Coronavirus in the UK

What are the "Christmas bubble" rules in the UK?

England

• In tiers one to three - up to three households can form a temporary bubble on Christmas Day only • People are advised to "stay local" • In tier four - you can't be in a Christmas bubble and cannot travel to other areas

Wales

 Up to two households can form a temporary bubble on Christmas Day only • Level four lockdown rules apply, except on Christmas Day

Bubbles can mix indoors in private home

You can meet people outside your Christmas bubble outdoors, but only in line with rules of your tier

You can't go to a pub or

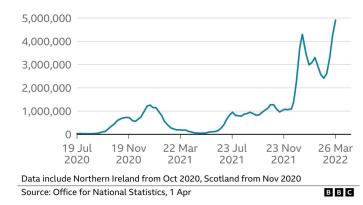

If you have coronavirus symptoms or are self-isolating you cannot join a bubble

BBC

Nearly 5 million UK infections

Estimated people testing positive for coronavirus

Scotland • Up to eight people from three households (not counting under

12s) can form a temporary bubble on Christmas Day only • No travel allowed to rest of UK • Level four lockdown starts 26 December

Northern Ireland • Up to three households can form a bubble for one day between 23 and 27 December

• You must not travel to Scotland or a tier four area in England

MMR and measles in England

Early report

Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children

A J Wakefield, S H Murch, A Anthony, J Linnell, D M Casson, M Malik, M Berelowitz, A P Dhillon, M A Thomson, P Harvey, A Valentine, S E Davies, J A Walker-Smith

Summary

Background We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Methods 12 children (mean age 6 years (range 3-10), 11 boys) were referred to a paediatric gastroenterology unit with a history of normal development followed by loss of acquired skills, including language, together with diarrhoea and abdominal pain. Children underwent gastroenterological, neurological, and developmental assessment and review of developmental records. Ileocolonoscopy and biopsy sampling, magnetic-resonance imaging (MRI), electroencephalography (EEG), and lumbar puncture were done under sedation. Barium follow-through radiography was done where possible. Biochemical, haematological, and immunological profiles were examined.

Findings Onset of behavioural symptoms was associated, by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities, ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in the colon in 11 children and reactive ileal lymphoid hyperplasia in seven, but no granulomas. Behavioural disorders included autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two). There were no focal neurological abnormalities and MRI and EEG tests were normal. Abnormal laboratory results were significantly raised urinary methylmalonic acid compared with agematched controls (p=0-003), low haemoglobin in four children, and a low serum IgA in four children.

Interpretation We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible environmental triggers.

Lancet 1998; 351: 637-41 See Commentary page 611

Introduction

We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some cases, food intolerance. We describe the clinical findings, and gastrointestinal features of these children.

EARLY REPORT

Patients and methods

12 children, consecutively referred to the department of paediatric gastroenterology with a history of a pervasive developmental disorder with loss of acquired skills and intestinal symptoms (diarrhoea, abdominal pain, bloating and food intolerance), were investigated. All children were admitted to the ward for 1 week, accompanied by their parents.

Clinical investigations

We took histories, including details of immunisations and exposure to infectious diseases, and assessed the children. In 11 cases the history was obtained by the senior clinician (JW-S). Neurological and psychiatric assessments were done by consultant staff (PH, MB) with HMS-4 criteria.1 Developmental histories included a review of prospective developmental records from parents, health visitors, and general practitioners. Four children did not undergo psychiatric assessment in hospital; all had been assessed professionally elsewhere, so these assessments were used as the basis for their behavioural diagnosis.

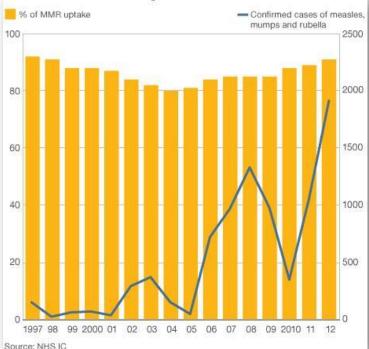

After bowel preparation, ileocolonoscopy was performed by SHM or MAT under sedation with midazolam and pethidine. Paired frozen and formalin-fixed mucosal biopsy samples were taken from the terminal ileum; ascending, transverse, descending, and sigmoid colons, and from the rectum. The procedure was recorded by video or still images, and were compared with images of the previous seven consecutive paediatric colonoscopies (four normal colonoscopies and three on children with ulcerative colitis), in which the physician reported normal appearances in the terminal ileum. Barium follow-through radiography was possible in some cases.

Also under sedation, cerebral magnetic-resonance imaging (MRI), electroencephalography (EEG) including visual, brain stem auditory, and sensory evoked potentials (where compliance made these possible), and lumbar puncture were done.

Laboratory investigations

Thyroid function, serum long-chain fatty acids, and cerebrospinal-fluid lactate were measured to exclude known causes of childhood neurodegenerative disease. Urinary methylmalonic acid was measured in random urine samples from eight of the 12 children and 14 age-matched and sex-matched normal controls, by a modification of a technique described previously.1 Chromatograms were scanned digitally on computer, to analyse the methylmalonic-acid zones from cases and controls. Urinary methylmalonic-acid concentrations in patients and controls were compared by a two-sample t test. Urinary creatinine was estimated by routine spectrophotometric

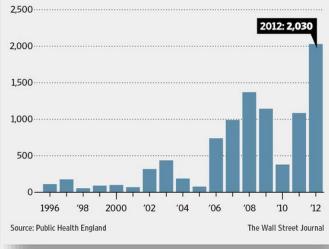

Children were screened for antiendomyseal antibodies and boys were screened for fragile-X if this had not been done

Worrisome Comeback

Fears that a measles vaccine might cause autism helped lead to a temporary decrease in vaccinations in England and Wales, which resulted in an increase of measles cases there.

Confirmed cases of measles

Breakdown of Americans, broken down [+] YOUGOV SURVEY

Why is that important?

Science and research often influence laws or governmental guidance that the general population need to follow

If there is a too low amount of trust in scientific research this can lead to people not listening or respecting the advice of scientists on important matters

Equally bad, if there is too high an amount of trust in individual instances of scientific research it can have negative consequences.

Science outreach is about giving the general population an understanding of how science really works.

Dictionary

Definitions from Oxford Languages · Learn more

outreach

the extent or length of reaching out. "the loving outreach of God to the world"

verb

/ˌaʊtˈriːtʃ/

reach further than. "their pack outreached and outwitted the Welsh team"

What is "Outreach"?

Forming connections between the general population and researchers.

More generally outreach is about connecting groups which may not naturally come into positive contact.

Going into schools

Attending student poster sessions

Digital outreach (social media, YouTube, etc)

Summer schools

TV Shows and Films

Open Lectures

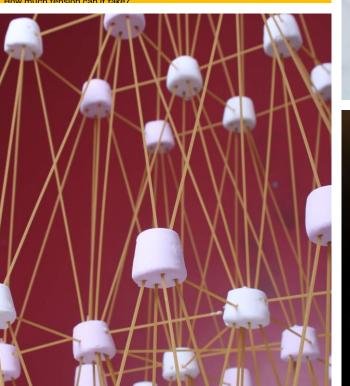

Tensile Strength is the STEM song from the episode Rocket Ski Rescue. It is sung by Blaze and AJ, and it plays as Blaze and Grammy are trying out different tensile strength techniques while trying to catch up with the runaway Crusher.

Lyrics 👌

Blaze, AJ: Tensile strength (Woo-oo-oo-oooo-oo-oo) Pull 'til it breaks (Woo-oo-oo-oo-oo-oo)

Blaze: Have you ever tried a tug of war With a piece of spaghetti? 'Cause if you're gonna pull with all your might Better hope that material is ready

Blaze, AJ: Tensile strength (Woo-oo-oo-oo-oo-oo) Pull 'til it breaks (Woo-oo-oo-oo-oo-oo) Drawn out, stretched out

Professor Brian Cox explores the dramatic lives of the eight majesti make up our solar system.

Who is the target of outreach?

Everyone is invited to enjoy and understand science in a meaningful way, but the following groups are often targeted with outreach:

- Secondary School students (14-16)
- Sixth form students (16-18)
- Minority groups

Careers in the Workforce

Why is Outreach important?

STEM careers make up around **2.5 million jobs** in the UK.

Research scientists make up an even smaller fraction of that.

Most people are never going to have any sort of contact with research in an academic environment.

They may <u>never</u> read a research paper.

It is important that the information that exists in the research world makes its way into the real world.

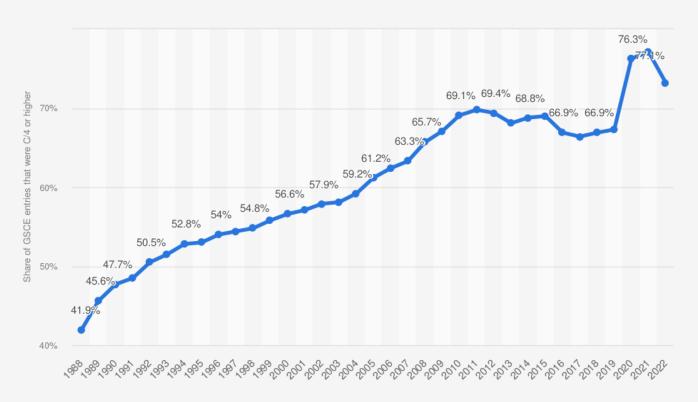

Benefits to the community

- Open doors to research community
- Make science interesting or enjoyable
- Allow understanding of what a research career could be like
- Minority representation
- Remove fear of science and maths
- Increase their resistance to misinformation

What do I do?

- I take formulas which have been derived from either experiments or theory
- I model the interactions of particles assuming that the rules the formula describes are true
- I check whether the information the simulation gives me lines up with current experimental values

• Do the results the model is giving me make sense?

What do I do?

- I take formulas which have been derived from either experiments or theory
- I model the interactions of particles assuming that the rules the formula describes are true
- I check whether the information the simulation gives me lines up with current experimental values
- I take the information it gives me back and use it to calculate properties of the material

My Research – In a nutshell

- These salts are used in the nuclear power industry
- This research also explores the state of matter when it is very hot and high pressure

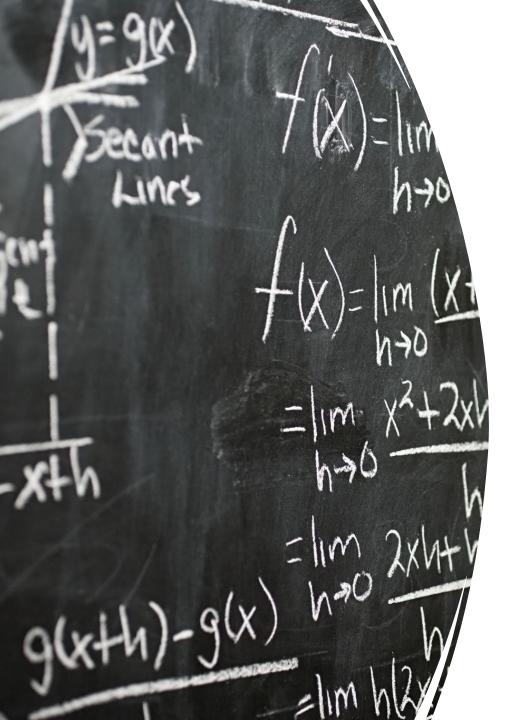

End of example

THE EQUIVALENCE PRINCIPLE

Matthew W. Davies

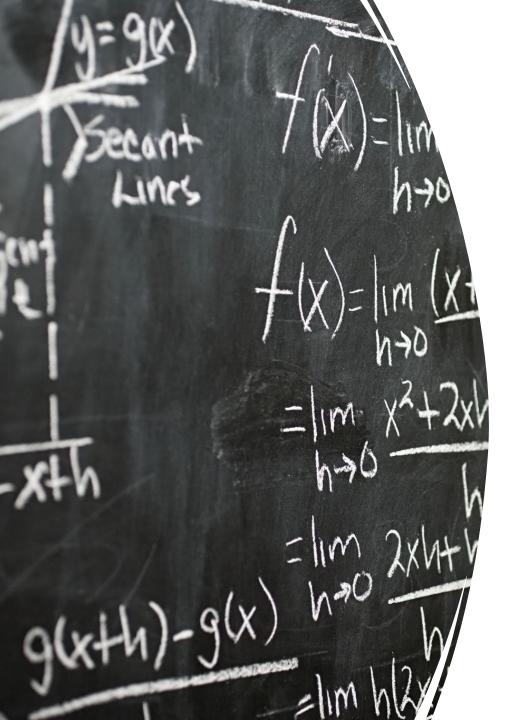

Queen Mary University of London

LEARNING OBJECTIVES

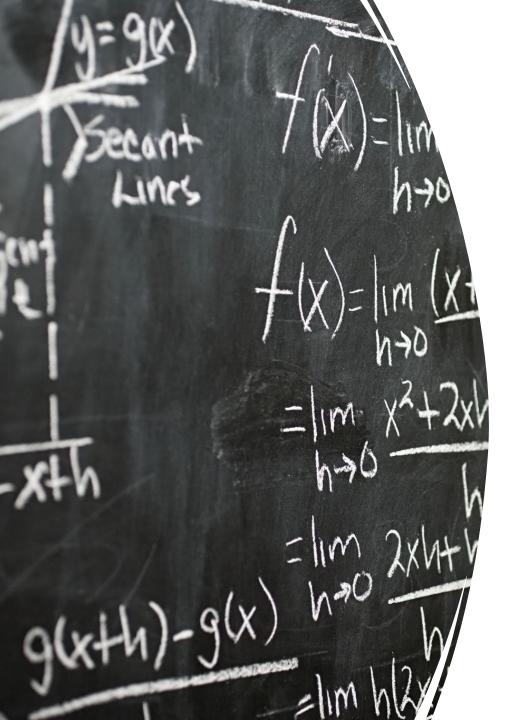

Overall Objective: To understand the problems and peculiarities of Newton's Laws of Motion and how solving them leads to the key principles of General Relativity

LEARNING OBJECTIVES

Overall Objective: To understand the problems and peculiarities of Newton's Laws of Motion and how solving them leads to the key principles of General Relativity

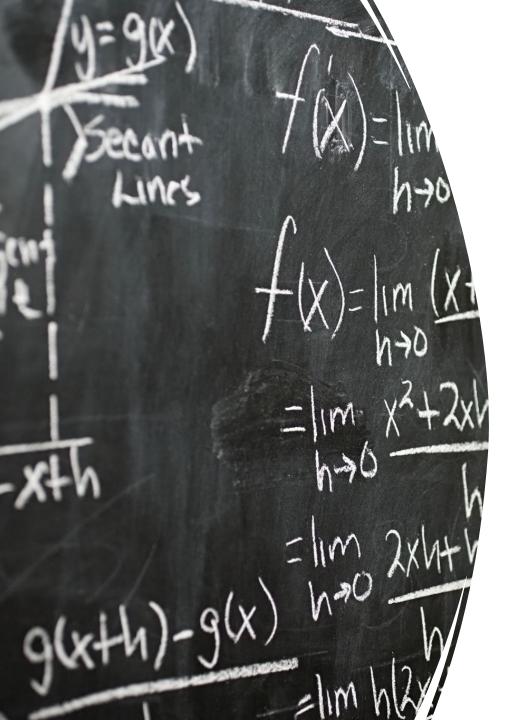

1. To understand what a "frame of reference" is and that there are a special class of reference frames called "inertial reference frames"

LEARNING OBJECTIVES

Overall Objective: To understand the problems and peculiarities of Newton's Laws of Motion and how solving them leads to the key principles of General Relativity

- I. To understand what a "frame of reference" is and that there are a special class of reference frames called "inertial reference frames"
- 2. To introduce the concepts of "absolute space" and "fictitious forces"

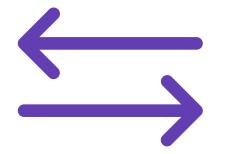

LEARNING OBJECTIVES

Overall Objective: To understand the problems and peculiarities of Newton's Laws of Motion and how solving them leads to the key principles of General Relativity

- 1. To understand what a "frame of reference" is and that there are a special class of reference frames called "inertial reference frames"
- 2. To introduce the concepts of "absolute space" and "fictitious forces"
- 3. To understand Einstein's Equivalence Principle, one of the key principles of General Relativity

WHAT IS MOTION?

What does it mean to move?

How do you know when you are moving?

First Law: An object will continue to move in a straight line with uniform velocity, or remain at rest, unless acted upon by an external force

First Law: An object will continue to move in a straight line with uniform velocity, or remain at rest, unless acted upon by an external force

Second Law: The rate of change of momentum of a body is equal to the resultant force exerted on that body

First Law: An object will continue to move in a straight line with uniform velocity, or remain at rest, unless acted upon by an external force

Second Law: The rate of change of momentum of a body is equal to the resultant force exerted on that body

Third Law: Every action has an equal and opposite reaction

First Law: An object will continue to move in a straight line with uniform velocity, or remain at rest, unless acted upon by an external force

DOES NEWTON'S FIRST LAW MAKE ANY SENSE?

DOES NEWTON'S FIRST LAW MAKE ANY SENSE?

DOES NEWTON'S FIRST LAW MAKE ANY SENSE?

- Newton: "Einstein is being acted on by an external force"
- Einstein: "Newton and the box are being acted on by an external force"
- Who is right?

How to get involved with outreach

- Queen Mary University
- STEM ambassadors
- Start your own thing!
- Apply for funding for projects

The Talk – My Research – Outreach Questions?
