Heavy Neutrino Decay: Detection Sensitivity and Decay Width

Tuesday 9 May 2023 15:15 (15 minutes)

We investigate the decay of MeV-scale sterile neutrinos into $e+e^-$ pairs, which is a signature that can be exploited by current solar neutrino and future dark matter experiments to set stringent limits in mass-mixing parameter space. We present a closed-form cross-section correctly accounting for the neutral/charged current interference and rederive Borexino bounds based on this result. We also comment on future sensitivities.
