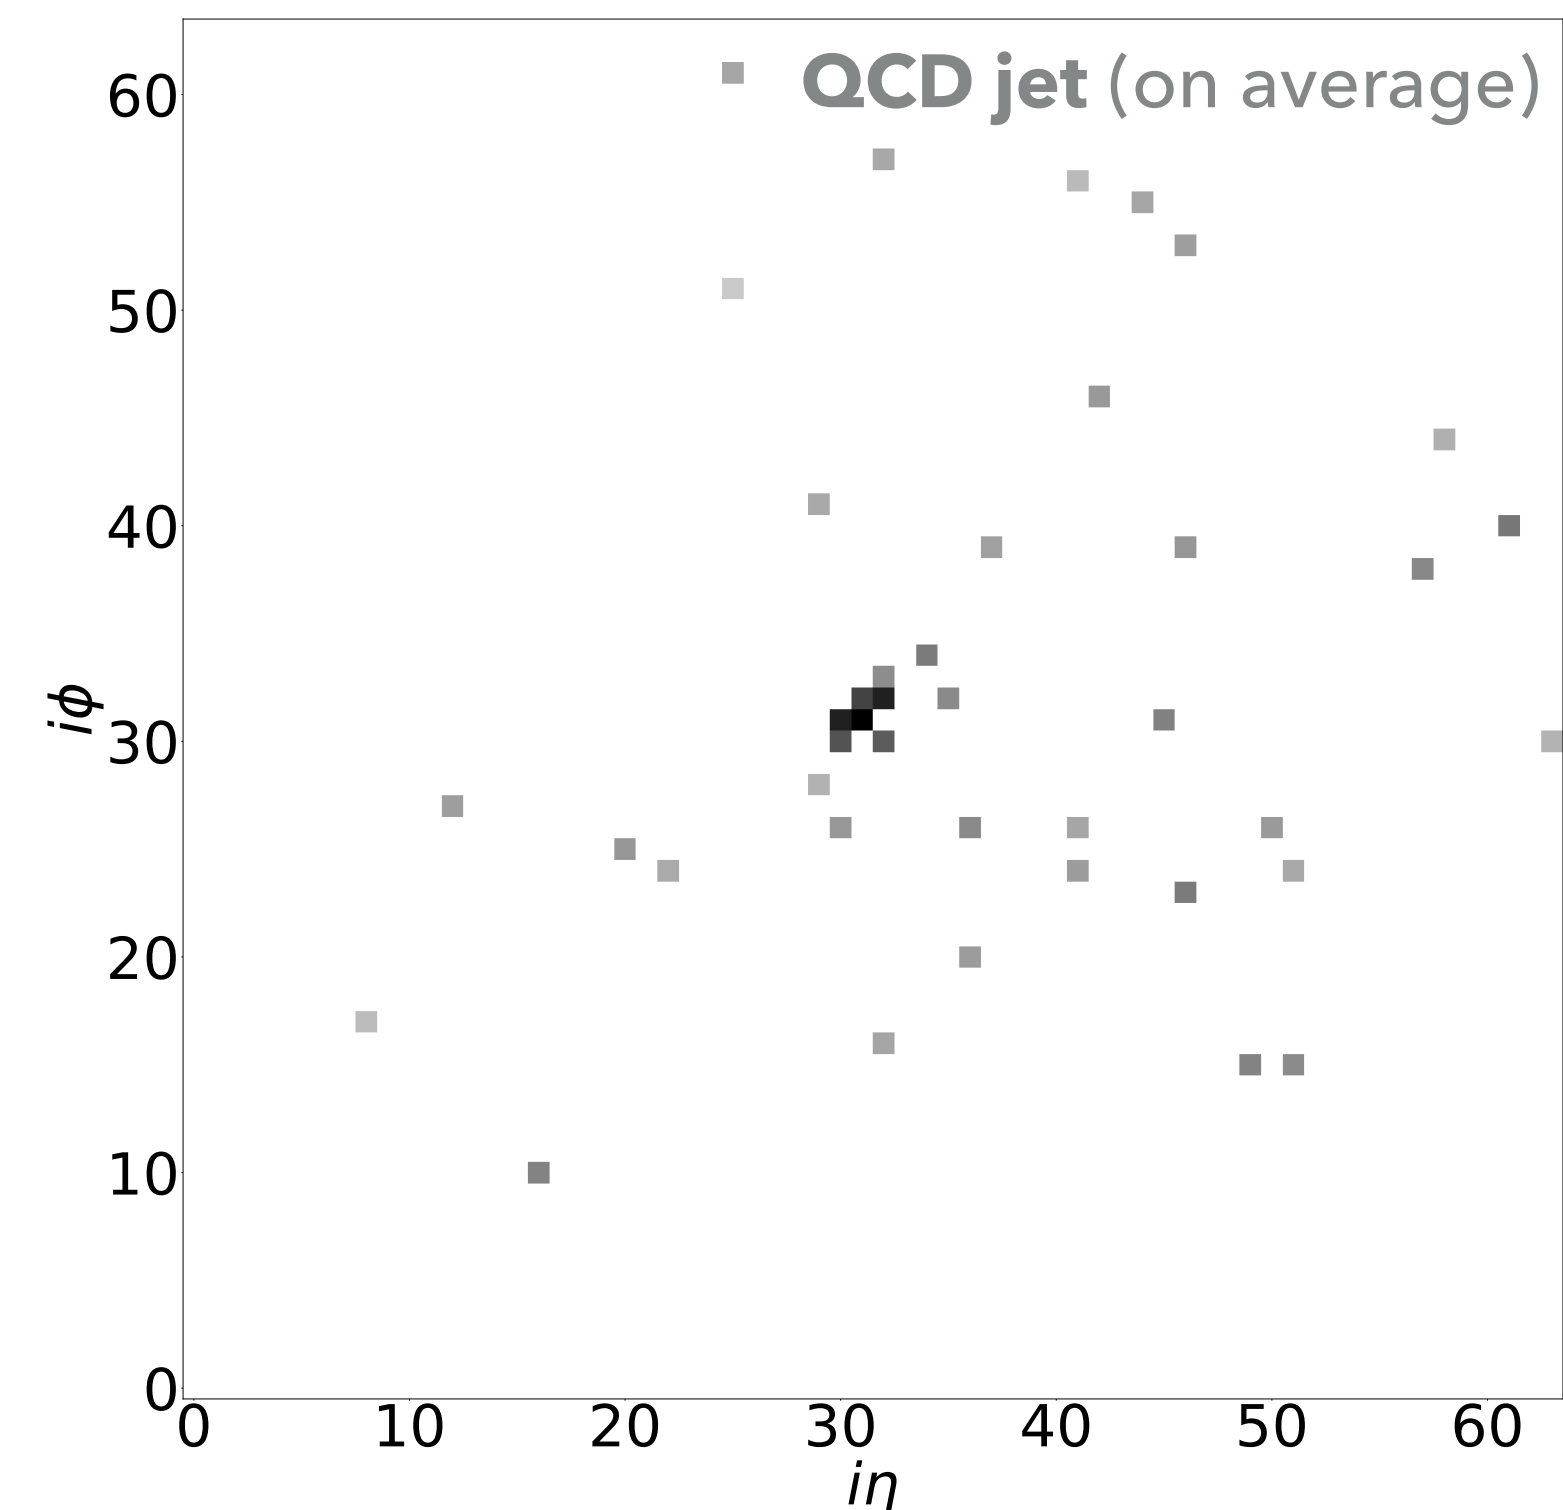

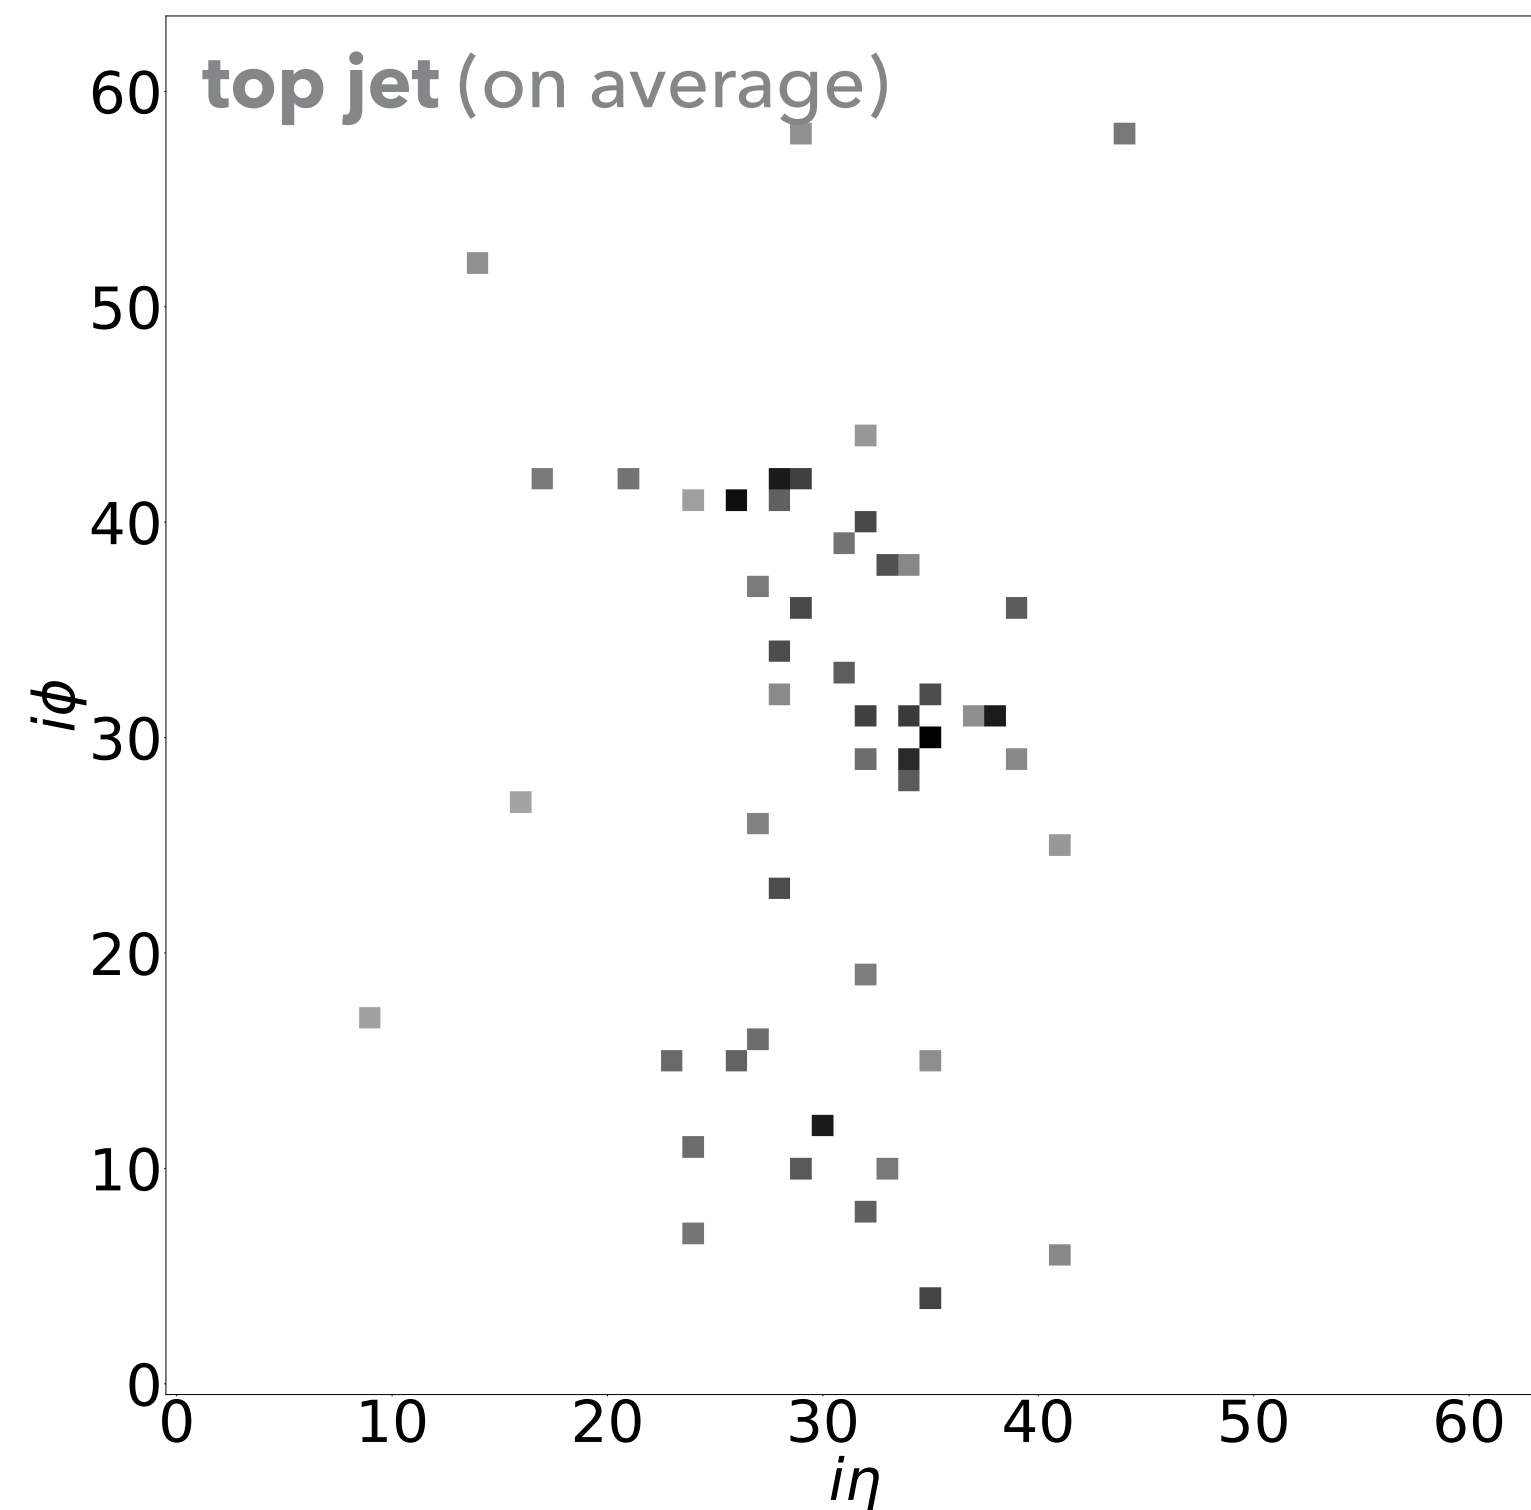

▶ energy correlation functions, e.g. $N_2^{\beta=1} = 2e_3^{\beta=1} / (1e_3^{\beta=1})^2$

$$1e_3^\beta = \sum_{1 \leq i < j < k \leq n_J} z_i z_j z_k \min\{\Delta R_{ij}^\beta, \Delta R_{ik}^\beta, \Delta R_{jk}^\beta\}$$

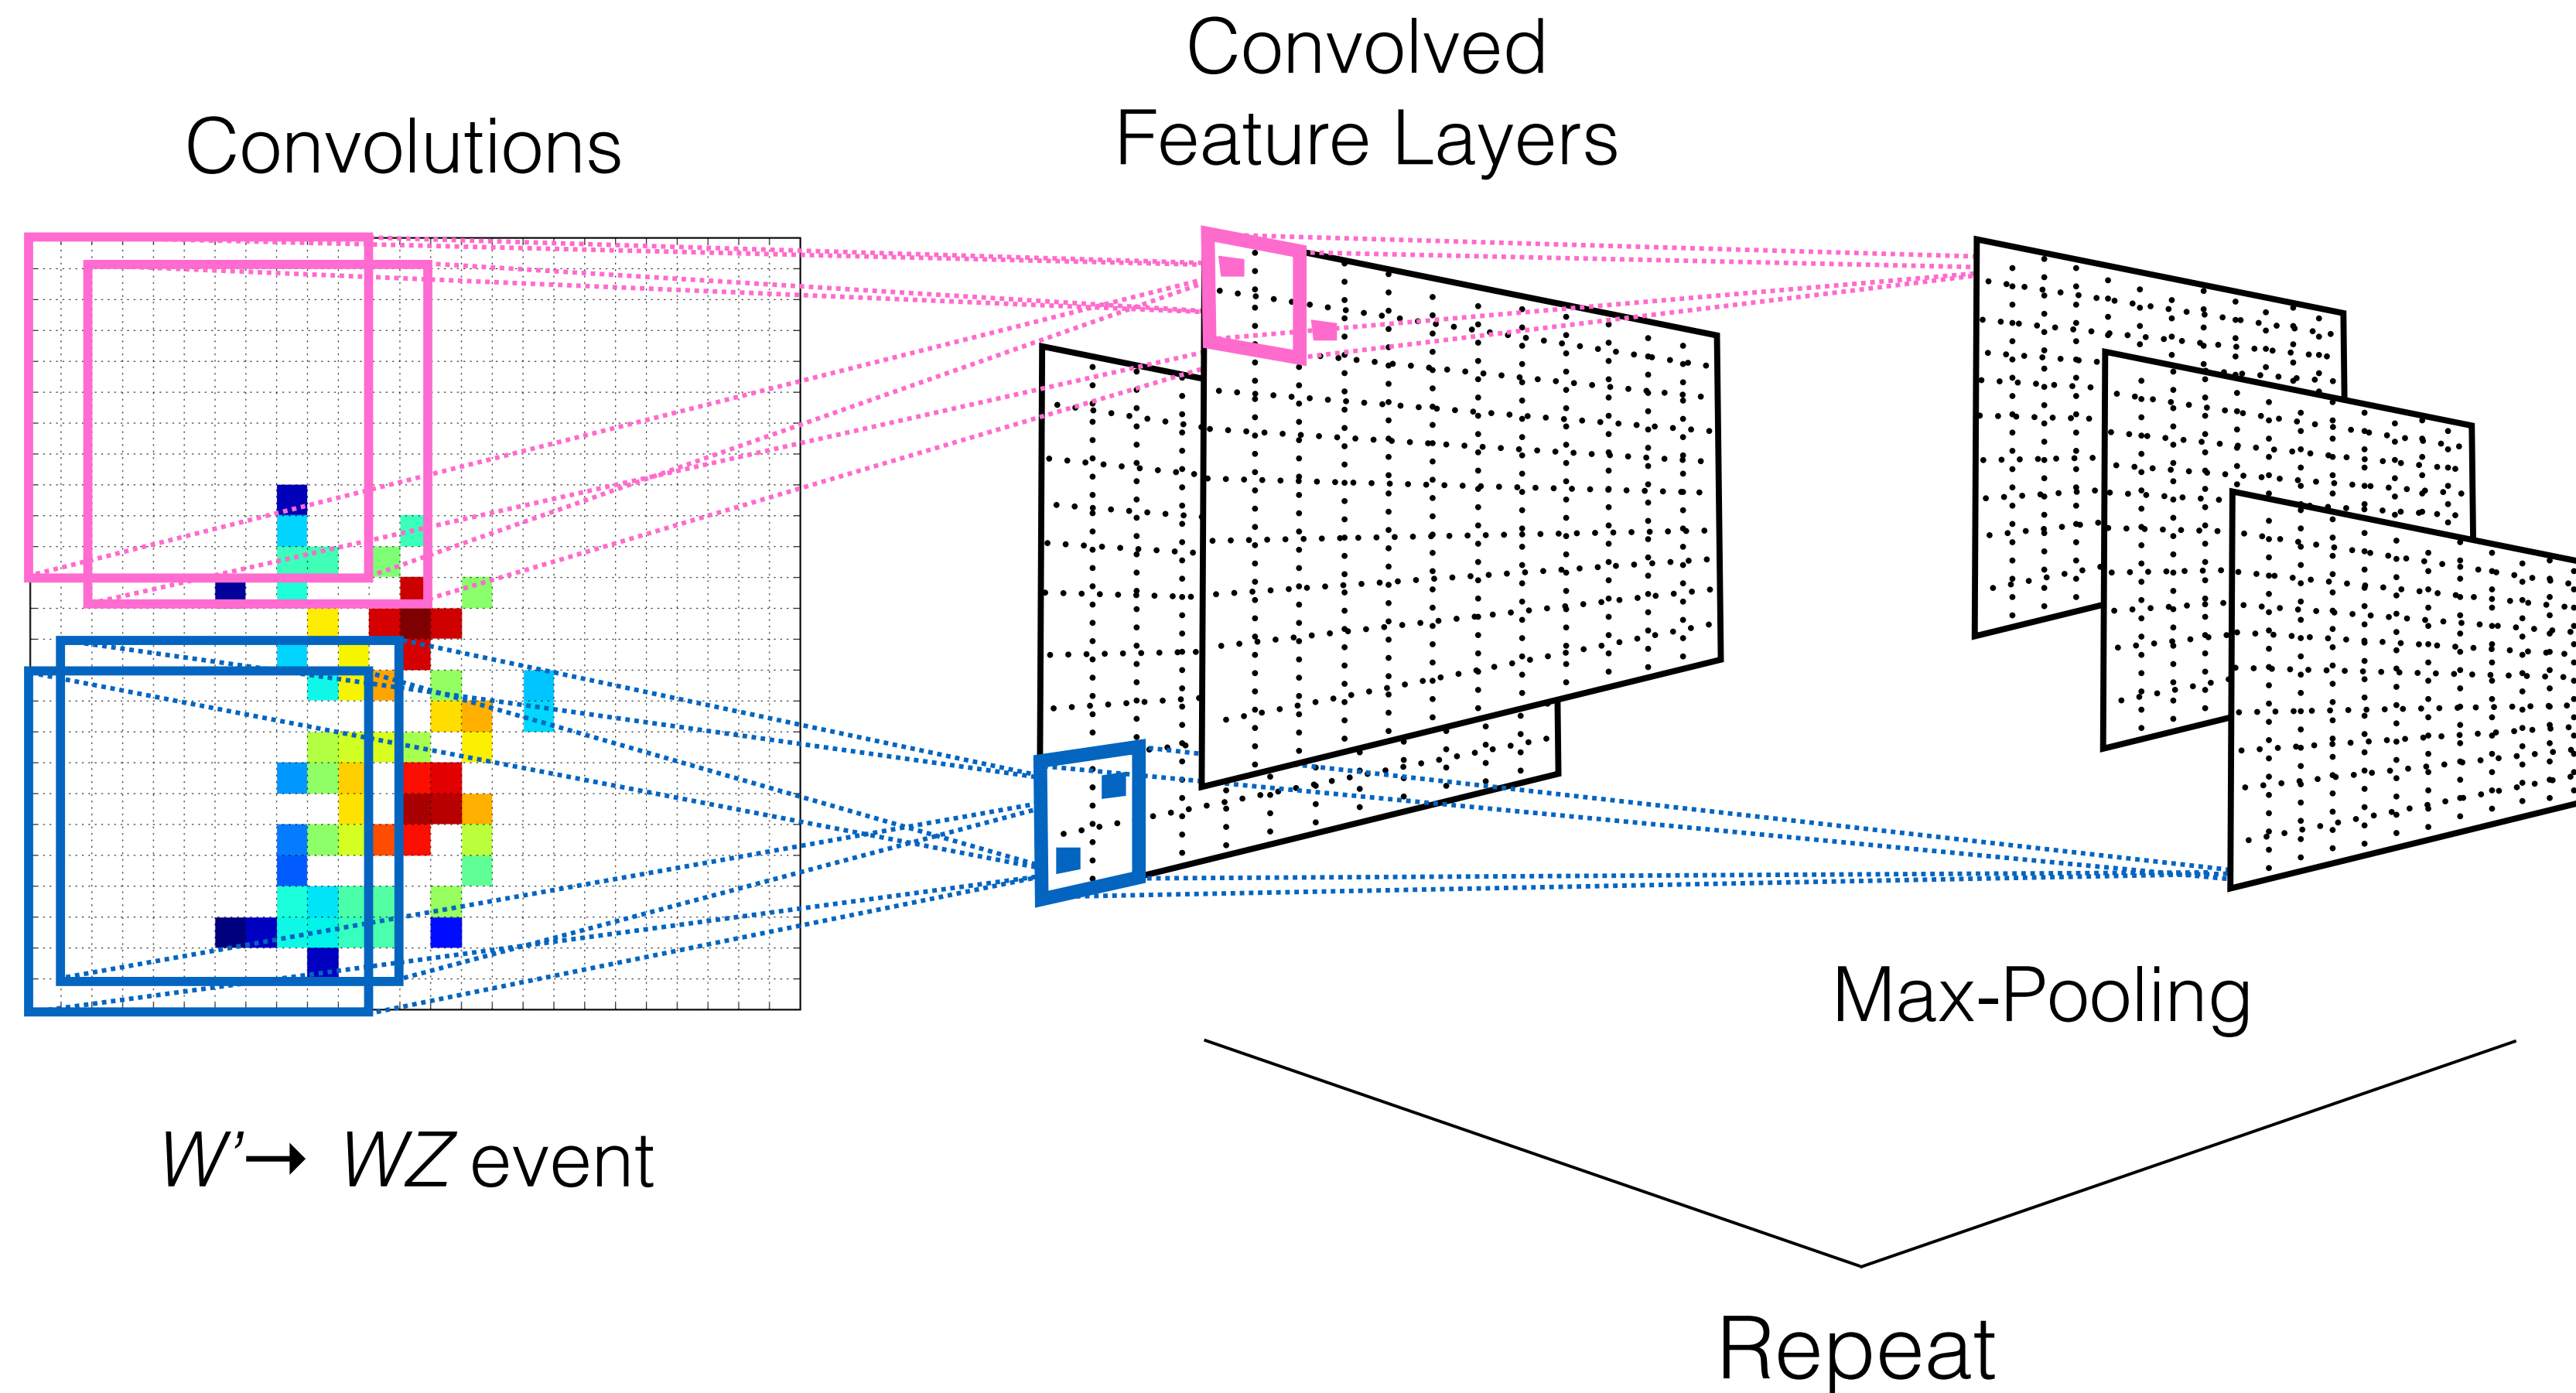

$$2e_3^\beta = \sum_{1 \leq i < j < k \leq n_J} z_i z_j z_k \min\{\Delta R_{ij}^\beta \Delta R_{ik}^\beta, \Delta R_{ij}^\beta \Delta R_{jk}^\beta, \Delta R_{ik}^\beta \Delta R_{jk}^\beta\}$$

- ▶ Jet images = pixelated versions of calorimeter hits in 2D (η , ϕ)
- ▶ Much lower level

- ▶ Natural to apply 2D CNN

► CNNs among the best performing algorithms

	AUC	Acc	$1/\epsilon_B$ ($\epsilon_S = 0.3$)			#Param
			single	mean	median	
CNN [16]	0.981	0.930	914±14	995±15	975±18	610k

- ▶ In deep learning, tailoring algorithms to the structure (and symmetries) of the data has led to groundbreaking performance

- ▶ CNNs for images

- ▶ RNNs for language processing

- ▶ Distributed unevenly in space
- ▶ Sparse
- ▶ Variable size
- ▶ No defined order
- ▶ Interconnections → Graphs

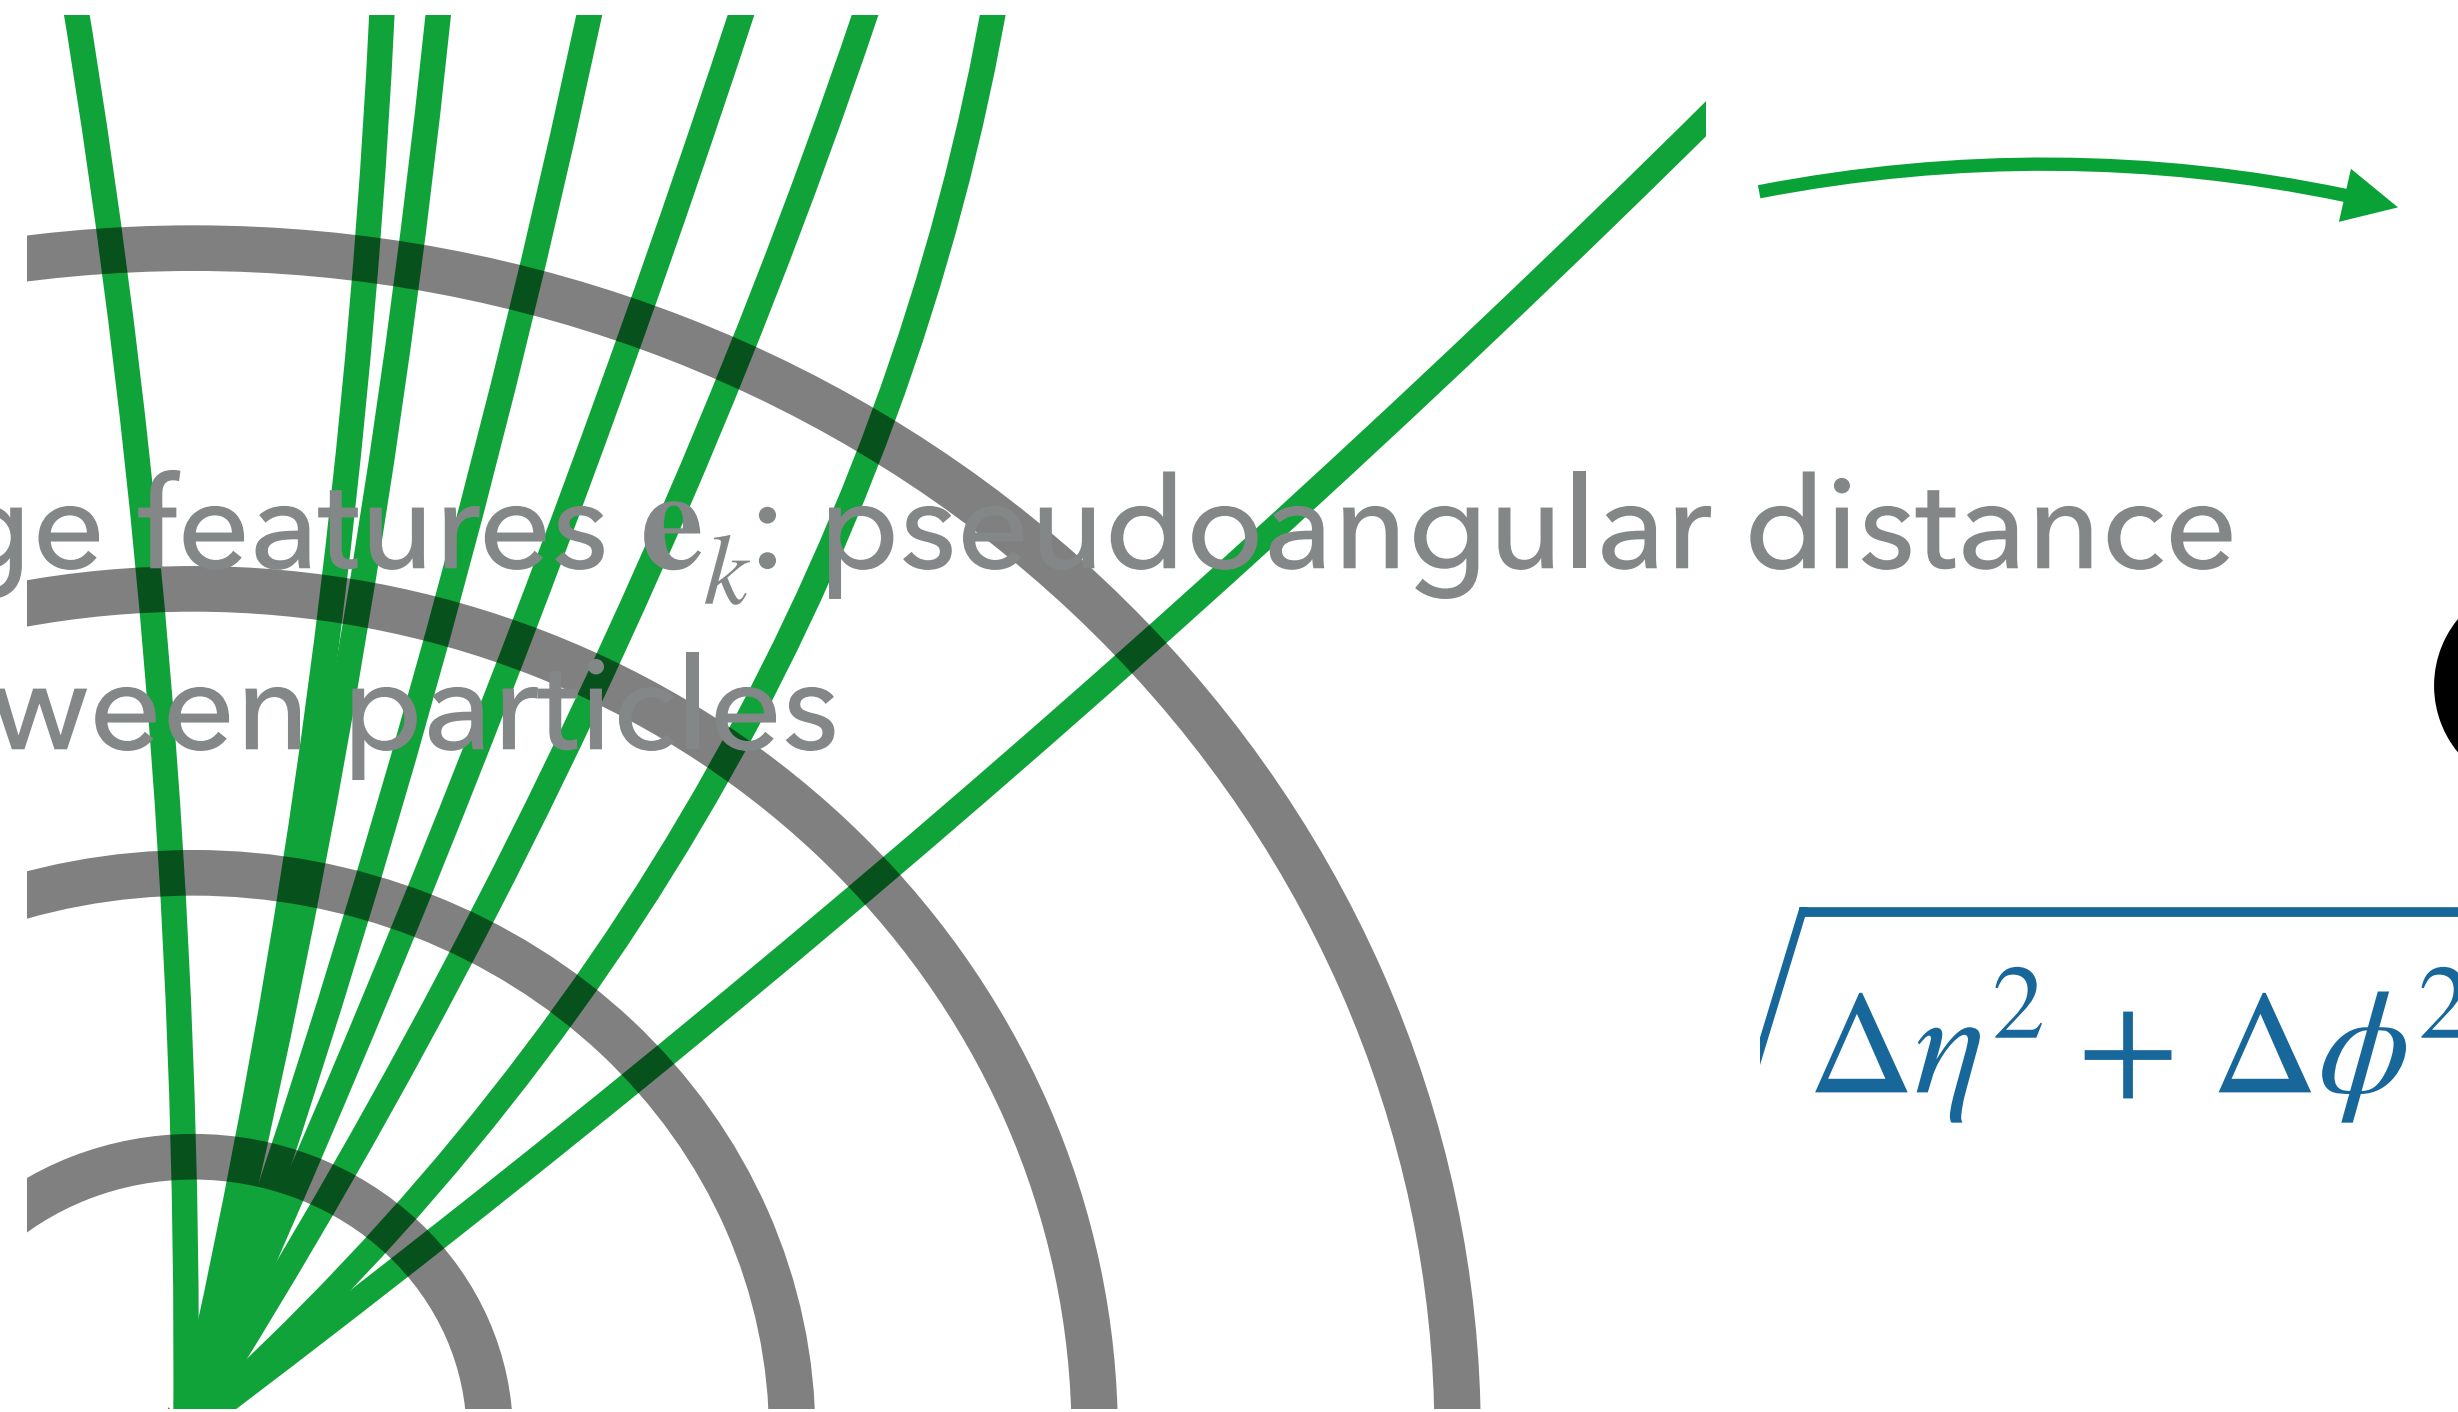

- ▶ What about high energy physics data like jets?

- ▶ Node features \mathbf{v}_i : particle 4-momentum

$$p = [E, p_x, p_y, p_z] \equiv [p_T, \eta, \phi, m]$$

- ▶ Edge features e_k : pseudoangular distance between particles

- ▶ Graph (global) features \mathbf{u} : jet mass

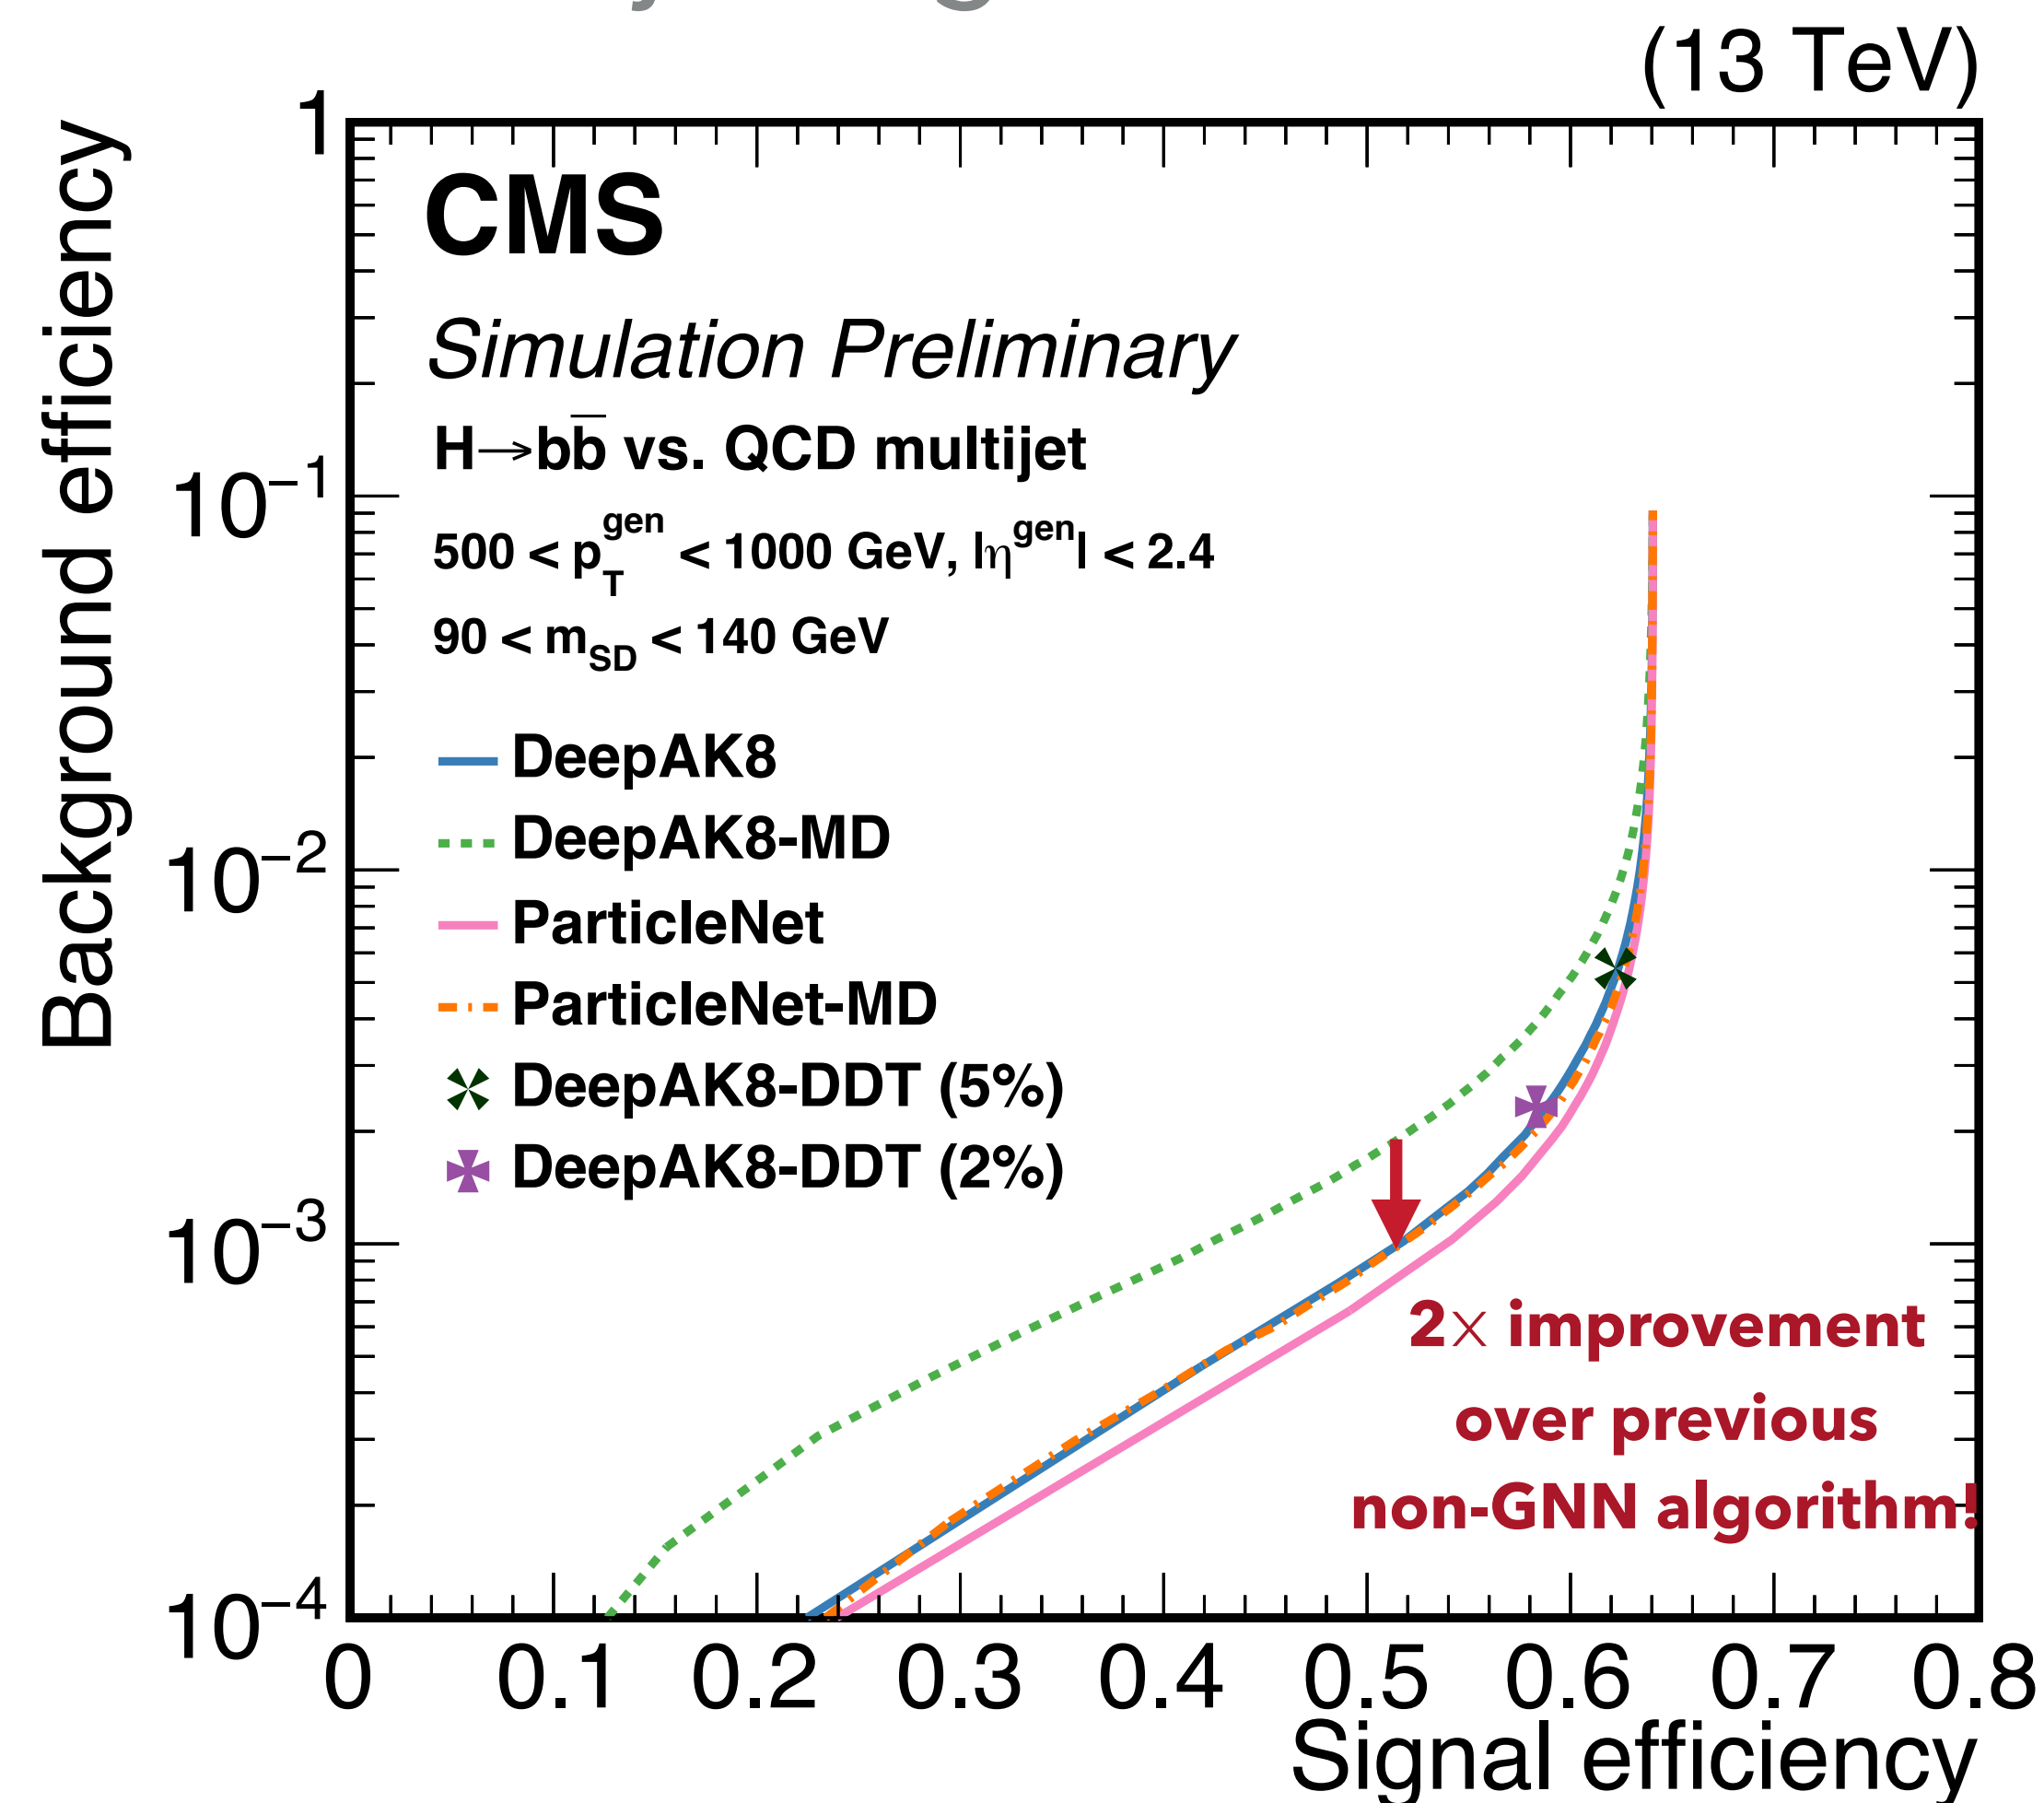

$$m = \sqrt{\sum_{i \in \text{jet}} E_i^2 - p_{x,i}^2 - p_{y,i}^2 - p_{z,i}^2}$$

HOW TO USE GNNS IN HEP

- ▶ Node-level tasks
 - ▶ Identify "pileup" particles
- ▶ Graph-level tasks
 - ▶ **Jet tagging**

- ▶ ParticleNet, using “dynamic edge convolutions:” graph is constructed based on “closeness” in an abstract “latent” space
- ▶ Identifies H(bb) with an efficiency of ~50% while rejecting 99.9% of background

- ▶ Symmetry-equivariant networks
 - ▶ More economical (fewer, but more expressive parameters), interpretable, and trainable

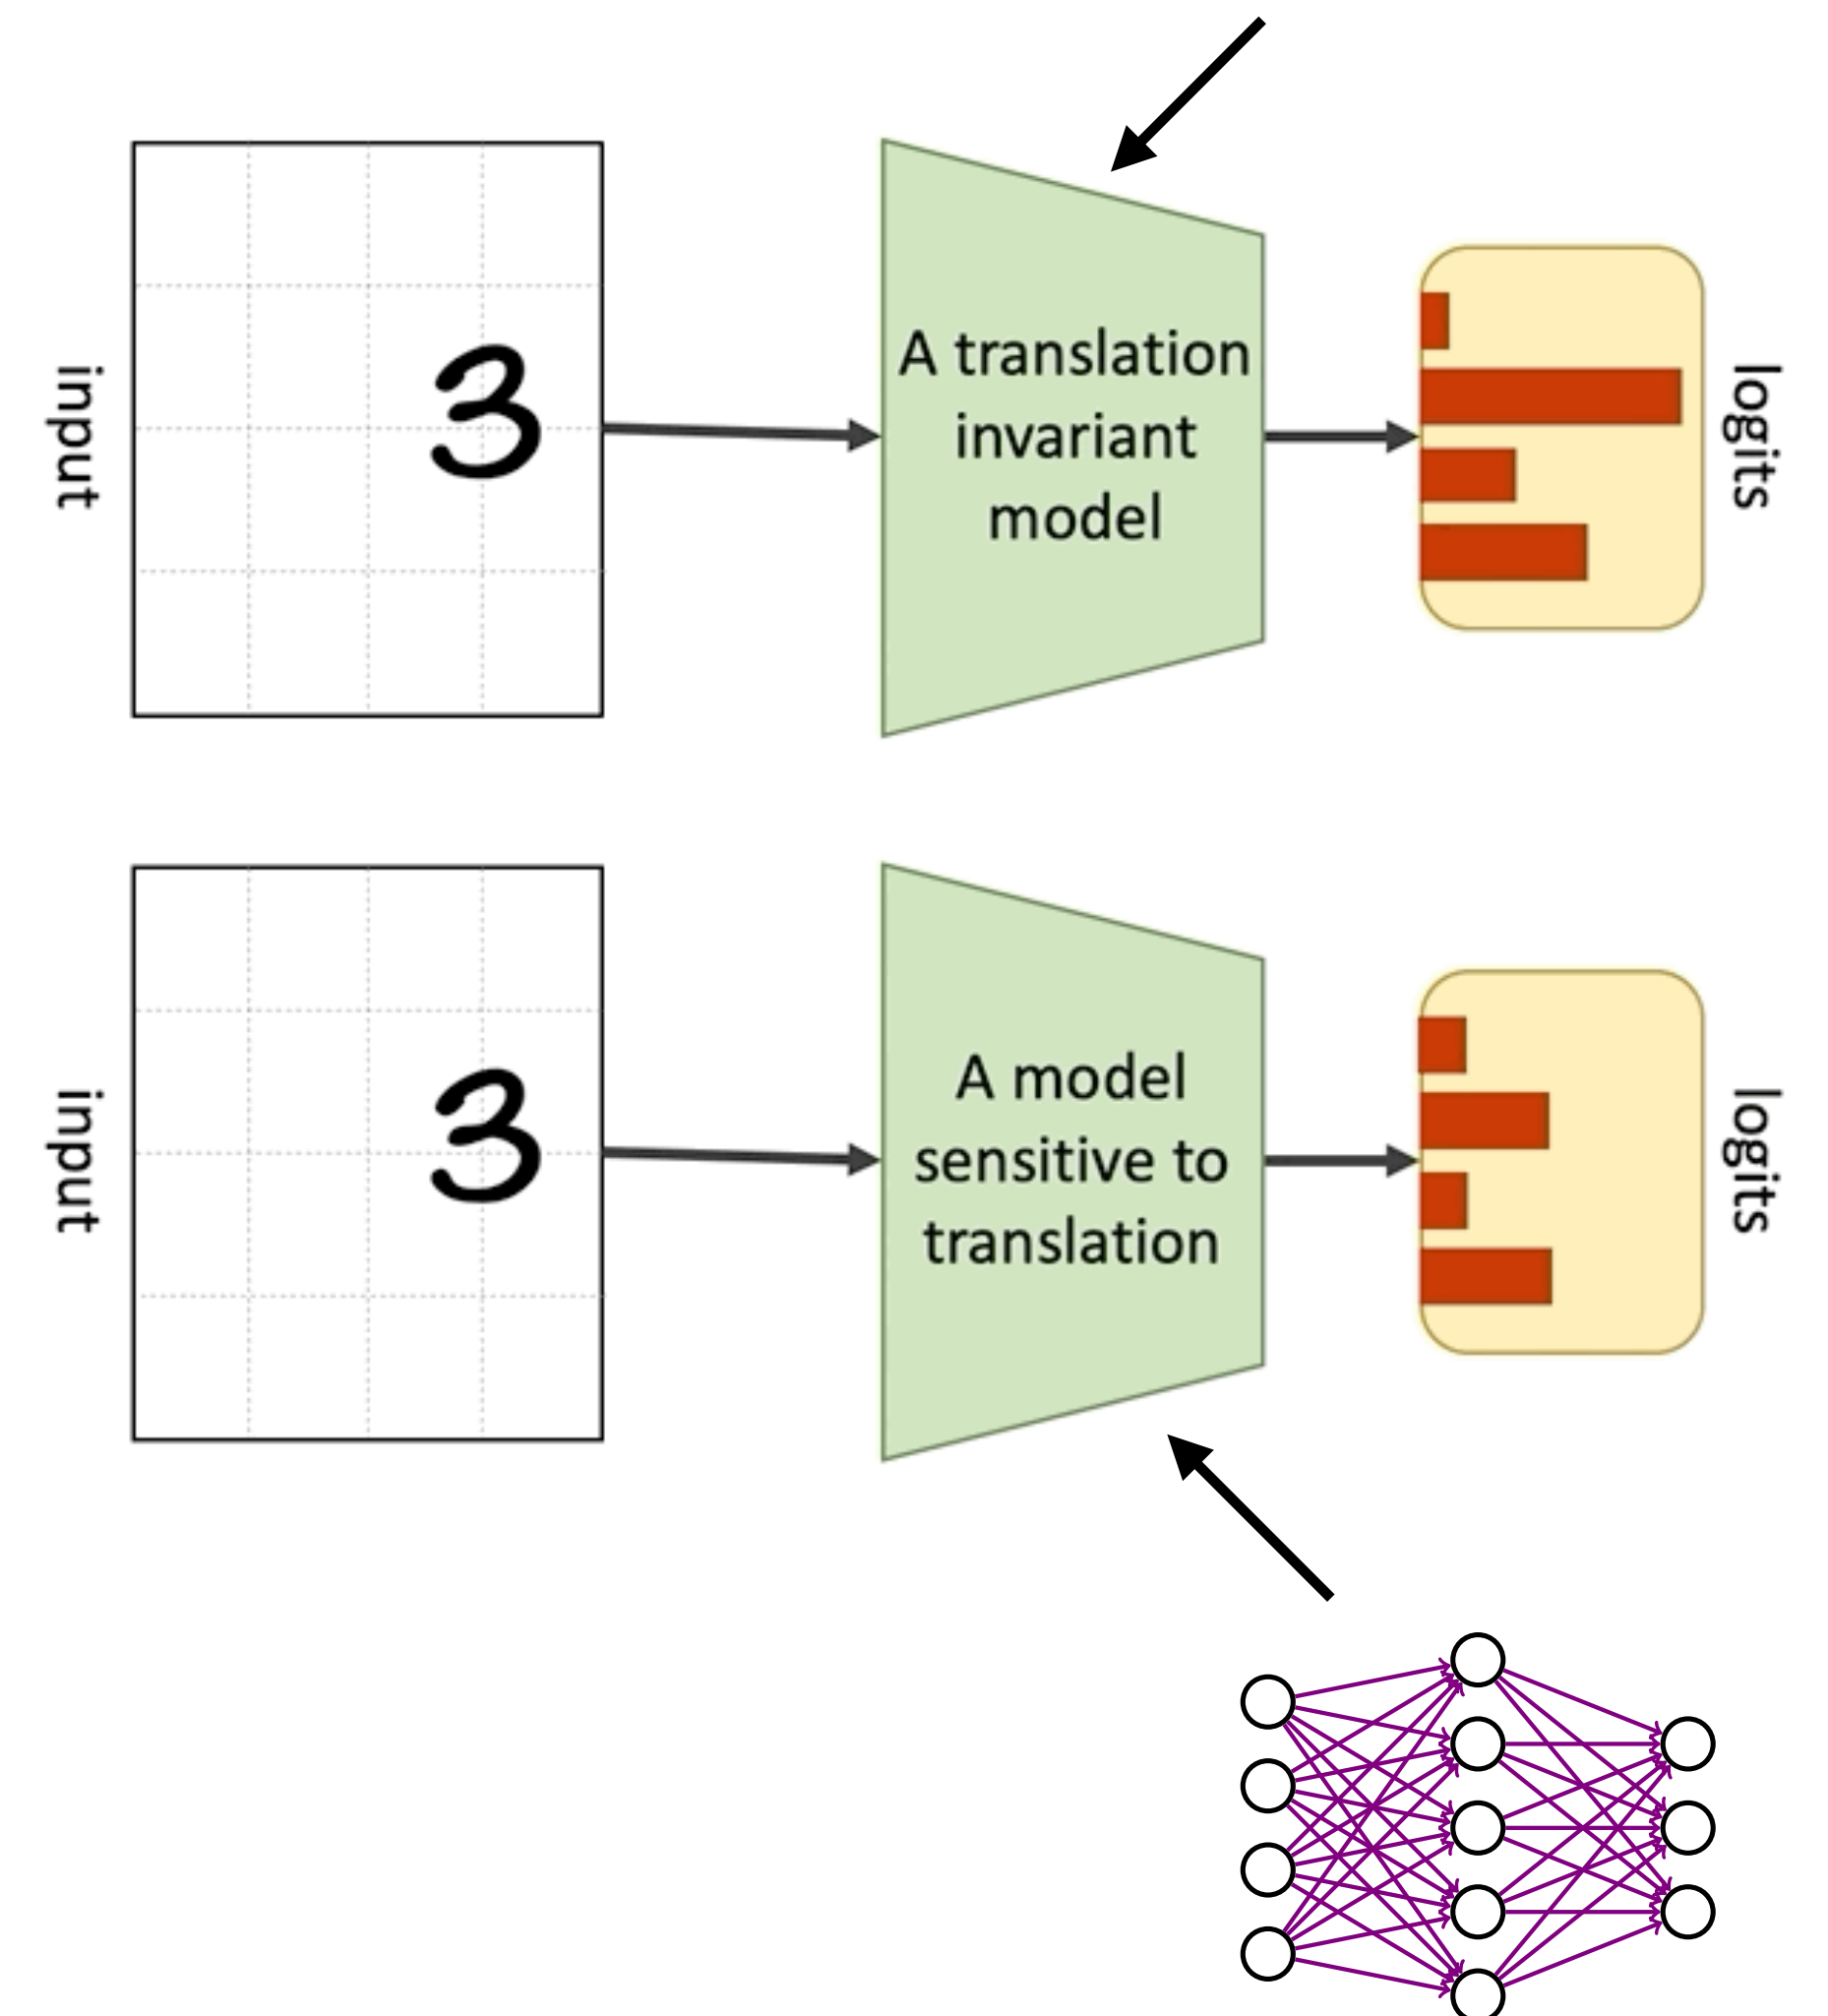

Invariance

$$f(\rho_g(x)) = f(x)$$

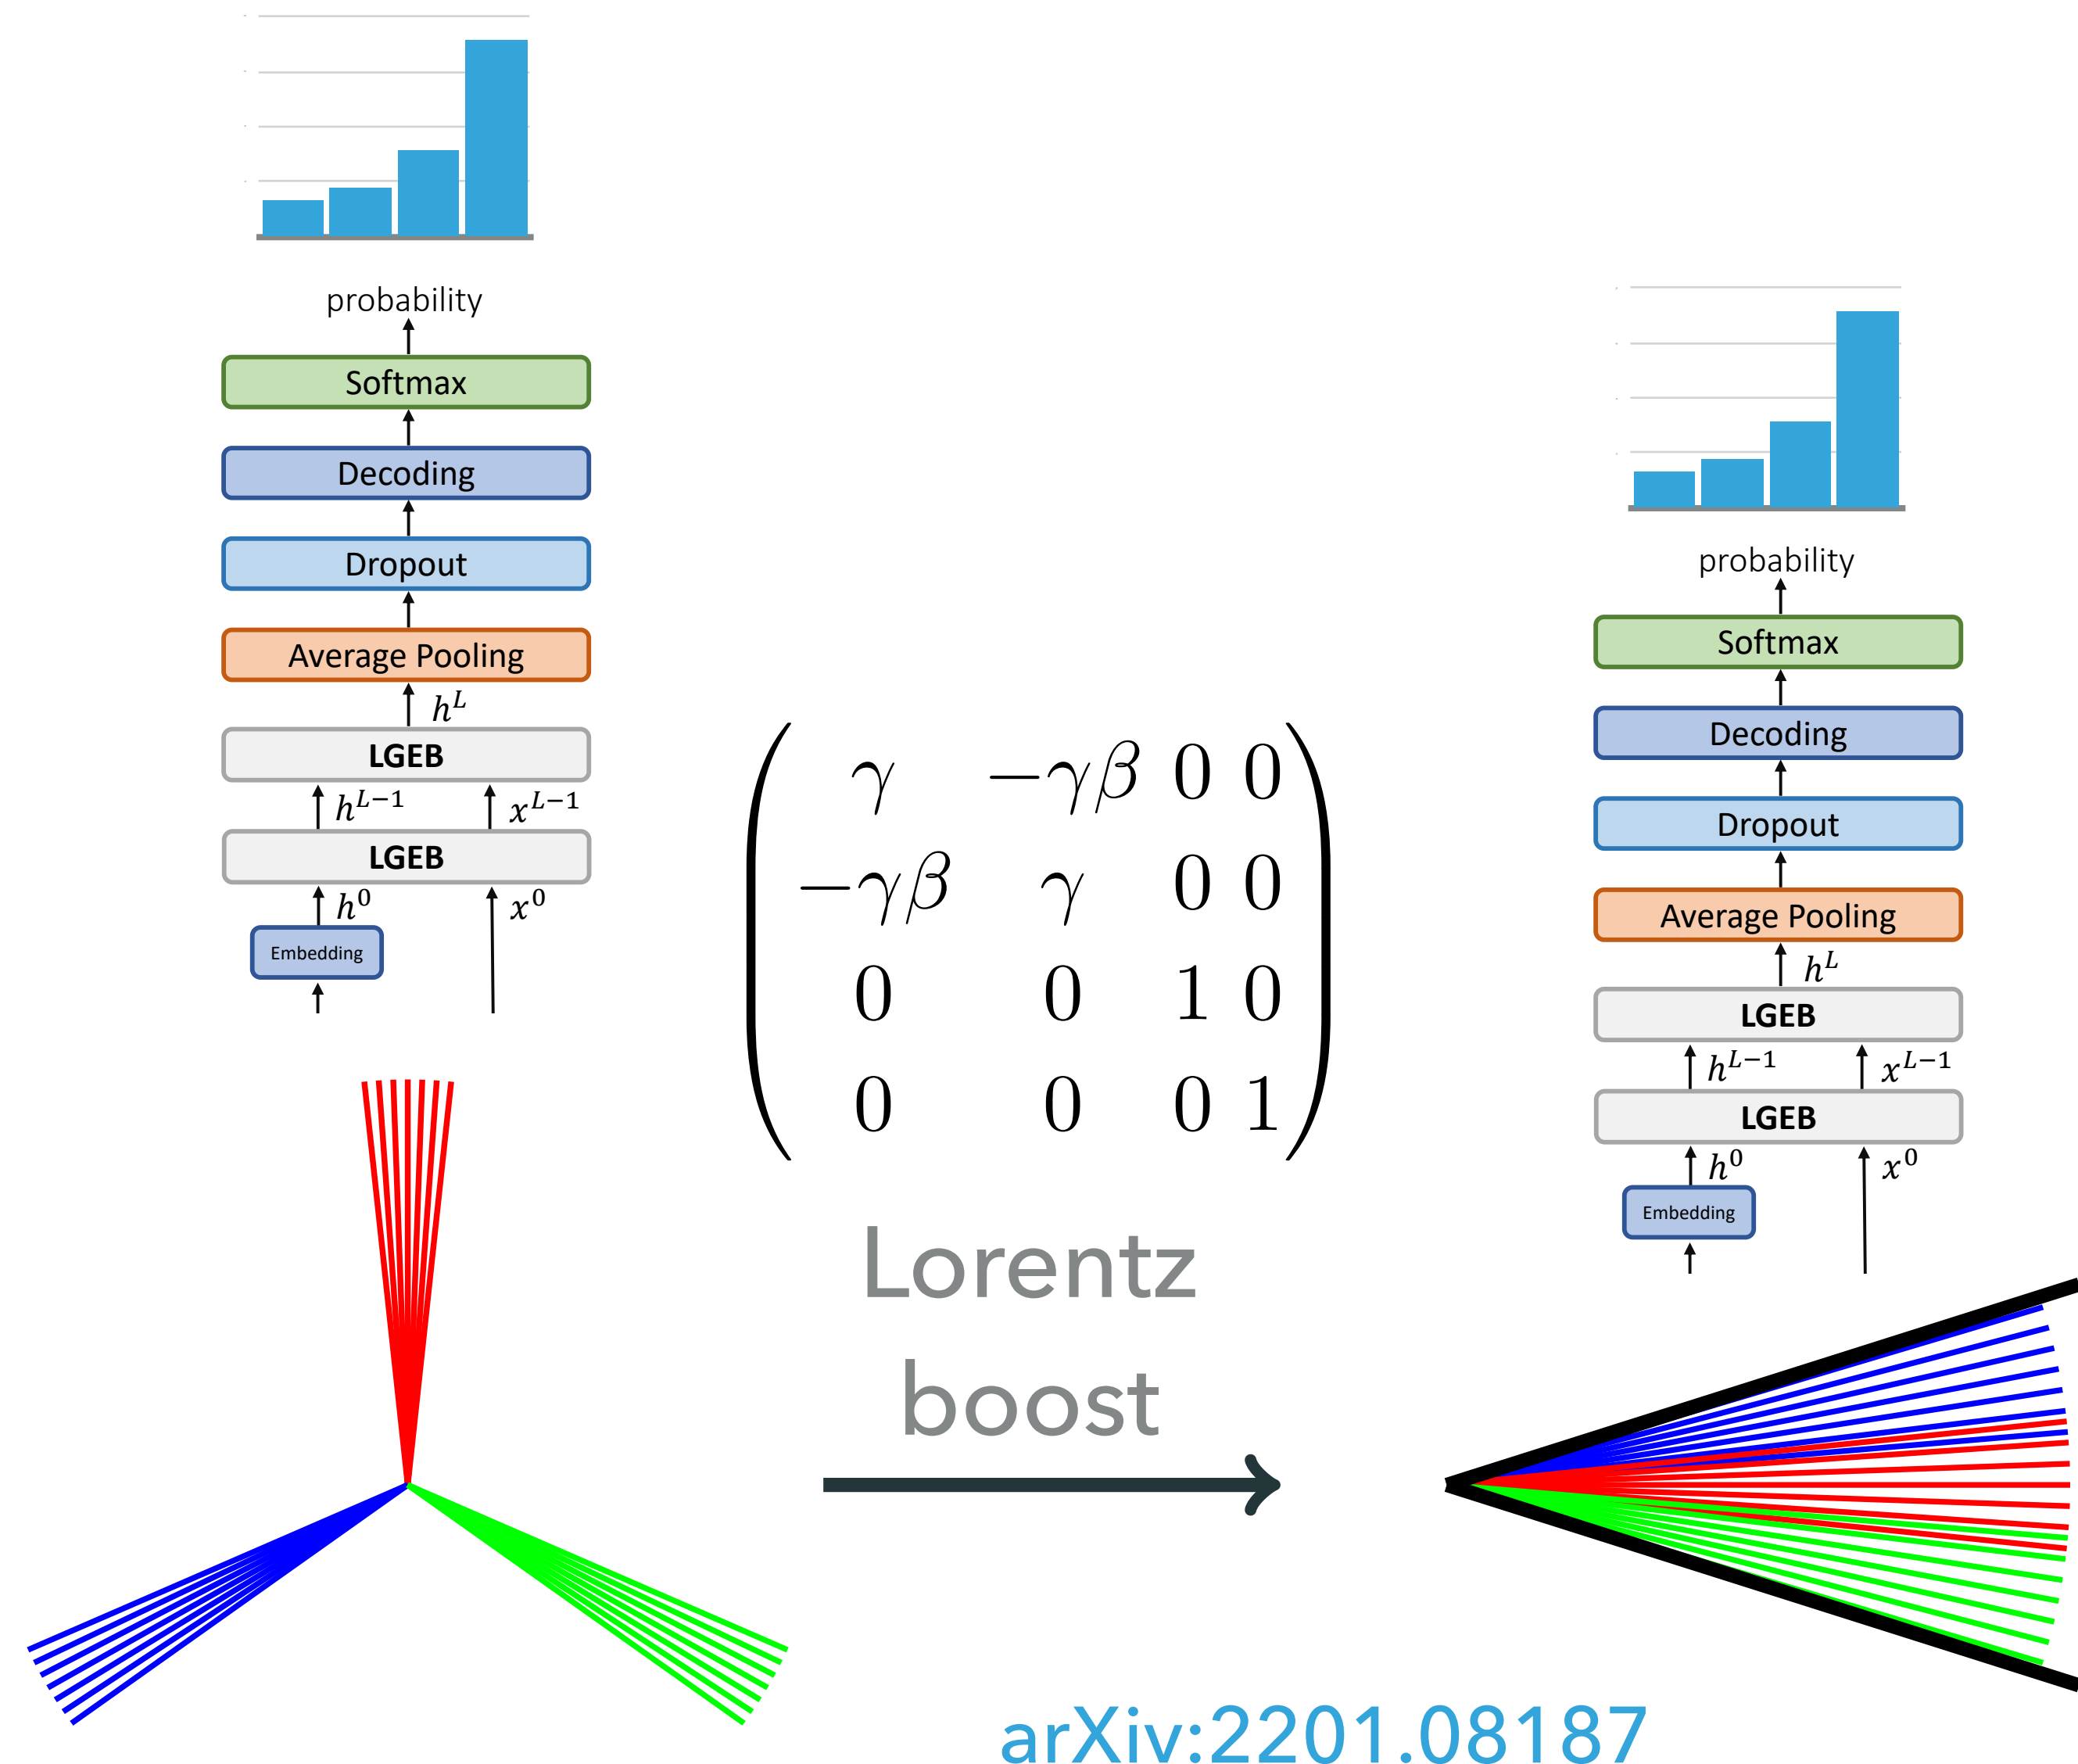

Equivariance

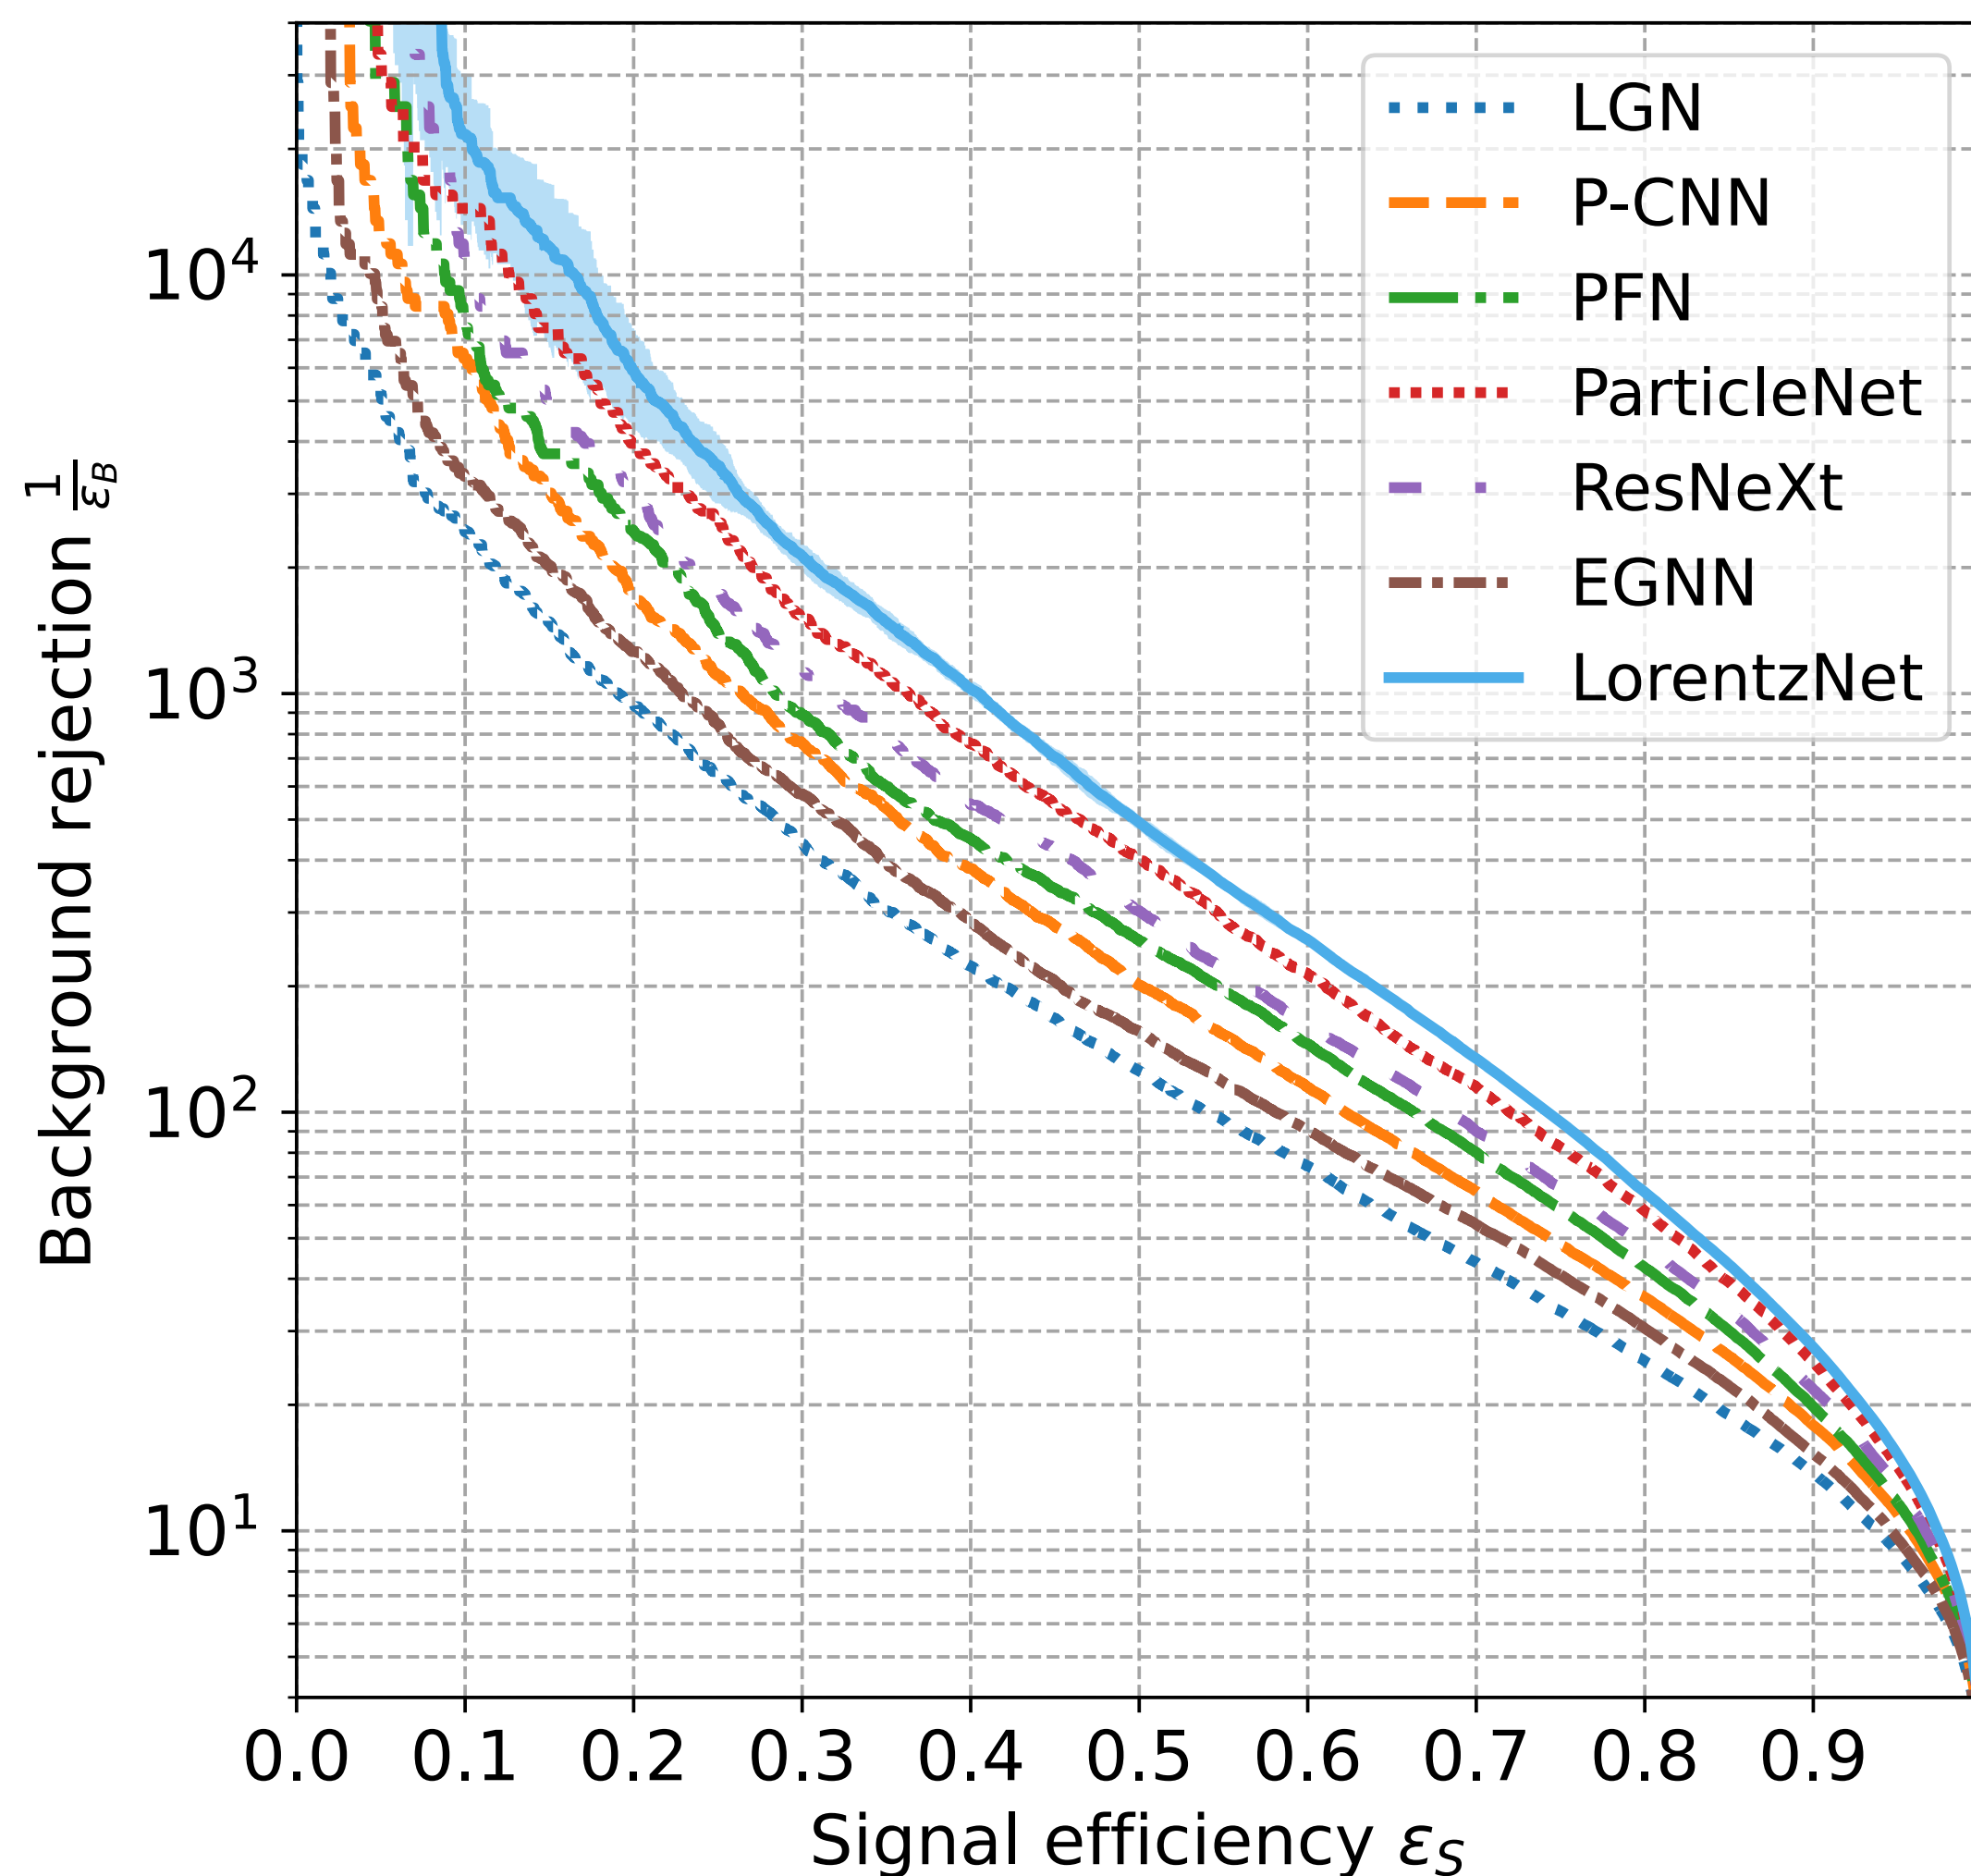

$$f(\rho_g(x)) = \rho'_g(f(x))$$

- ▶ Lorentz-invariant networks:
 - ▶ Boosting all particles into a new frame should give the same result
- ▶ Lorentz-equivariant networks:
 - ▶ Boosting all particles into a new frame should give an output that transforms the same way

- ▶ State-of-the-art performance for top quark tagging
- ▶ Lorentz group invariance confirmed

**I. DATA REPRESENTATIONS
& SYMMETRIES**

II. ANOMALY DETECTION

III. GENERATIVE MODELING

III. FAST INFERENCE

VI. SUMMARY & OUTLOOK

- ▶ Supervised = full label information
- ▶ Semi-supervised = partial labels
- ▶ Weakly-supervised = noisy labels
- ▶ Unsupervised = no labels
 - ▶ Example: autoencoders compress data and then uncompress it
 - ▶ Assumption: if x is far from $\text{Decoder}(\text{Encoder}(x))$, then x has low $p_{\text{bkgd}}(x)$

- ▶ Challenge with “black box” signals run in 2020–2021
- ▶ Plethora of new techniques

3 Unsupervised

- 3.1 Anomalous Jet Identification via Variational Recurrent Neural Network
- 3.2 Anomaly Detection with Density Estimation
- 3.3 BuHuLaSpa: Bump Hunting in Latent Space
- 3.4 GAN-AE and BumpHunter
- 3.5 Gaussianizing Iterative Slicing (GIS): Unsupervised In-distribution Anomaly Detection through Conditional Density Estimation
- 3.6 Latent Dirichlet Allocation
- 3.7 Particle Graph Autoencoders
- 3.8 Regularized Likelihoods
- 3.9 UCluster: Unsupervised Clustering

4 Weakly Supervised

- 4.1 CWoLa Hunting
- 4.2 CWoLa and Autoencoders: Comparing Weak- and Unsupervised methods for Resonant Anomaly Detection
- 4.3 Tag N' Train
- 4.4 Simulation Assisted Likelihood-free Anomaly Detection
- 4.5 Simulation-Assisted Decorrelation for Resonant Anomaly Detection

5 (Semi)-Supervised

- 5.1 Deep Ensemble Anomaly Detection
- 5.2 Factorized Topic Modeling
- 5.3 QUAKE: Quasi-Anomalous Knowledge for Anomaly Detection
- 5.4 Simple Supervised learning with LSTM layers

**I. DATA REPRESENTATIONS
& SYMMETRIES**

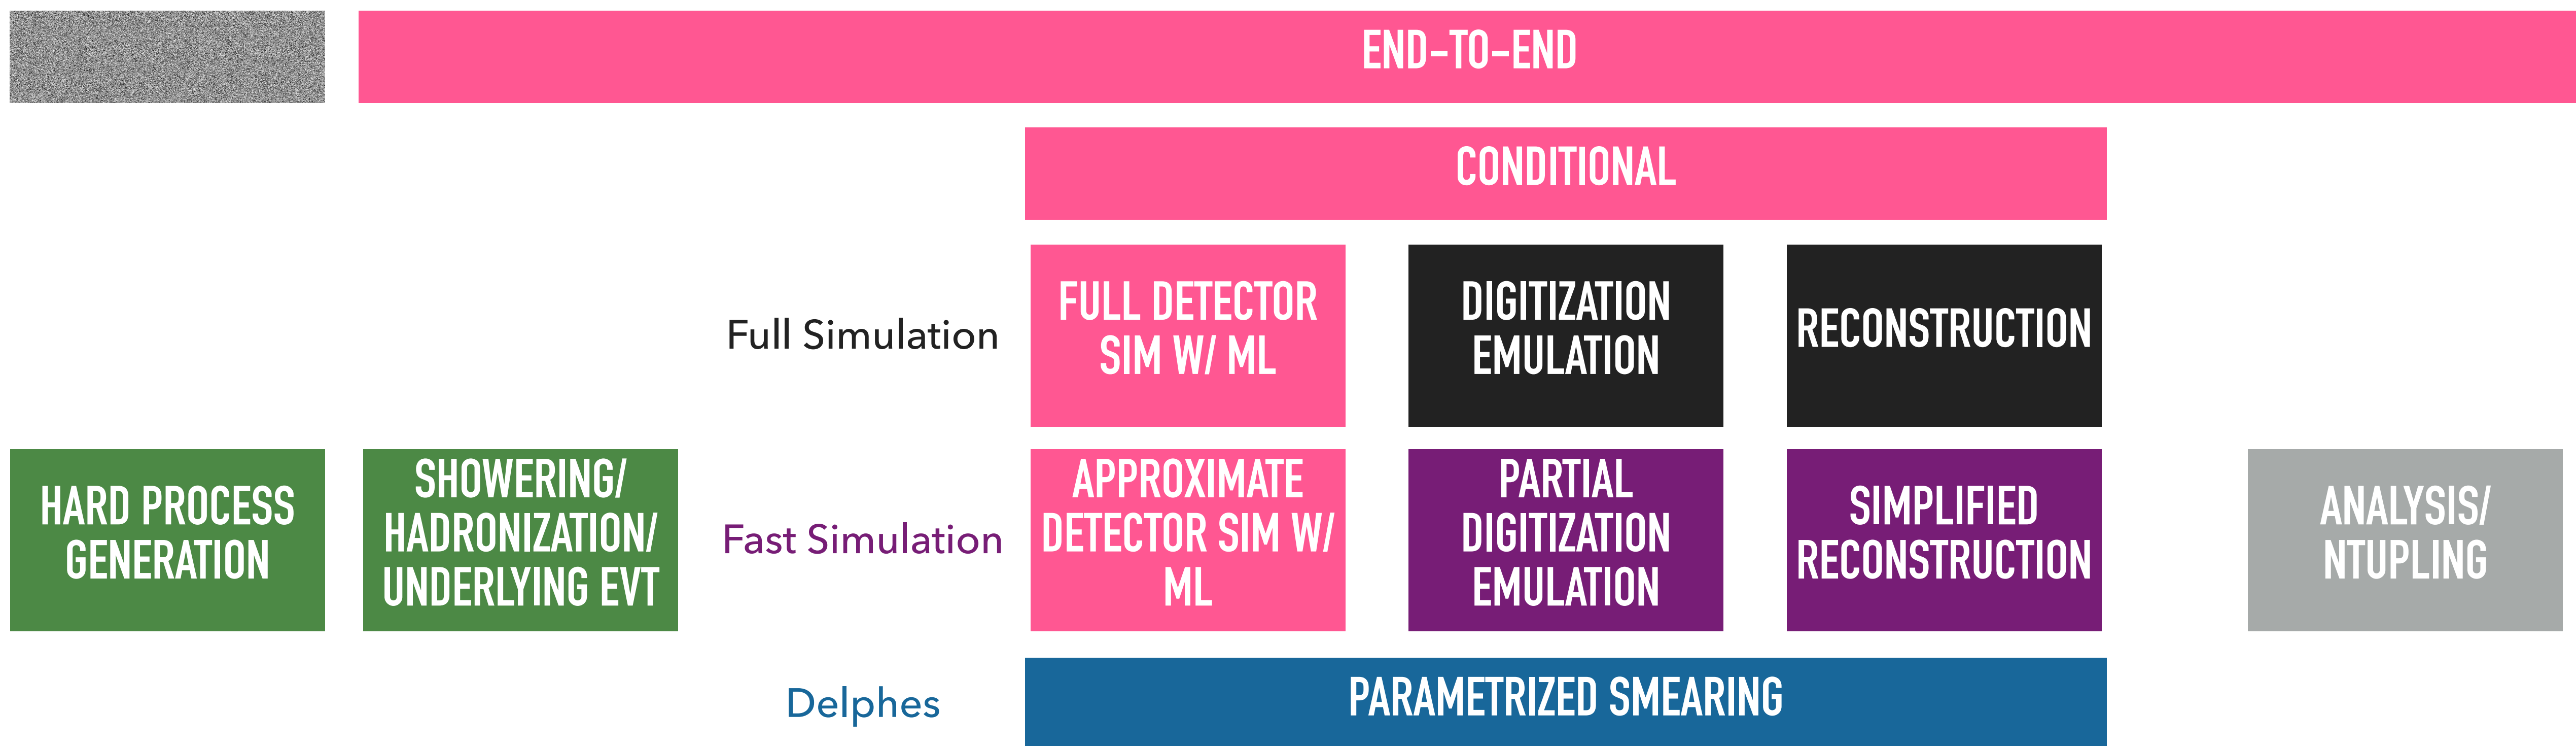

II. ANOMALY DETECTION

III. GENERATIVE MODELING

III. FAST INFERENCE

VI. SUMMARY & OUTLOOK

- ▶ Several different strategies:
 - ▶ Replace (part of) FullSim: increase speed, preserve accuracy
 - ▶ Replace (part of) FastSim: maintain speed, increase accuracy
 - ▶ Conditional: map generated → reconstructed events
 - ▶ **End-to-end: map random noise → reconstructed events directly**

GENERATIVE ADVERSARIAL NETWORKS

[arXiv:1406.2661](https://arxiv.org/abs/1406.2661)

[arXiv:1912.04958](https://arxiv.org/abs/1912.04958) 24

Note: failure modes!

[thisperson](#)

- ▶ Train two neural networks in tandem:
 - ▶ one to generate realistic "fake" data
 - ▶ the other to discriminate "real" from "fake" data

On the Evaluation of Generative Models in High Energy Physics

Raghav Kansal,* Anni Li, and Javier Duarte

(Dated: November 16, 2022)

There has been a recent explosion in research into machine-learning- (ML-) based generative modeling to tackle computational challenges for simulations in high energy physics (HEP). In order to use such alternative simulators in practice, we need a well defined metrics to compare different generative models and evaluate their discrepancy from the true distributions. We present the first systematic review and investigation into evaluation metrics and their sensitivity to failure models of generative models, using the framework of two-sample goodness-of-fit testing, and their relevance and viability for HEP. Inspired by previous work in both physics and computer vision, we propose two new metrics, the Fréchet and Kernel Physics Distances (FPD and KPD), and perform a variety of experiments measuring their performance on simple Gaussian-distributed, and simulated high energy jet datasets. We find FPD, in particular, to be the most sensitive metric to all alternative jet distributions tested and recommend its adoption, along with KPD and Wasserstein distances between individual feature distributions, for evaluating generative models in HEP. We finally demonstrate the efficacy of these proposed metrics in evaluating and comparing a novel attention-based generative model, GAPT, to the state-of-the-art MPGAN jet simulation model.

Physics P

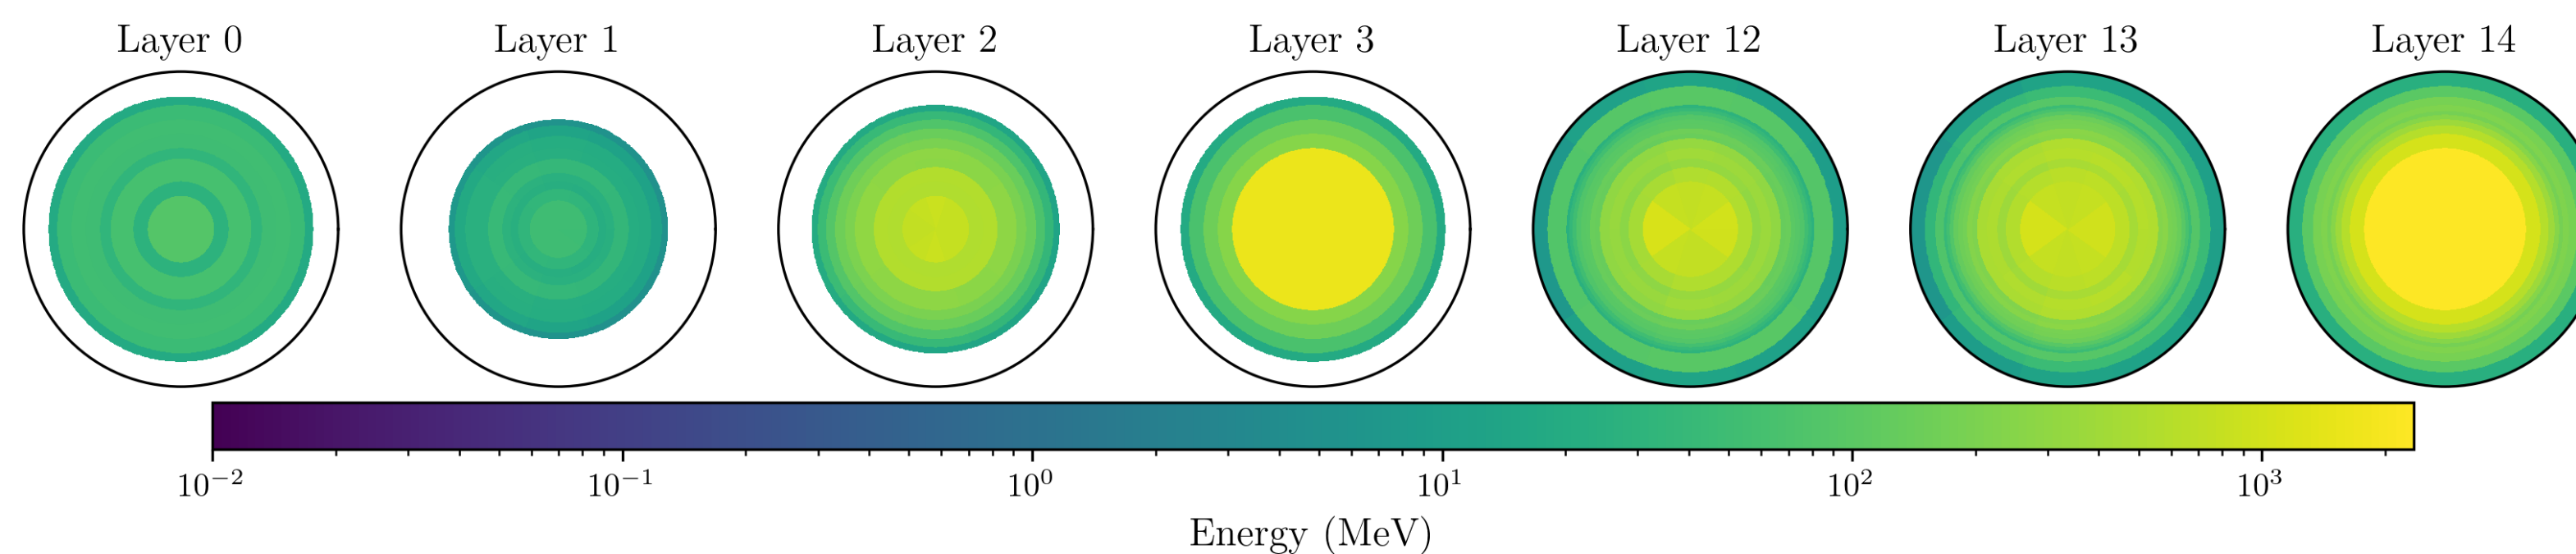

- ▶ Ongoing challenge for generative modeling of calorimeter showers in HEP!
- ▶ Many new approaches presented at ML4Jets 2022: <https://indico.cern.ch/event/1159913/>

Shower average GEANT4 photon reference dataset

Shower average GEANT4 pion reference dataset

- ▶ Diffusion models have very recently dethroned GANs for natural images
- ▶ Generative model is trained using a diffusion process that slowly perturbs the data by adding noise – model learns to **denoise**
- ▶ Generation of new samples by reversing the diffusion process

- ▶ Distribution of deposited energies for generated particle energies (top) and the energy deposition in a single layer of a calorimeter (bottom) vs time step

**I. DATA REPRESENTATIONS
& SYMMETRIES**

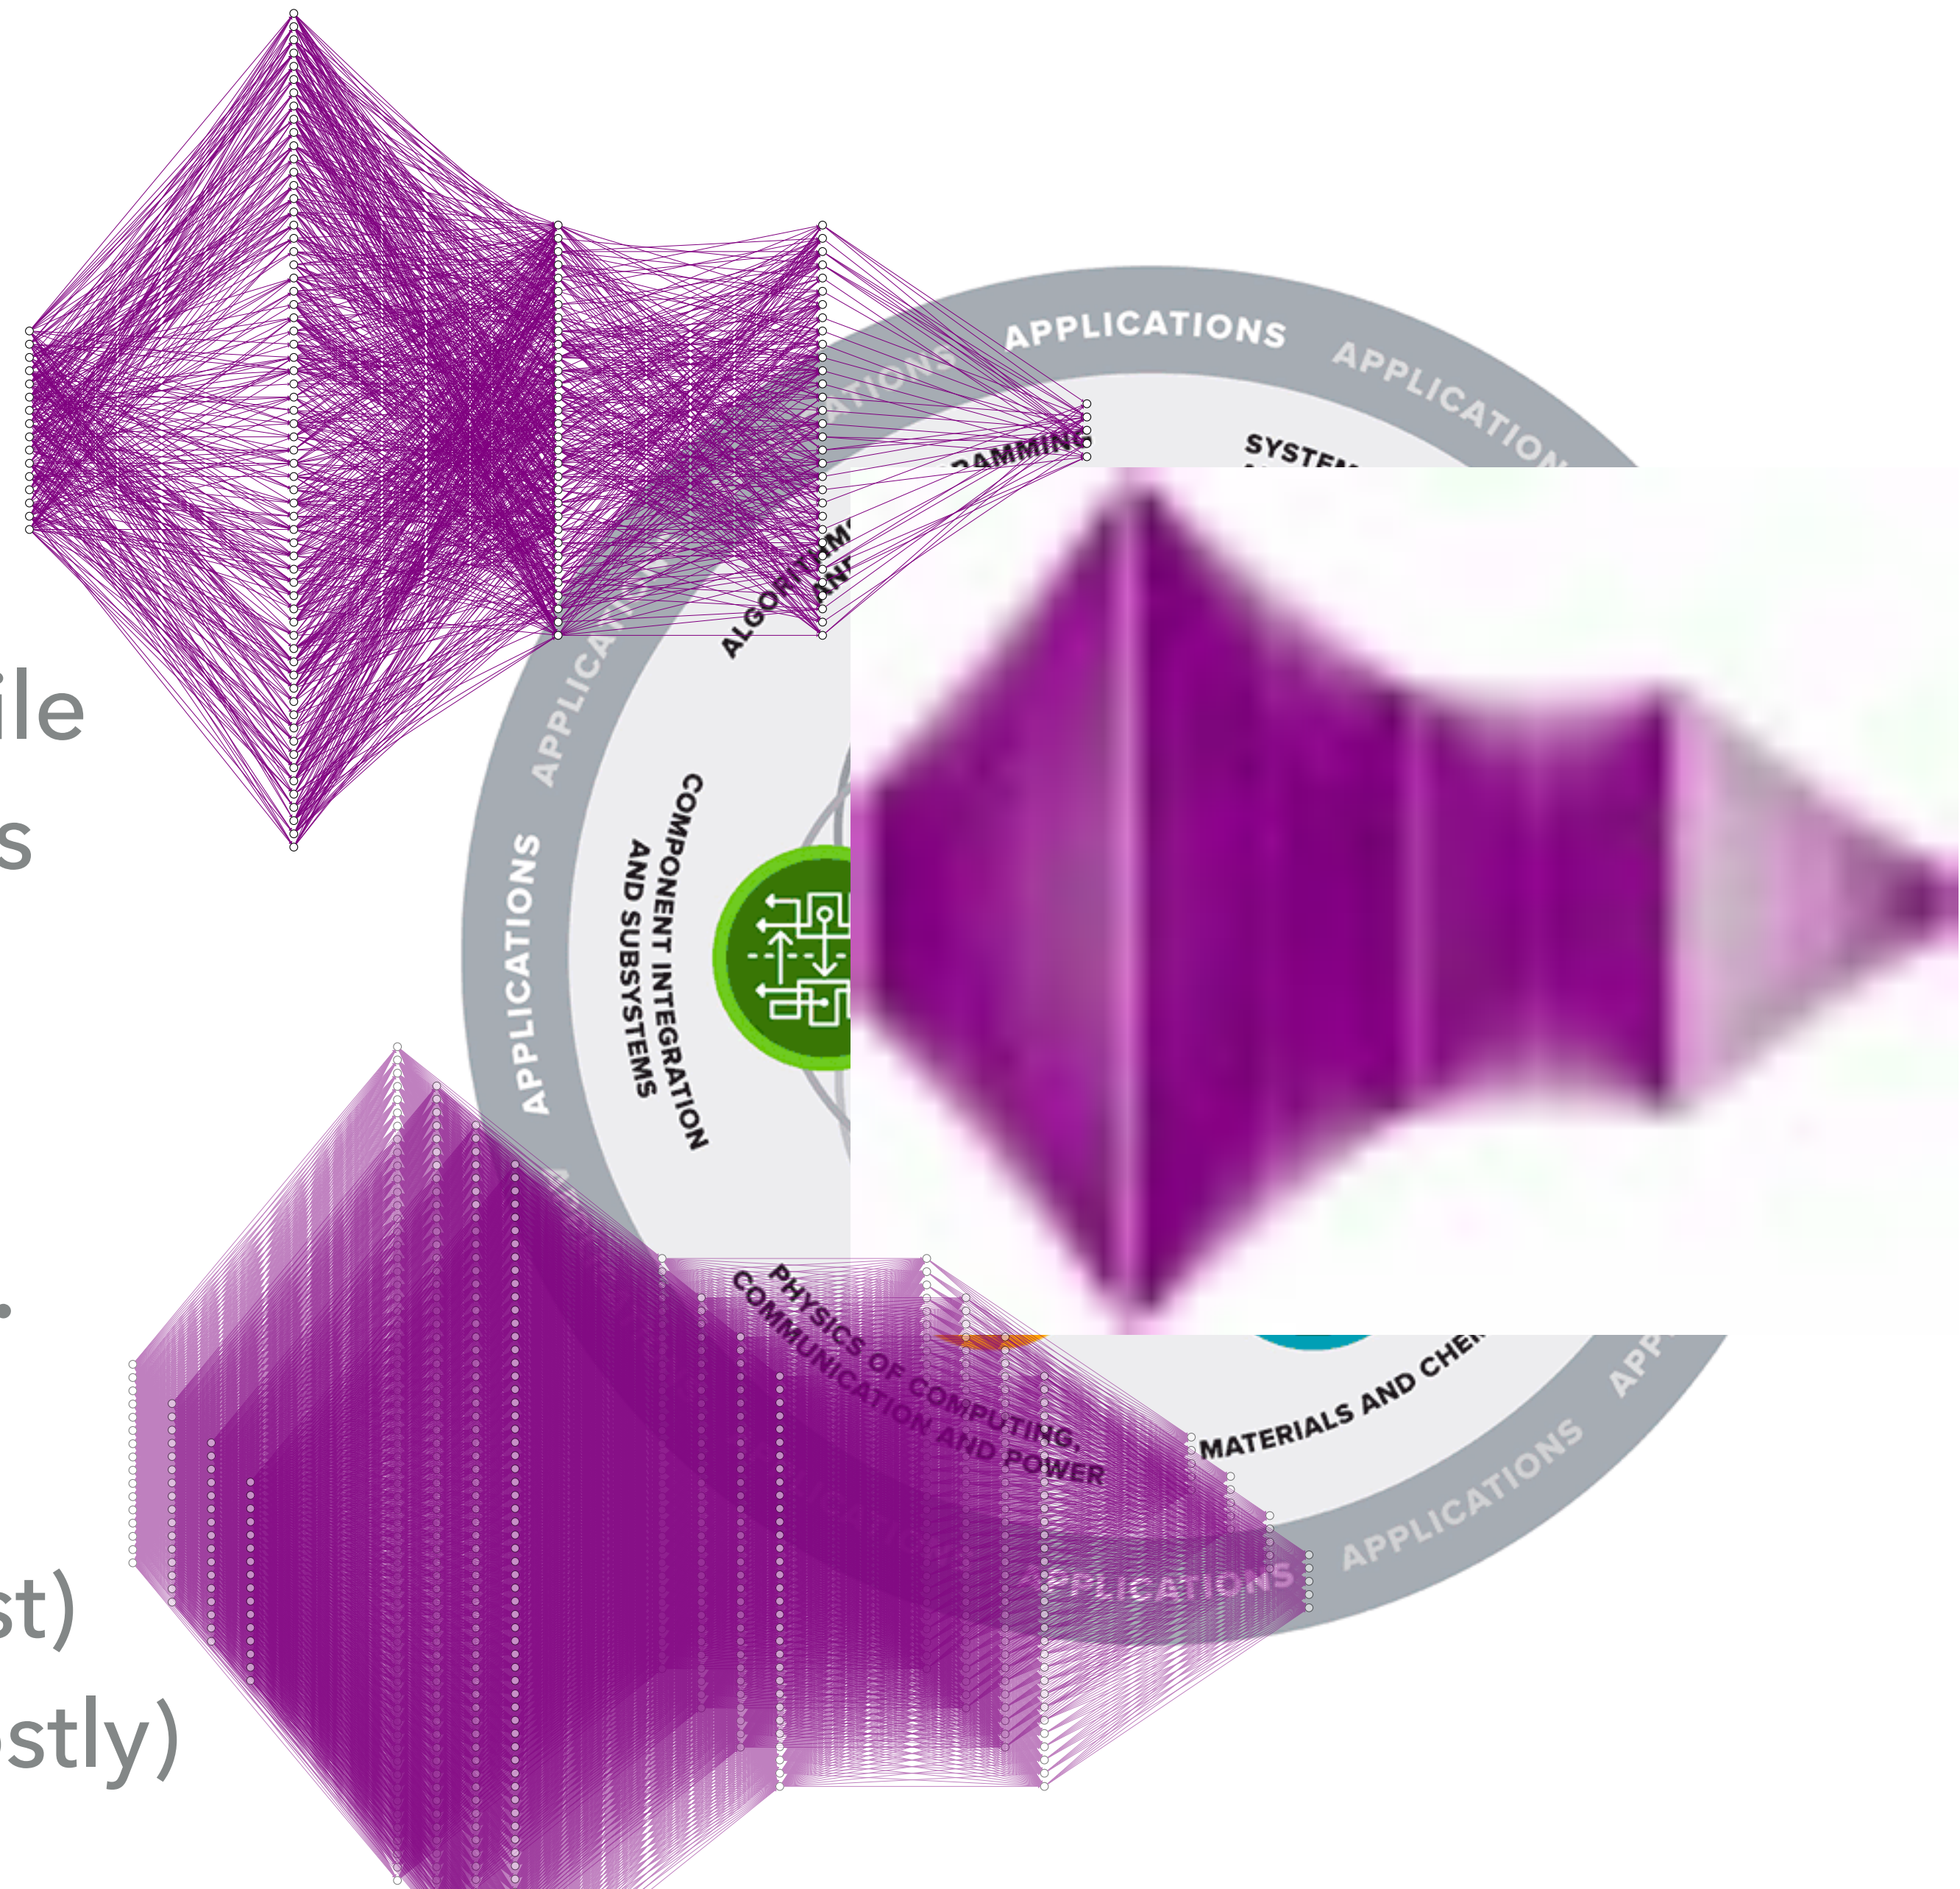

II. ANOMALY DETECTION

III. GENERATIVE MODELING

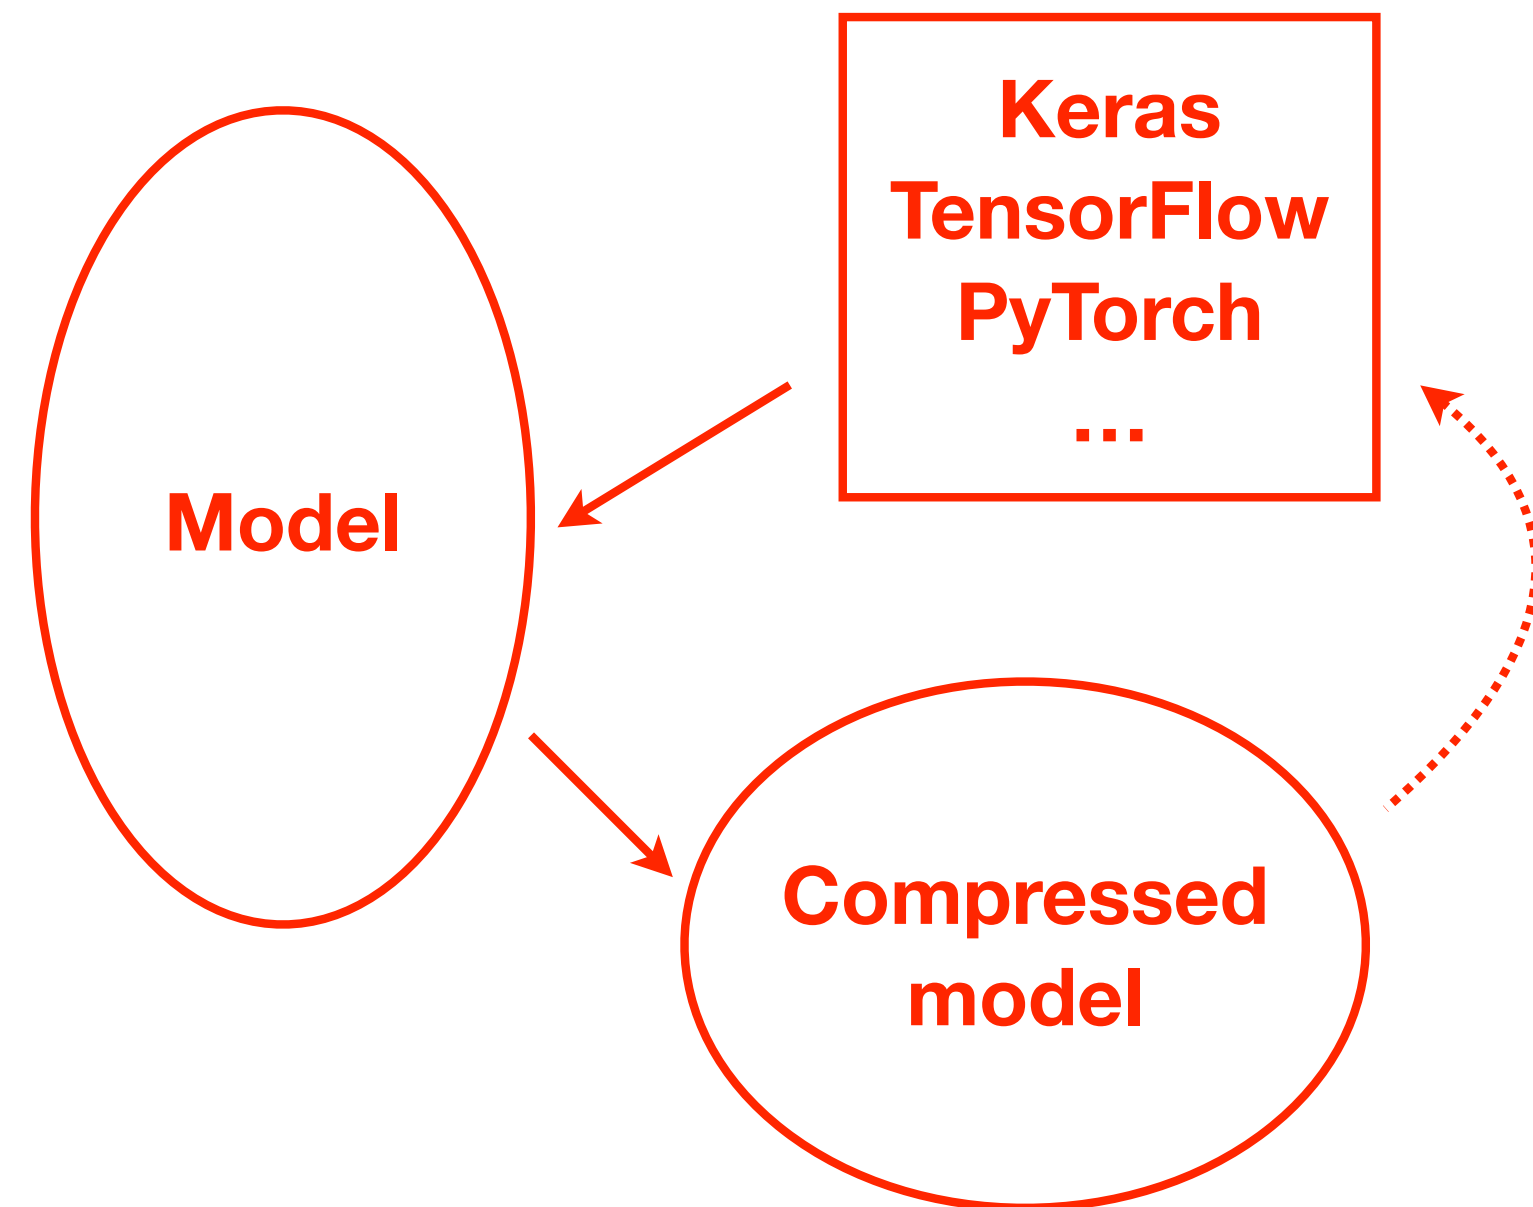

III. FAST INFERENCE

VI. SUMMARY & OUTLOOK

- ▶ **Codesign:** intrinsic development loop between algorithm design, training, and implementation
- ▶ Compression
 - ▶ Maintain high performance while removing redundant operations
- ▶ Quantization
 - ▶ Reduce precision from 32-bit floating point to 16-bit, 8-bit, ...
- ▶ Parallelization
 - ▶ Balance parallelization (how fast) with resources needed (how costly)

- ▶ [hls4ml](#) for scientists or ML experts to translate ML algorithms into RTL firmware

Machine learning model optimization, compression

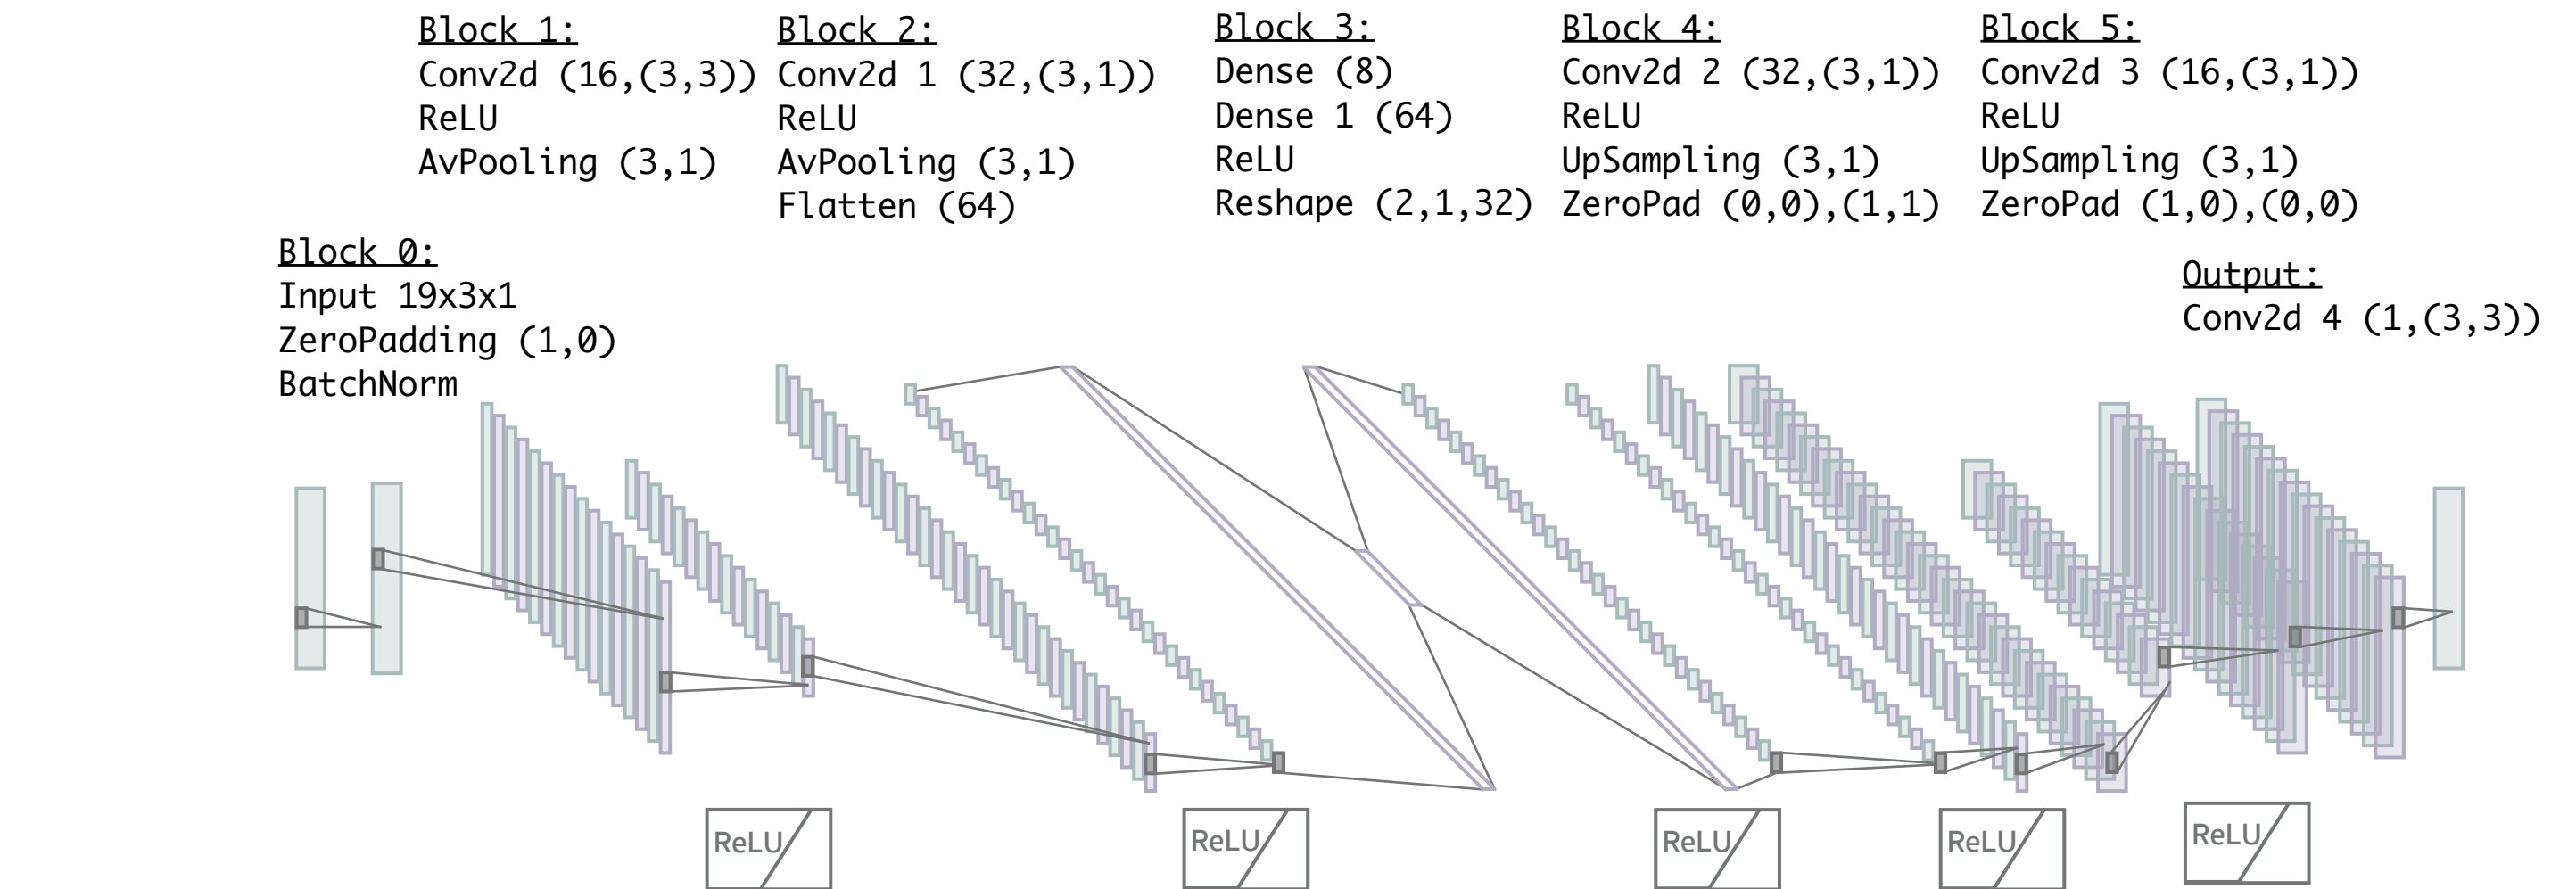

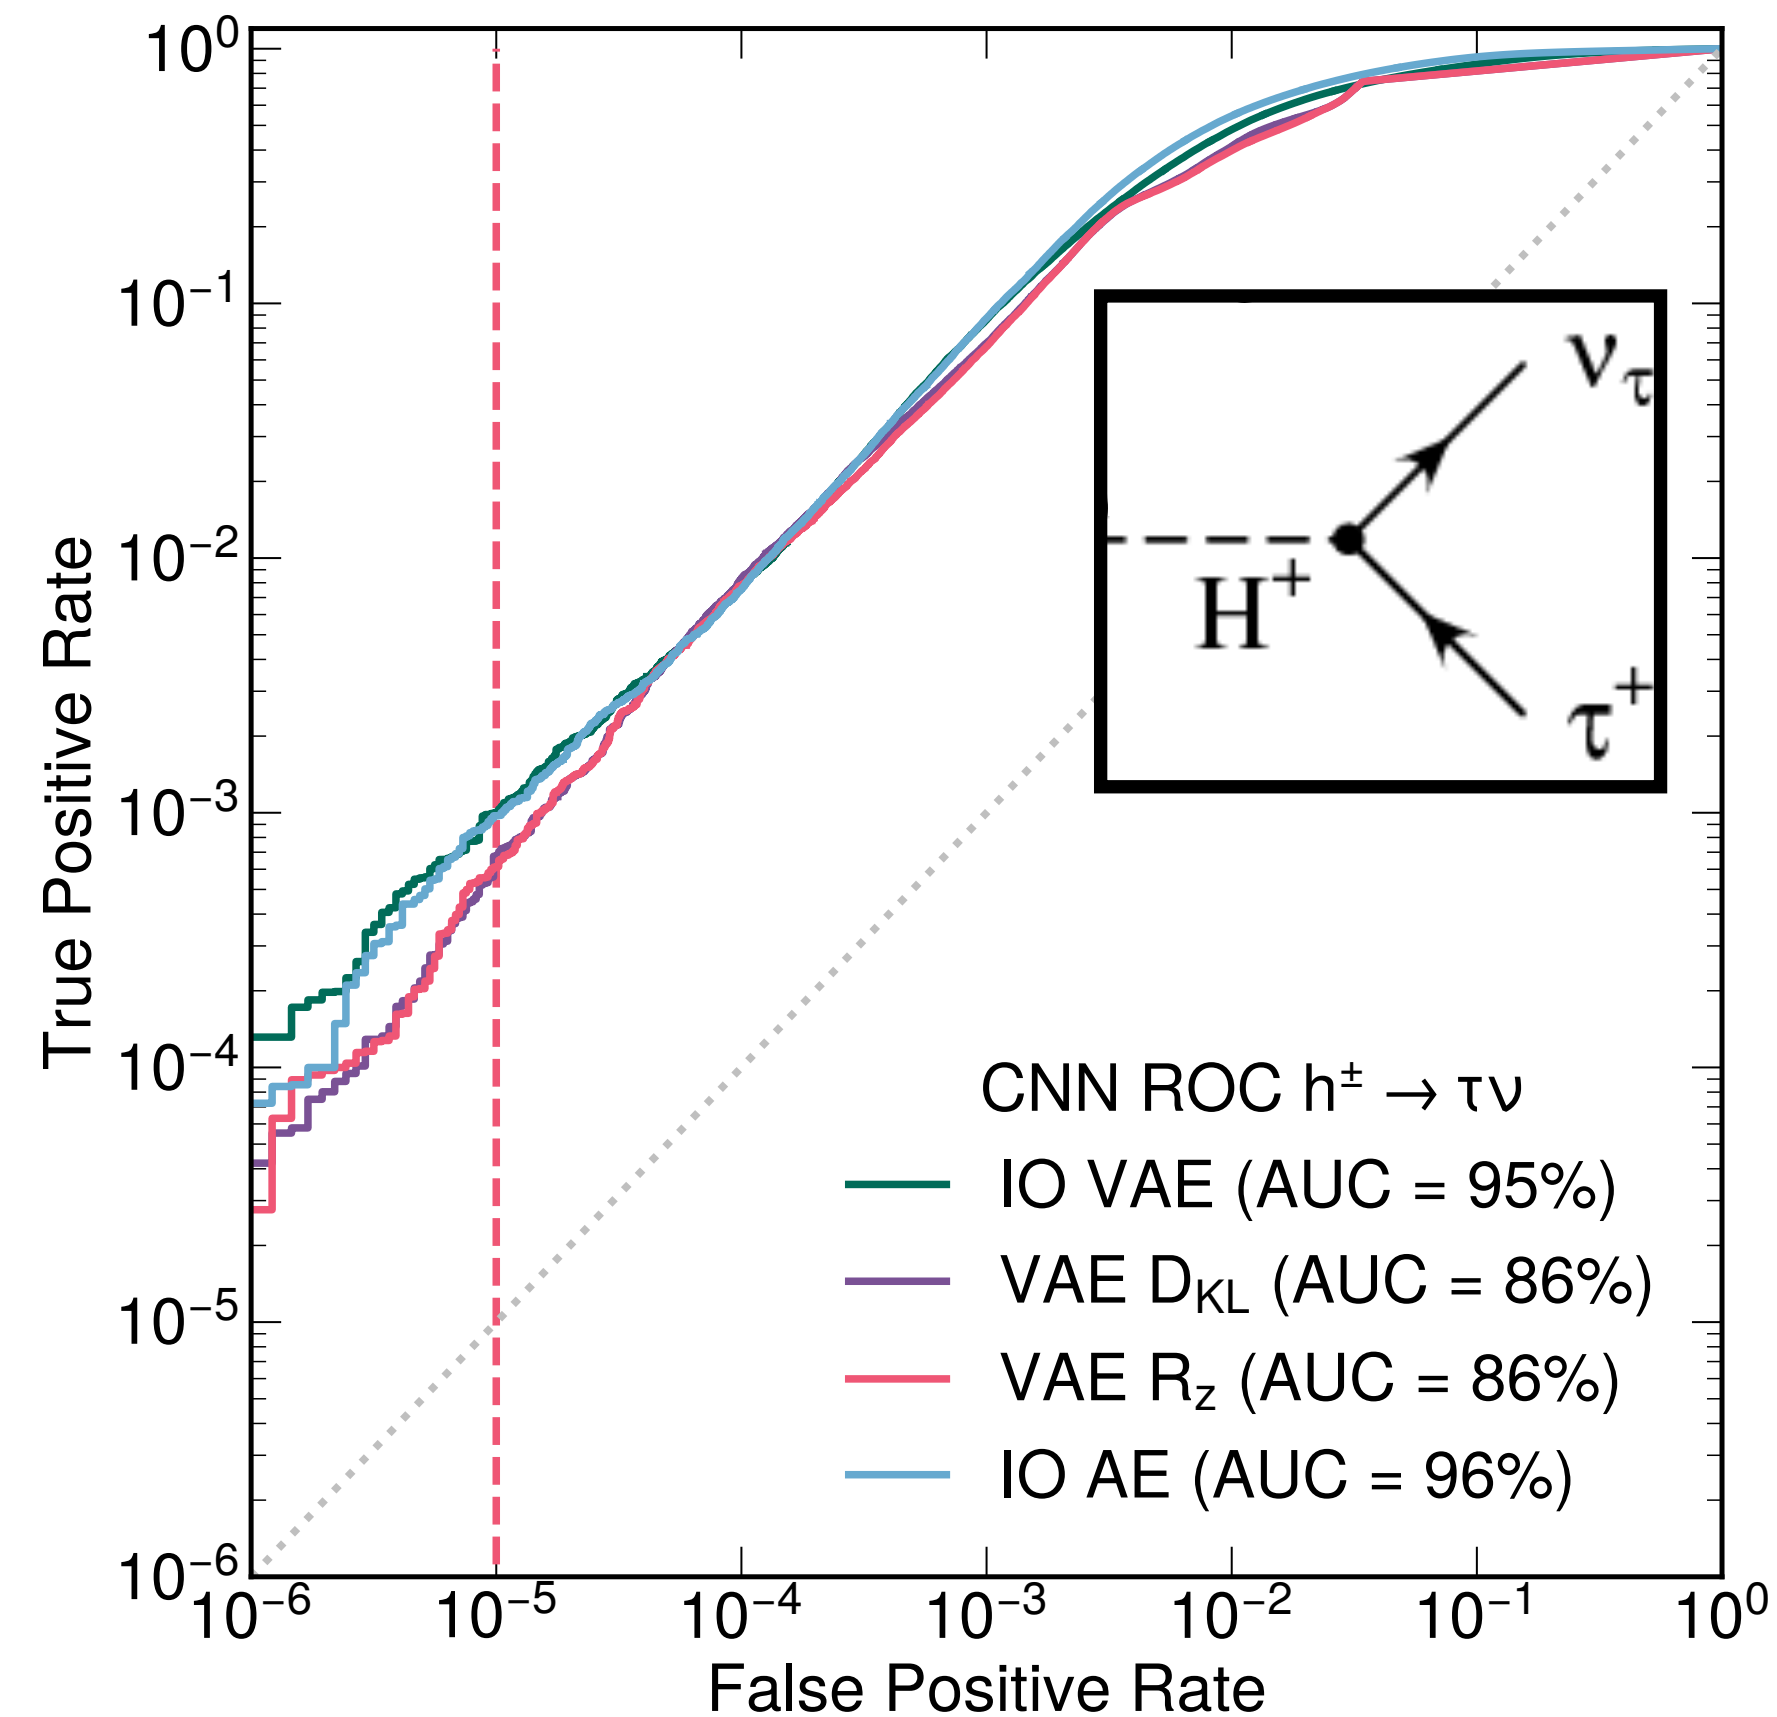

- ▶ Challenge: if new physics has an unexpected signature that doesn't align with existing triggers, precious BSM events may be discarded at trigger level
- ▶ Can we use unsupervised algorithms to detect non-SM-like anomalies?
 - ▶ Autoencoders (AEs): compress input to a smaller dimensional latent space then decompress and calculate difference
 - ▶ Variational autoencoders (VAEs): model the latent space as a probability distribution; possible to detect anomalies purely with latent space variables

Key observation: Can build an anomaly score from the latent space of VAE directly!
No need to run decoder!

$$R_z = \sum_i \frac{\mu_i^2}{\sigma_i^2}$$

- ▶ CNNs as the basis for (V)AEs for anomaly detection
- ▶ Good anomaly detection performance for unseen signals ($LQ \rightarrow b\tau, A \rightarrow 4l, h^\pm \rightarrow \tau\nu, h^0 \rightarrow \tau\tau$)
- ▶ **VAE** fits in latency and resource requirements for HL-LHC!

Model	DSP [%]	LUT [%]	FF [%]	BRAM [%]	Latency [ns]	II [ns]	AUC [%]	TPR @ FPR=10 ⁻⁵
CNN VAE R_z	10	12	4	2	365	115	86	0.06%
CNN AE	7	47	5	6	1480	895	96	0.10%

**I. DATA REPRESENTATIONS
& SYMMETRIES**

II. ANOMALY DETECTION

III. GENERATIVE MODELING

III. FAST INFERENCE

VI. SUMMARY & OUTLOOK

- ▶ Different representations of HEP data, from tabular data, image data, set data, graph data, paired with corresponding algorithms can achieve excellent performance
- ▶ Plethora of ML techniques in HEP from anomaly detection to generative modeling have exploded in recent years
 - ▶ Availability of public datasets and challenges have advanced the state-of-the-art
- ▶ Fast ML can accelerate science allowing us to test hypotheses faster, enhance performance of detectors/accelerators, and save potentially overlooked data
