Back-to-back dijets at the EIC: small x and Sudakov resummation

We present our recent calculation of the dijet electroproduction cross section at the NLO accuracy within the Color Glass Condensate effective field theory. We focus on kinematical regime where the two jets are forward w.r.t. projectile's longitudinal direction and are almost back-to-back in transverse plane. We discuss the interplay between small- x and Sudakov resummation and show numerical results for the EIC kinematics.
