Prospects of Heavy Higgs scalar in the natural SUSY at LHC upgrades

Tuesday 9 May 2023 18:15 (15 minutes)

Under supersymmetry (SUSY) models with low electroweak naturalness (natSUSY), which have been suggested to be the most likely version of SUSY to emerge from the string landscape, we examine the viabilities of future search for the heavy SUSY Higgs bosons H , A , H^{\pm} through various their decay signatures in LHC. The traditional $H, A \rightarrow \tau\tau$, as well as $H^{\pm} \rightarrow \tau + \nu$, $t + b$, with a spectator top-jet channels are considered. In particular, we also examine $H/A/H^{\pm} \rightarrow W/Z/h + \text{MET}$. These decay channels only come from natSUSY, in which the higgsinos are expected at the few hundred GeV scales whilst electroweak gauginos inhabit the TeV scale, such that for TeV-scale heavy SUSY Higgs bosons as the current LHC limits required, their decays modes into gaugino plus higgsino are kinematically open. We evaluate these signals against several Standard Model backgrounds to get both the 95% CL exclusion and 5σ discovery reach in the $\tan\beta$ vs. m_A plane for the future high luminosity LHC (HL-LHC) with 3000 fb^{-1} of integrated luminosity.
