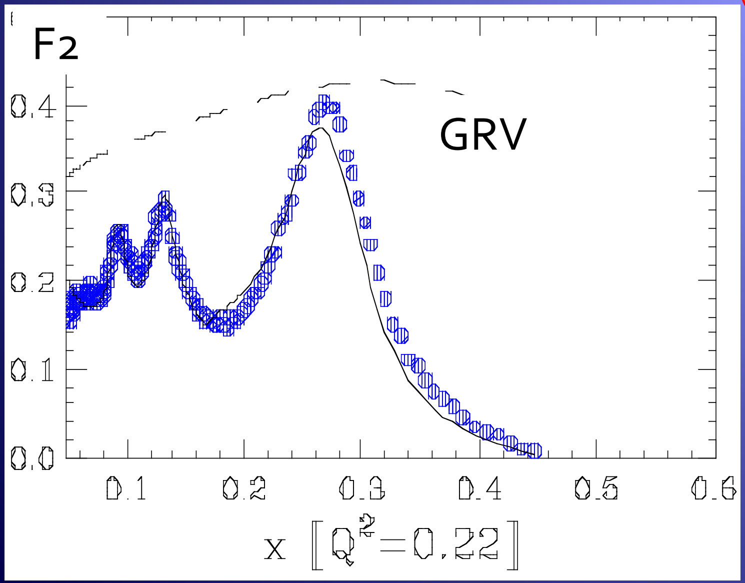
NuFACT 2023 Workshop, Seoul, August 21-26, 2023

Bodek-Yang Model

- Bodek-Yang model: describe DIS cross section in all Q^2 regions
- Challenges in e/μ-N DIS
  - High x PDFs at low Q^2
  - Resonance region overlapped with a DIS contribution
  - Hard to extrapolate DIS contribution to low Q^2 region from high Q^2 data due to non-perturbative QCD effects



- A model in terms of quark-parton model (easy to convert e/μ scattering to ν scattering)

✓ Understanding of high x PDFs at low Q^2? wealthy SLAC, JLAB data.

✓ Understanding of resonance scattering in terms of quark-parton model?
(duality works, many studies by JLAB)

Lessons from previous QCD studies

- NLO & NNLO analyses with DIS data: PRL 82, 2467 (1999), Eur. Phys. J. **C13**, 241 (2000) by Bodek and Yang
  - Kinematic higher twist (target mass) effects are large
  - Resonance region can be well described (duality works).
  - Most of dynamic higher twist corrections (in NLO analysis) are similar to missing NNLO higher order terms.

- NNLO pQCD+TM with NNLO PDFs can describe the non-perturbative QCD effects at low Q^2
- Thus, we reverse the approach to build the model:
  - Use effective LO PDFs with a news caling variable, ξw to absorb target mass, higher twist, missing QCD higher order

$$x_{Bj} = \frac{Q^2}{2M\nu} \Rightarrow \xi_W = \frac{Q^2 + B}{\{M\nu[1+\sqrt{(1+Q^2/\nu^2)}] + A\}}$$

$$F_2(x,Q^2) \rightarrow \frac{Q^2}{Q^2 + C} F_2(x_w, Q^2)$$

NLO vs NNLO

Studies of higher twist and higher order effects in NLO and NNLO QCD analysis of lepton-nucleon scattering data on F_2 and $R = \sigma_L/\sigma_T$

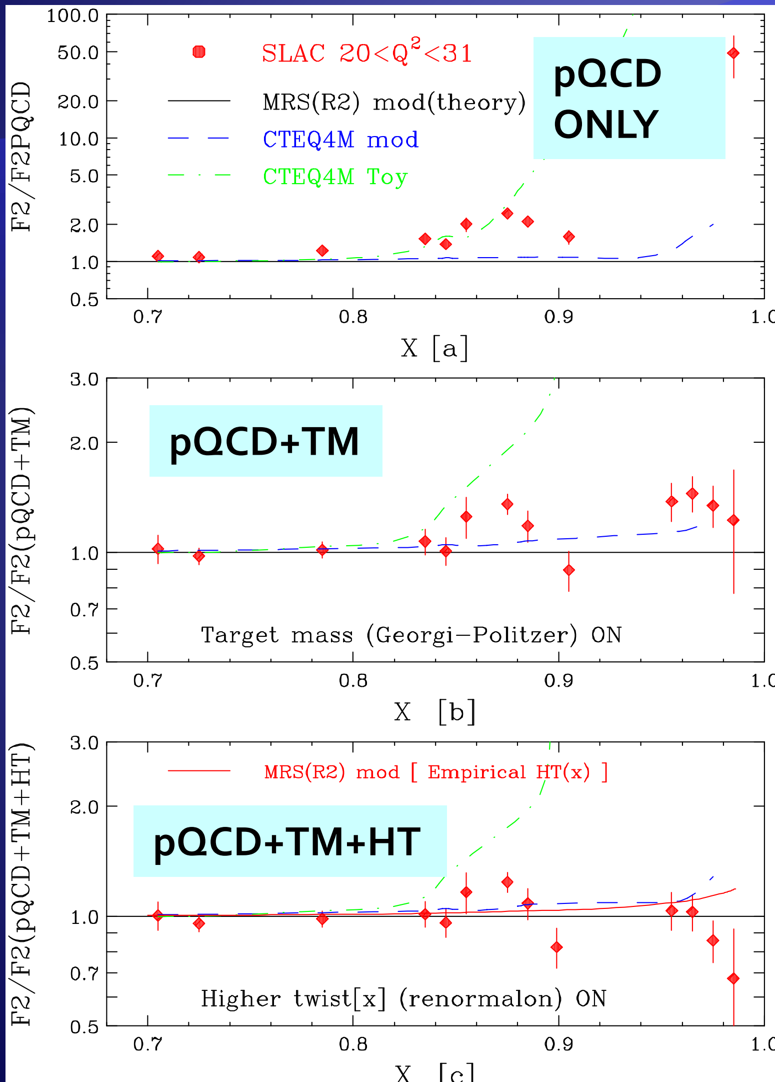
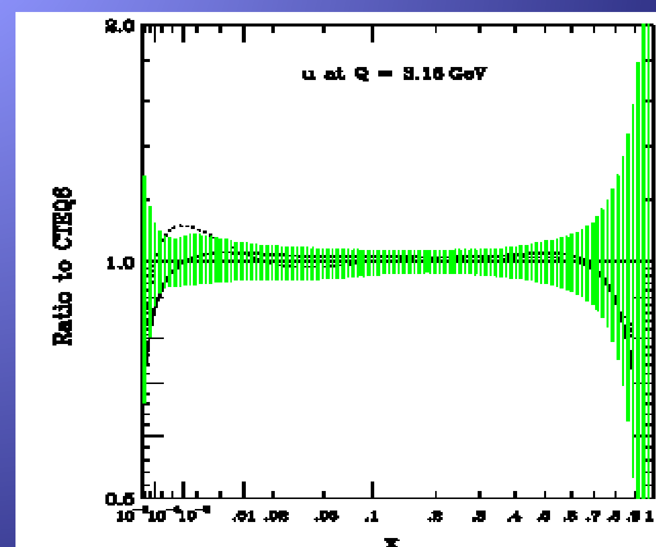
Very high x and low Q^2 data



Parton Distributions, d/u, and Higher Twist Effects at High x

U. K. Yang and A. Bodek
Phys. Rev. Lett. **82**, 2467 – Published 22 March 1999

- Very high x and low Q^2 data is well described by the pQCD+TM+HT
- Extraction of the high x PDF is promising (1999)



Bodek-Yang Effective LO PDFs Model

1. Start with GRV LO PDF (Q^2_{min}=0.80)
2. Replace x_{bj} with a new scaling, ξ_w
3. Multiply all PDFs by K factors for photo prod. limit and higher twist

   [$\sigma(\gamma) = 4\pi\alpha/Q^2 * F_2(x, Q^2)$]

   Ksea = $Q^2/[Q^2+Csea]$

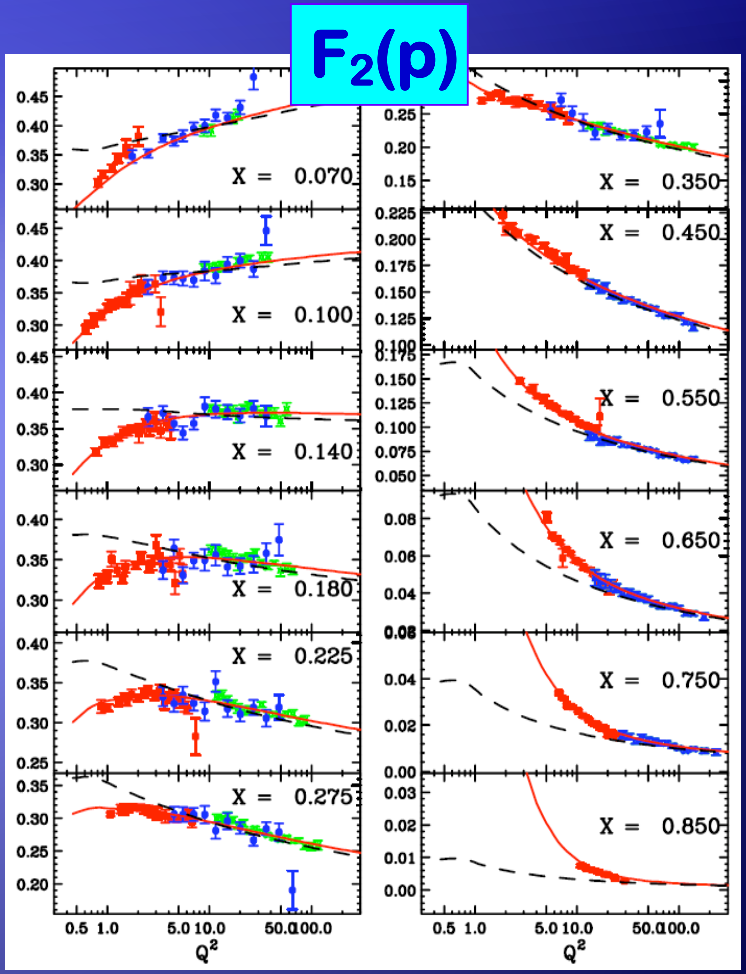
   Kval = $[1- G_D^2 (Q^2)] * [Q^2+C_{2V}] / [Q^2+C_{1V}]$

   motivated by Adler Sum rule

   where $G_D^2 (Q^2) = 1/ [1+Q^2 / 0.71]^2$
4. Freeze the evolution at $Q^2 = Q^2_{min}$

   - $F_2(x, Q^2 < 0.8) = K(Q^2) * F_2(\xi w, Q^2=0.8)$
5. Fit all DIS F_2(p/D) data:

   SLAC/BCDMS/NMC/HERA data



Nucl.Phys.B 139 (2005)

Photo-production data

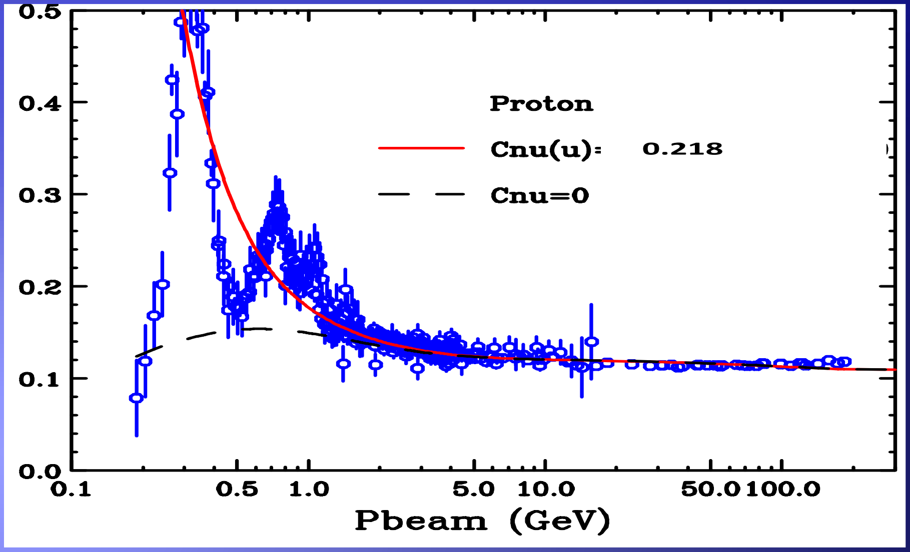
- Additional K^{LW} factor for valence quarks:

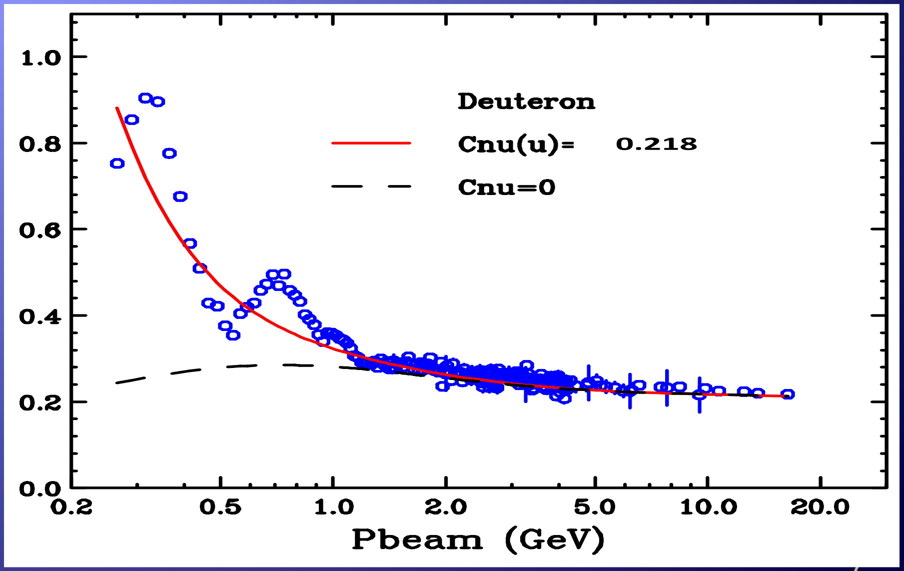
$$Kval = K^{LW} * [1 - G_D{}^2(Q^2)] * [Q^2+C_{2V}] / [Q^2+C_{1V}]$$

$$K^{LW} = (\nu^2+C^{\nu})/\nu^2$$

This makes a duality work all the way down to $Q^2=0$ (for charged leptons)

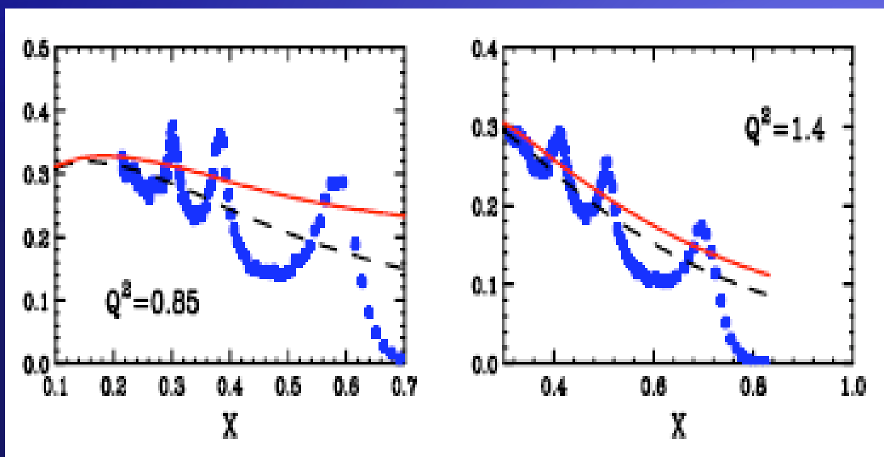
- Photo-production data with ν(Pbeam)>1 GeV included in the fitting



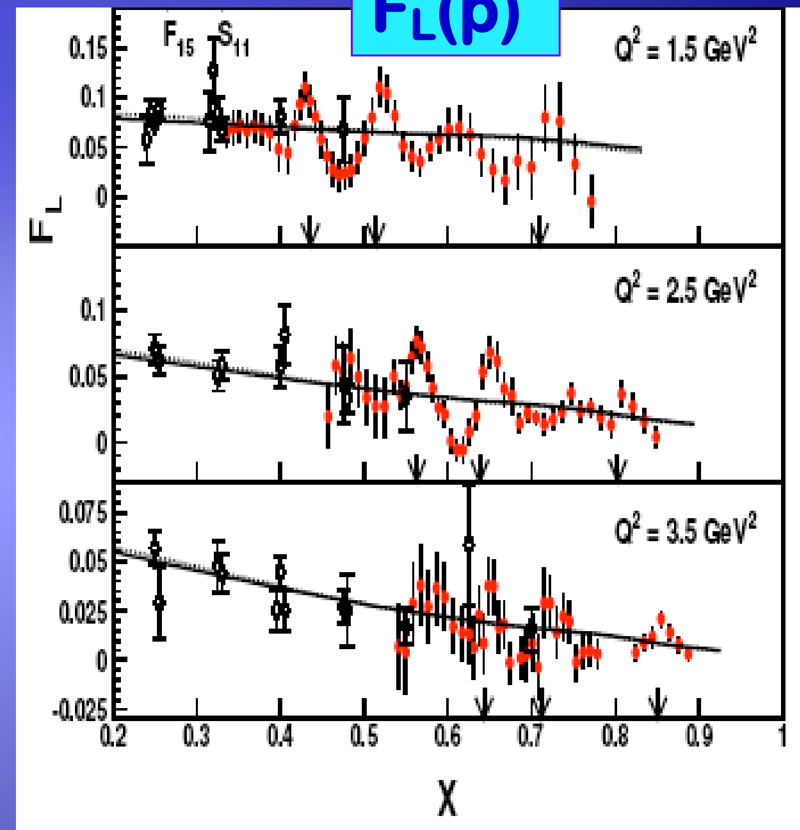


F2 & F_L Resonance data

$F_2(p)$



$F_L(p)$



- Predictions for F_L are in good agreement (not included in the fit) duality works

$$F_L = F_2(1+4M^2x^2/Q^2)\frac{R}{(1+R)}$$

Neutrino cross sections

- Effective LO model with ξw describe all DIS and resonance F_2 data as well as photo-production data (Q^2=0 limit): vector contribution works well
- Neutrino Scattering:
  - Effective LO model works for xF_3?
  - Nuclear effects using e/μ scattering data
  - Axial vector contribution at low Q^2?
  - Use $R=R_{1998}$ to get $2xF_1$
  - Implement charm mass effect through ξw slow rescaling algorithm for F_2, $2xF_1$, and xF_3

arXiv:2108.09240

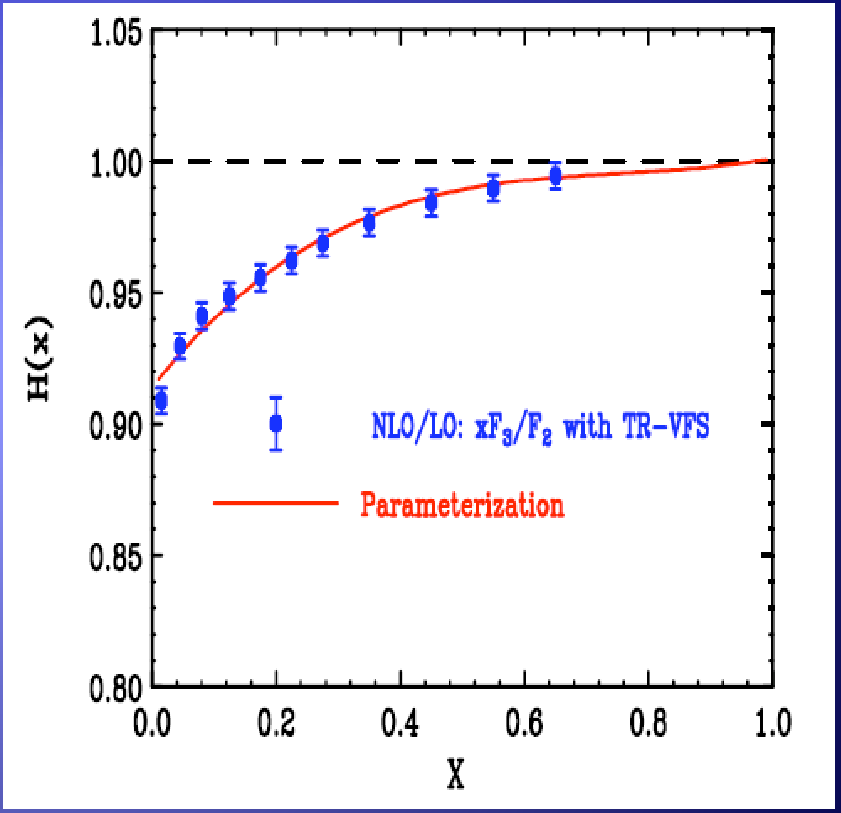
Effective LO model for xF_3?

- Scaling variable, ξw absorbs higher order effect for F_2, but the higher order effects for F_2 and xF_3 are not the same
- Use NLO QCD to get double ratio

$$H(x) = \frac{xF_3(\mathrm{NLO})}{xF_3(\mathrm{LO})} / \frac{F_2(\mathrm{NLO})}{F_2(\mathrm{LO})}$$

not 1 but almost indep. of Q^2

- Enhance anti-neutrino cross section by 3%



Axial Vector Structure Functions

- At high Q^2 , vector and axial vector contribution are same, but not at low Q^2
- The non-zero PCAC component of F_2^{axial} at low Q^2: mostly longitudinal

$$2xF_1^{axial} = 2xF_1^{vector}$$

- K factors for axial contributions (F_2 & xF_3): type II

$$K_{sea}^{vector} = \frac{Q^2}{Q^2 + C} \Rightarrow K_{sea}^{axial} = \frac{Q^2 + 0.55C_{sea}^{axial}}{Q^2 + C_{sea}^{axial}}$$

$$K_{val}^{axial} = \frac{Q^2 + 0.1C_{val}^{axial}}{Q^2 + C_{val}^{axial}}$$

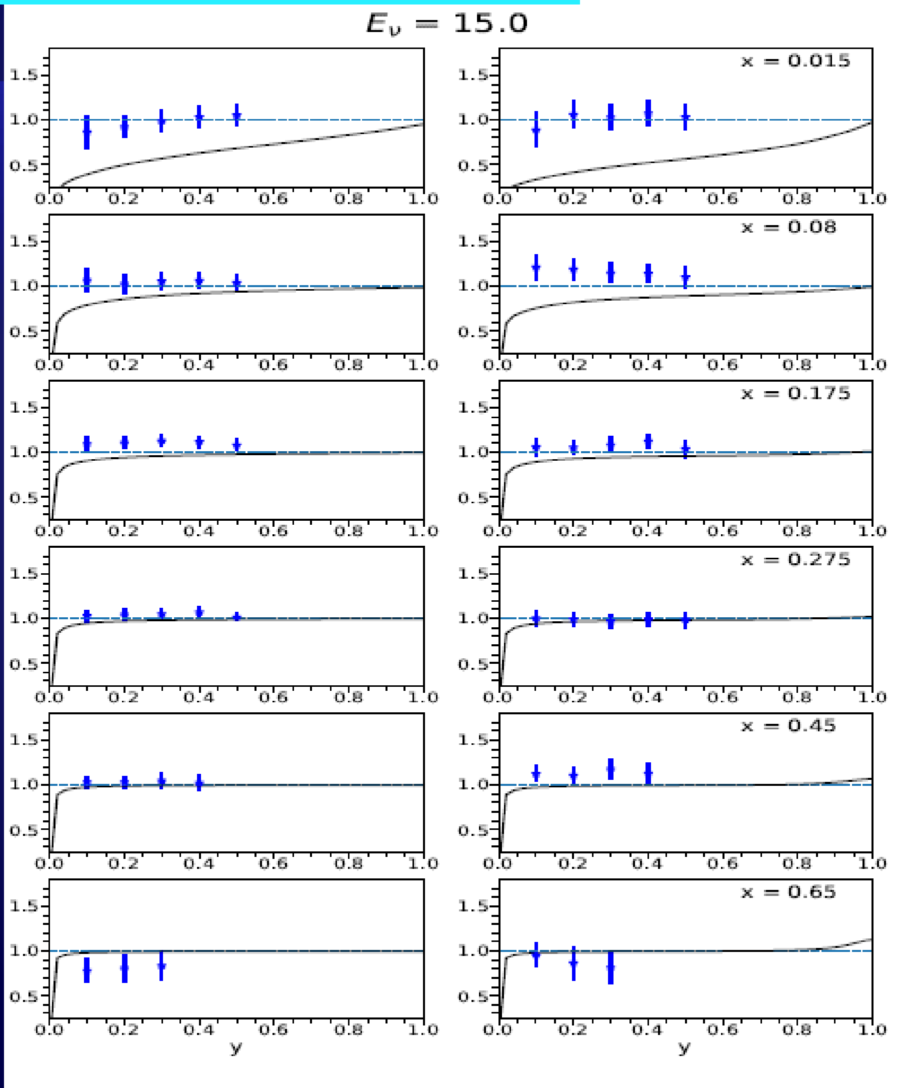
$$\text{where } C_{sea}^{axial} = 0.75, \;\; C_{val}^{axial} = 0.18$$

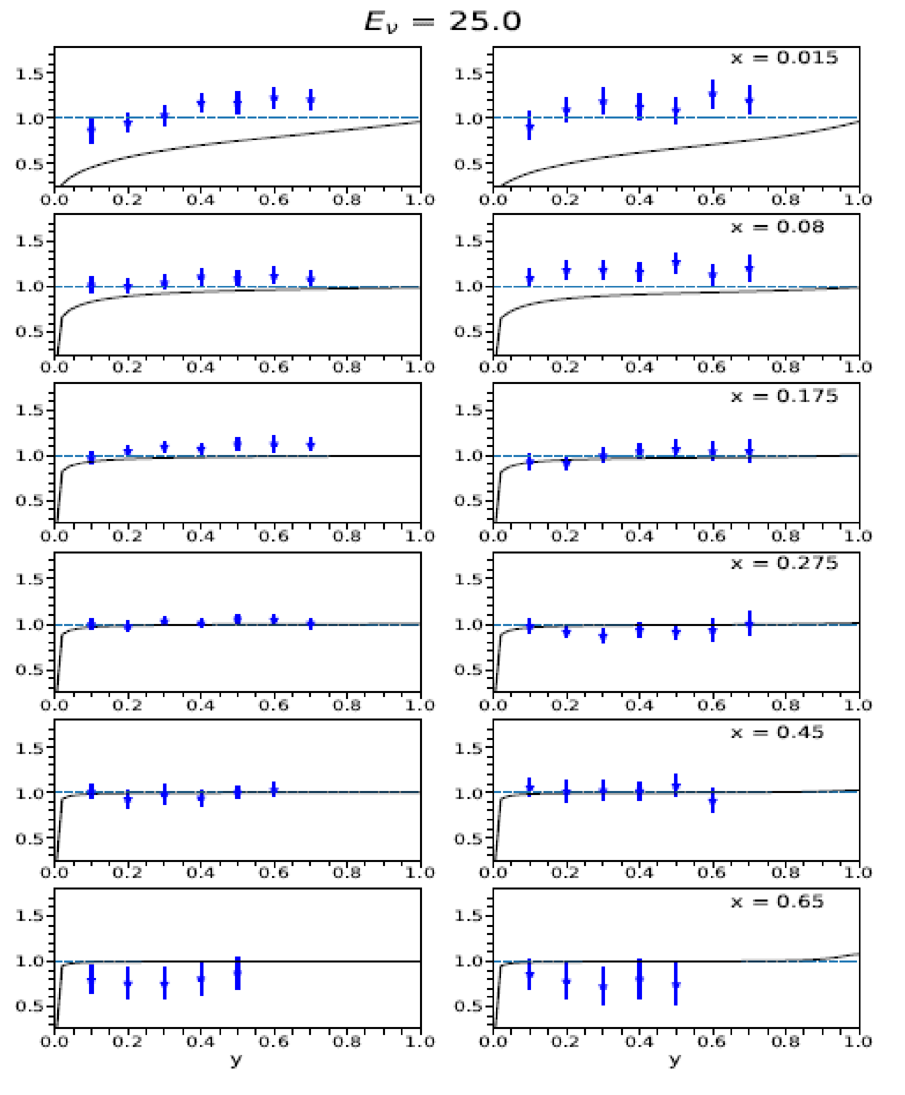
Comparison with CCFR(Fe) , CHORUS (Pb) data

Point: CHORUS/BY (Type II)

Line: Type I/Type II

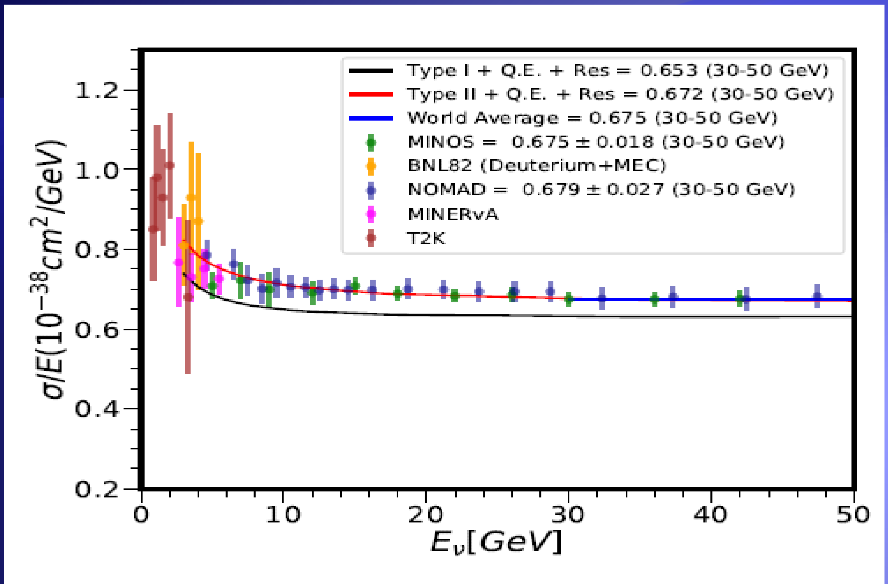
Type 1 (Vector = Axial)

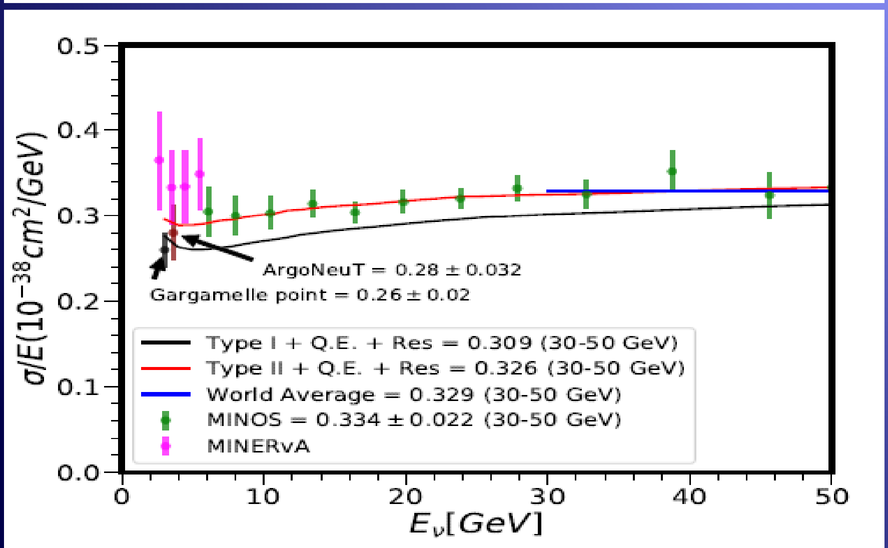


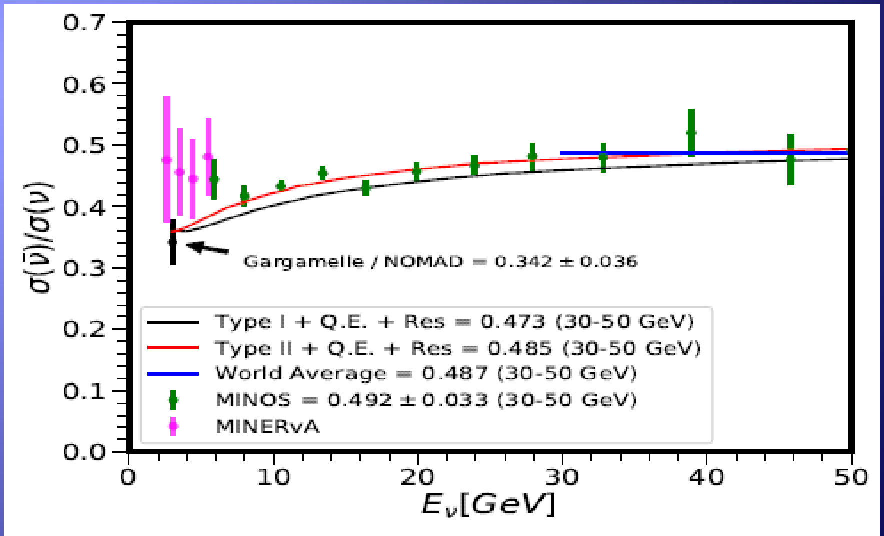


Total cross sections

- BY(DIS, W>1.4) + Q.E. + Resonance



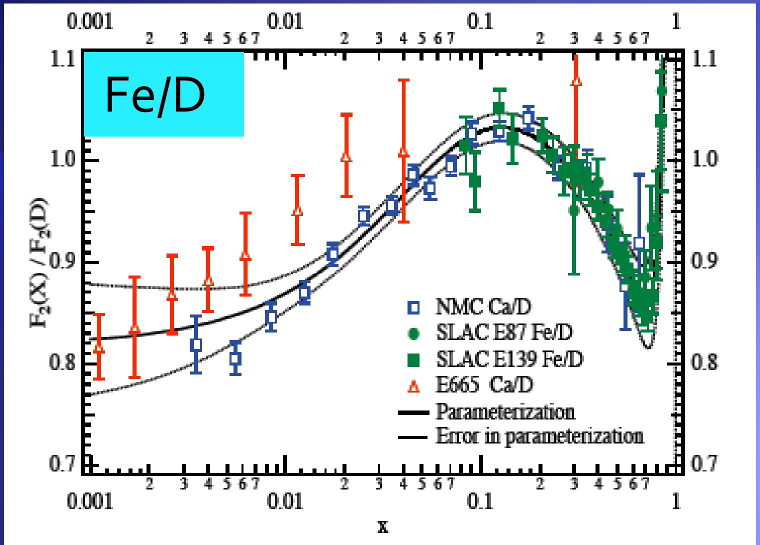


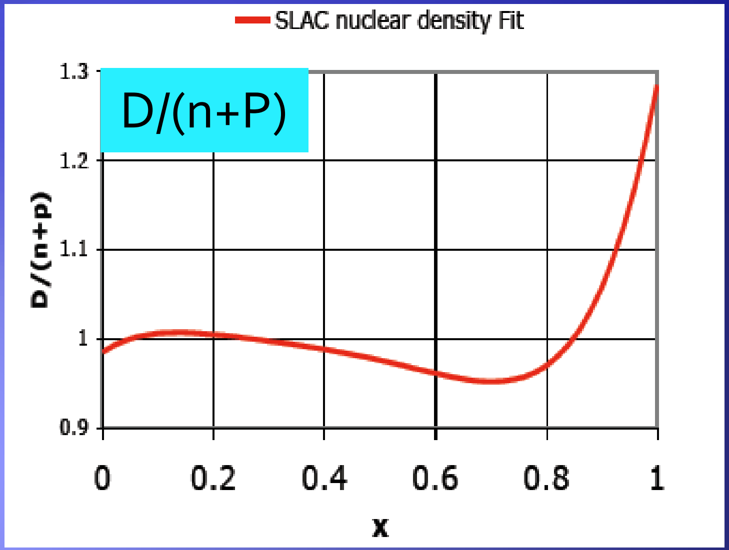


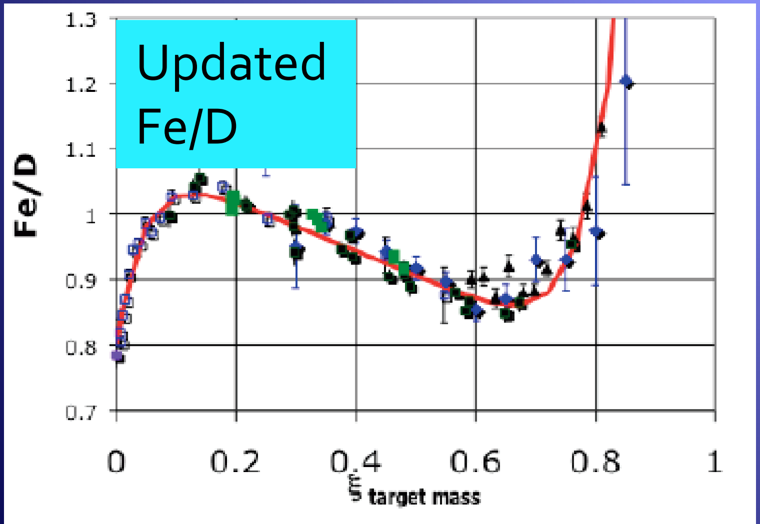
Summary & Discussions

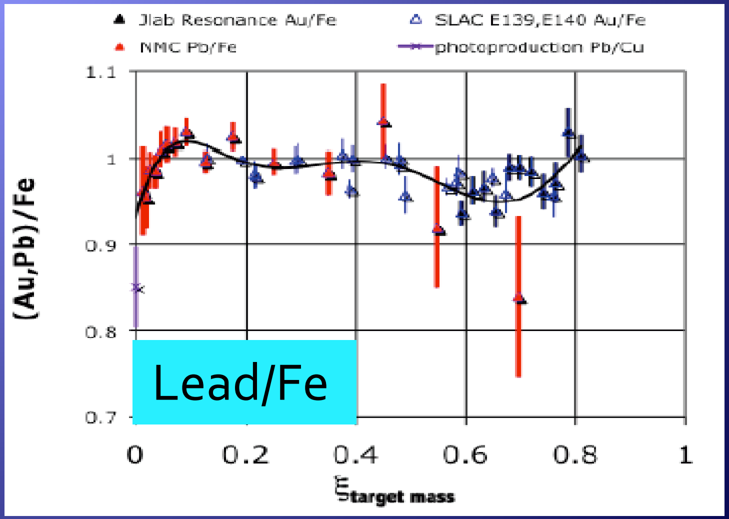
- BY Effective LO model with ξw describe all e/μ DIS and resonance data as well as photo-production data (down to Q^2=0): provide a good reference for vector SF for neutrino cross section
- BY(DIS) type II model (axial=PCAC) provide a good reference for both neutrino and anti-neutrino cross sections (W>1.8). Low energy neutrino experiments can normalize their data to our model to extract their flux
- Model also works well down to W=1.4 GeV on average (duality), thus providing overlap with resonance models

Nuclear Effects: use e/μ data

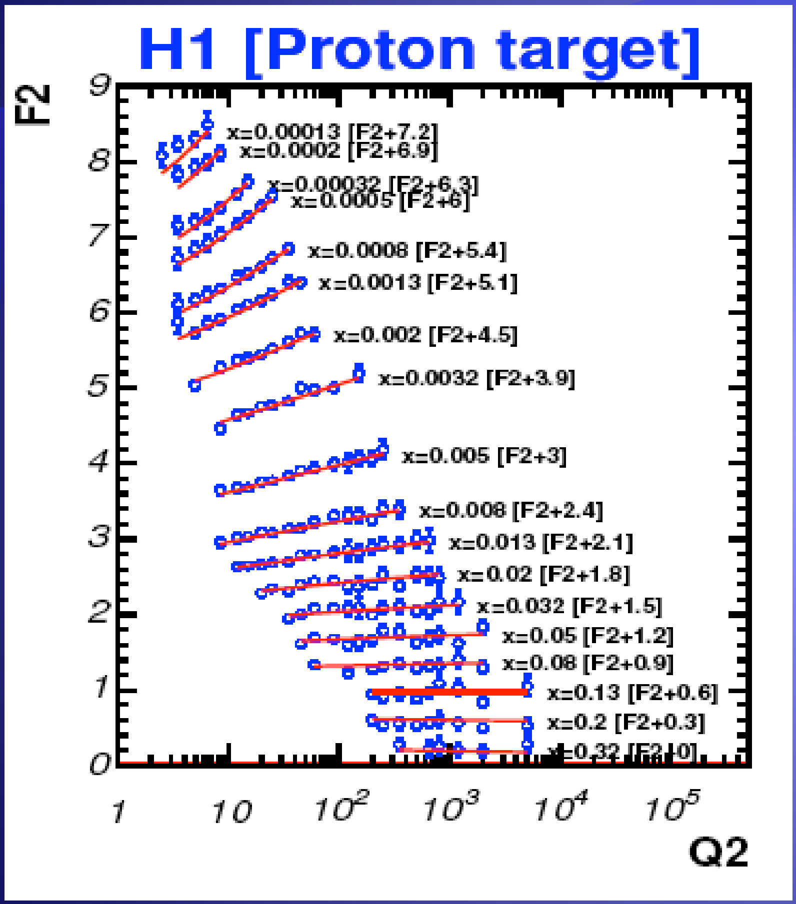


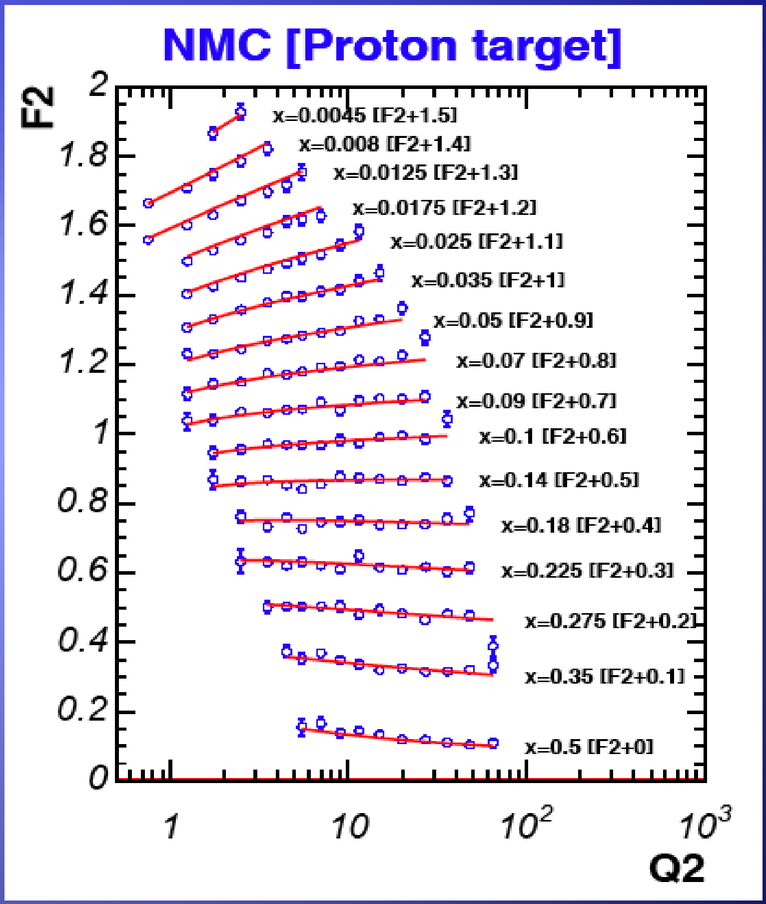






Low x HERA and NMC data





- Fit works at low x
