

INTRO TO LHC PHYSICS

First Network School on Collider Physics and Machine Learning

Anna Sfyrla, UniGe

anna.sfyrla@unige.ch

January 2023

WHAT WILL THIS LECTURE BE ABOUT?

INTRODUCTION

- Definitions and basic concepts

INPUT TO THE PHYSICS

- The data: trigger, data preparation
- The theory: Monte carlo simulations
- Reconstruction, or how to translate detector signals to particles

PHYSICS ANALYSES

- Through example, step-by-step
- Discussion of analysis methods

*Is there a topic you would like to add to this material?
If so: please let me know at the end of this lecture and I will see if I can add it!*

IMPORTANT DISCLAIMERS

- A** • Strong bias to
 - LHC physics: the most challenging in terms of complexity!
 - ATLAS: personal history
- Will give some examples from other experiments (and colliders)

- B** • Diverse audience: the lecture might be too basic for some
- Let me know if you have specific topics you would like to see!

PART 1

WHAT WILL THIS LECTURE BE ABOUT?

INTRODUCTION

- Definitions and basic concepts

INPUT TO THE PHYSICS

- **The data: trigger**, data preparation
- The theory: Monte carlo simulations
- Reconstruction, or how to translate detector signals to particles

PHYSICS ANALYSES

- Through example, step-by-step
- Discussion of analysis methods

*Is there a topic you would like to add to this material?
If so: please let me know at the end of this lecture and I will see if I can add it!*

INTRODUCTION

Gauge term

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu}$$

Interactions between fermions

$$+ i\bar{\psi} \not{D} \psi + \text{h.c.}$$

Mass for fermions

$$+ \bar{\psi}_i Y_{ij} \psi_j \phi + \text{h.c.}$$

Mass for bosons

$$+ |D_\mu \phi|^2 - V(\phi)$$

Hermitian conjugate; Keeps the theory "sound"

Higgs potential

Gauge term

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu}$$

Interactions between fermions

$$+ i\bar{\psi} \not{D} \psi + \text{h.c.}$$

Mass for fermions

$$+ \bar{\psi}_i y_{ij} \psi_j \phi + \text{h.c.}$$

Mass for bosons

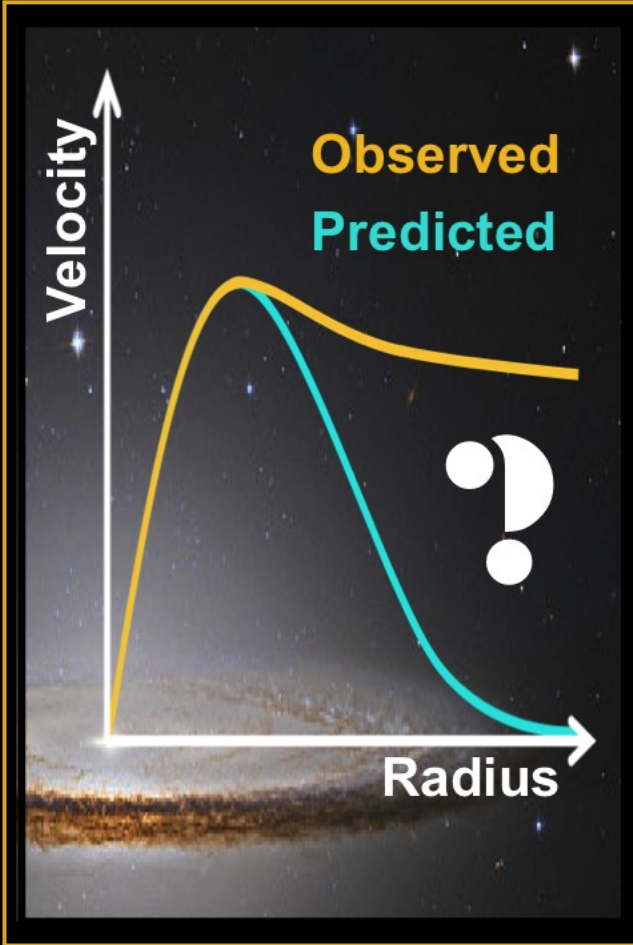

$$+ |D_\mu \phi|^2 - V(\phi)$$

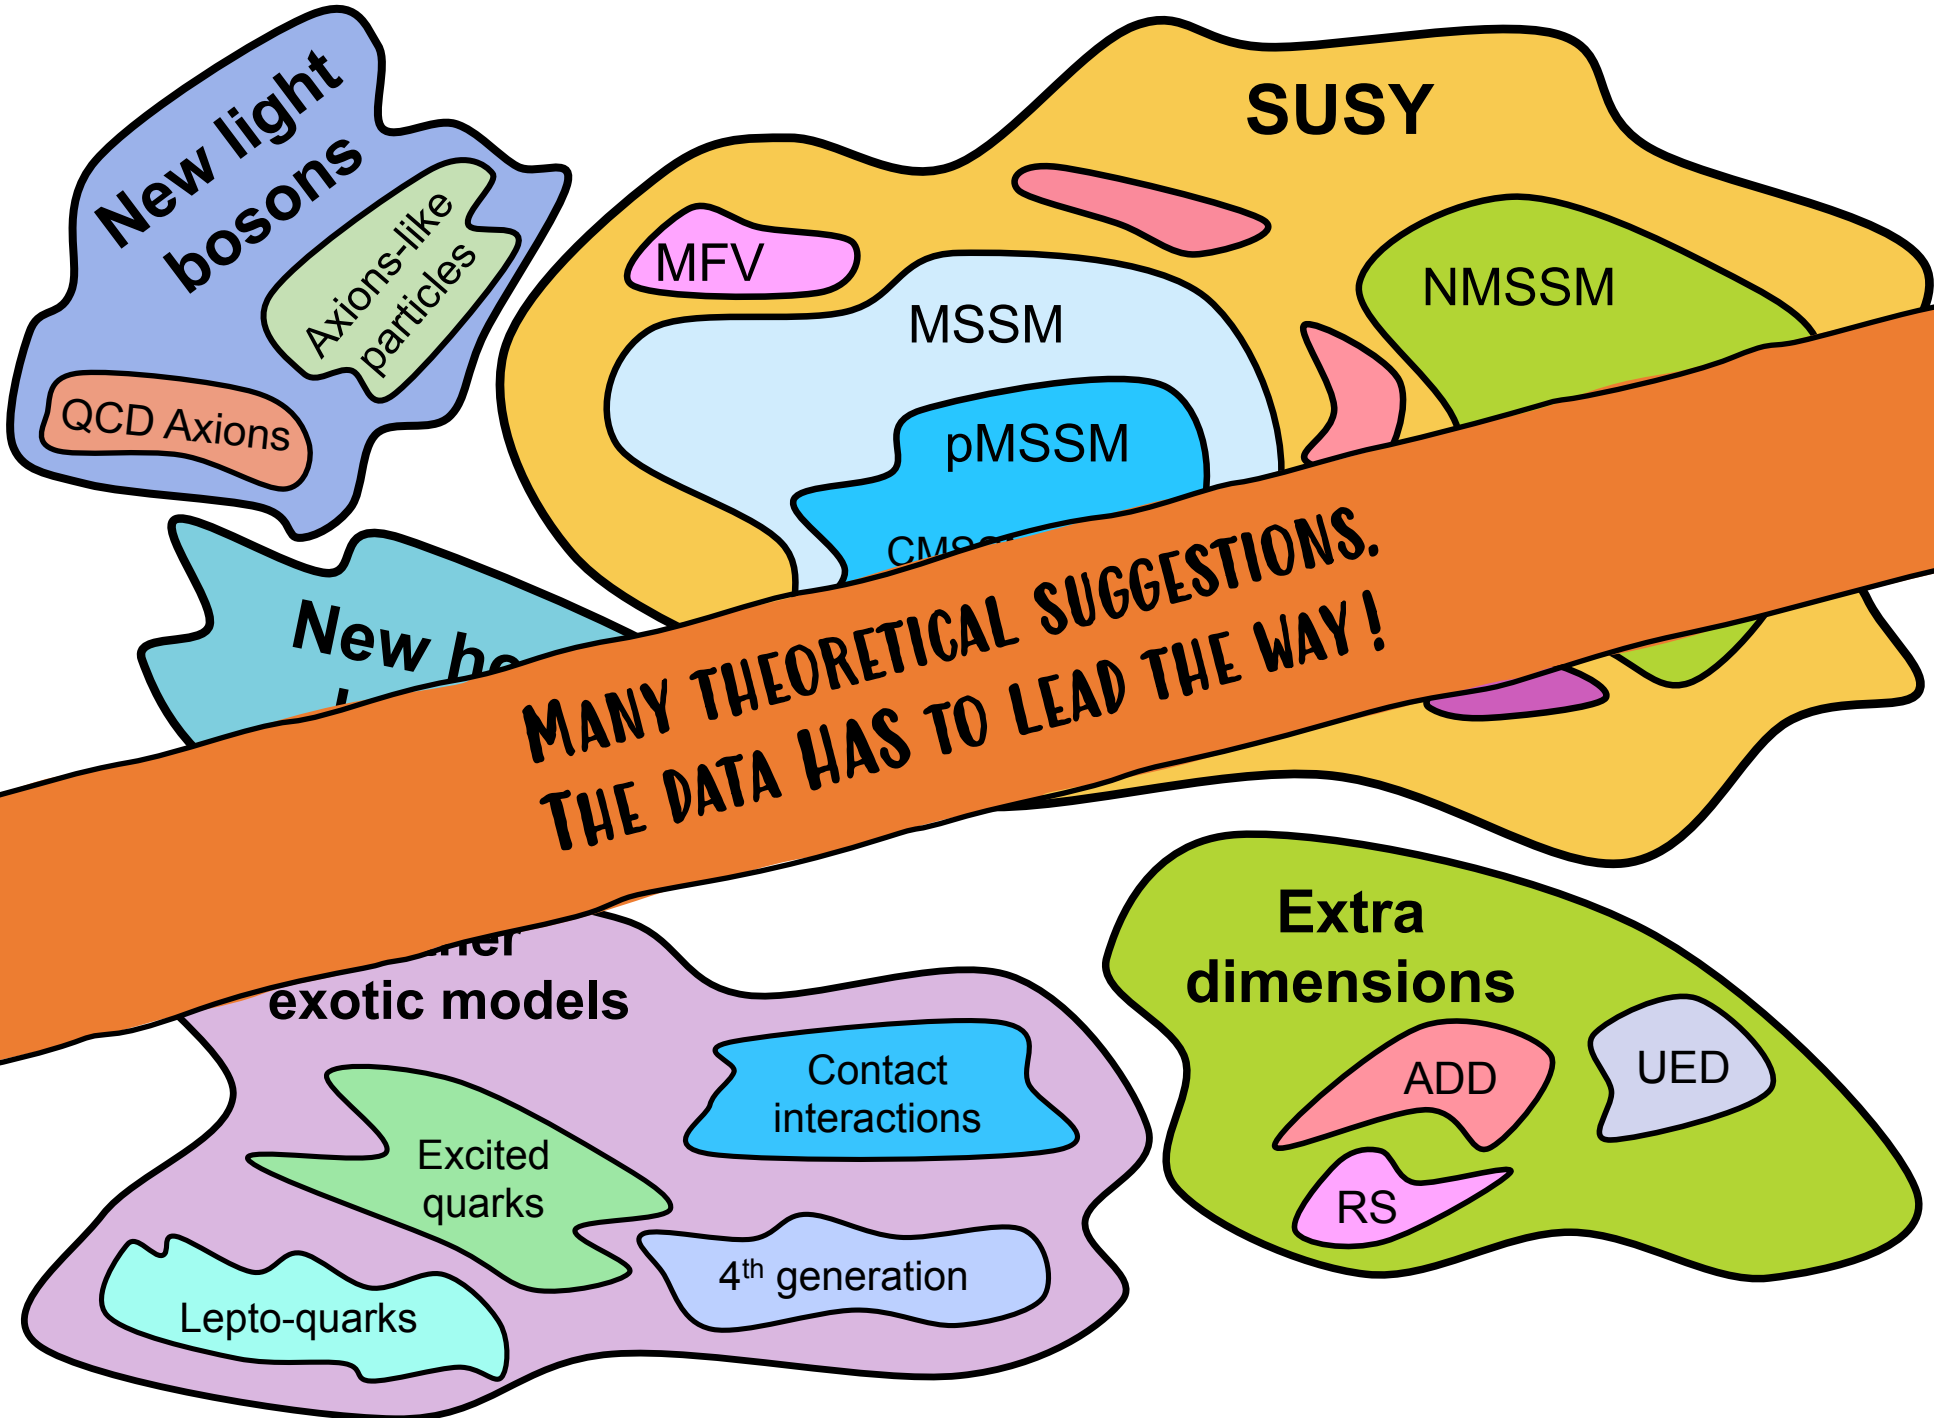

Higgs potential

Hermitian conjugate; Keeps the theory "sound"

| | I | II | III | |
|---------|-------------------|-------------------|-------------------|---------------|
| Quarks | 2.4 MeV u | 1.3 GeV c | 170 GeV t | 0 γ |
| | 4.8 MeV d | 104 MeV s | 4.2 GeV b | 0 g |
| Leptons | < 2 eV ν_1 | < 2 eV ν_2 | < 2 eV ν_3 | 91 GeV Z |
| | 0.5 MeV e | 106 MeV μ | 1.8 GeV τ | 80 GeV W |
| | | | | 125 GeV H |

- Why are there three families of quarks and leptons?
- What is the origin of the different quark and lepton masses?
- Is there a further substructure of fundamental particles?
- Are there more fundamental forces at the microscopic level?
- What is the nature of the Higgs boson?

NEW DIRECTIONS IN SCIENCE ARE LAUNCHED BY NEW TOOLS MUCH MORE OFTEN THAN BY NEW CONCEPTS.

THE EFFECT OF A CONCEPT-DRIVEN REVOLUTION IS TO EXPLAIN OLD THINGS IN NEW WAYS.

THE EFFECT OF A TOOL-DRIVEN REVOLUTION IS TO DISCOVER NEW THINGS THAT HAVE TO BE EXPLAINED.

A “Livingston plot” showing accelerator energy versus time, updated to include machines that came on line after 1990s. The filled circles indicate new or upgraded accelerators of each type.

Why ~ 100 000 TeV for LHC?

2001 snowmass accelerator RnD report

LHC

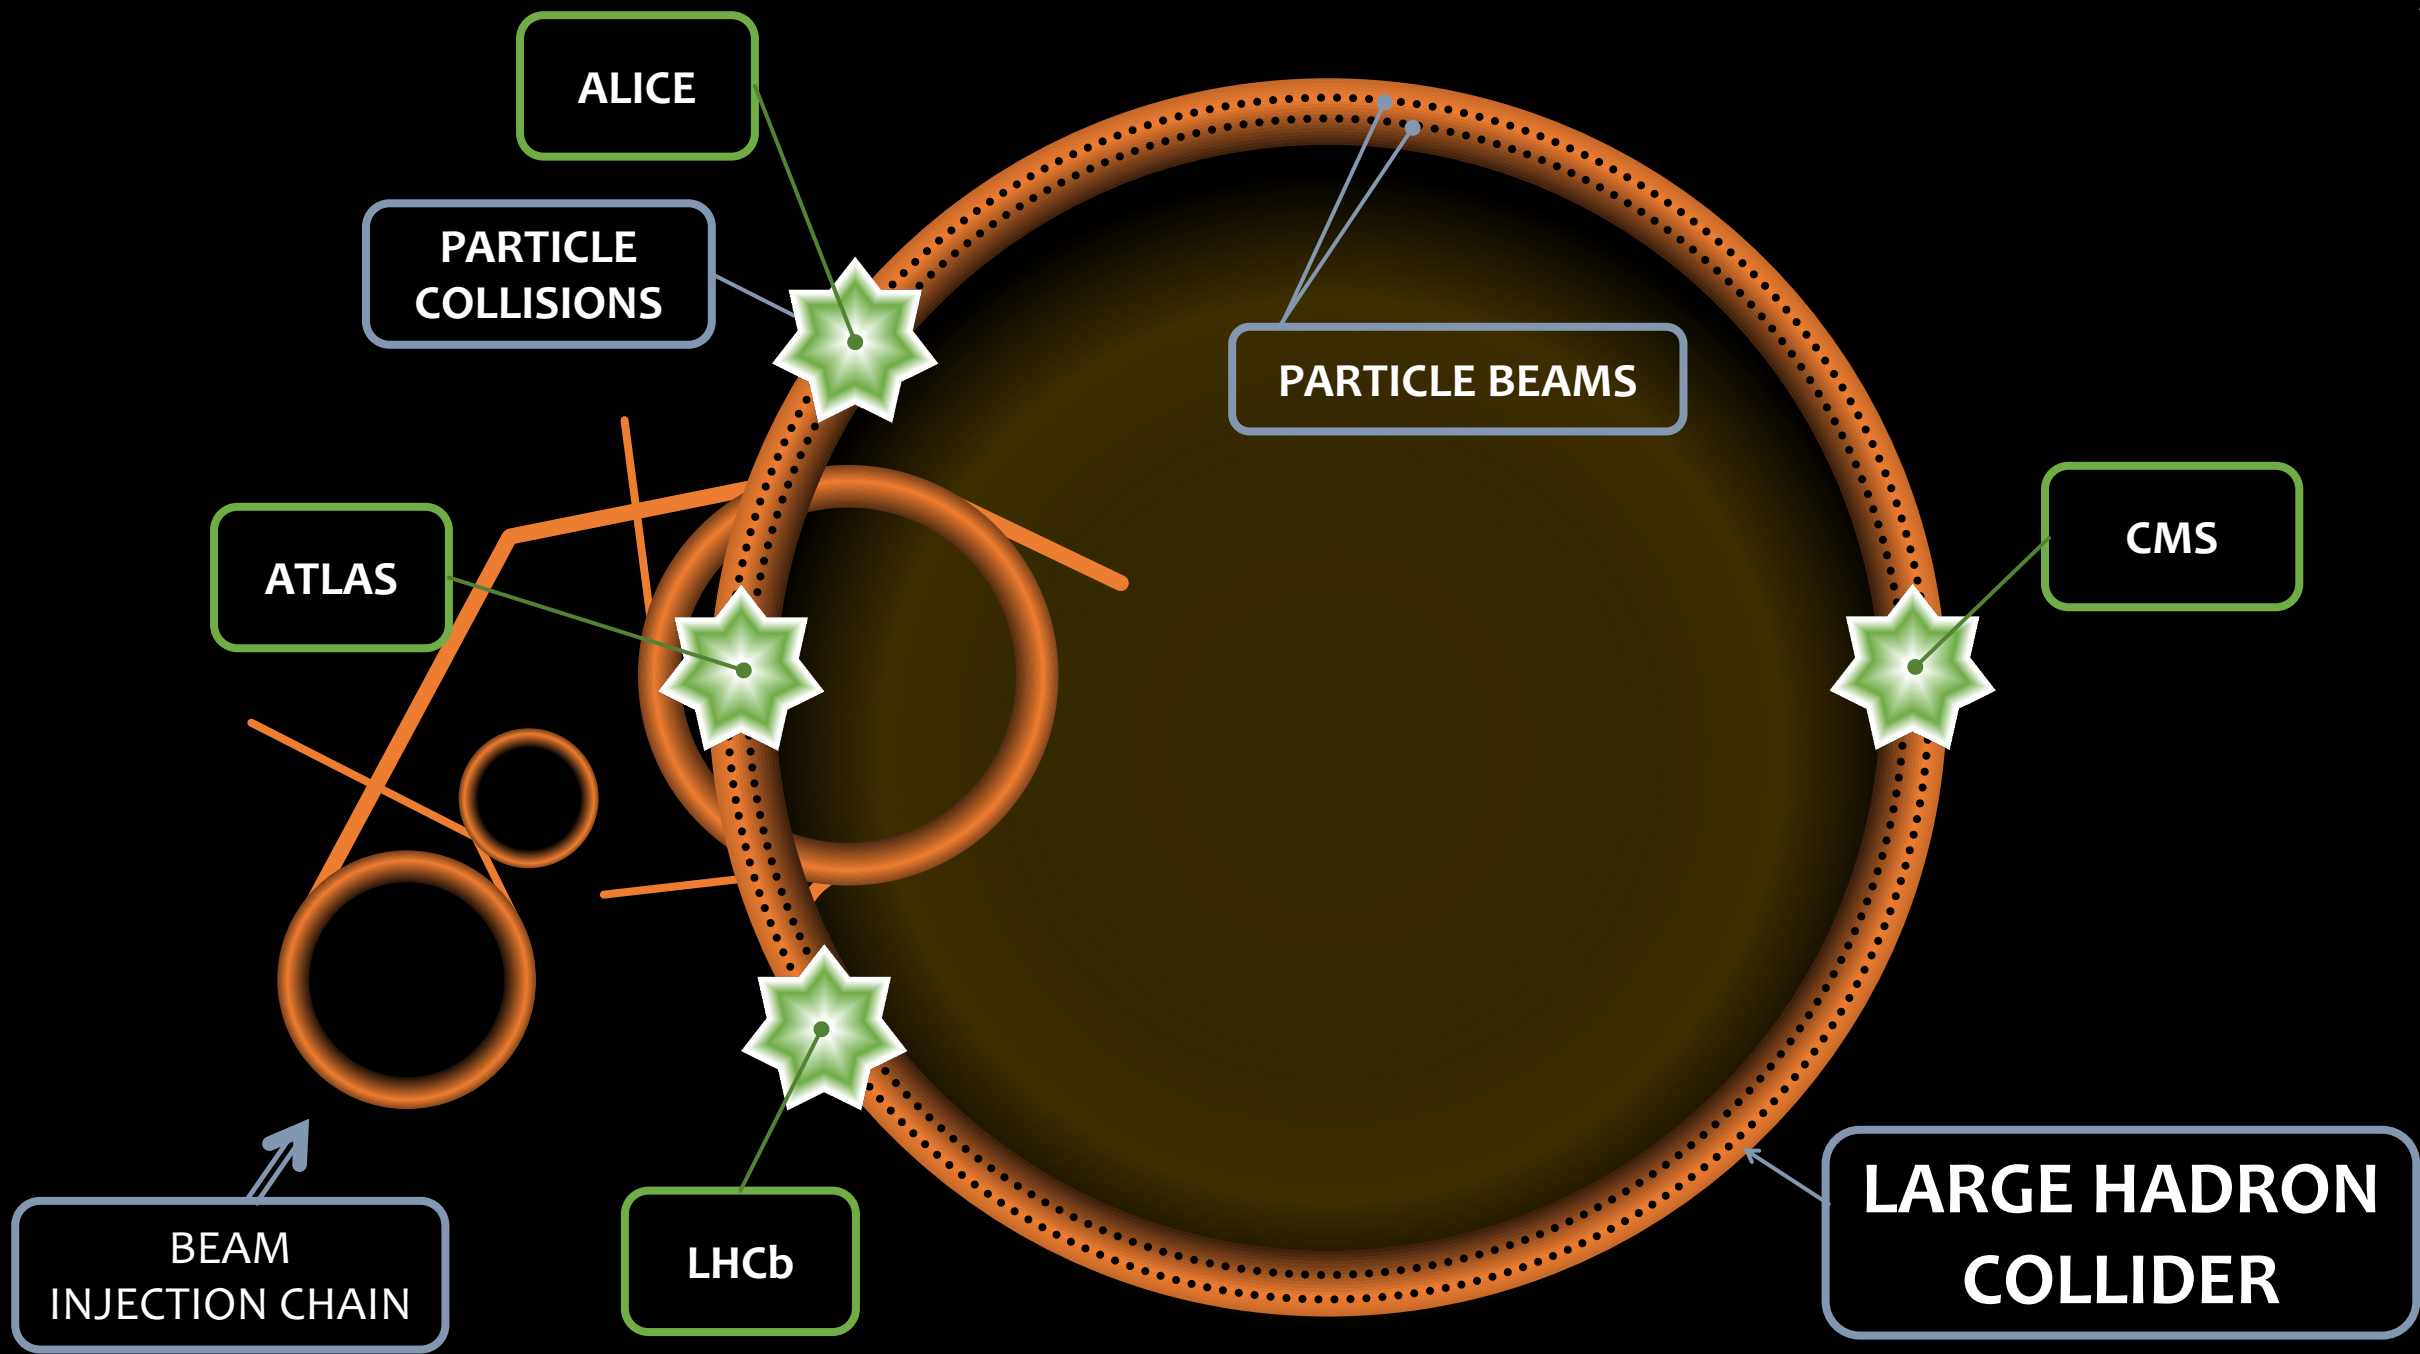

THE BASICS

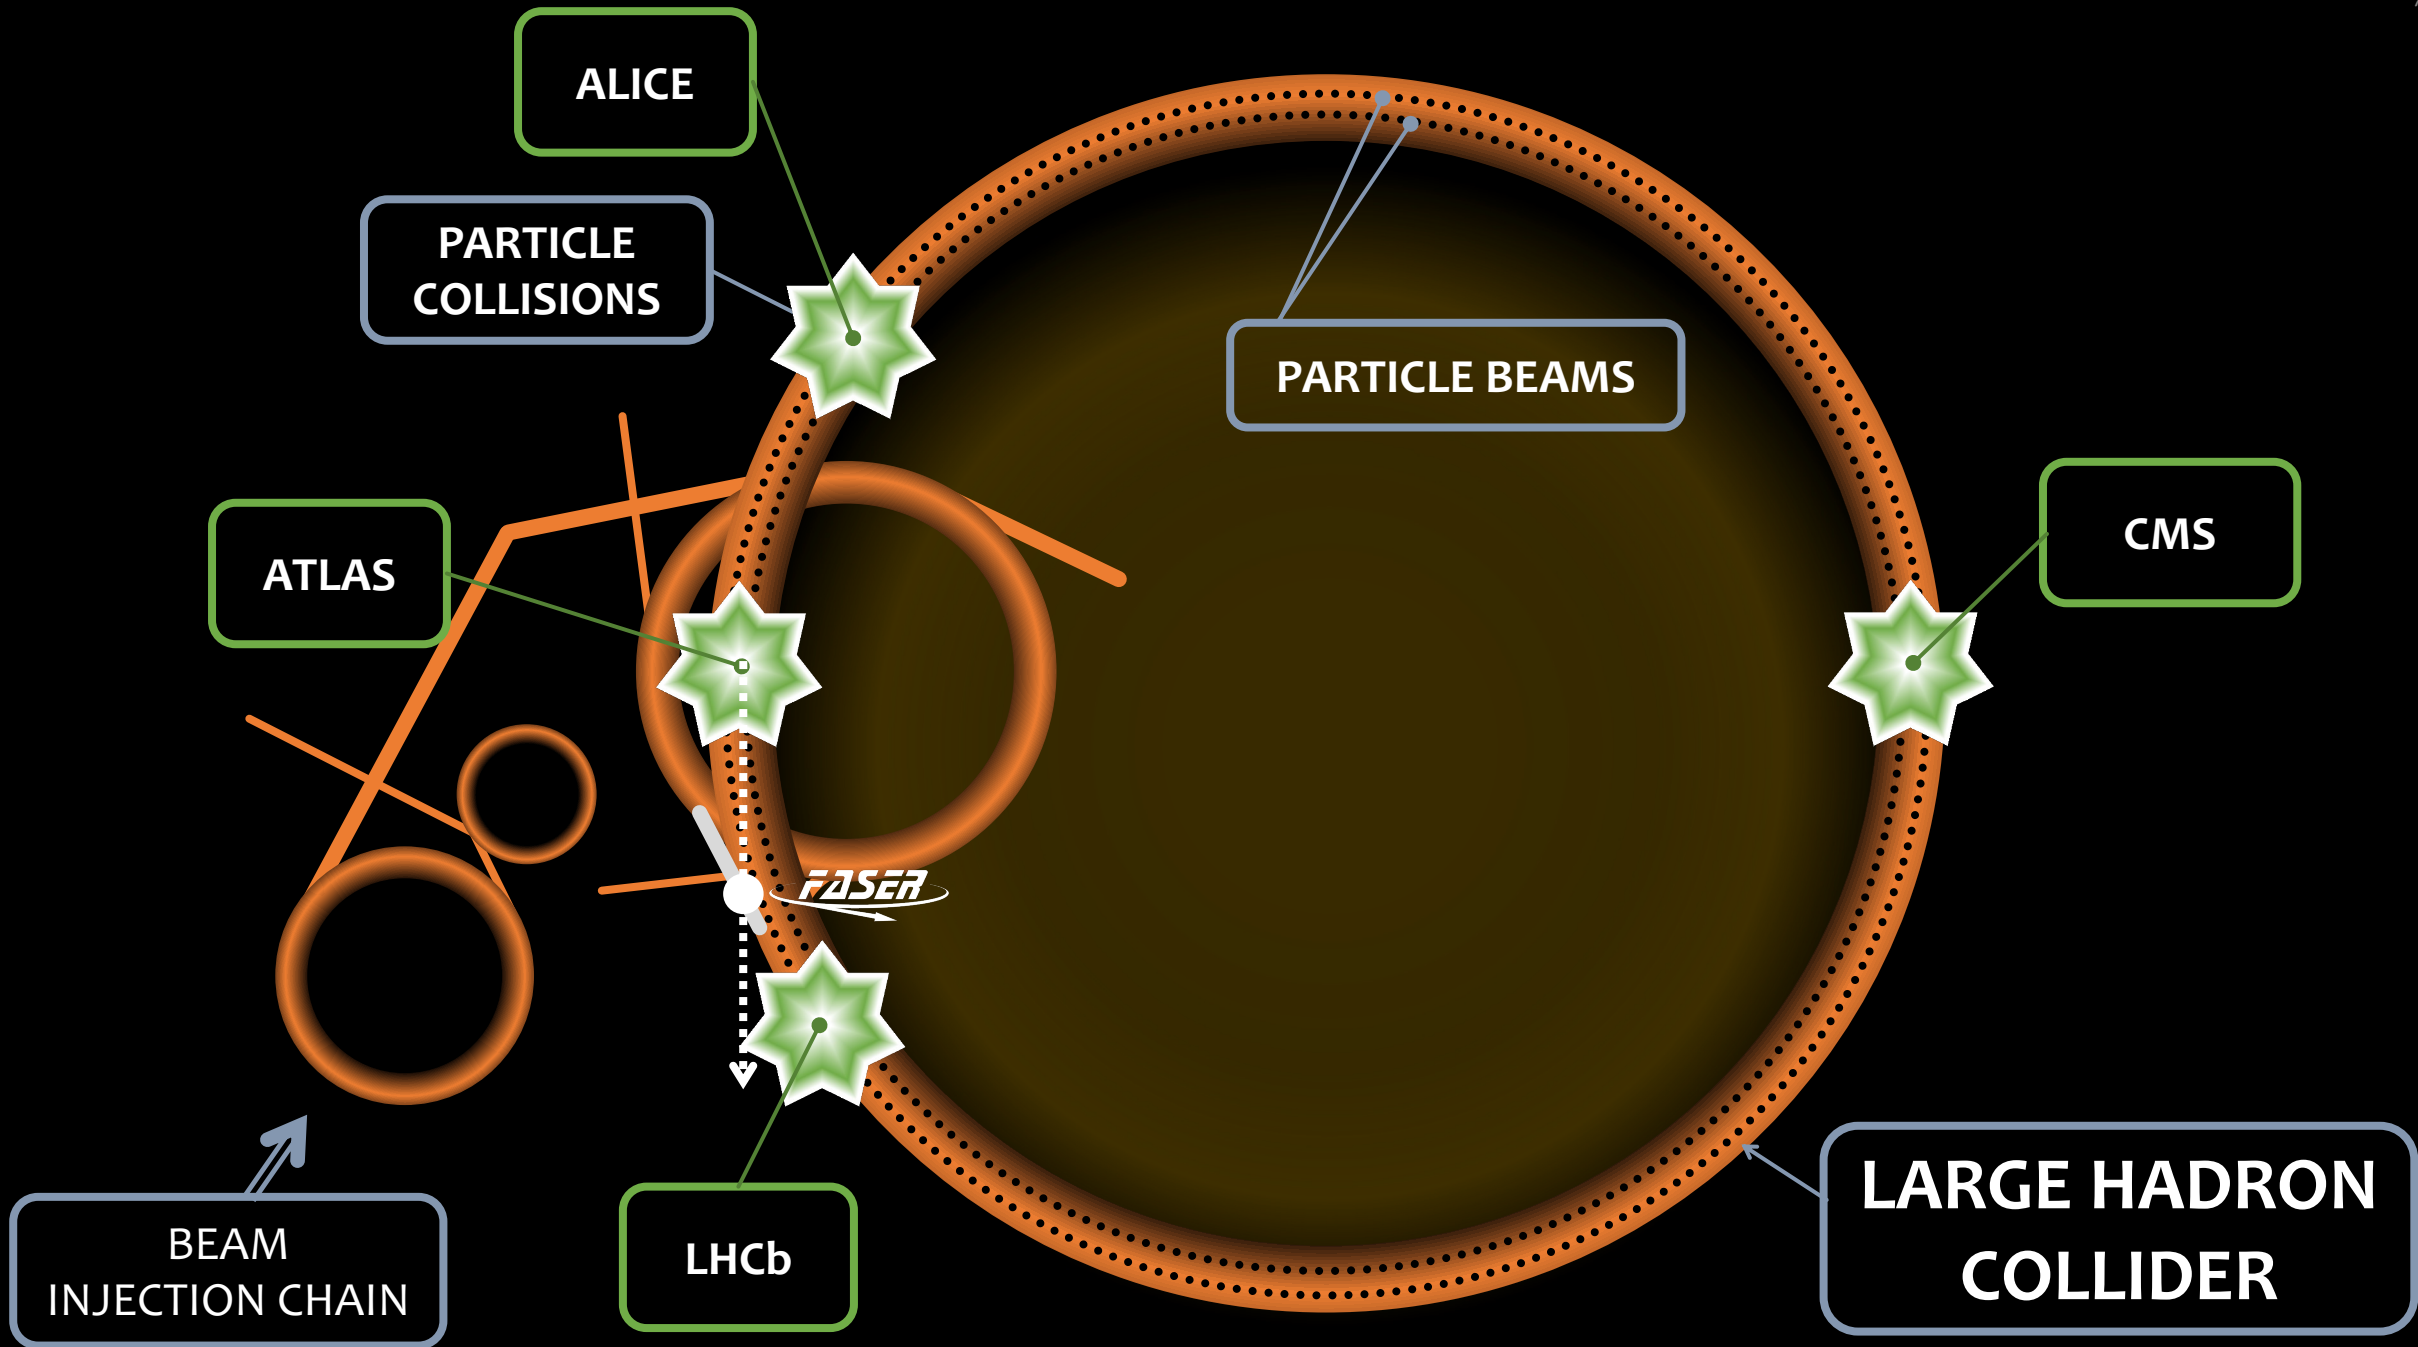

THE COLLIDING PARTICLES

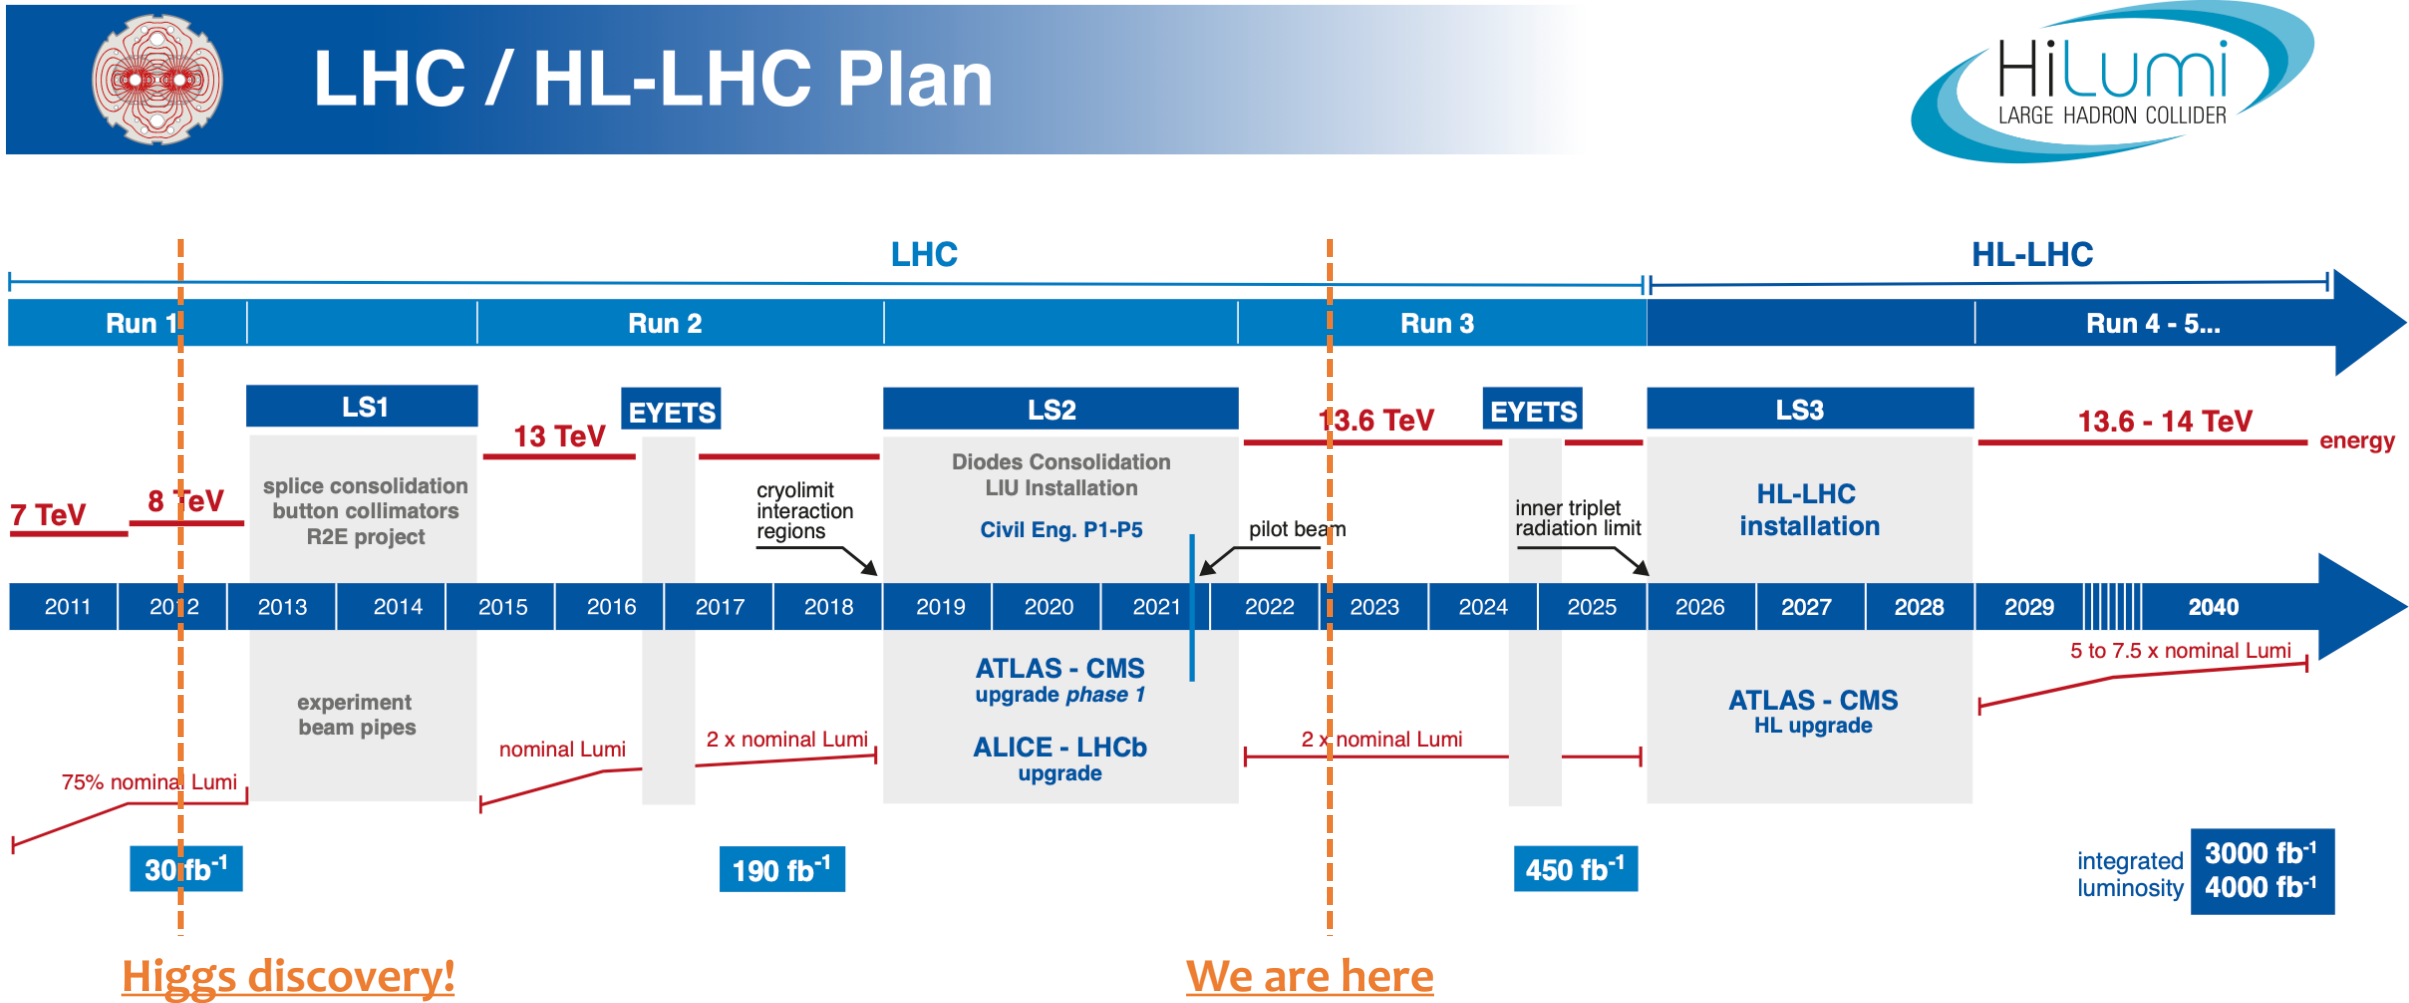

Why pp at the LHC?
Why not e^+e^- or $p\bar{p}$?

THE LHC SCHEDULE

THE PROTON-PROTON COLLISION

LATELY INSIDE THE LHC:
2 PROTONS 0.000000000000000001 SEC BEFORE THE COLLISION

THE PROTON-PROTON COLLISION

Relative beam sizes around IP1 (Atlas) in collision

THE PROTON-PROTON COLLISION

Proton bunches
 $\sim 1.5 \times 10^{11}$ protons/bunch
Bunch spacing: 25 ns

Knowing LHC circ 26.7 km – can you calculate yourselves:

- What is the revolution frequency?
- What is the maximum allowed number of bunches simultaneously circulating at the LHC?
- What is the maximum collision frequency?

- All authors sign all papers

[Submitted on 13 Aug 2020 (v1), last revised 20 Nov 2020 (this version, v2)]

Search for new phenomena in final states with large jet multiplicities and missing transverse momentum using $\sqrt{s} = 13$ TeV proton–proton collisions recorded by ATLAS in Run 2 of the LHC

ATLAS Collaboration

Results of a search for new particles decaying into eight or more jets and moderate missing transverse momentum are presented. The analysis uses 139 fb^{-1} of proton–

A new collaborator becomes an author if:

- Have been a *qualifying ATLAS member* for *at least one year*.
- Not be an author of another major LHC collaboration at the time of application.
- Have spent *at least 80 working days* doing **pre-agreed** ATLAS technical work.

SOME BASIC CONCEPTS

(ATLAS) COORDINATE SYSTEM

$$\eta \equiv -\ln \tan \frac{\theta}{2}$$

Pseudorapidity ranges in ATLAS and CMS?
And how about LHCb (and FASER)?

?

Drawing: S. Franchellucci

RAPIDITY AND PSEUDO-RAPIDITY

If we want to measure the angle between two particles, we should get the same answer in the lab frame and CM frame, and to connect the two we need a boost in z

Angle θ : not invariant in Lorenz boost in z-direction

$$y = \frac{1}{2} \ln \frac{E + p_z}{E - p_z} = \frac{1}{2} \ln \frac{1 + \beta \cos \theta}{1 - \beta \cos \theta}$$

$$y \rightarrow y' = y + \ln \sqrt{\frac{1 - \beta}{1 + \beta}} \Rightarrow \Delta y' = \Delta y$$

Massless particle approximation: $\eta \equiv -\ln \tan \frac{\theta}{2}$

<https://www.mathsisfun.com/data/grapher-equation.html>

DISTANCE Δ BETWEEN TWO PARTICLES

$$\Delta R = \sqrt{\Delta\eta^2 + \Delta\phi^2}$$

OBSERVABLES

Two key equations: $\sum_i p_{z,i} \neq 0$ $\sum_i p_{T,i} = 0$

Invariant mass: $m = \sqrt{E^2 - P^2} = \sqrt{(\sum_i E_i)^2 - (\sum_i \vec{p}_i)^2}$

Missing transverse momentum $E_T^{\text{miss}} = -\sum_i \vec{p}_{T,i}$

Transverse mass:

$$M_T^2 = (E_{T,a} + E_{T,b})^2 - (\vec{p}_{T,a} + \vec{p}_{T,b})^2 = 2|p_{T,a}||p_{T,b}|(1 - \cos \phi_{ab})$$

And many more, we will see some more as we go through the lecture...

A STEP BACK IN TIME: Z AND W DISCOVERY

A step back in time

PILE-UP

Up to 60-70 p-p collisions / bunch crossing
Two kinds: In-time and Out-of-time

Can you estimate yourselves (considering $pp \sigma = 100 \text{ mb}$ and 25 ns bunch xing):

- What is the expected pile-up when the LHC runs at 1×10^{34} or $2 \times 10^{34} / \text{cm}^2\text{s}$?

A small orange rectangular icon with a white question mark inside, tilted slightly to the right.

ATLAS EXPERIMENT

Run Number: 152166, Event Number: 467774

Date: 2010-03-30 13:31:46 CEST

THE PROTON-PROTON COLLISION STIRLING PLOT

More: <https://www.hep.ph.ic.ac.uk/~wstirlin/plots/plots.html>

Standard Model Total Production Cross Section Measurements

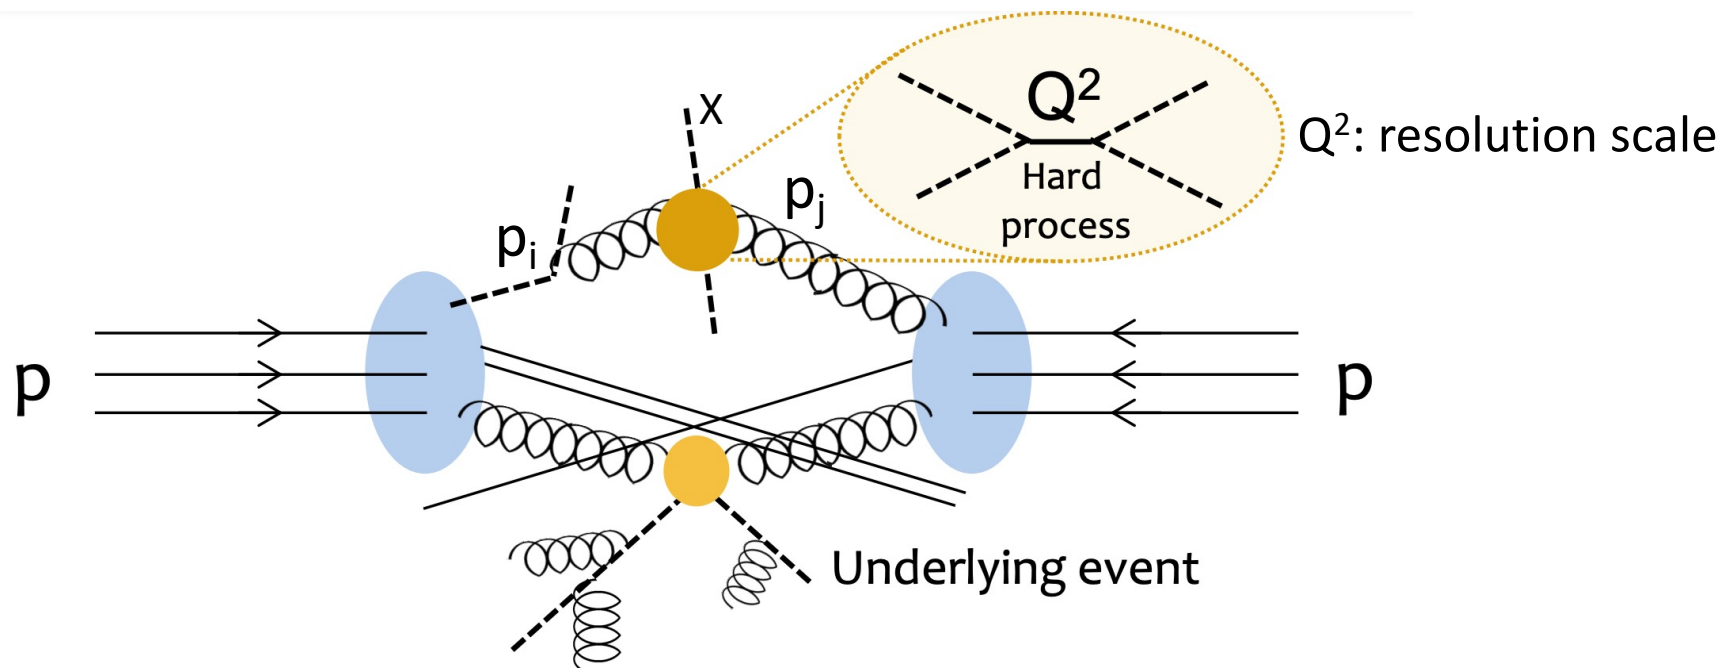

Status: February 2022

HARD PROCESS

The centre-of-mass energy of the interaction is not known a priori

$$\hat{s} = x_1 x_2 s$$

$$\sigma(pp \rightarrow X) = \sum_{i,j} \int dx_1 dx_2 f_{i,p}(x_1, Q^2) f_{j,p}(x_2, Q^2) \hat{\sigma}_{ij \rightarrow X}(x_1 x_2 s, Q^2)$$

sum runs over all possible initial-state partons, with longitudinal momentum fractions $x_{1,2}$, that can give rise to a final state X at a centre-of-mass energy of $\sqrt{x_1 x_2 s}$

PARTON DISTRIBUTION FUNCTIONS

- probability to find a parton with a momentum fraction of x
- not calculable, but measured in DIS experiments

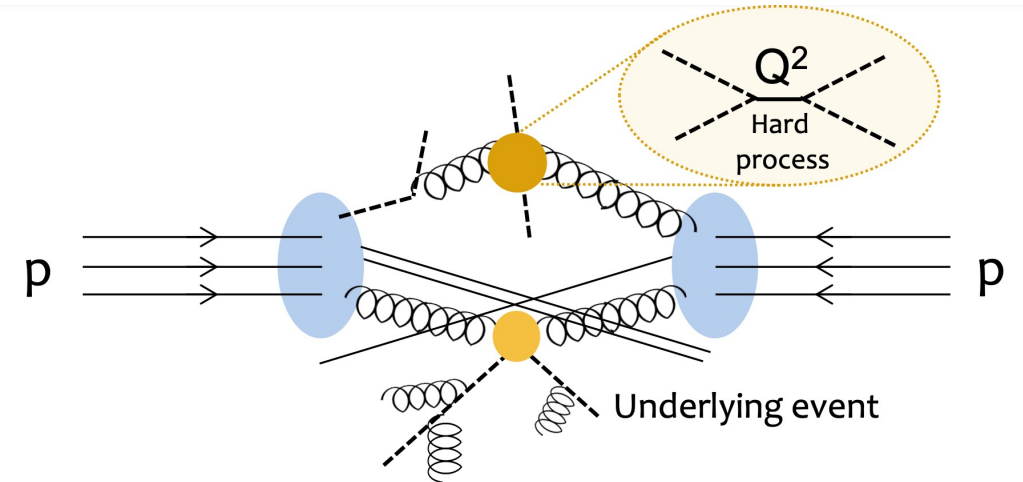

MINBIAS EVENT

- Inelastic hadron-hadron events selected with an experiment's "minimum bias trigger"
- Usually associated with inelastic events
- Useful for studies of:
 - General characteristics of pp interactions
 - Multi-parton interactions, structure of protons, ...
 - Understand the impact of the non-hard-scatter processes to the physics analyses

UNDERLYING EVENT

- The soft part associated with the hard-scattering process
 - beam-beam remnants
 - parton-parton interactions
 - Initial and final state radiation

OTHER BACKGROUND EVENTS: BEAM INDUCED

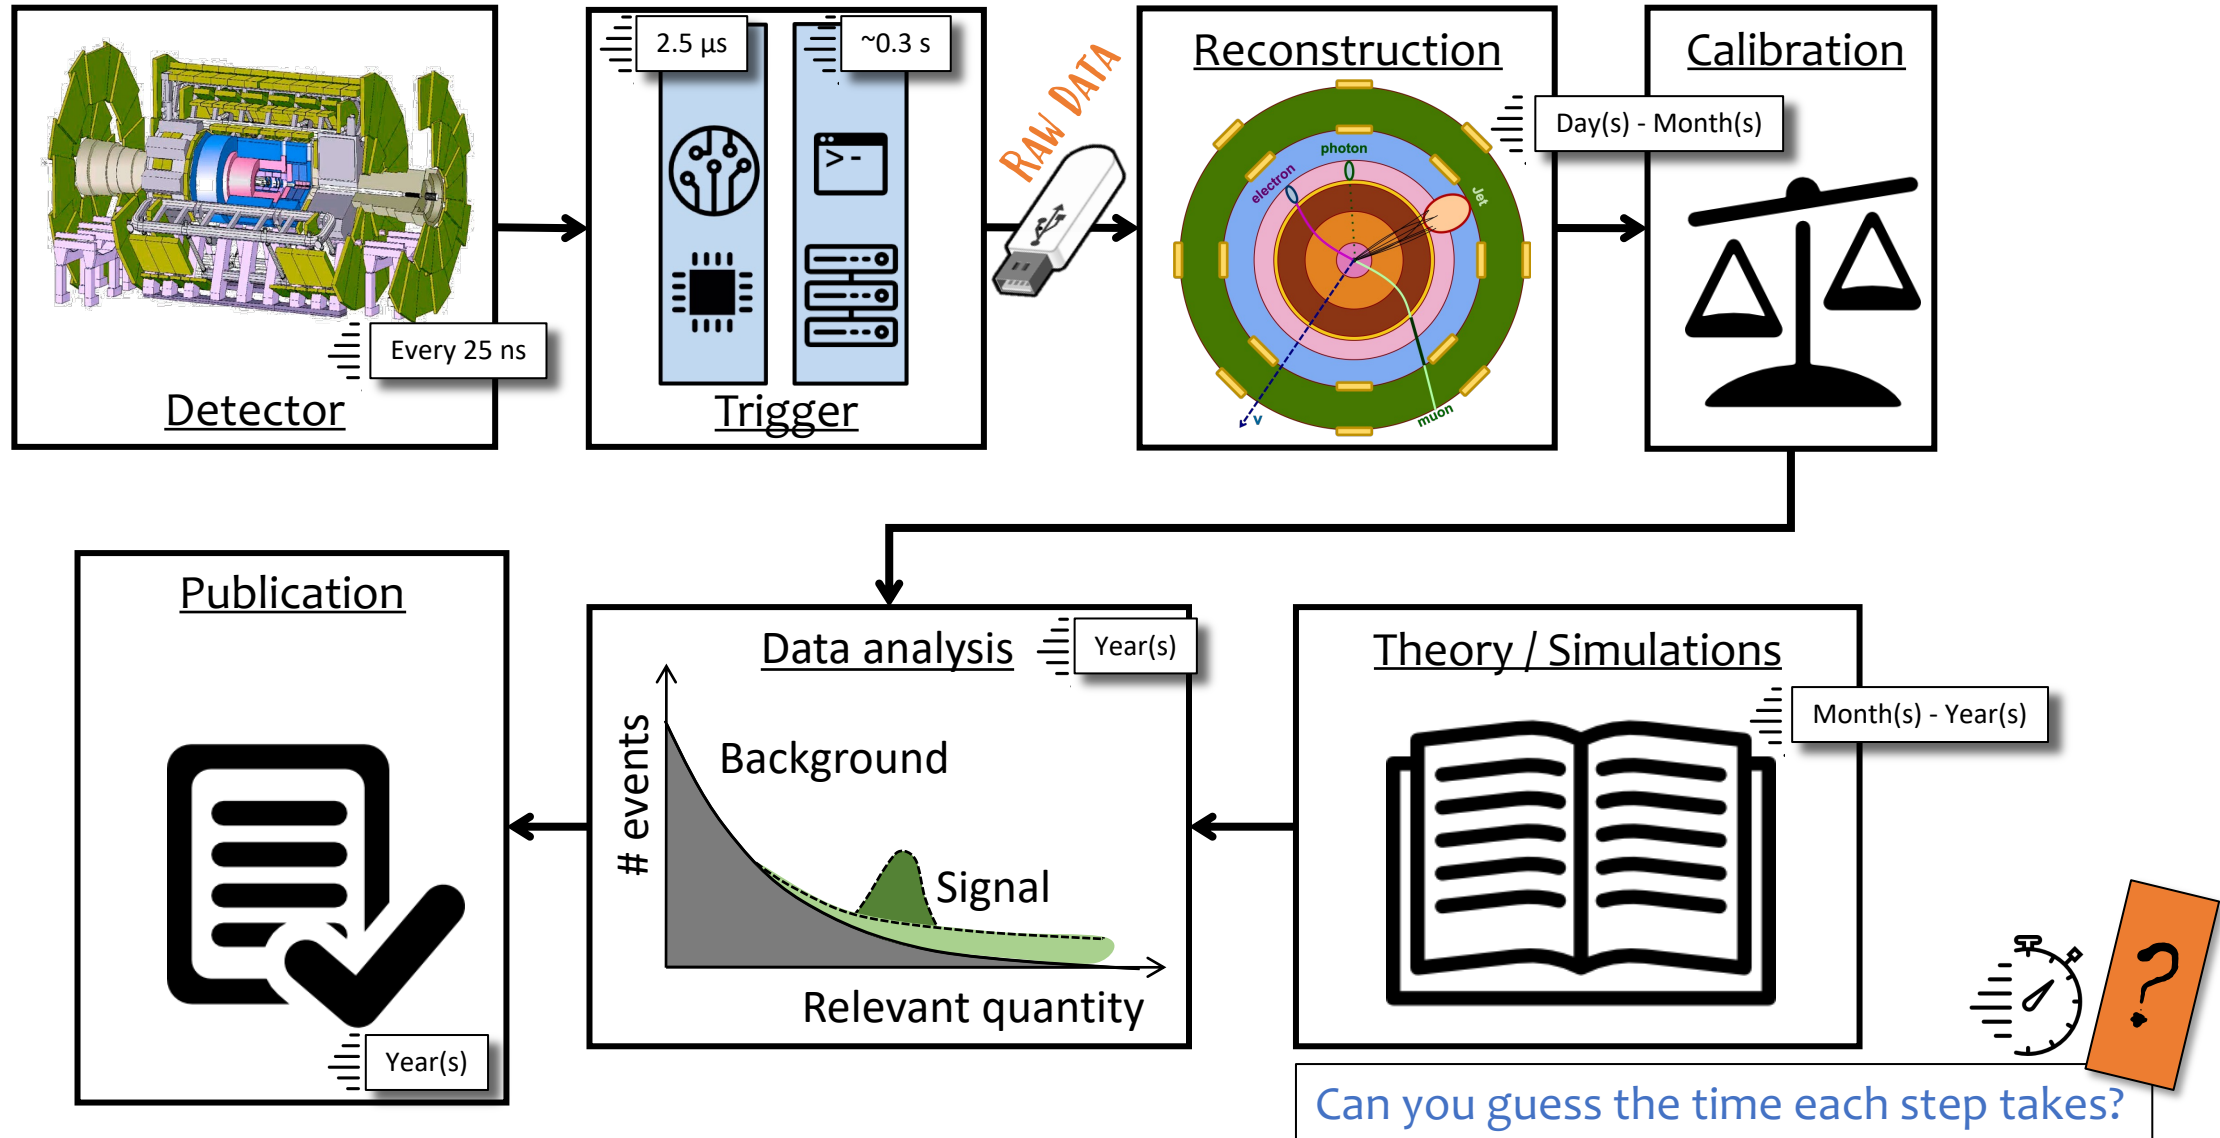

1. **Beam gas events:** collisions between the proton bunch and residual gas inside the beam-pipe. Can be inelastic (occurring off-center in the detector if nearby the detector) or elastic.
2. **Beam halo events:** the effect of protons from a bunch scraping against an up-stream collimator. The scraping results in sprays of muons running approximately parallel to the beam-line.
3. **Cavern background:** the gas of neutrons and photons inundating the cavern during a typical run of the LHC. These mostly contribute random hits in the muon system.

THE RAW DATA

THE LIFETIME OF A COLLISION EVENT

WHAT DOES RAW DATA CONTAIN?

A simple example from the trigger on ATLAS (run1 data)

- ⊙ More than 300K such words in each event, corresponding to the full data from all the detector components.
- ⊙ Data size: 1-1.5MB / event depending on the compression. Pretty consistent between ATLAS and CMS.
- ⊙ **Challenge:**
make sense out of all these numbers!!

WHAT DOES RAW DATA CONTAIN?

TRIGGER

Standard Model Total Production Cross Section Measurements

Status: February 2022

Reminder: $\sigma = \frac{\# \text{ events}}{L}$

Event Rate
 $L_{inst} = 10^{34} \text{ cm}^{-2}\text{s}^{-1}$

Standard Model Total Production Cross Section Measurements

Status: February 2022

Reminder: $\sigma = \frac{\# \text{ events}}{L}$

Event Rate
 $L_{\text{inst}} = 10^{34} \text{ cm}^{-2}\text{s}^{-1}$

Standard Model Total Production Cross Section Measurements

Status: February 2022

TRIGGERING CHALLENGE

Maintain a rich acceptance in physics (including **unknown new phenomena!**) while respecting the limitations of

- Detector readout
- DAQ system & HLT
- Computing system

and knowing that the event rate is dominated by “backgrounds” and is significantly affected by pile-up.

- ➔ Find ways to reduce fakes and improve robustness to pile-up, respecting the limitations imposed by various systems.
- ➔ Various upgrades and new features introduced in DAQ, L1 and HLT.
- ➔ Key feature: **robustness**; **events that are not triggered are lost forever.**

TRIGGERING IN PHYSICS

The ATLAS / CMS paradigm

“REAL-TIME” PROCESSING – HOW FAST IS IT?

- The hardware level trigger system is a **‘fixed latency’ system**: every bunch crossing needs to be processed in the same amount of time for the system to remain in-sync.
- The high-level trigger system processes the event at a maximum allowed time, which is a lot higher than the **average processing time**

An example run in 2015:

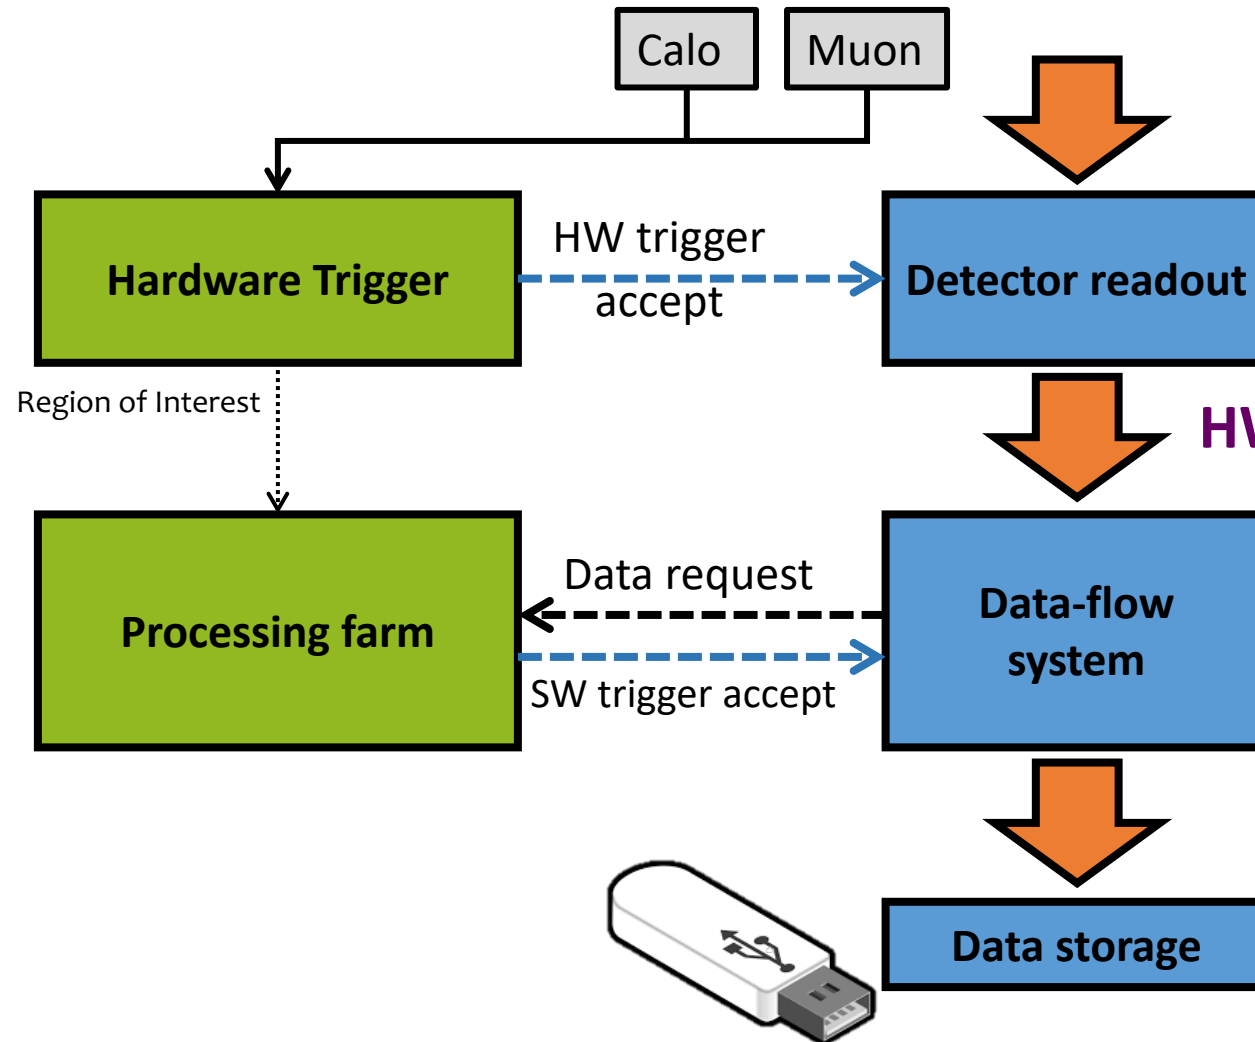

TRIGGERING IN PHYSICS

Architecture: Very simplified view

In 2018

40 MHz
13 TeV

HW trigger accept
~ 100 kHz

Storage
1 kHz

TRIGGERING IN PHYSICS

Architecture: Very simplified view

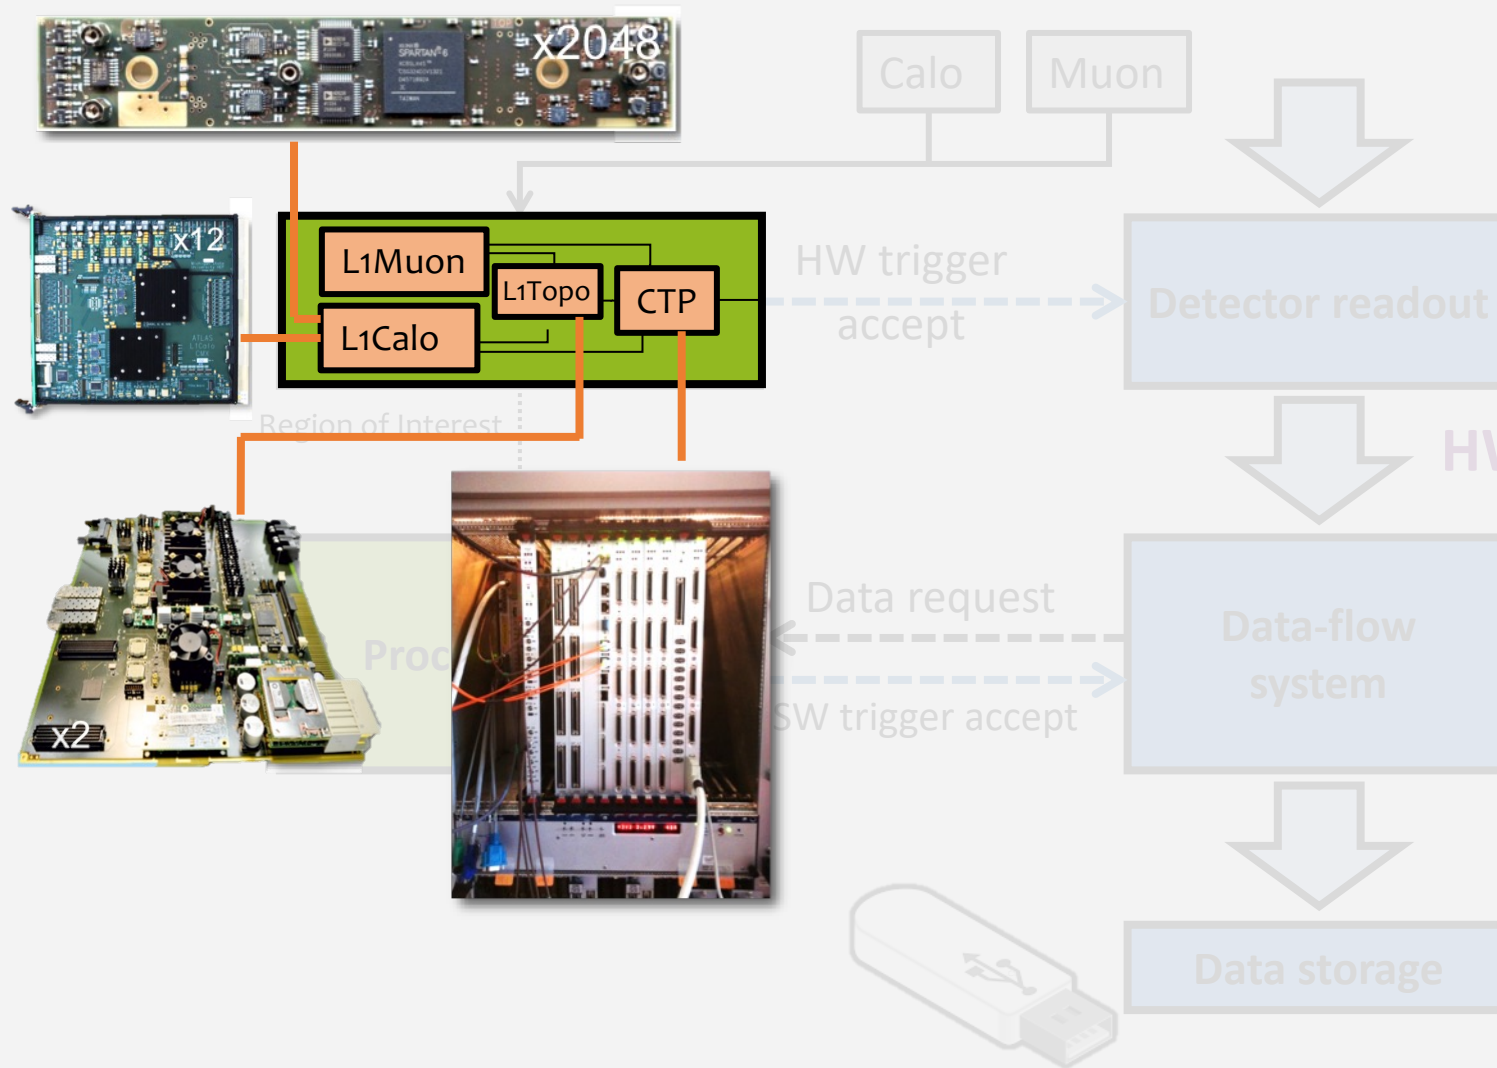

In 2018

40 MHz
13 TeV

HW trigger accept
~ 100 kHz

Storage
1 kHz

TRIGGERING IN PHYSICS

Architecture: Very simplified view

Either CPUs or CPUs + GPUs (LHCb, CMS) in Run3

TRIGGERING IN PHYSICS

Architecture: Very simplified view

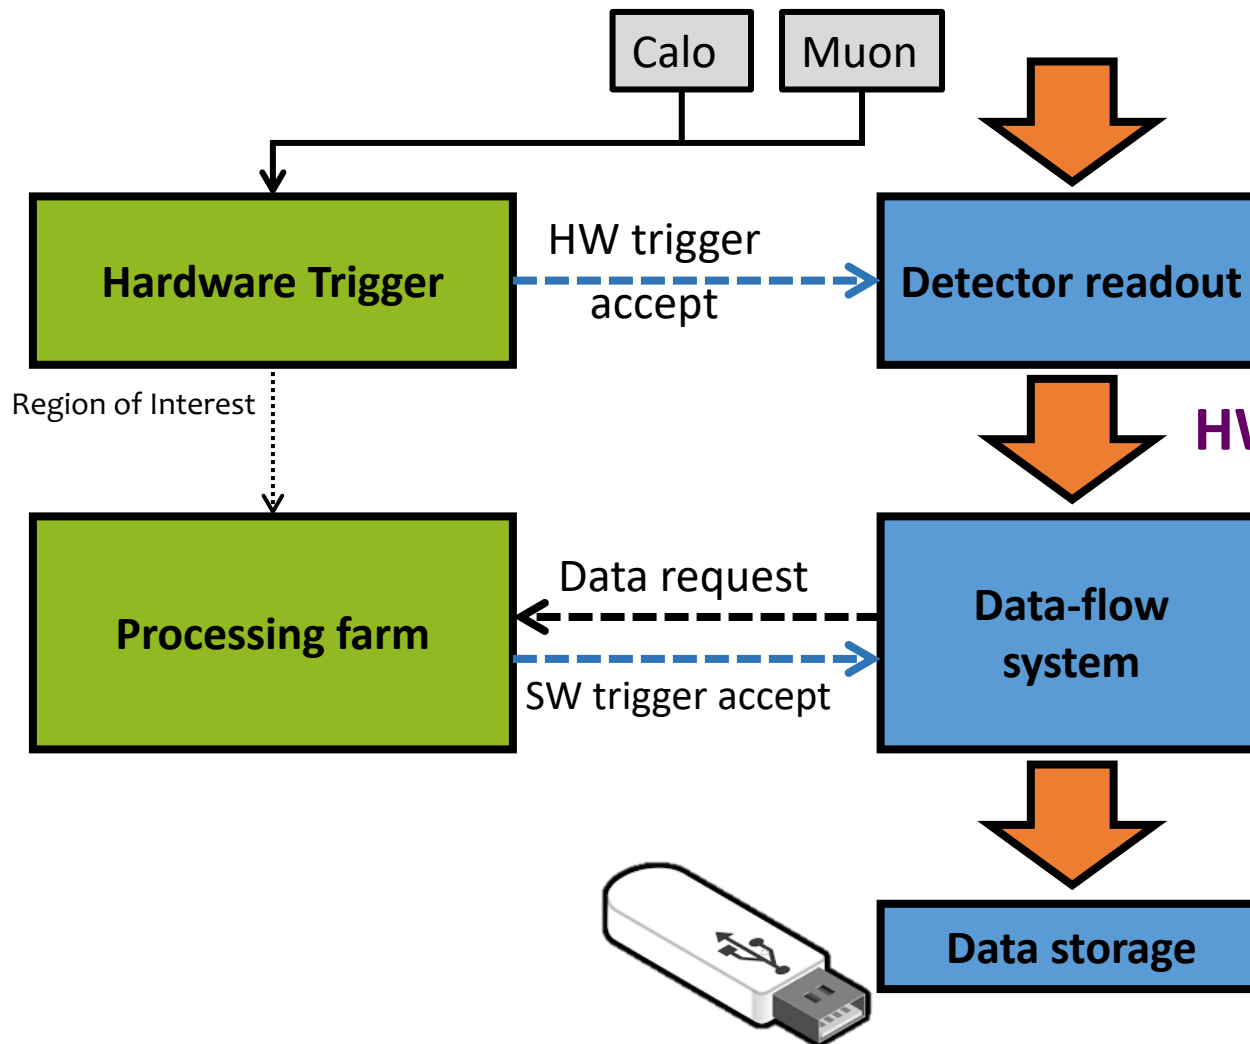

In 2018

40 MHz
13 TeV

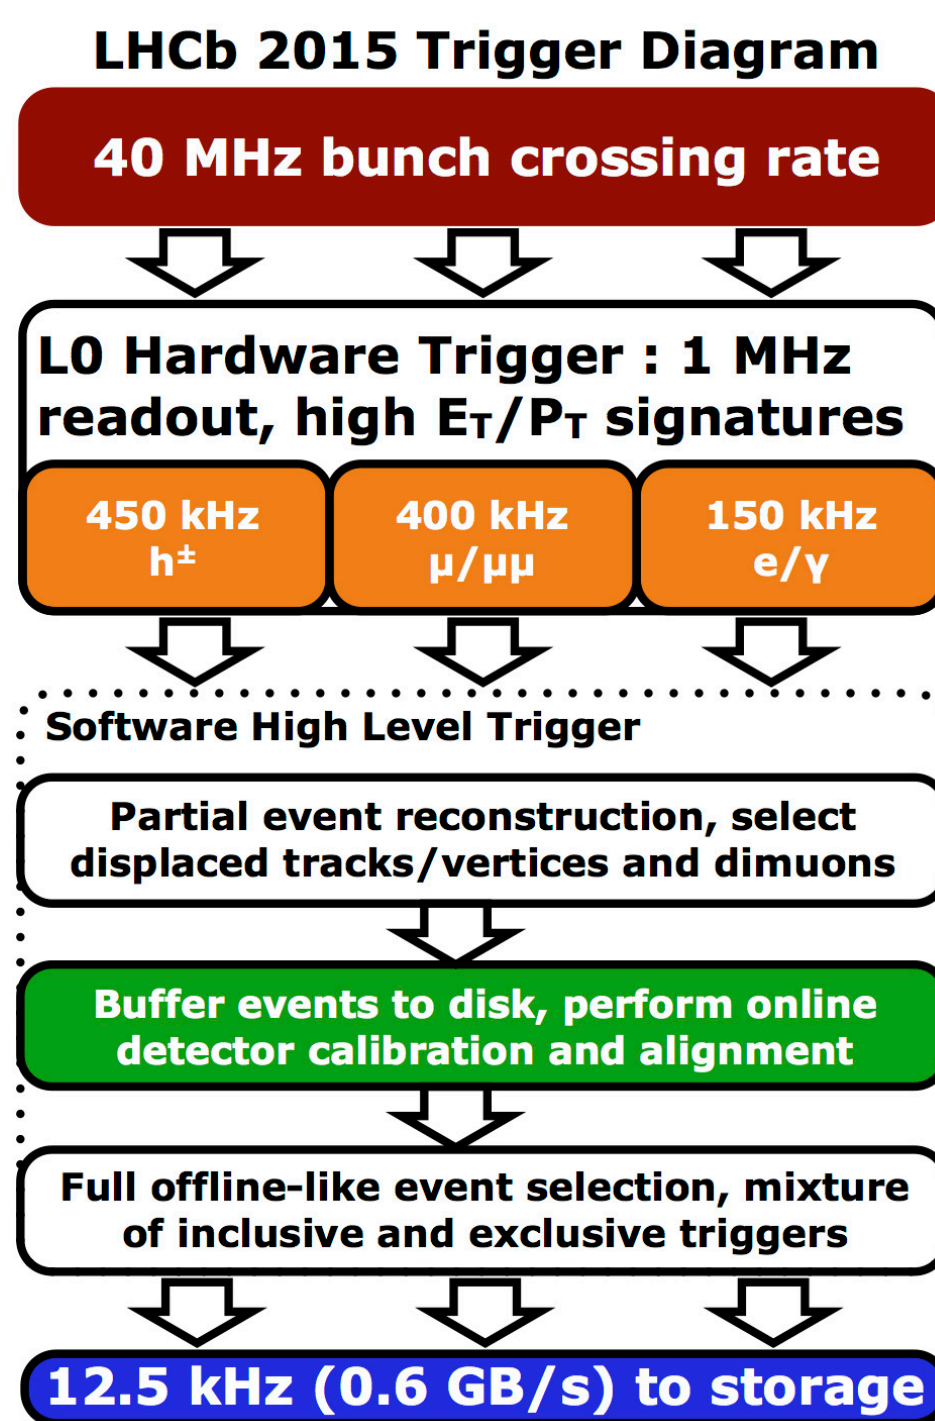

HW trigger accept
~ 100 kHz

Storage
1 kHz

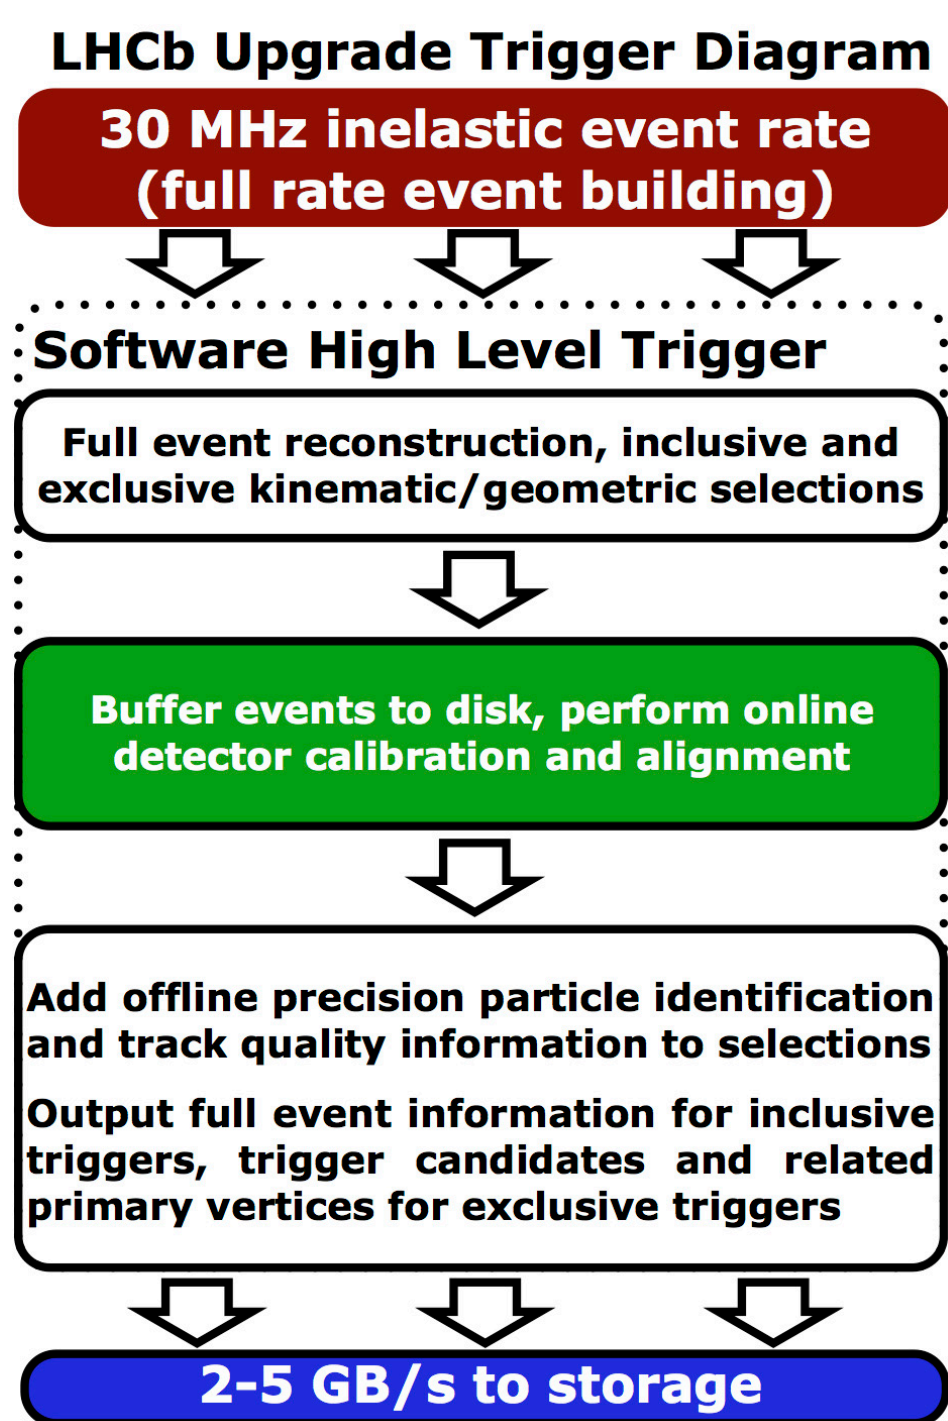

- Limitations from:
- detector;
 - data acquisition;
 - computing

TRIGGERING IN PHYSICS IN LHCb

Outside ATLAS and CMS

TRIGGERING IN PHYSICS IN LHCb

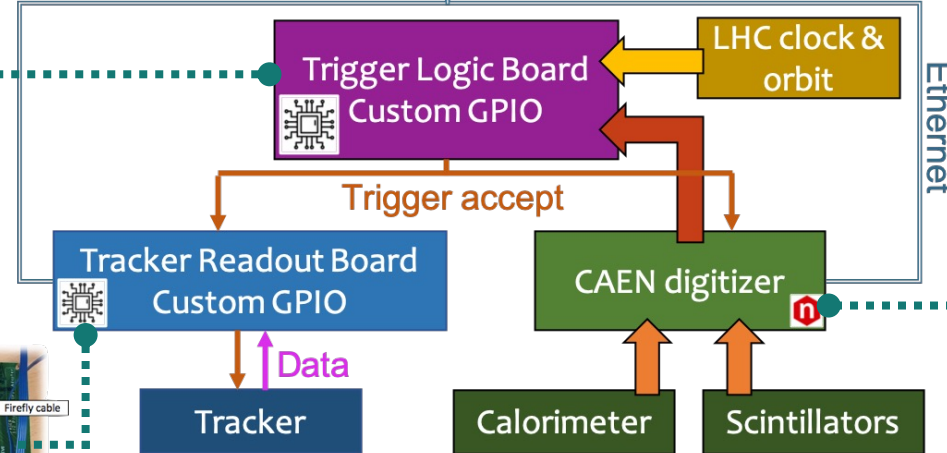

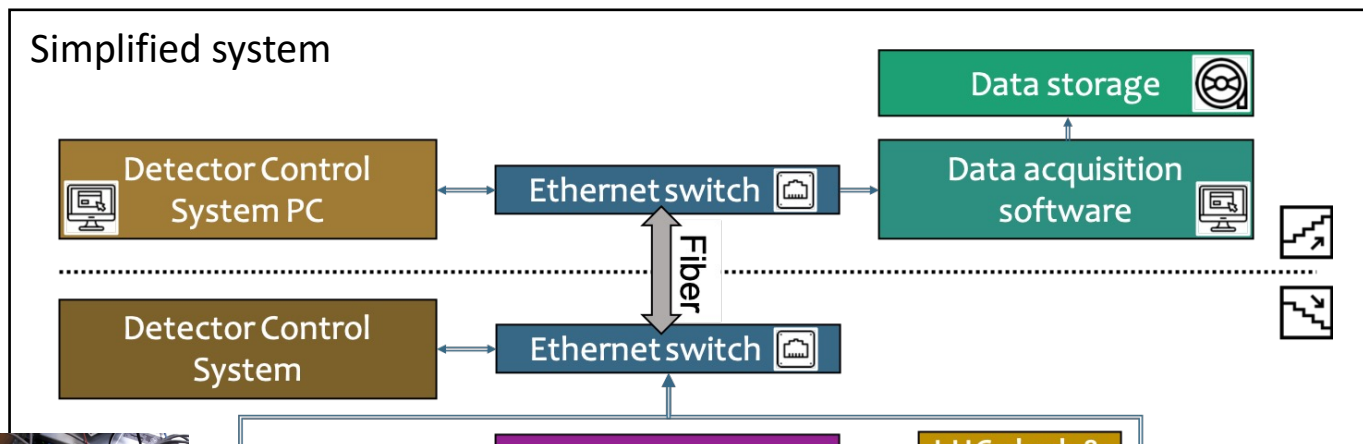

Outside ATLAS and CMS

Outside ATLAS and CMS

TRIGGERING IN PHYSICS IN FASER

- **Trigger rate about 1000 Hz**, dominated by muons from the IP
 - L1A includes random and software triggers
- Expected **bandwidth about 15 MB / s**, dominated by PMTs' wide signal ($\sim 1 \mu s$)

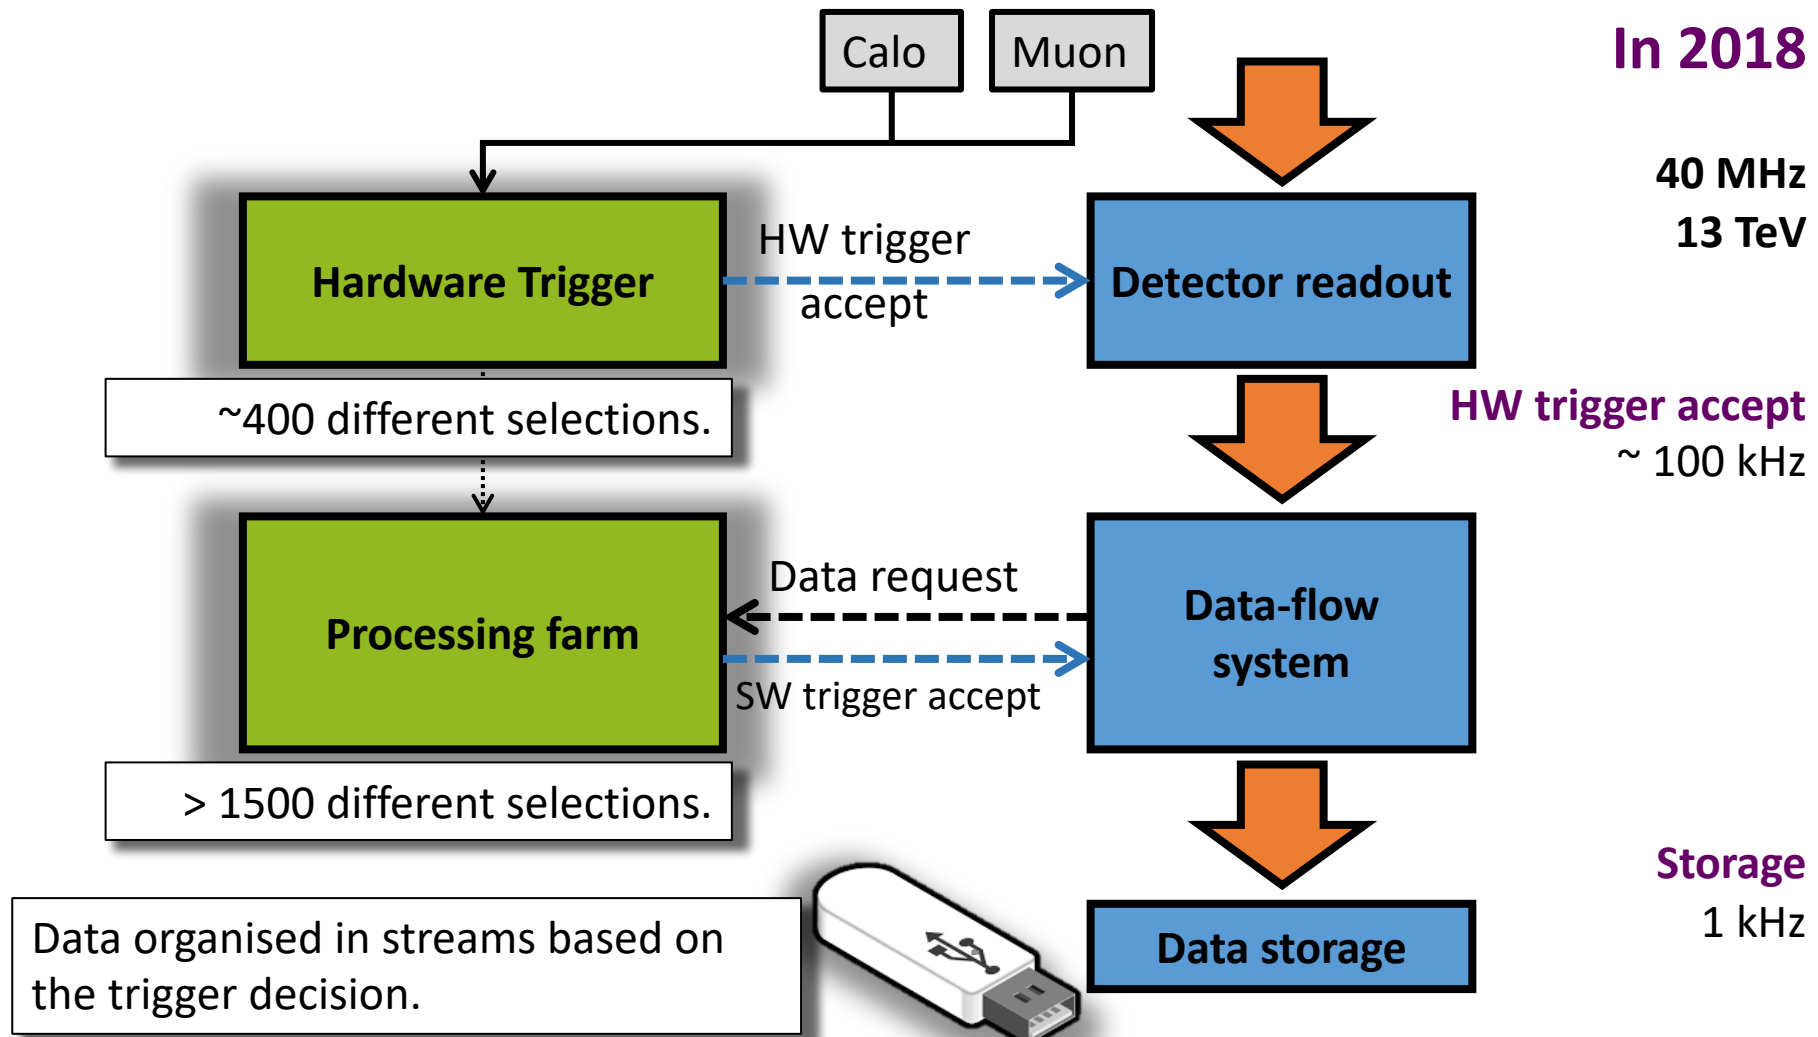

WHAT TDAQ ARCHITECTURE TO BUILD?

- Depends on many parameters and numbers.
- For example: event size out of HW trigger level.

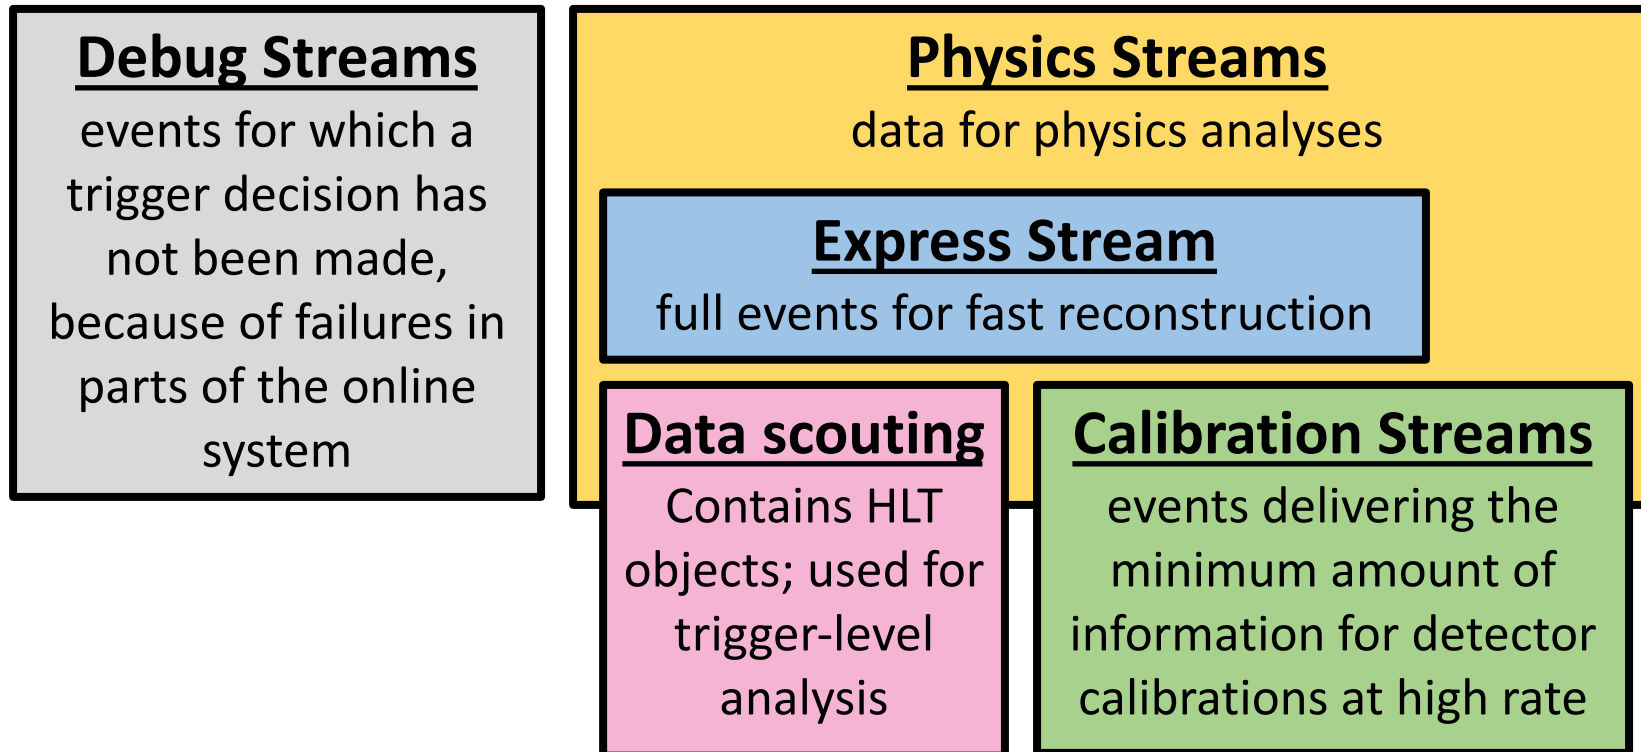

TRIGGERING IN PHYSICS

Architecture: Very simplified view

STREAMING

- ◎ Streaming is based on trigger decisions at all stages
- ◎ The Raw Data physics streams are generated at the HLT output level

PHYSICS MENUS

Menu constructed to respect limitations from:

- detector;
- data acquisition;
- computing

| Trigger selection | 2015 offline threshold (GeV) | 2016 offline threshold (GeV) | 2017 offline threshold (GeV) | 2022 offline threshold (GeV) | Representative physics case |
|-----------------------|---|---|---|---|---|
| Peak Luminosity | $5 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$ | $1.2 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ | $1.7 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ | $2.0 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ | |
| isolated single e | 25 | 27 | 27 | 27 | “Main” triggers. Thrs driven by Higgs (ZH, WH), Top, SUSY. |
| isolated single μ | 21 | 27 | 27 | 25 | |
| di- γ | 40, 30 | 40, 30 | 40, 30 | 40, 30 | Higgs ($H \rightarrow \gamma\gamma$, $HH \rightarrow bb\gamma\gamma$). |
| di- τ (+ jet) | 40, 30 | 40, 30 | 40, 30 | 40, 30 | Higgs ($H \rightarrow \tau\tau$, $HH \rightarrow bb\tau\tau$), SUSY. |
| four-jet (incl. HF) | 45 | 45 | 45 | 45 | SUSY, Higgs, exotics |
| MET | 180 | 200 | 200 | 200 | |

We will come back to trigger menus and performance when we will have talked about reconstruction!

TRIGGER OPERATIONS

Limitations from:

- **detector:** e.g. L1 rate and processing latency
- **data acquisition:** e.g. HLT output bandwidth
- **computing:** e.g. HLT output bandwidth for prompt reconstruction

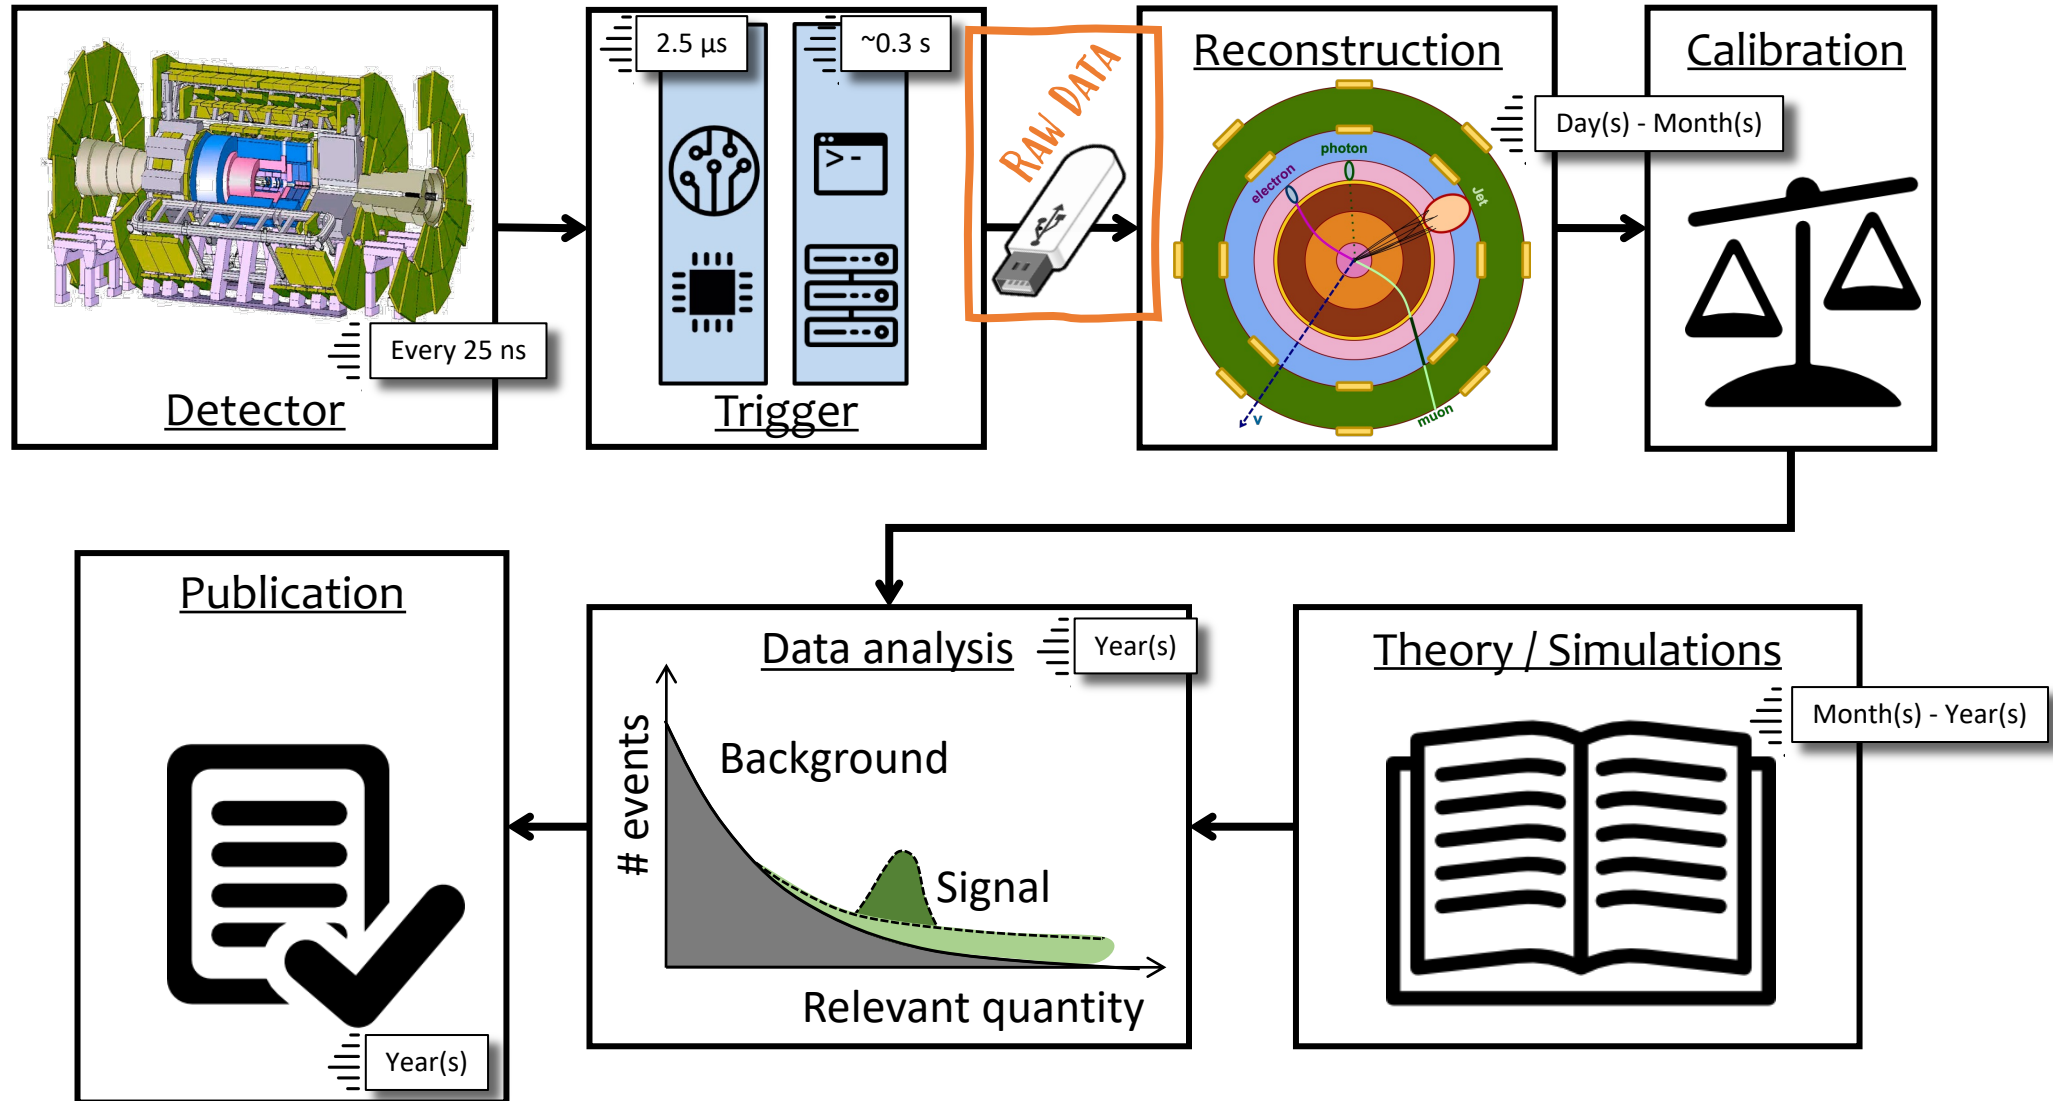

TRIGGER OPERATIONS

- **Bandwidth = Rate x Event size**
- Rate defines the number of events collected
- Can get higher rate if event size smaller...
→ Partial events for calibrations, but also physics!

Can you estimate the ~ size of a trigger-level analysis event?

The LHC

PART 2

WHAT WILL THIS LECTURE BE ABOUT?

INTRODUCTION

- Definitions and basic concepts

INPUT TO THE PHYSICS

- **The data: trigger, data preparation**
- **The theory: Monte carlo simulations**
- Reconstruction, or how to translate detector signals to particles

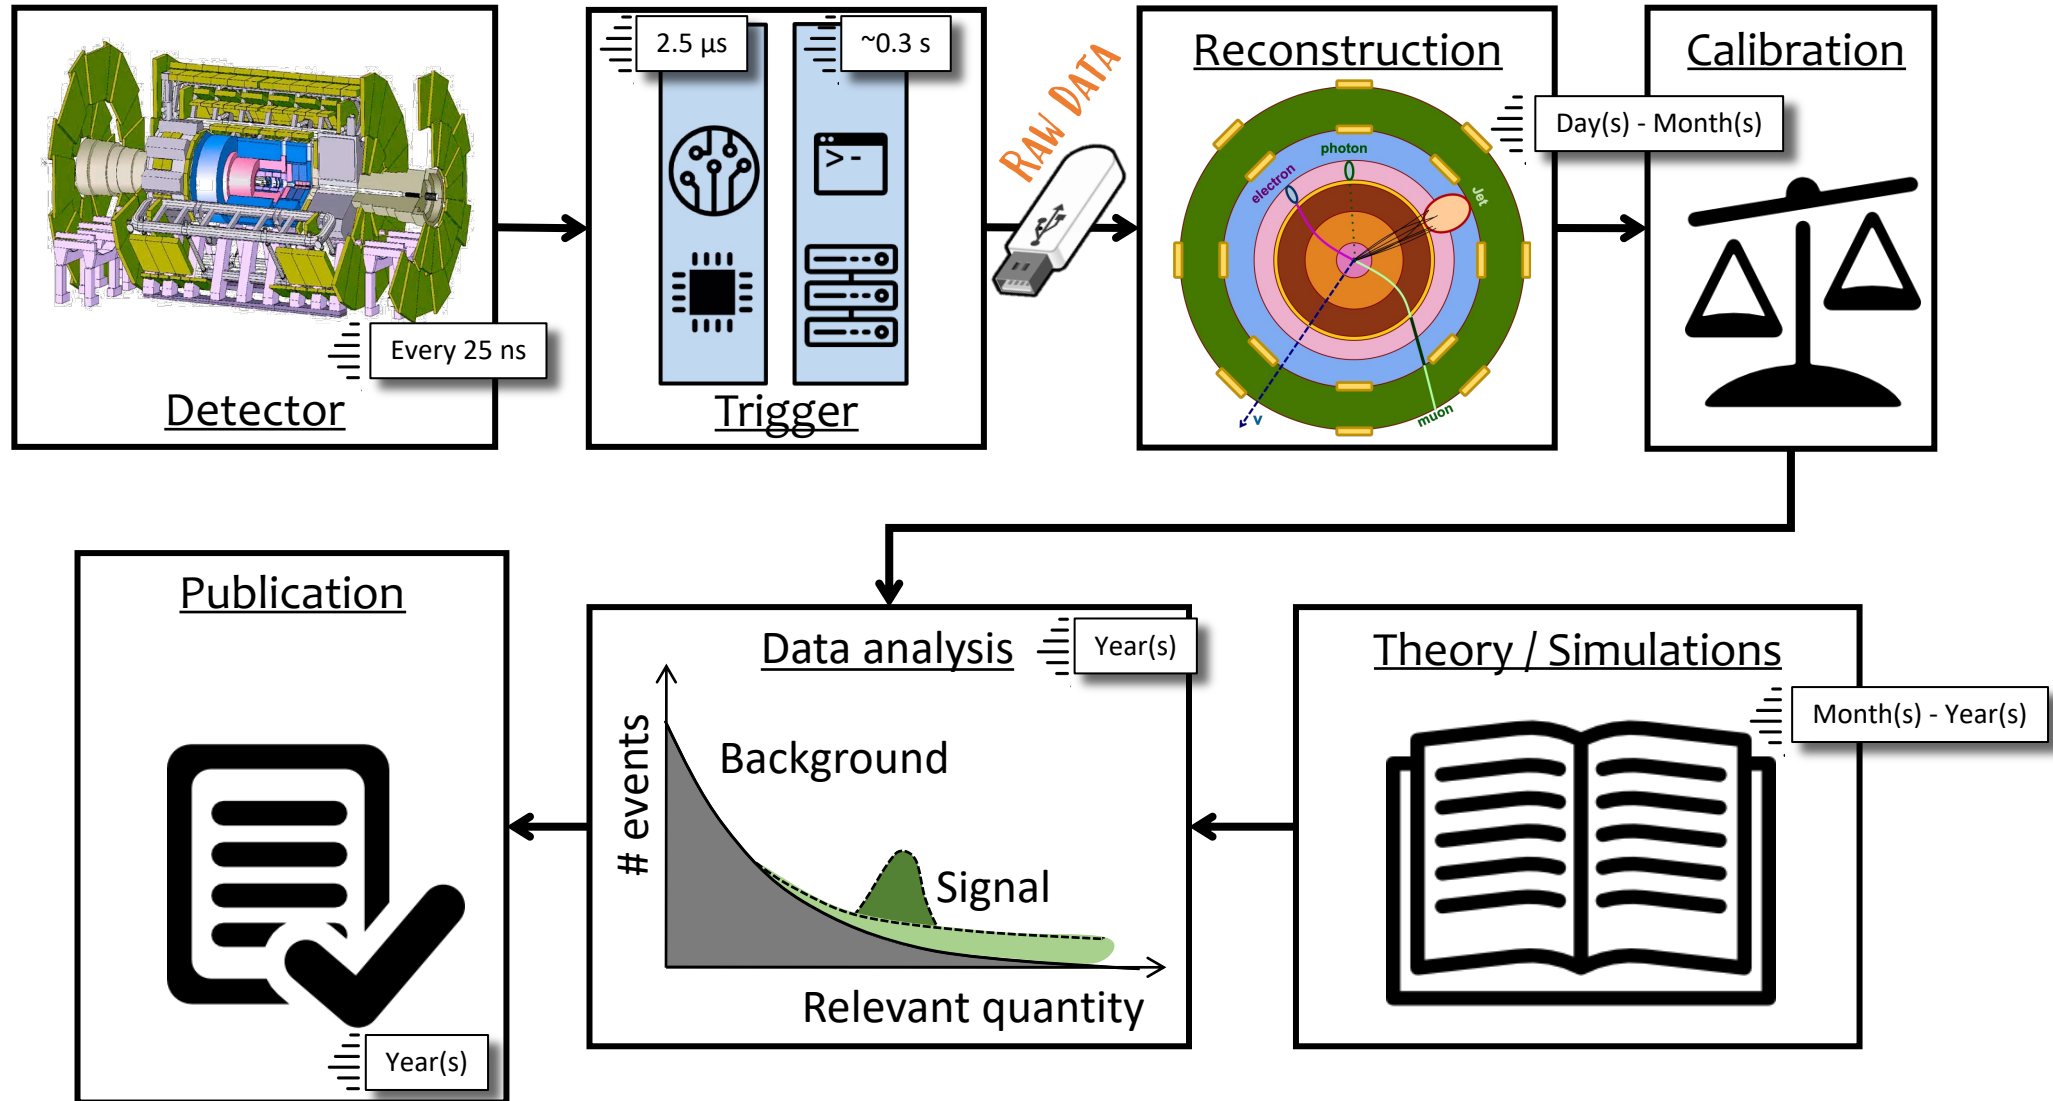

PHYSICS ANALYSES

- Through example, step-by-step
- Discussion of analysis methods

*Is there a topic you would like to add to this material?
If so: please let me know at the end of this lecture and I will see if I can add it!*

THE LIFETIME OF A COLLISION EVENT

DATA PREPARATION

LET'S FIRST TALK ABOUT
COMPUTING!

Yearly data volumes

LHC - 2016
50 PB raw data

LHC Science data
~200 PB

Facebook uploads
180 PB

SKA Phase 1 -
2023
~300 PB/year
science data

Google searches
98 PB

Google Internet archive
~15 EB

SKA Phase 2 - mid-2020's
~1 EB science data

HL-LHC - 2026
~1 EB Physics data

HL-LHC - 2026
~600 PB Raw data

*Few years old already⁹⁷
E.g. by now google is
at least 3-5x larger!*

WORLDWIDE LHC COMPUTING GRID

an international collaboration to distribute and analyse LHC data

Integrates computer centres worldwide that provide computing and storage resource into a single infrastructure accessible by all LHC physicists.

- **161 sites, 42 countries**
- **1 M CPU cores**
- **1 EB of storage**
- **> 2 M jobs/day**
- **> 100 PB moved/month**
- **accessed by 10k users**
- **10-100 Gb links**

Network proved better than anyone imagined: Any job can run anywhere

WORLDWIDE LHC COMPUTING GRID

THE TIER SYSTEM

- **Tier-0 (CERN):**
 - Data recording, reconstruction and distribution
- **Tier-1:**
 - Permanent storage, re-processing, analysis
- **Tier-2:**
 - Simulation, end-user analysis

ATLAS DATA MANAGEMENT

Data storage
Access
Replication
Deletion

F indable

A ccessible

I nteroperable

R eusable

Scalable
Policy-driven
Monitorable
Supporting "FAIR" data principles

Now established in
the HEP community
and beyond

HARDWARE

Magnetic tapes, retrieved by robotic arms, are used for long-term storage

Storage

Tape (at CERN)
about 270 PB

- Most reliable and cost-effective technology for large-scale archiving
- Data stored there infinitely

Disk
about 200 PB

- Data for initial processing
- Copies for further processing / user analysis
- Data in disks gets staged from tape, on demand

Processing power

CPUs

- Mainly GRID
- About 400k cores

GPUs

- Mostly for RnD
 - Few 10s
- Also considering for the future:
FPGA accelerators*

Opportunistic resources

- Online farm, 100k cores
- High Performance Computers, primarily in the US
- Volunteer computing

Nvidia GeForce

SOFTWARE

The ATLAS Experiment's main offline software repository

- **All software organized in packages in Git.** For example:

 <https://gitlab.cern.ch/atlas/athena>

- **All software open source, copyrighted and licenced (Apache 2)**
 - “Copyright (C) 2002-2020 CERN for the benefit of the ATLAS collaboration”
 - For open use – but also for crediting developers **who move out of academia**
- **Thorough tracking of software developments a key of success**
 - Via the Jira software, supported by CERN IT  Jira Software
 - **Multiple releases exist for merging of new code with existing one**
 - **Automated tools run nightly to verify code sanity & performance**
 - Globally the software projects are coordinated with careful planning

- **Software Tools**

- Databases
- Analysis tools: ROOT is the workhorse!

- **Analysis-specific software developed by teams available to whole collaboration!**
