## Discovering the Origin of Neutrino Masses at SHiP

Monday, May 8, 2023 2:30 PM (15 minutes)

In  $U(1)_R$  extensions of supersymmetric models, the bino and its Dirac partner, the singlino, can play the role of right-handed neutrinos. The bino and the singlino form a pseudo-dirac pair, dubbed the 'bi $\nu$ o', which can generate Standard Model neutrino masses via the inverse seesaw mechanism. We investigate the prospects for detecting long-lived bi $\nu$ os at SHiP, where GeV scale bi $\nu$ os can be copiously produced in the decays of mesons. We show that SHiP can probe new regions of parameter space that are complementary to searches for the lepton flavor-violating decay  $\mu \rightarrow e\gamma$ . This scenario provides a well-motivated benchmark for future experiments of a right-handed neutrino that mixes with all Standard Model neutrinos, and is directly related to the generation of neutrino masses.
