Agenda of the afternoon

Outline

Introduction

• Interaction between beam and RF system

• Design of RF systems

- Design flow and constraints
- Examples of RF systems at CERN

• Summary

Introduction

Study interaction between beam and RF

Complementary approaches for the same problem

(Semi-)Analytical

- Describe particle motion by differential equations
- → Continuous trajectories of particle motion
- → Deduce useful parameters for stable acceleration:
 - \rightarrow RF bucket
 - \rightarrow Synchrotron frequency
 - \rightarrow Stable phase
 - \rightarrow ...

Study interaction between beam and RF

Complementary approaches for the same problem

(Semi-)Analytical	Numerical: tracking
 Describe particle motion by differential equations → Continuous trajectories of particle motion → Deduce useful parameters for stable acceleration: → RF bucket → Synchrotron frequency → Stable phase → 	 Track particle parameters from turn to turn → Profit from discretization of motion: turn-by-turn, RF station-by-RF station → No notion of RF bucket, synchrotron frequency, stable phase, etc. → Follow ensemble of particles to study evolution of bunch

Study interaction between beam and RF

7

Complementary approaches for the same problem

(Semi-)Analytical	Numerical: tracking
• Describe particle motion by differential equations	• Track particle parameters from turn to turn
 → Continuous trajectories of particle motion → Deduce useful parameters for stable acceleration: → RF bucket → Synchrotron frequency → Stable phase <lu>→</lu> 	 → Profit from discretization of motion: turn-by-turn, RF station-by-RF station → No notion of RF bucket, synchrotron frequency, stable phase, etc. → Follow ensemble of particles to study evolution of bunch
→ Classical Today of longitudinal beam dynamics	Tomorrow afternoon

Objectives of longitudinal hands-on

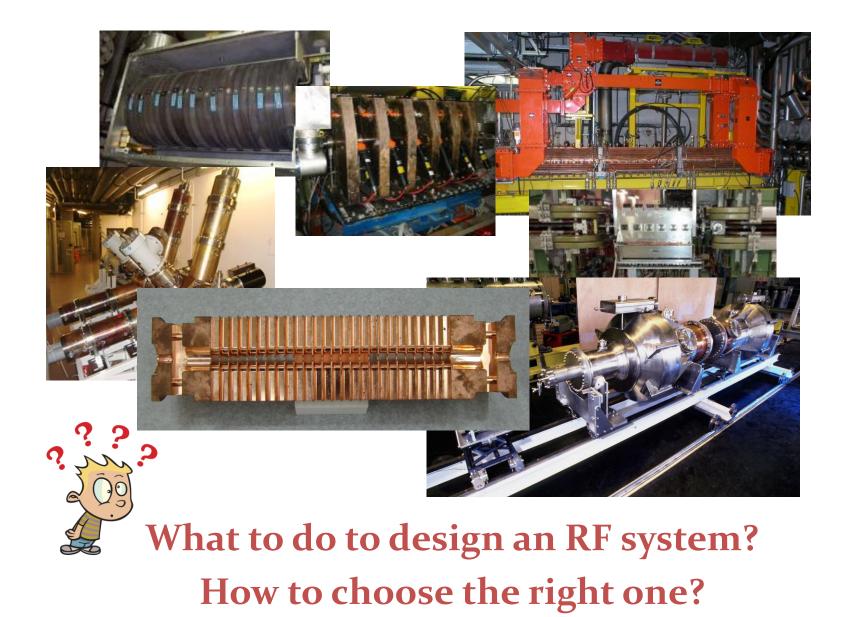

1. Design RF system (upgrade)

LongitudinalHandsOnRFSystemCalculations_empty.ipynb

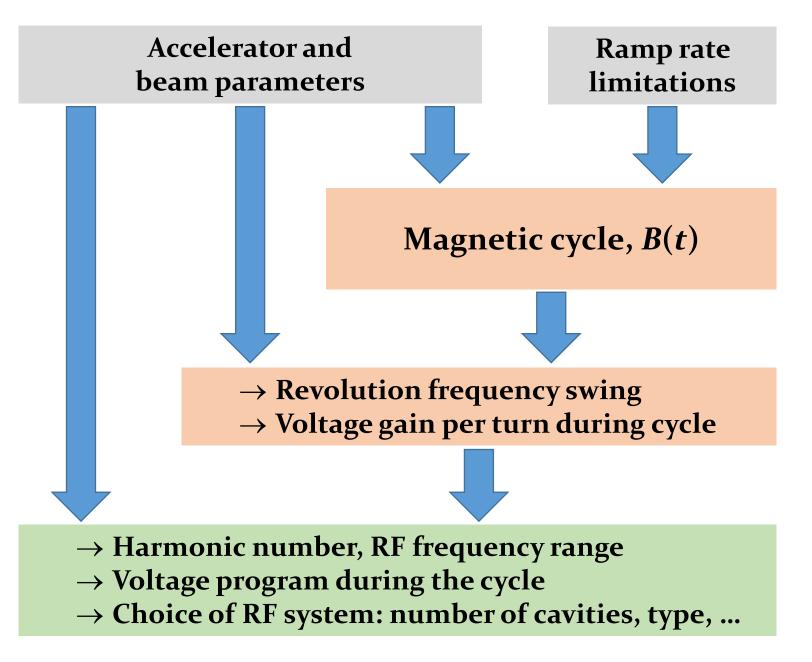

- Study boundary conditions
- Derive requirements for RF system
- Choose main components
- Compare with existing facilities
- 2. Play with longitudinal beam dynamics LongitudinalHandsOnTracking_empty.ipynb
 - Build your own particle tracker
 - Understand motion of particles in longitudinal phase space
 - Transition from single particle motion to evolution of an entire bunch

RF system design

Introduction

Simplified design work flow

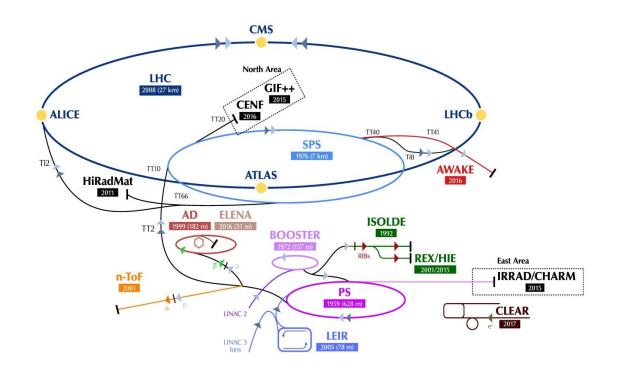

RF parameters of existing accelerators

Try to follow design choices of existing accelerator

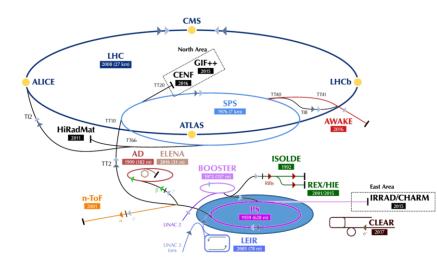

- Can we understand the arguments?
- Are the choices reasonable?

Good design?

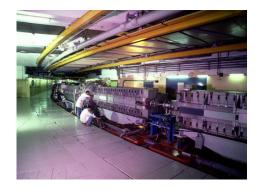

Proton Synchrotron

Example: RF System for CERN PS

- Attention
 - \rightarrow Present RF system designed in ~1969
 - \rightarrow Not the same energy range as today

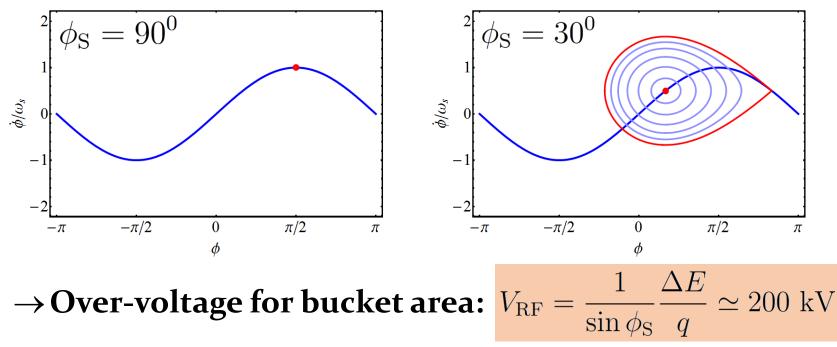

Parameter	Value
Circumference, $2\pi R$	$2\pi \cdot 100 \text{ m} = 628 \text{ m}$
Acceleration time, t_{cycle}	1 \$
Maximum ramp rate, <i>dB/dt</i>	2.3 T/s
Injection energy, $E_{\rm kin}$	45 MeV
Flat-top energy, $E_{\rm tot}$	initially 28 GeV

Example: CERN PS - choice of RF voltage

→ Energy gain per turn defined by size and ramp rate

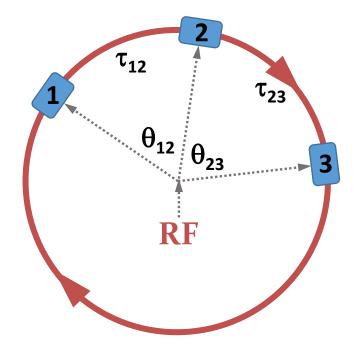

$$\Delta E_{\rm turn} = 2\pi q \rho R \dot{B}$$

→ At 2.3 T/s ramp rate: ~100 keV gain per turn
→ Just sufficient to accelerate synchronous particle

Example: CERN PS - choice of RF harmonic

→ Operate RF stations in phase with respect to beam → Use common RF signal

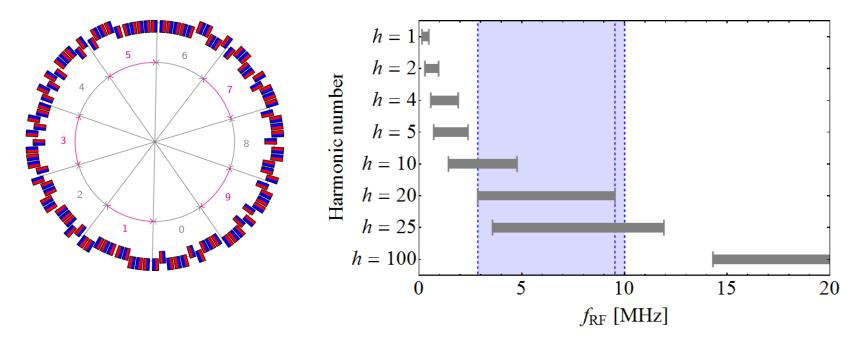

• Time of flight, τ_{nm} between RF cavities: 16

 \rightarrow RF stations must be located an multiples of $2\pi/h$

Example: CERN PS - choice of harmonic

17

→ Main elements: 100 bending magnets → 100 possible location for RF stations in-between \rightarrow 100 = 2 · 2 · 5 · 5, hence divisible by 2, 4, 5, 10, 20, 25, 50

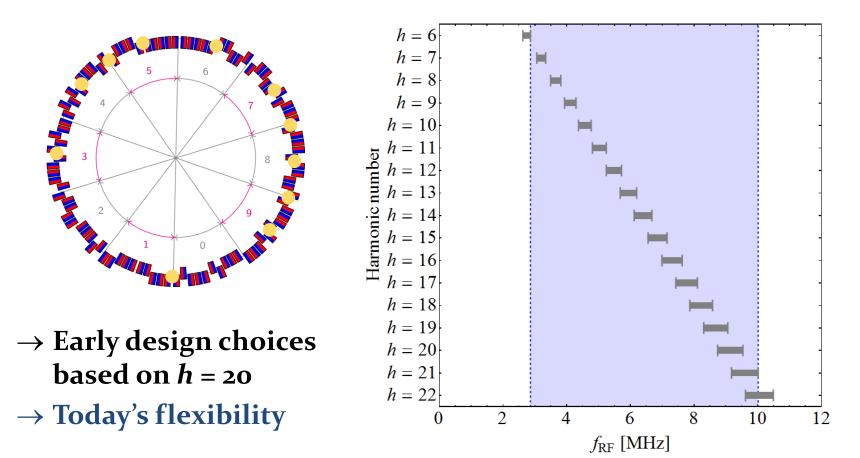

→ Distribute total RF voltage over many cavities

 \rightarrow Possible harmonic numbers 20 or 25 \rightarrow *h* = 20 retained

Example: CERN PS choice of harmonic

→ Distance between RF stations: multiples of $2\pi/20$ → No need to use common RF with today's technology → Injection energy at 2 GeV (1.4 GeV) → 5% (10%) swing

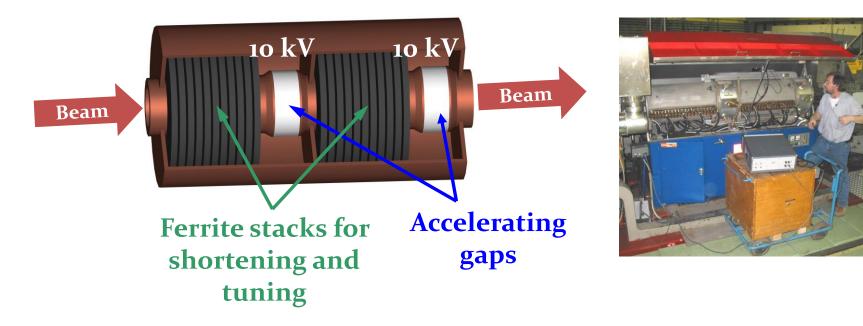

18

Example: CERN PS choice of cavity

\rightarrow RF system parameters:	Parameter	
	Harmonic, h	7, 20 , 21
	Frequency, $f_{\rm RF}$	2.8-10 MHz
	Voltage, $V_{\rm RF}$	10 (+1) × 20 kV

 \rightarrow Distribute voltage over 10 RF stations: 20 kV/cavity

Shortened $\lambda/4$ coaxial resonators with ferrite tuning

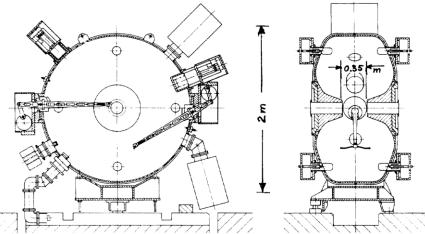

Electrons in the PS

- As an injector of LEP electrons were accelerated in the PS to *E* = 3.5 GeV
- Is the RF system for acceleration of protons usable?

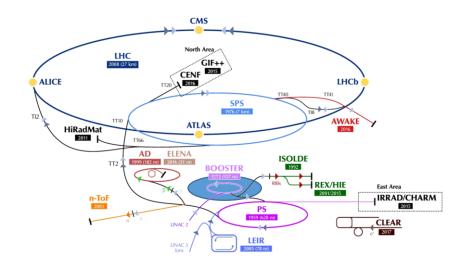

$$\Delta E_{\text{turn}} = \frac{e^2}{3\epsilon_0 (m_0 c^2)^4} \frac{E^4}{\rho} \simeq 190 \text{ keV/turn}$$
$$\epsilon_0 \simeq 8.85 \cdot 10^{-12} \text{ As/Vm}$$

- → Bucket area too small and bunches too long at 3.5 GeV
- → Optimized RF system for electron acceleration

Parameter		
Harmonic, <i>h</i>	240	
Frequency, $f_{\rm RF}$	114 MHz	
Voltage, $V_{\rm RF}$ 1 MV		
(5 × more than 10 MHz cavities)		

PS Booster

Example: RF System for CERN PS Booster

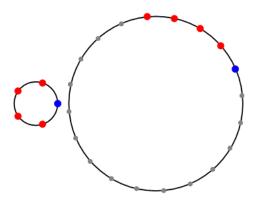

- PS injector synchrotron
 - $\rightarrow 2\pi R_{\rm PSB} = 2\pi R_{\rm PS}/4$
 - \rightarrow Sandwich of 4 rings
 - \rightarrow Total length as PS circumference

Parameter	Value
Circumference, $2\pi R$	$2\pi \cdot 25 \text{ m} = 157 \text{ m}$
Acceleration time, t_{cycle}	~0.5 S
Maximum ramp rate, <i>dB/dt</i>	2.3 T/s
Injection energy, $E_{\rm kin}$	50/160 MeV
Flat-top energy, $E_{\rm kin}$	0.8/1.0/1.4/2.0 GeV

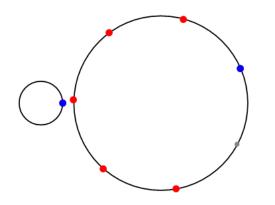

Example: CERN PS Booster (PSB)

- Circumference $2\pi R_{PSB} = 2\pi R_{PS}/4 = 157 \text{ m}$
- Initial design as PS injector

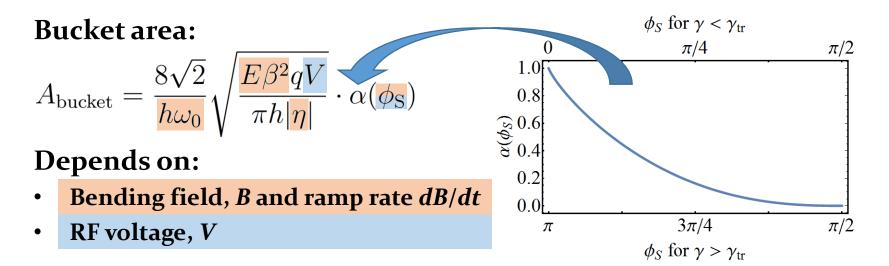

$$f_{\rm RF,PSB} = f_{\rm RF,PS}$$
$$h_{\rm PSB} = h_{\rm PS}/4 = 5$$

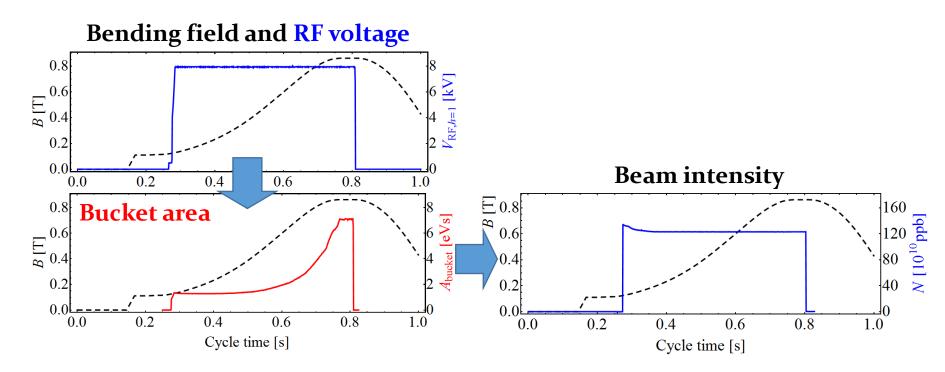

→ Modifications as preinjector to LHC:

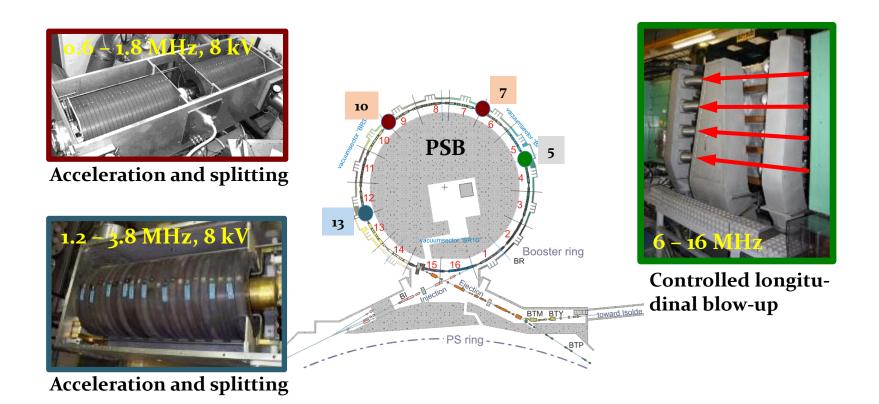

Parameter	
Harmonic, <i>h</i>	1 or/and 2
Frequency, $f_{\rm RF}$	0.6/11.8 MHz
Voltage, $V_{\rm RF}$	820 kV

Example: CERN PSB (single harmonic, h = 1)²⁴

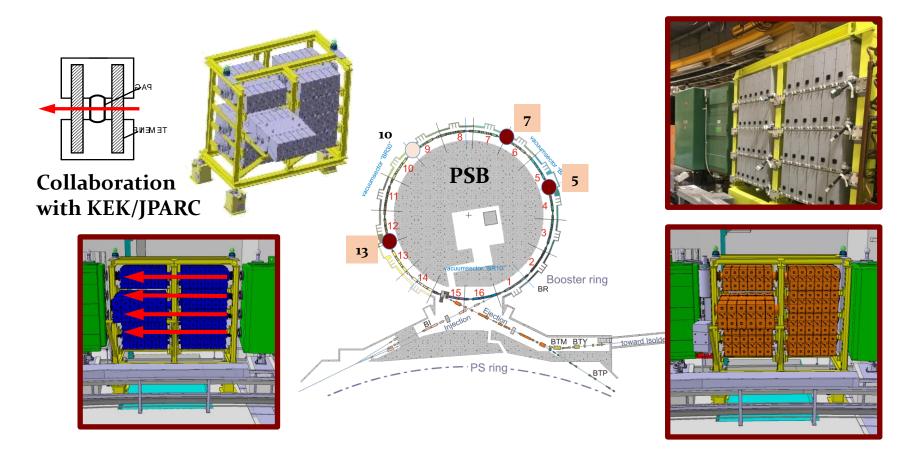

RF systems in the PS Booster

\rightarrow 4 rings with 3 cavities

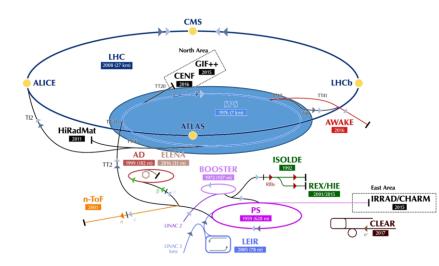

→ PS Booster RF systems based on tuned ferrite cavities

RF systems in the PS Booster after upgrade

- \rightarrow New wide-band cavities covering h = 1, 2, and higher
- → Based on innovative **Finemet** material
- → Much increased flexibility

Super Proton Synchrotron

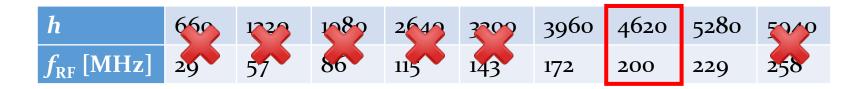

Example: RF System for CERN SPS

 $\Delta E_{\rm turn} = 2\pi q \rho R \dot{B}$ Needs significantly more RF voltage: several MV	
Parameter	Value
Circumference, $2\pi R$	$2\pi \cdot \mathbf{1.1 km} = 6.91 \mathrm{km}$
Acceleration time, t_{cycle}	~4 S
Maximum ramp rate, <i>dB/dt</i>	~0.74 T/s
Injection Energy, <i>E</i> _{tot}	initially 10 GeV
Flat-top energy, $E_{\rm tot}$	450 GeV

Example: SPS - choice of RF harmonic

Harmonic number should be multiple of	
Revolution frequency ratio of PS and SPS	11
Acceleration harmonic in the PS	20
Super-periodicity of SPS	6

 \rightarrow Looking for multiples of 660

Lower **RF** frequency

Higher RF frequency

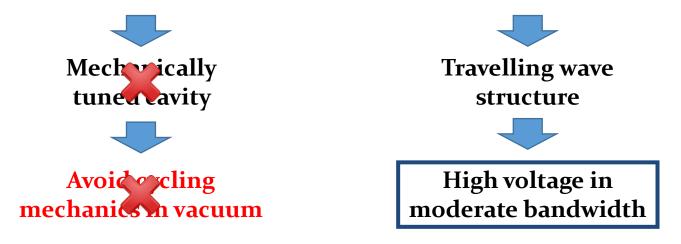

Example: SPS choice of RF cavities

• Requirements:

Parameter	
Harmonic, <i>h</i>	4620
Frequency, $f_{\rm RF}$	200 MHz
Bandwidth, $\Delta f_{\rm RF}$	0. 44%
Voltage, $V_{\rm RF}$	Few MV

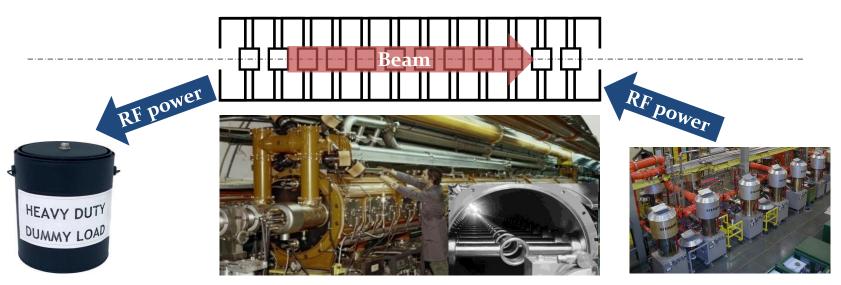

How to build such an RF system?

 \rightarrow Cavity resonator would need tuning or low $Q < 1/0.44\% \approx 230$

Example: SPS travelling wave cavities

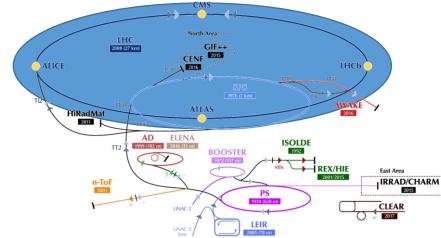

\rightarrow Multi-cell structure operated as a waveguide

- → Sufficient bandwidth without mechanically moving parts
- \rightarrow Travelling wave structure always matched to amplifier
- \rightarrow Beam takes power it needs from the waveguide

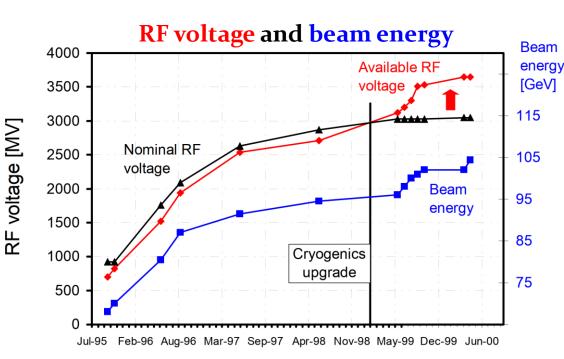

$$P_{\text{load}} = P_{\text{in}} - P_{\text{beam}} - P_{\text{loss}}$$

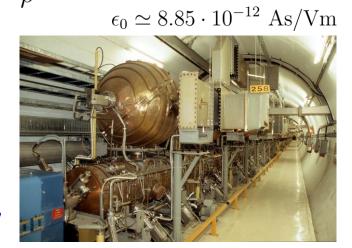

Large Electron Positron and Hadron Colliders

Ex.: RF against synchrotron radiation in LEP³³

- LEP energy was entirely dominated by synchrotron radiation
- At E = 100 GeV: $\Delta E_{\text{turn}} = \frac{e^2}{3\epsilon_0 (m_0 c^2)^4} \frac{E^4}{\rho} \simeq 3 \text{ GeV/turn}$
- →About 3 % of beam energy lost each turn

Date

Example: LHC

- LHC maximum energy and ramp rate limited by superconducting bending magnets: 20 minutes ramp time
- \rightarrow Average energy gain per turn only $\Delta E_{turn} \approx 500 \text{ keV/turn}$
- \rightarrow Revolution frequency stays almost constant
- → RF voltage required to keep bunches short

Parameter (per beam)	
Harmonic, <i>h</i>	35640
Frequency, $f_{\rm RF}$	400.8 MHz
Voltage, $V_{\rm RF}$	16 MV

Summary

- Design of RF system for circular accelerator
 - 1. Start from accelerator parameters
 - 2. Define RF parameters based on beam requirements
 - 3. Chose RF system
 - \rightarrow Mostly several design options are possible

You will design an RF system (upgrade)

- 1. Protons accelerator:
- 2. Electron storage ring:

Upgrade of CERN SPS to 1.3 TeV Energy and current upgrade

A big Thank You

to all colleagues providing support, material and feedback

Simon Albright, Maria-Elena Angoletta, Philippe Baudrenghien, Thomas Bohl, Wolfgang Höfle, Erk Jensen, Alexander Lasheen, Elena Shaposhnikova, Frank Tecker, Daniel Valuch, Manfred Wendt, Jörg Wenninger and many more...

Thank you very much for your attention!
