May 9-11, 2011

Introduction

This talk (Non-SUSY Searches @ CMS) describes

- some of early new physics searches we've performed
 - using 2010 pp data ($\sim 36 \text{ pb}^{-1}$) @ 7 TeV
- some of the important theories we've tested so far
 - new heavy resonances
 - quark/lepton compositeness
 - extra dimensions & other exotic signatures

Many results are published or submitted/accepted for publication

~20 searches are detailed in:

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/PhysicsResultsEXO>

Searches for New Physics with Dijets & Multijets

- Bump search in the dijet spectrum
- Dijet centrality ratio
- Dijet angular distribution
- Multijet resonance

Select dijet in event with $|\eta_1, \eta_2| < 2.5$ & $|\Delta\eta| < 1.3$

Look for bumps in dijet mass spectrum

- sensitive to the coupling of any new massive object to quarks and gluons.
- no resonance signal observed,
set model-independent limits on 8 models

ATLAS limit: $0.6 < m(q^*) < 2.15$ (36 pb⁻¹)

95% C.L. Mass Limit [TeV] (2.9pb⁻¹)

String	q*	Axigluon/ Coloron	E6 Diquark
0.5 – 2.5	0.5 – 1.58	0.50 – 1.17 1.47 – 1.52	0.50 – 0.58 0.97 – 1.08 1.45 – 1.60

Look for excess of central dijets compared to forward dijets

New physics tends to decay isotropically, but

QCD tends to be forward: **deviation from flat is sign of NP** →

2.9 pb⁻¹ data consistent with flat, set limit on $\Lambda > 4$ TeV

Contact Interaction

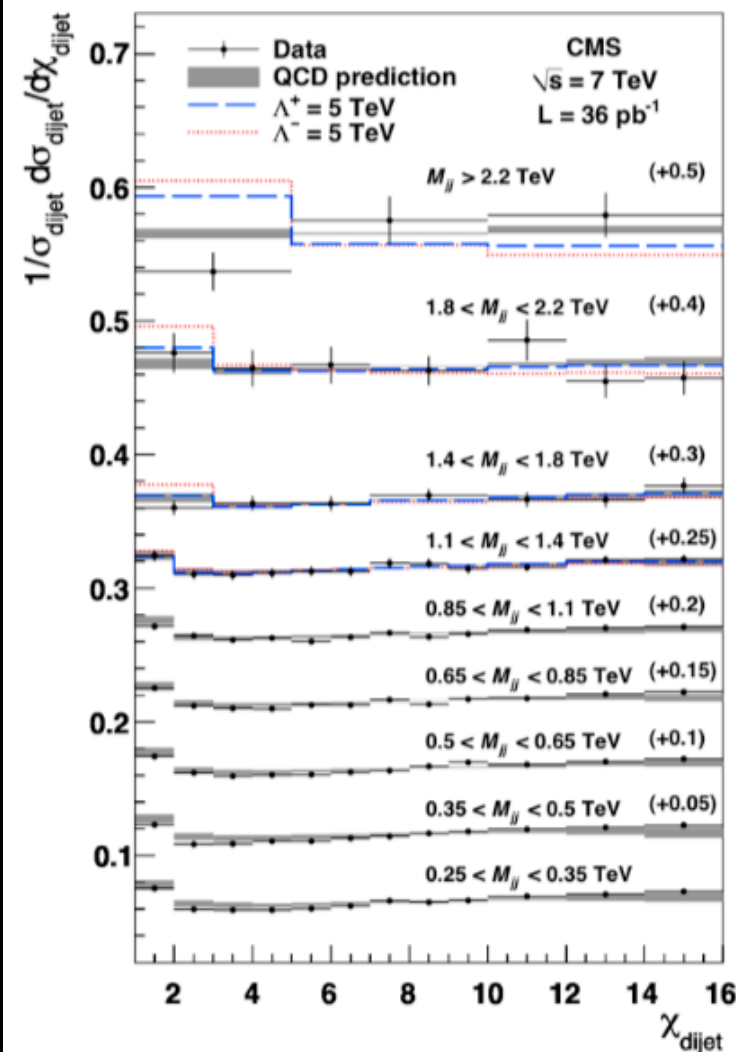

Look at dijet c.o.m scattering angle θ^* via χ variable \rightarrow

Isotropic new physics peaks at low χ & QCD is flat in χ

Good agreement between data (36 pb⁻¹) & NLO QCD,
set limit on C.I. scale $\Lambda^+ > 5.6$ (5.0) TeV, $\Lambda^- > 6.7$ (5.8) TeV
(similar to ATLAS expected limit: $\Lambda^+ > 5.7$ TeV)

$$\chi = e^{2y^*} = \frac{1 + |\cos \theta^*|}{1 - |\cos \theta^*|}$$

Searching for strongly coupled resonances decaying to **3-jets**

- look for 3 jet resonances in 6 jet final states
- modeled with RPV \tilde{g} decays

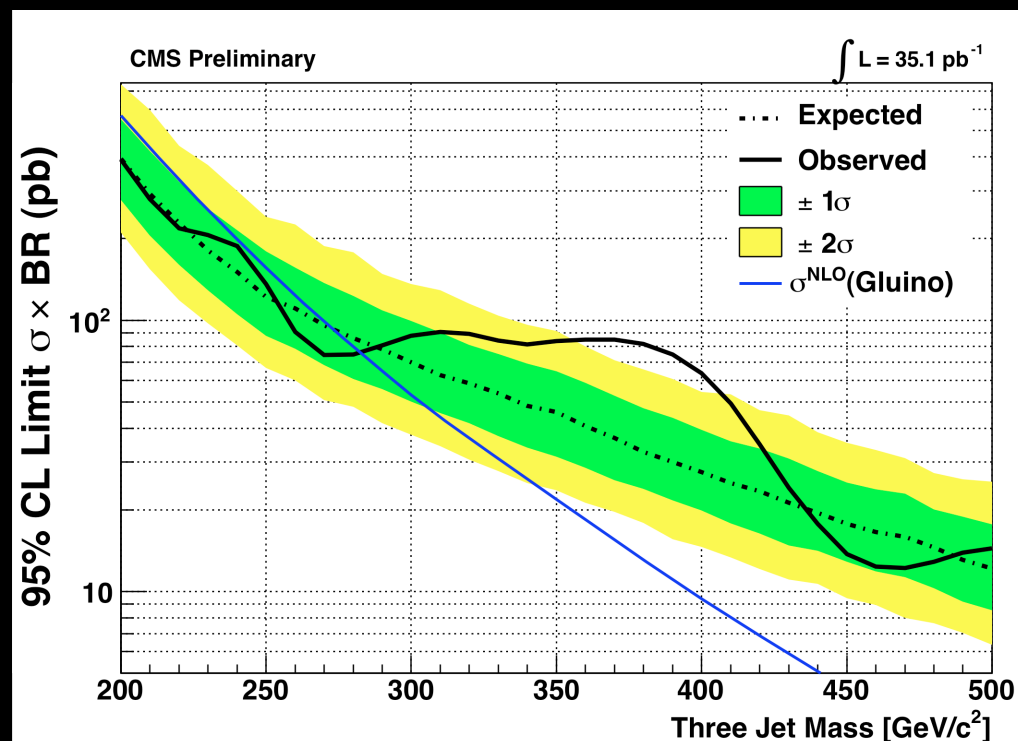

Signature Selection

- high Jet Multiplicity (≥ 6 Jets)
- large event scalar sum p_T (> 425 GeV)
- use an ensemble of jet combinations
- construct 20 jet triplet combinations (M_{jjj})

Limits set for RPV decaying gluinos

- excluding masses from 200 to 280 GeV
- highest limits to date, first pp limits
- largest excess seen @ 390 GeV \rightarrow significant of 1.9σ (look-elsewhere effect)

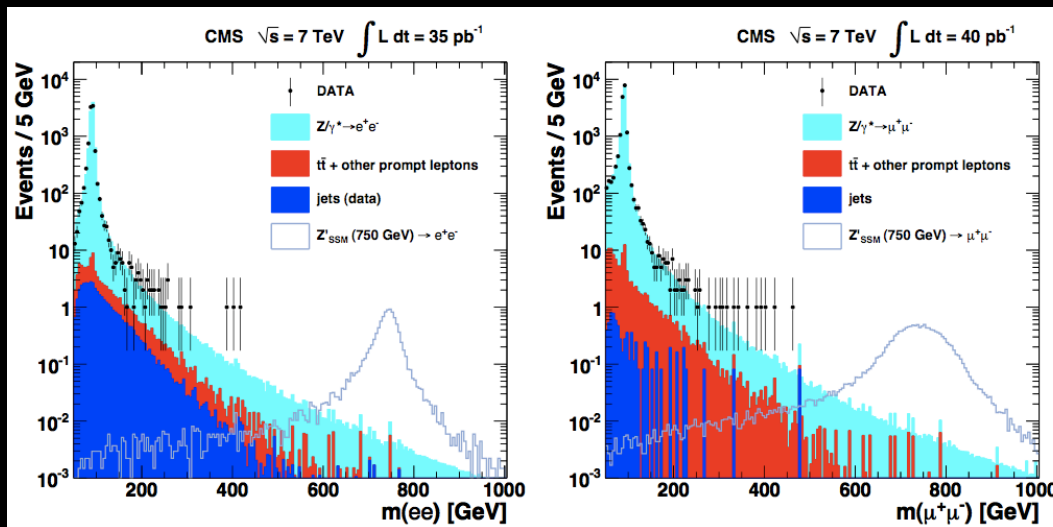

Searches for Additional Gauge Bosons

- Di-lepton Resonances: W' , Z'
- Leptoquarks: LQ1, LQ2

Look for bump in dilepton mass spectrum

- Two central, isolated $e(\mu)$ with $p_T > 25(20)$ GeV
- No deviation from SM (dominantly Drell-Yan)
- Set limits, **most stringent limits to date**

CMS limits (35 ~ 40 pb⁻¹)

Channel	$\mu\mu$	ee	Combined
Z_{SSM}	1027 GeV	958 GeV	1140 GeV
Z_ψ	792 GeV	731 GeV	887 GeV
$G_{KK}, k/M_{Pl} = 0.05$	778 GeV	729 GeV	855 GeV
$G_{KK}, k/M_{Pl} = 0.10$	987 GeV	931 GeV	1079 GeV

Express limit as a ratio b/w $\sigma(Z')$ to the SM Z

$$R_\sigma = \frac{\sigma(pp \rightarrow Z' + X \rightarrow \ell\ell + X)}{\sigma(pp \rightarrow Z + X \rightarrow \ell\ell + X)}$$

$W' \rightarrow e\nu$: arXiv:1012.4945, accepted by PRL
 $W' \rightarrow \mu\nu$: arXiv:1103.0030, submitted to PLB

W' Searches

Look for Jacobian peak in $M_T(e\nu)$ & $M_T(\mu\nu)$ distribution

- A central, isolated $e(\mu)$ with $p_T > 30(25)$ GeV
- No significant deviation from SM
- Set limits, **most stringent limits to date**

$$M_T = \sqrt{2E_T^\ell E_T^{\text{miss}} [1 - \cos \Delta\phi(\ell, E_T^{\text{miss}})]}$$

CMS limits (36 pb⁻¹)

ATLAS: 1.45 TeV
 Tevatron: 1.1 TeV

$e\nu$	1.36 TeV
$\mu\nu$	1.40 TeV
$e\nu + \mu\nu$	1.58 TeV

- LQs decays to lepton and quark. $\beta = \text{BR}(\text{LQ} \rightarrow lq)$, $1-\beta = \text{BR}(\text{LQ} \rightarrow \nu q)$
- Search for 1st (e) and 2nd (μ) generation LQs, look for S_T (scalar sum of jet & lepton p_T)

1st gen LQs – $eejj + e\nu jj$ channels

$M_{LQ} > 340, 384 \text{ GeV}$ for $\beta = 0.5, 1$

2nd gen LQs – $\mu\mu jj$ channel

$M_{LQ} > 394 \text{ GeV}$ for $\beta = 1$

- Exceed Tavatron limits for almost the entire β range (except @ very low β)
- Similar to ATLAS limit: $M_{LQ1} > 376 \text{ GeV}$ & $M_{LQ2} > 422 \text{ GeV}$ for $\beta = 1$

Searches for Compositeness

- Quark Compositeness
- Lepton Compositeness

Highest dimuon p_T candidate
event ~ 555 GeV

Weakly decaying excited quark

- $q^* \rightarrow qZ \rightarrow q \mu^+ \mu^-$ ($\Lambda = m_{q^*}$ and $f = f' = 1$)
- complementary to $q^* \rightarrow jj$ decay channel

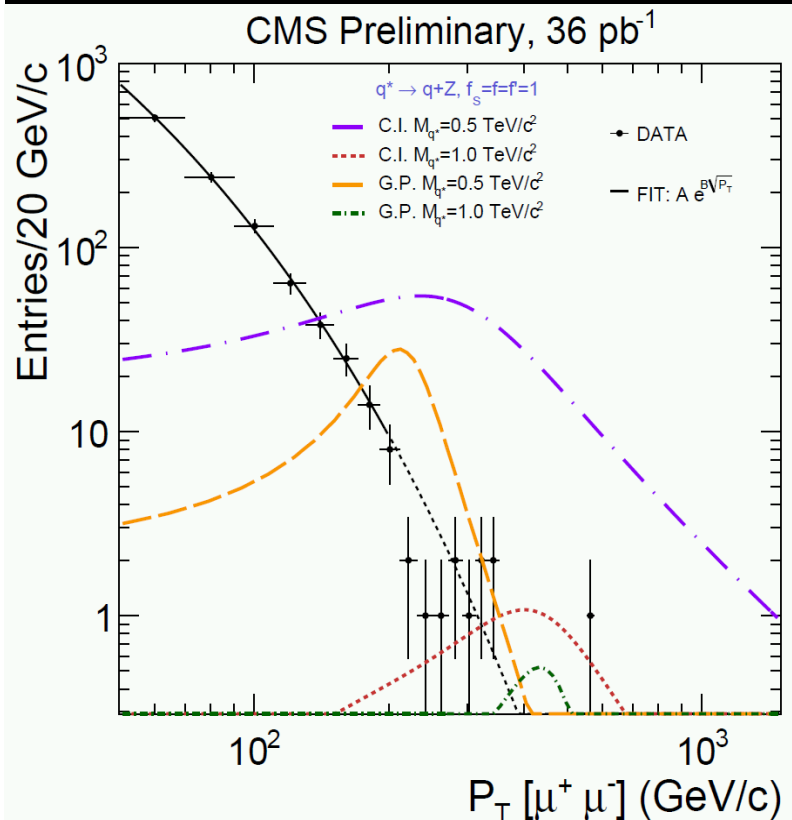

Searching for bump in $Z p_T$ spectrum

- no deviation from SM predictions,
- set limits on M_{q^*}

Gauge Interaction

Contact Interaction

$$M_{q^*} = \Lambda, f = f' = f_s = 1$$

$$M_{q^*} > 0.91 \text{ TeV}$$

$$M_{q^*} = \Lambda, f = f' = 1, f_s = 0$$

$$M_{q^*} > 1.17 \text{ TeV}$$

Production via new contact interaction

- $qq \rightarrow ee^* \rightarrow ee\gamma$
- $qq \rightarrow \mu\mu^* \rightarrow \mu\mu\gamma$

Experimental signature:

- 2 isolated e/μ of opposite charge
- isolated photon ($\Delta R(\gamma, l) > 0.5$)

Searching for excess in data at high $M(e\gamma)$ or $M(\mu\gamma)$

- 0 event observed, set limits on $M(e^*) > 760$ GeV, $M(\mu^*) > 785$ GeV for $\Lambda = 2$ (exceed Tevatron result)

$$qq \rightarrow ee^* \rightarrow ee\gamma$$

$$qq \rightarrow \mu\mu^* \rightarrow \mu\mu\gamma$$

Searches for TeV Scale Gravity

- RS Graviton
- Large Extra Dimension (ADD)
- Micro Black Holes

ADD Model

Looking for excess @ high mass in $\gamma\gamma/\mu\mu$ spectrum

- no event observed with $M_{\gamma\gamma}(M_{\mu\mu}) > 500$ (600) GeV
- set limits on M_s vs n

M_s = UV cut-off in σ , n = # of extra dimensions

Limit on strength of ED effect / UV cut-off

	GRW	Hewett		HLZ					
		Pos.	Neg.	$n_{ED} = 2$	$n_{ED} = 3$	$n_{ED} = 4$	$n_{ED} = 5$	$n_{ED} = 6$	$n_{ED} = 7$
Full	1.94	1.74	1.71	1.89	2.31	1.94	1.76	1.63	1.55
Trunc.	1.84	1.60	1.50	1.80	2.23	1.84	1.63	1.46	1.31

Limit on Pheno. parameter Λ_T , n , M_s

	Λ_T [TeV] (GRW)	M_s [TeV/ c^2] (HLZ)					
		$n = 2$	$n = 3$	$n = 4$	$n = 5$	$n = 6$	$n = 7$
Full	1.80	1.75	2.15	1.80	1.63	1.52	1.43
Truncated	1.68	1.67	2.09	1.68	1.49	1.34	1.24

ADD Model

one high p_T jet + large MET (a.k.a. Mono-jet)

- veto on leptons, dijets, cosmics, beam halo, instrumental backgrounds
 - data consistent with SM, set limits on M_D vs δ
- M_D = Planks scale, δ = # of extra dimensions

N_{DATA}	275
N_{BKG} (data-driven)	297 ± 45
N_{SIGNAL} ($M_D=2, \delta=2$)	115.2

CMS limits on M_D (36 pb^{-1})

δ	with K-factor**
2	2.37 TeV
3	1.98 TeV
4	1.77 TeV

** = 1.5 (1.4) for $\delta=2,3$ (4)

δ	CDF	LEP
2	1.40 TeV	1.6 TeV
3	1.15 TeV	1.2 TeV
4	1.04 TeV	0.94 TeV

Summary Plot

Smoking gun signature of TeV scale gravity
BH decay via Hawking radiation

- produce large number of energetic objects
- mostly quarks & gluons \rightarrow jets

Search for deviation in S_T distribution in
bins of object multiplicity (n ; at least > 2)

- S_T = scalar sum of all objects with $p_T > 50$ GeV

High multiplicity event

No excess observed in data
Set limit on the minimum BH
mass of 3.5 – 4.5 TeV
in semi-classical approximation

First direct BH limits

PLB 697, 434 (2011)

Searches for Long-Lived Heavy Particles

- Heavy Stable Charged Particles
- Stopped Gluinos

Long-Lived Heavy particles appear in many BSM (e.g. \tilde{g} in split SUSY)

- Since massive they are slow ($\beta < 0.9$)
- Gluinos hadronize forming R-Hadrons

We've performed searches for 2 distinctive signatures of LLH particles

1. Large dE/dx due to larger ionization for slow moving particles
2. Out-of-Time decays of particles which have come to rest before exiting the detector

ATLAS limit:
 $M_{\text{gluino}} > 586 \text{ GeV}$
 (34 pb^{-1})

$$M_{\tilde{g}} > 370 \text{ GeV}, \tau = 10 \mu\text{s} - 1000 \text{ s}$$

Searches for Forth Generation

- b'
- $t\bar{t}$ Resonances

Pair produced 4th generation heavy quarks b' . each $b' \rightarrow tW \rightarrow bWW$

Like-sign dilepton & trilepton
(e, μ) decays + jets

Events selected based on
leptons, N_{Jets} , large MET, &

$$S_T = \sum_{\text{jets}} p_T + \sum_{\text{leptons}} p_T + \cancel{E}_T$$

Like-sign dilepton & trilepton decays + 4(2) jets

$N_{\text{bgd}} = 0.3 \pm 0.2$ events

0 event observed

Limit @ 95% CL: $M_{b'} > 361$ GeV

Similar to new Tevatron limit: $M_{b'} > 372$ GeV

Bump hunt in $M(tt\bar{b})$ spectrum

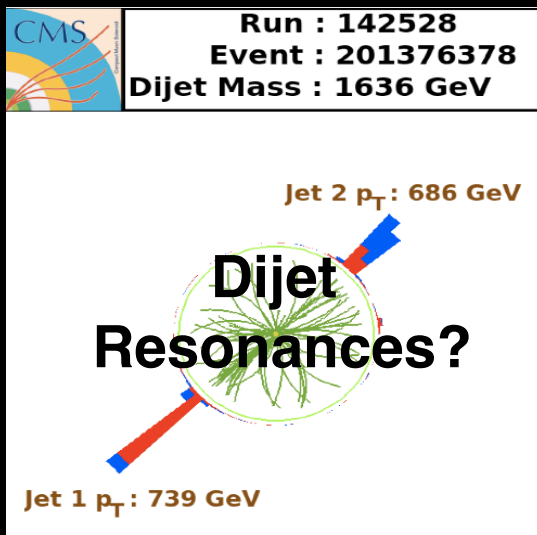

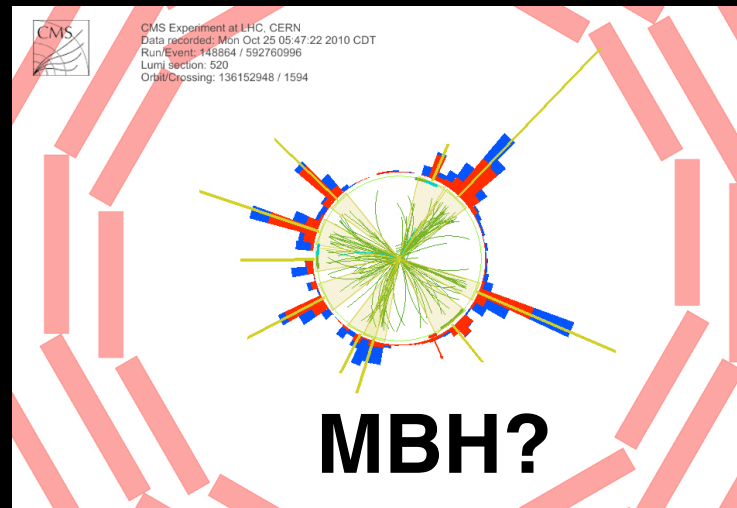

- Lepton + jets channels (e & μ)
- No significant excess of events above SM
- Set limit on the production cross section, competitive with Tevatron

25 pb for $m_{Z'} = 0.5$ TeV, 7 pb for $m_{Z'} = 1$ TeV,
4 pb for $m_{Z'} > 1.5$ TeV

Looking forward to see more of these events...

- CMS is searching for evidence of different models of new physics in several channels using the early LHC data & **already exploring new territory beyond the Tevatron.**
- Only recent results shown here.
Many new physics searches are underway.
- No signals of the new physics observed in the early LHC data yet.
- More LHC data on the way;
Analyses of $\sim 230 \text{ pb}^{-1}$ data samples just beginning.
New exciting results are in the pipe-line. Stay tune!
