

BLOIS 2023

MEASUREMENTS OF JET PRODUCTION AND THE STRONG COUPLING CONSTANT AT ATLAS

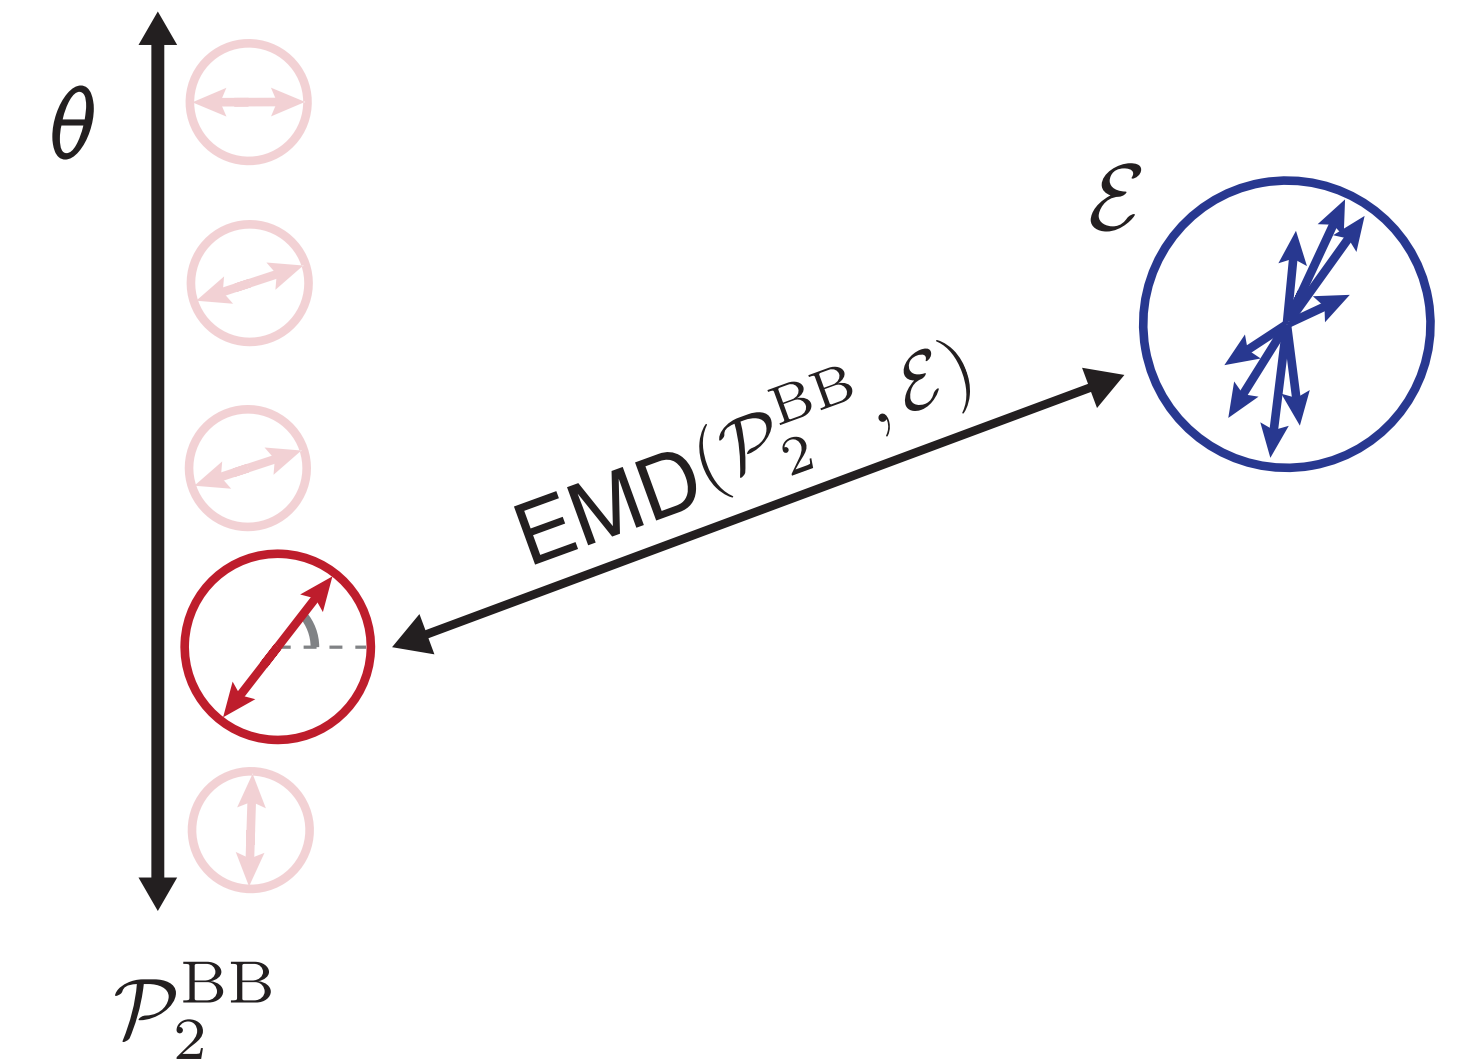

CONTENTS

- ▶ JET SHAPES AND EMD
- ▶ SHOWER MODEL AND JET SHAPE
- ▶ STRONG COUPLING FROM MULTI-JET EVENTS
- ▶ STRONG COUPLING FROM Z BOSON PT AND RAPIDITY

JET SHAPE AND ENERGY MOVERS DISTANCE

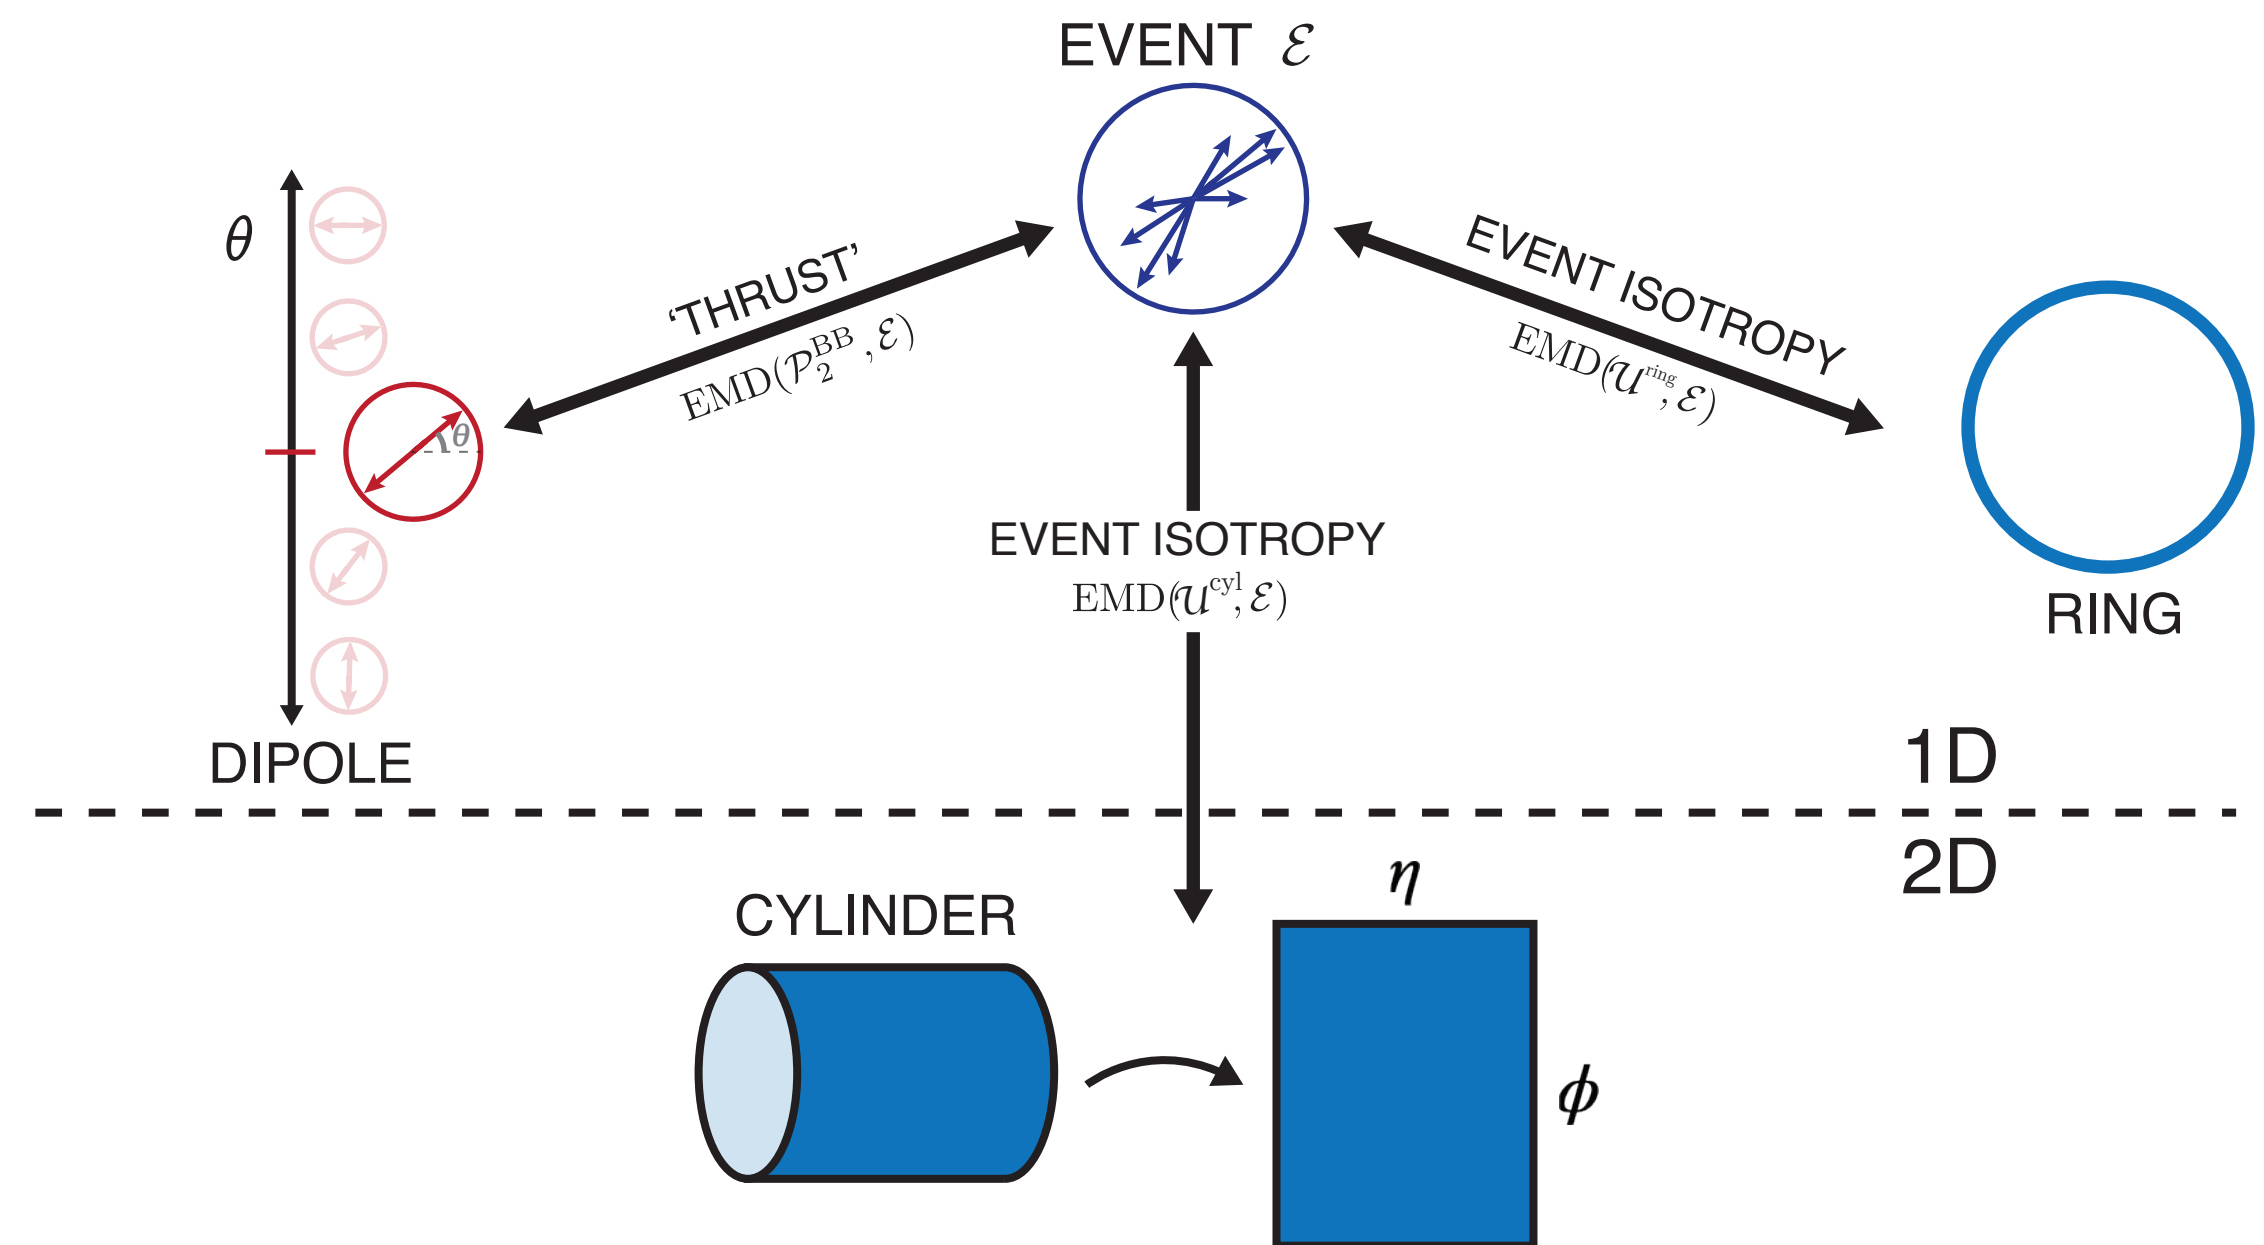

- ▶ You have to fill in holes with piles of sand - what is the least number of steps that you would need to take carrying a bucket of sand?
- ▶ This is a generic measure of the difference between two point collections.

- ▶ Event/jet shape variables involving a minimisation can often be expressed in terms of EMD.
- ▶ For example; thrust, its specialisations and the Fox-Wolfram moments.
- ▶ This is convenient, as lots of libraries to solve EMD exist.

THRUST AND ISOTROPY

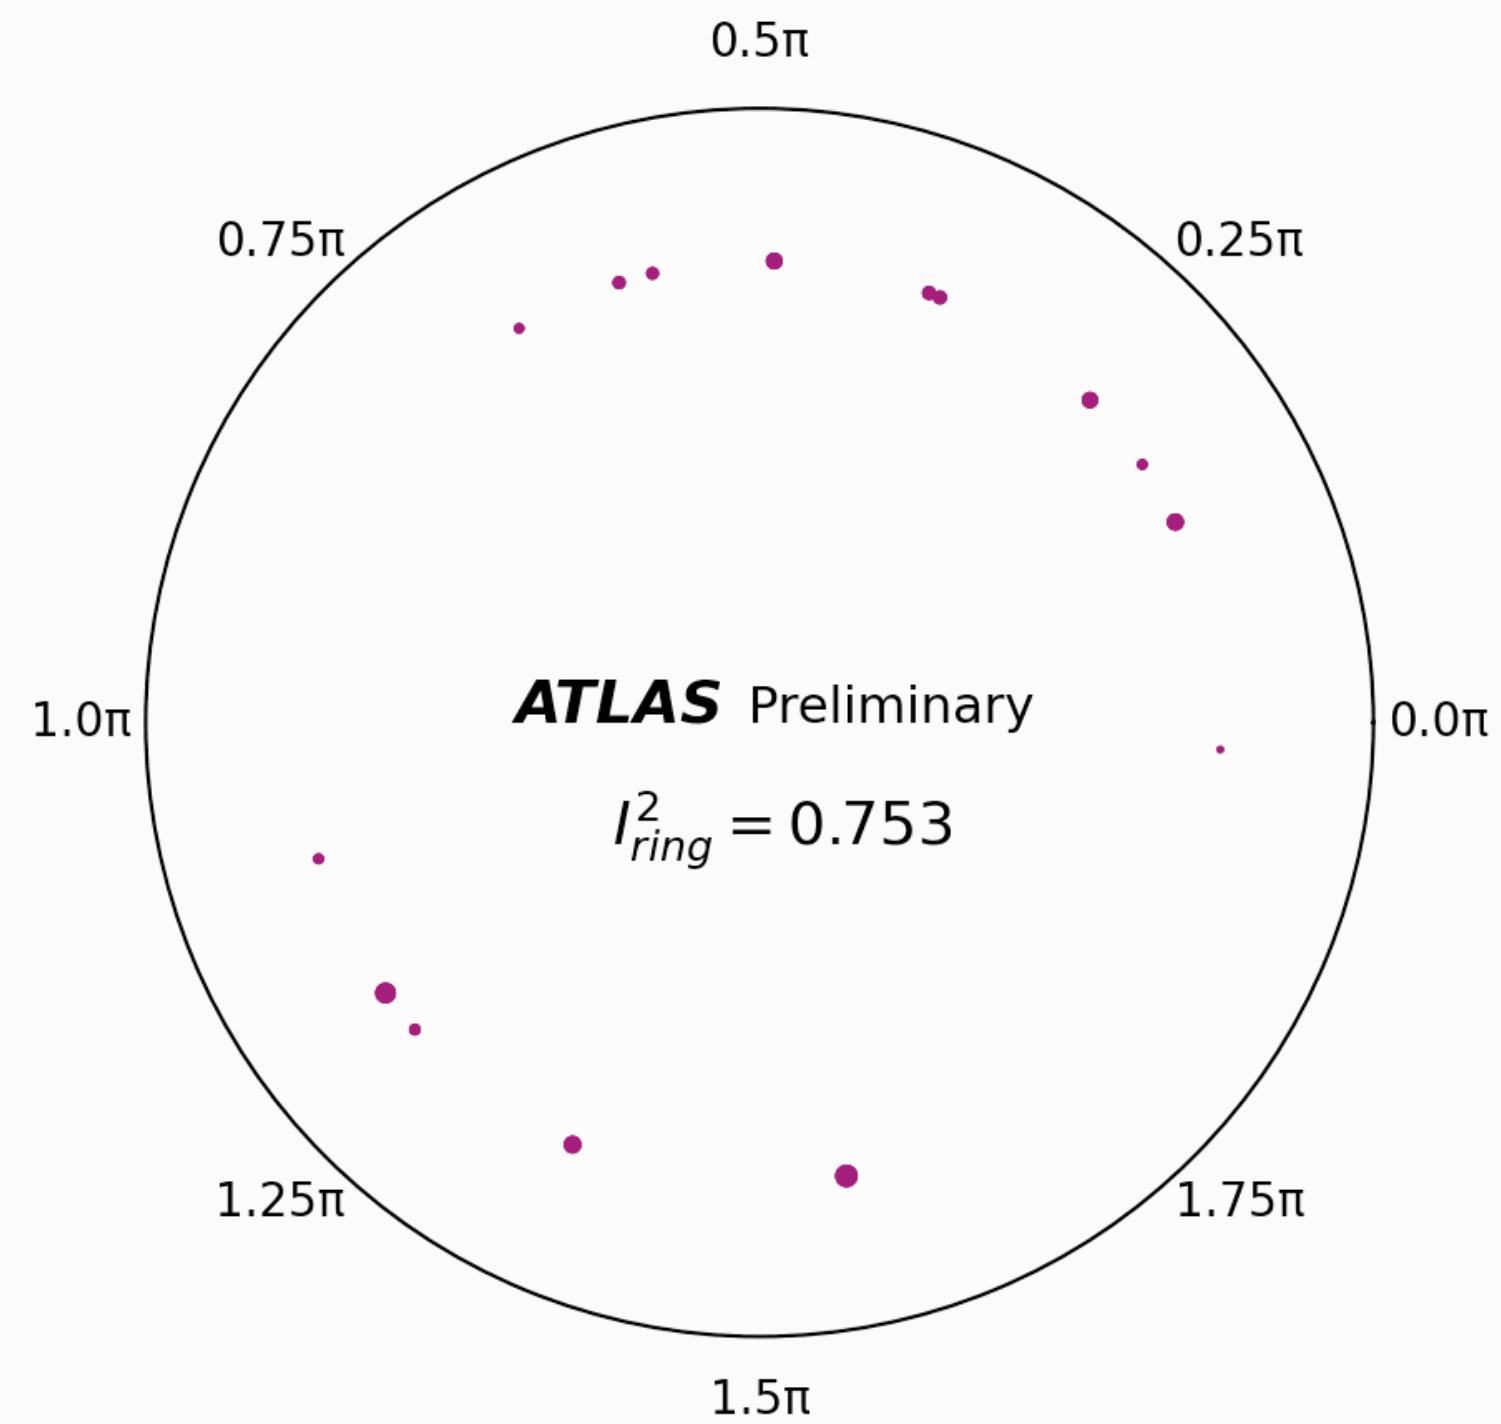

- ▶ atlas.web.cern.ch/Atlas/GROUPS/PHYSICS/CONFNOTES/ATLAS-CONF-2022-056/
- ▶ This study considers 3 event shapes;
 - ➔ Thrust, defined as usual. This can be seen as the EMD to a dipole configuration.
 - ➔ 2D event isotropy. This is the EMD to a ring of 128 points.
 - ➔ 3D event isotropy. This is the EMD to a cylinder of 16 by 22 points.
- ▶ They are applied to multi jet ($N_{\text{jets}} > 2$) events with $H_{T2} > 400\text{GeV}$ where H_{T2} is the scalar sum of the two largest jet $|p_T|$.

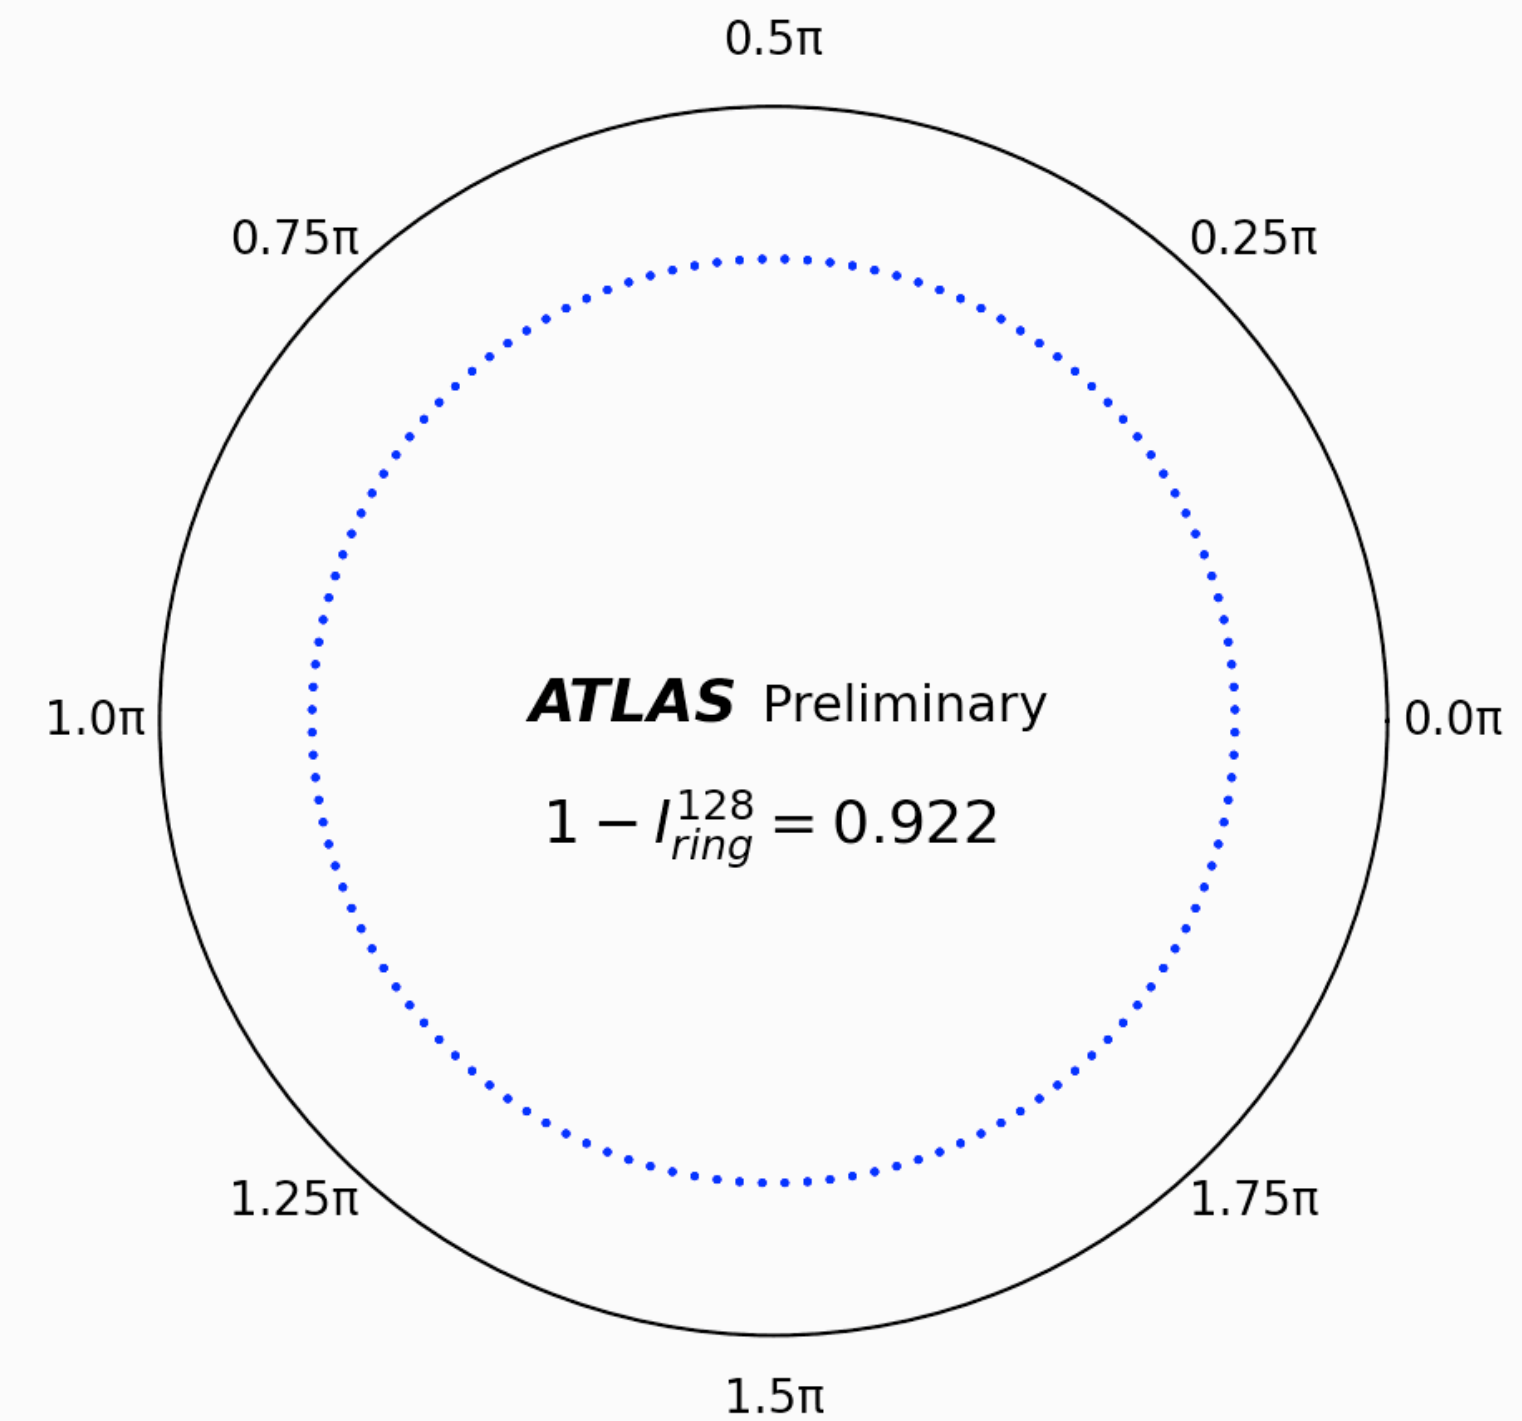

THRUST AND 2D ISOTROPY

CYLINDRICAL ISOTROPY

ATLAS Preliminary

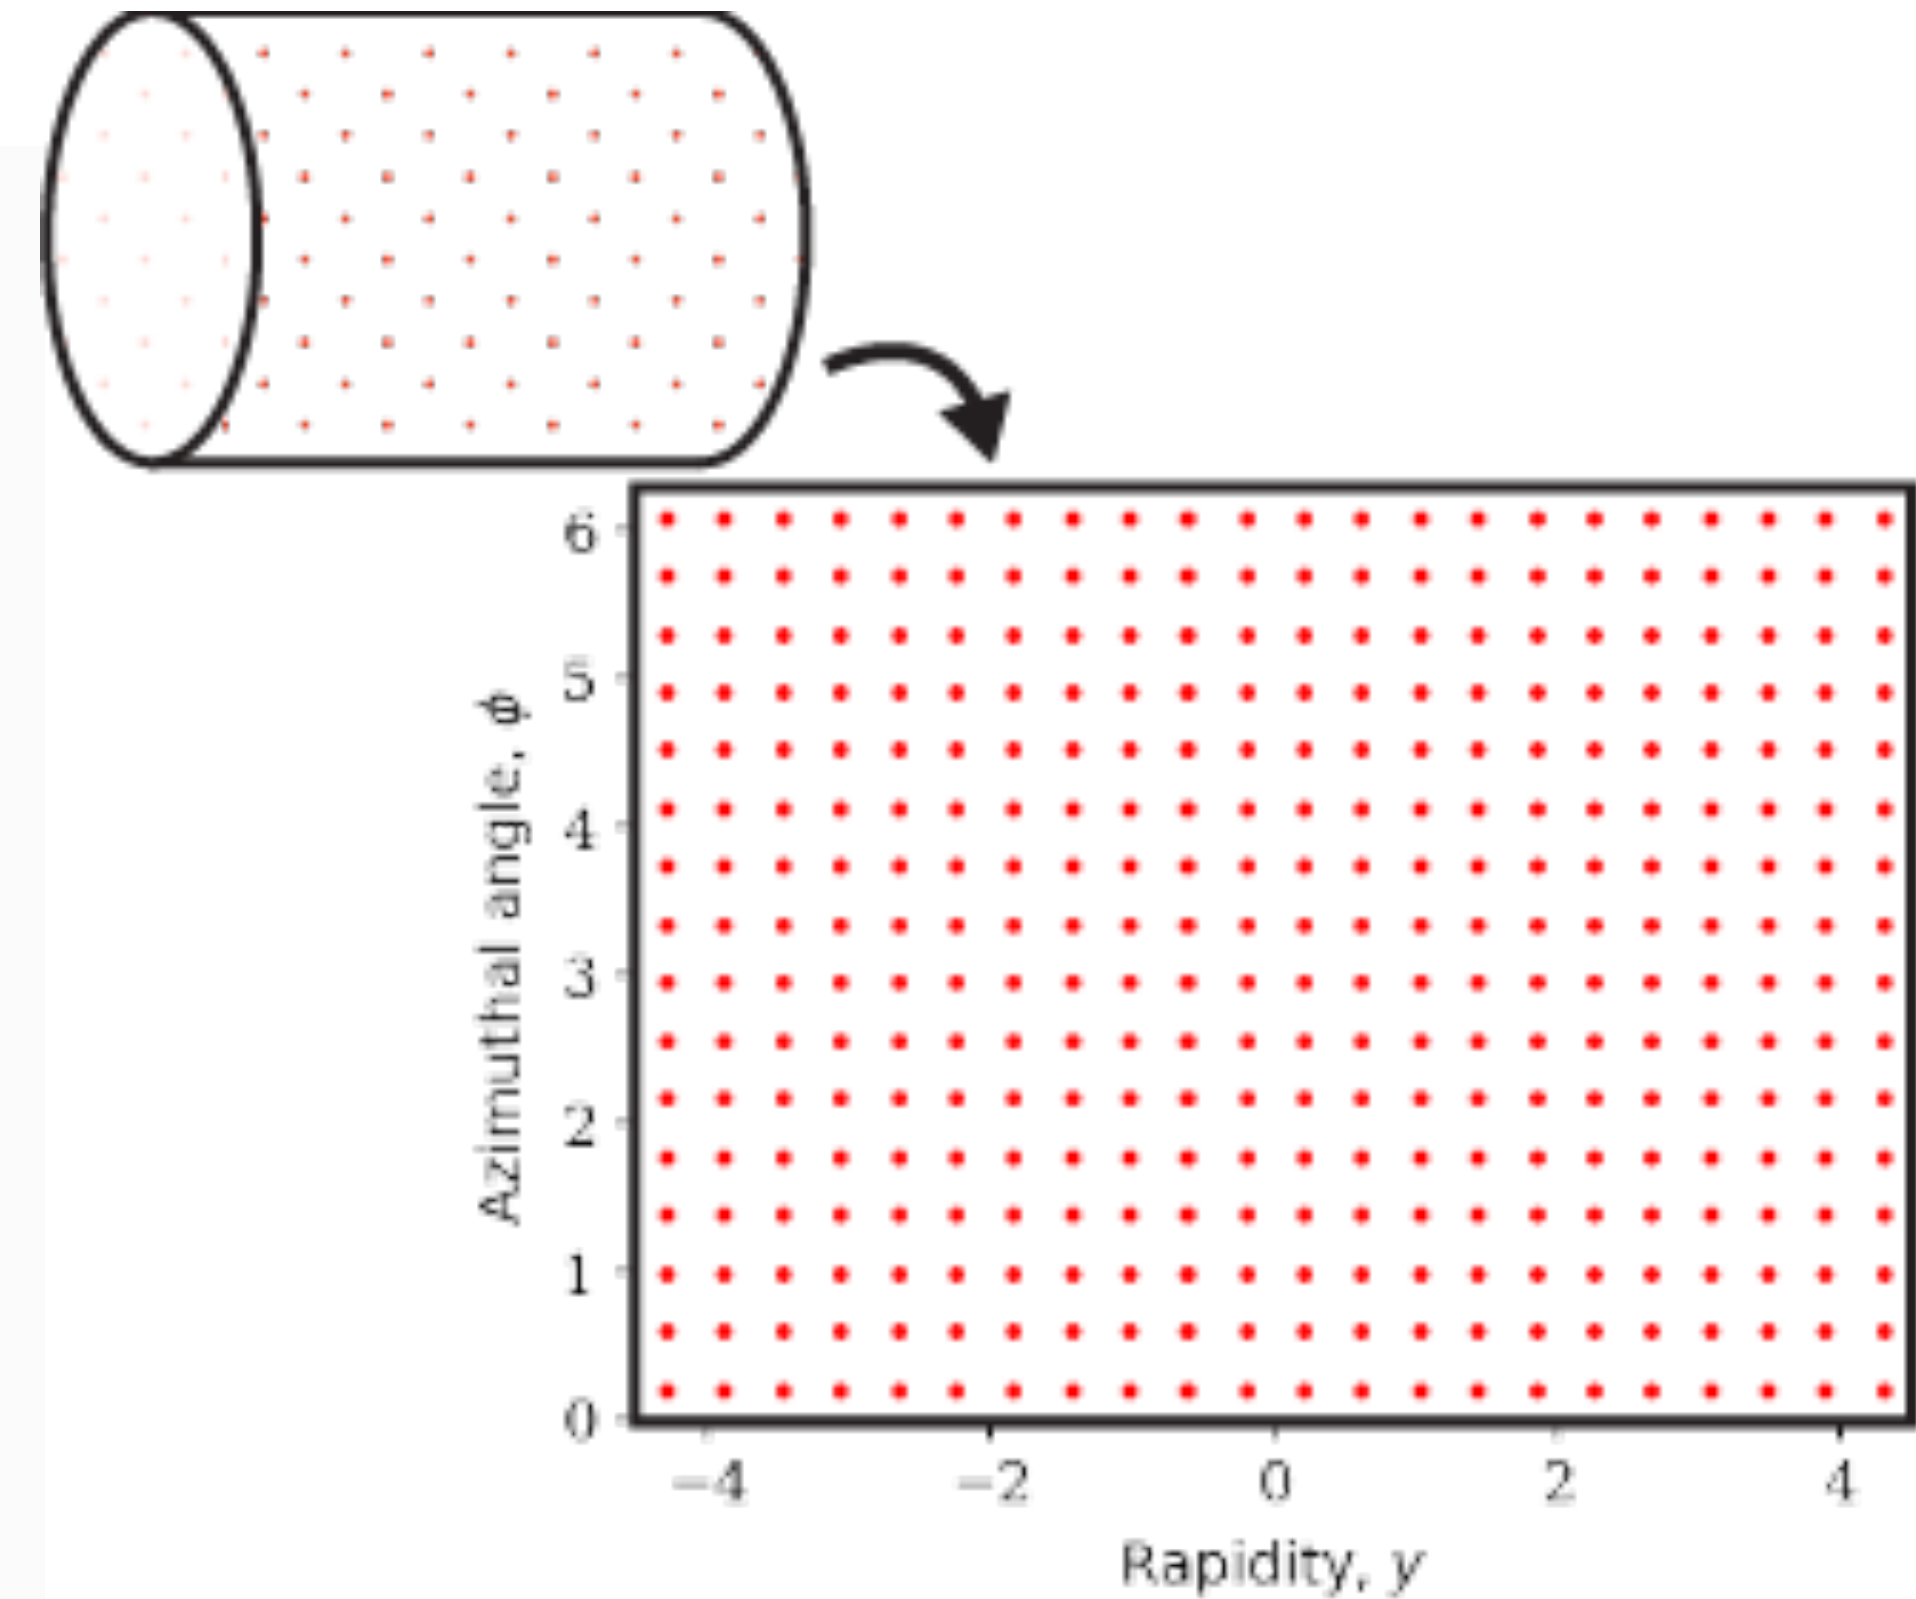

$$1 - I_{16}^{cy} = 0.816$$

CYLINDRICAL ISOTROPY

ATLAS Preliminary

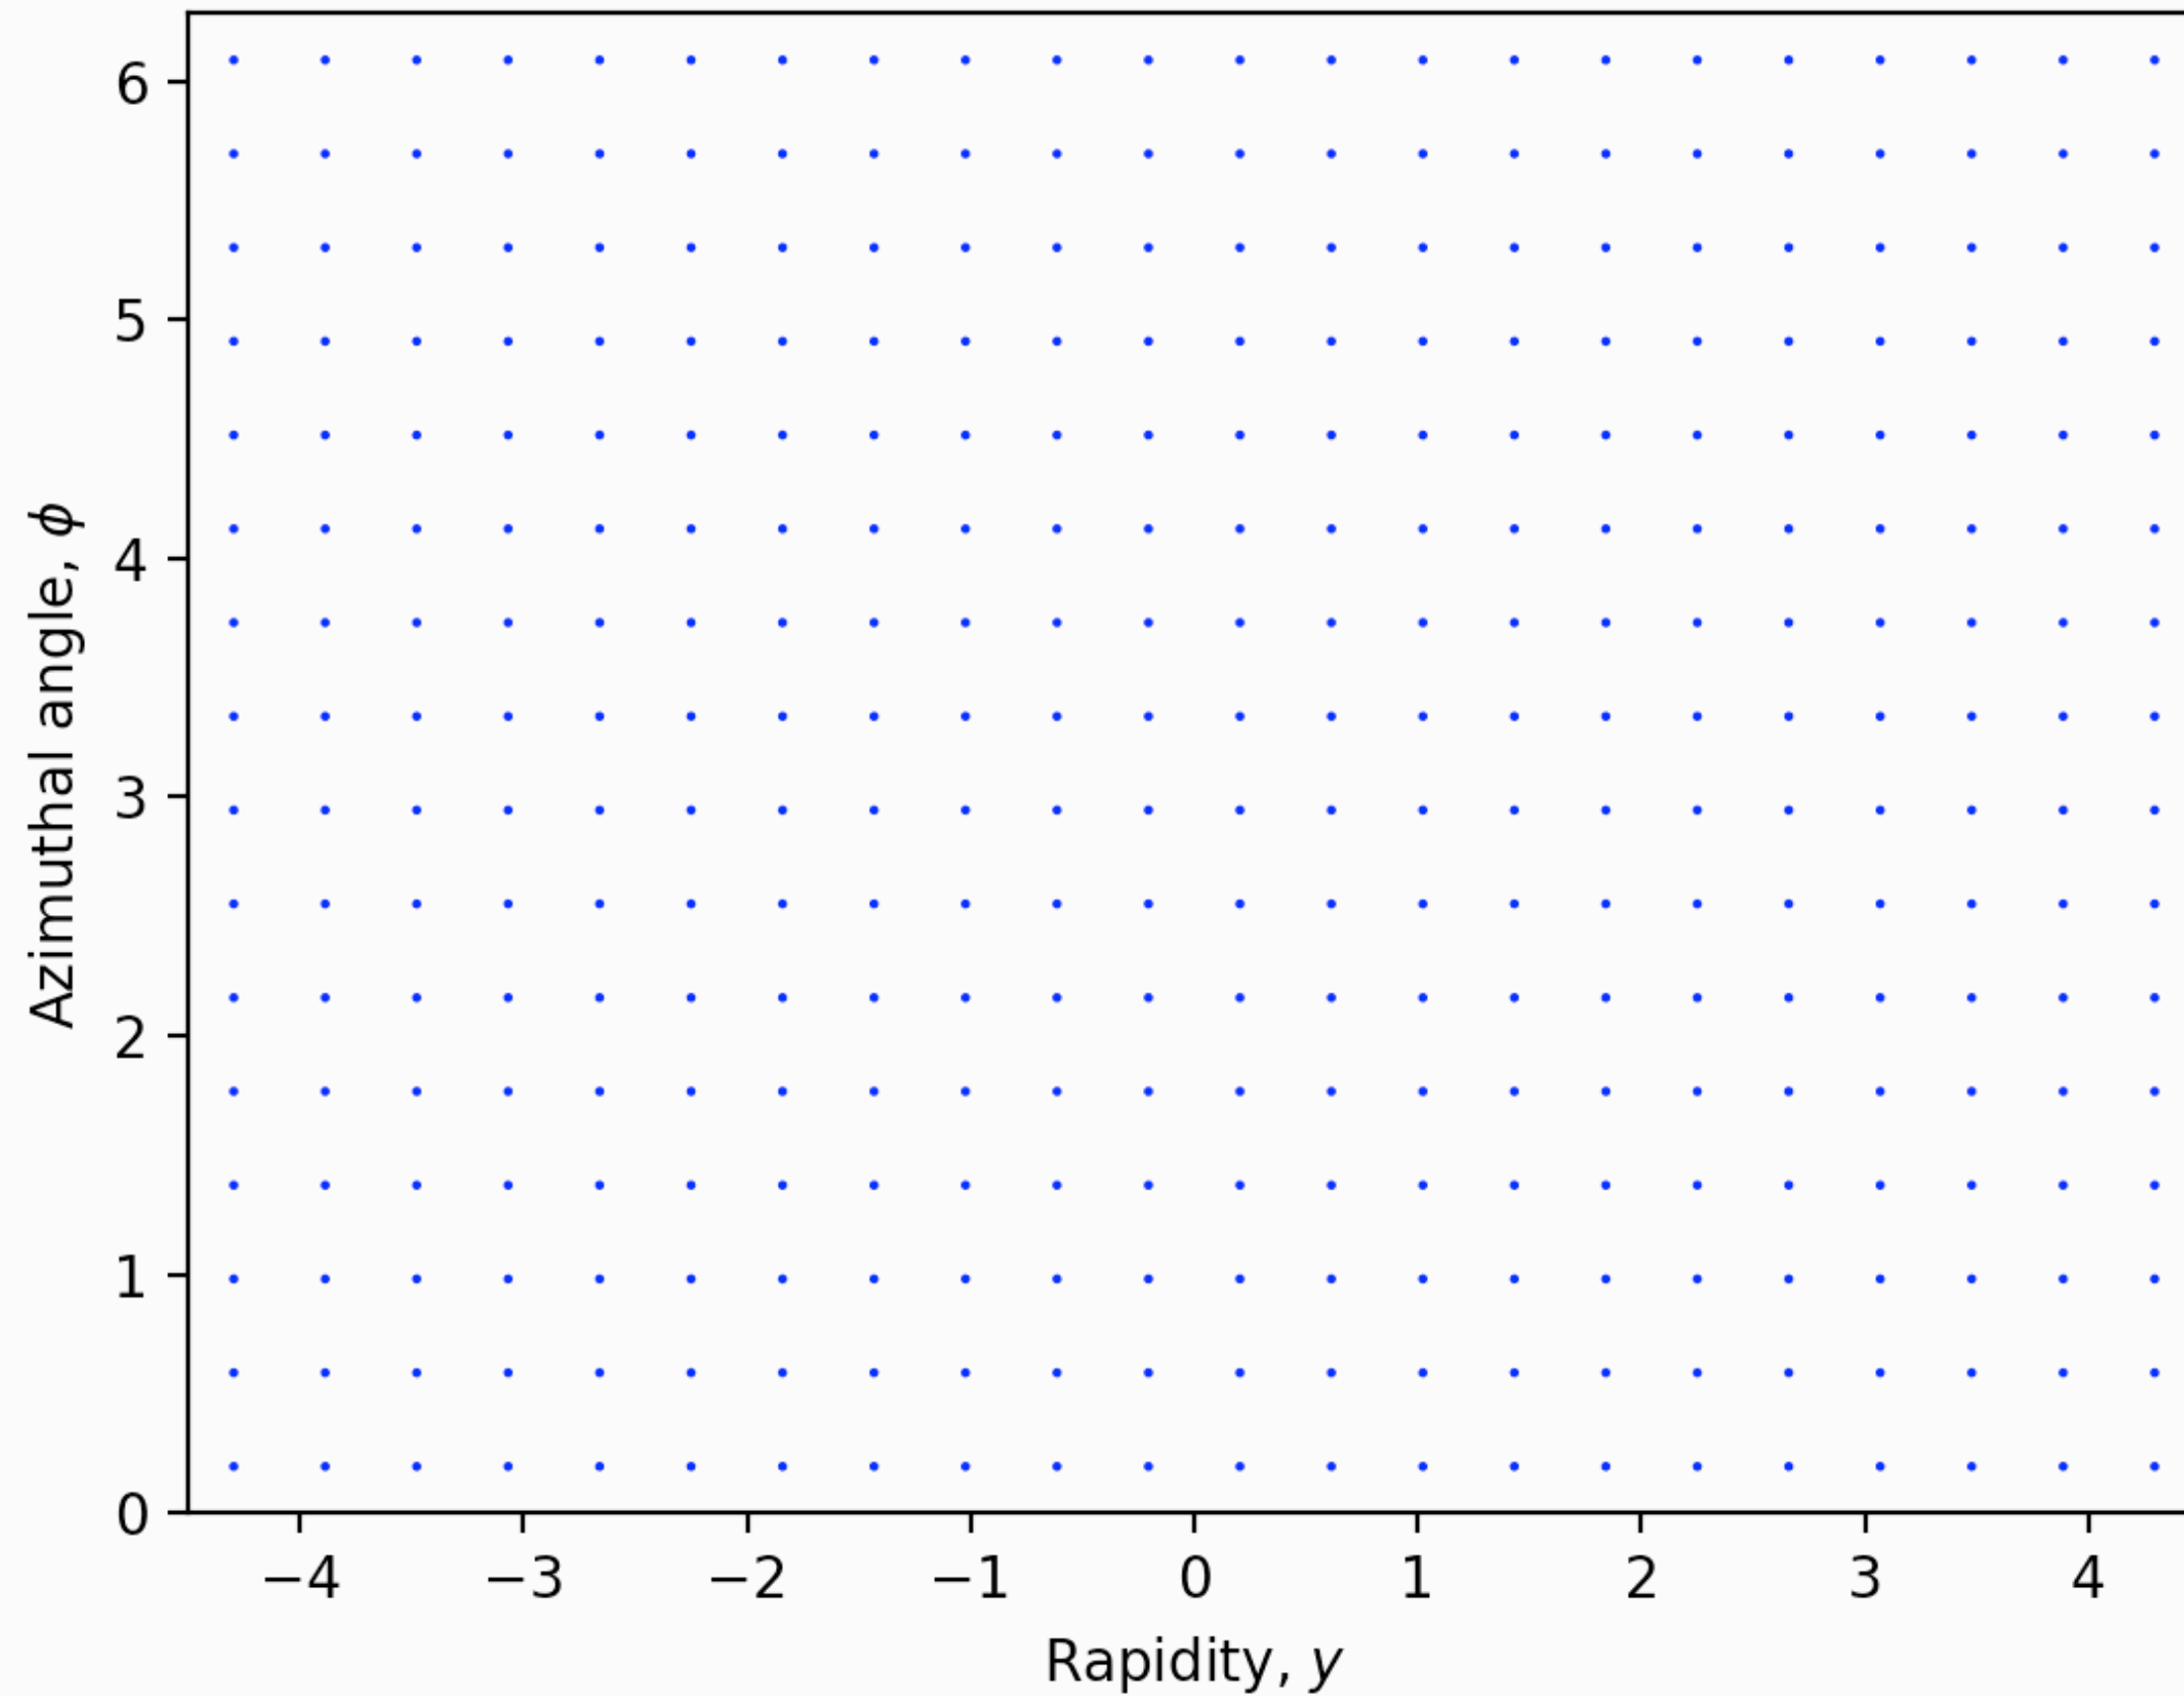

$$1 - |I_{16}^{cy}| = 0.816$$

CYLINDRICAL ISOTROPY

ATLAS Preliminary

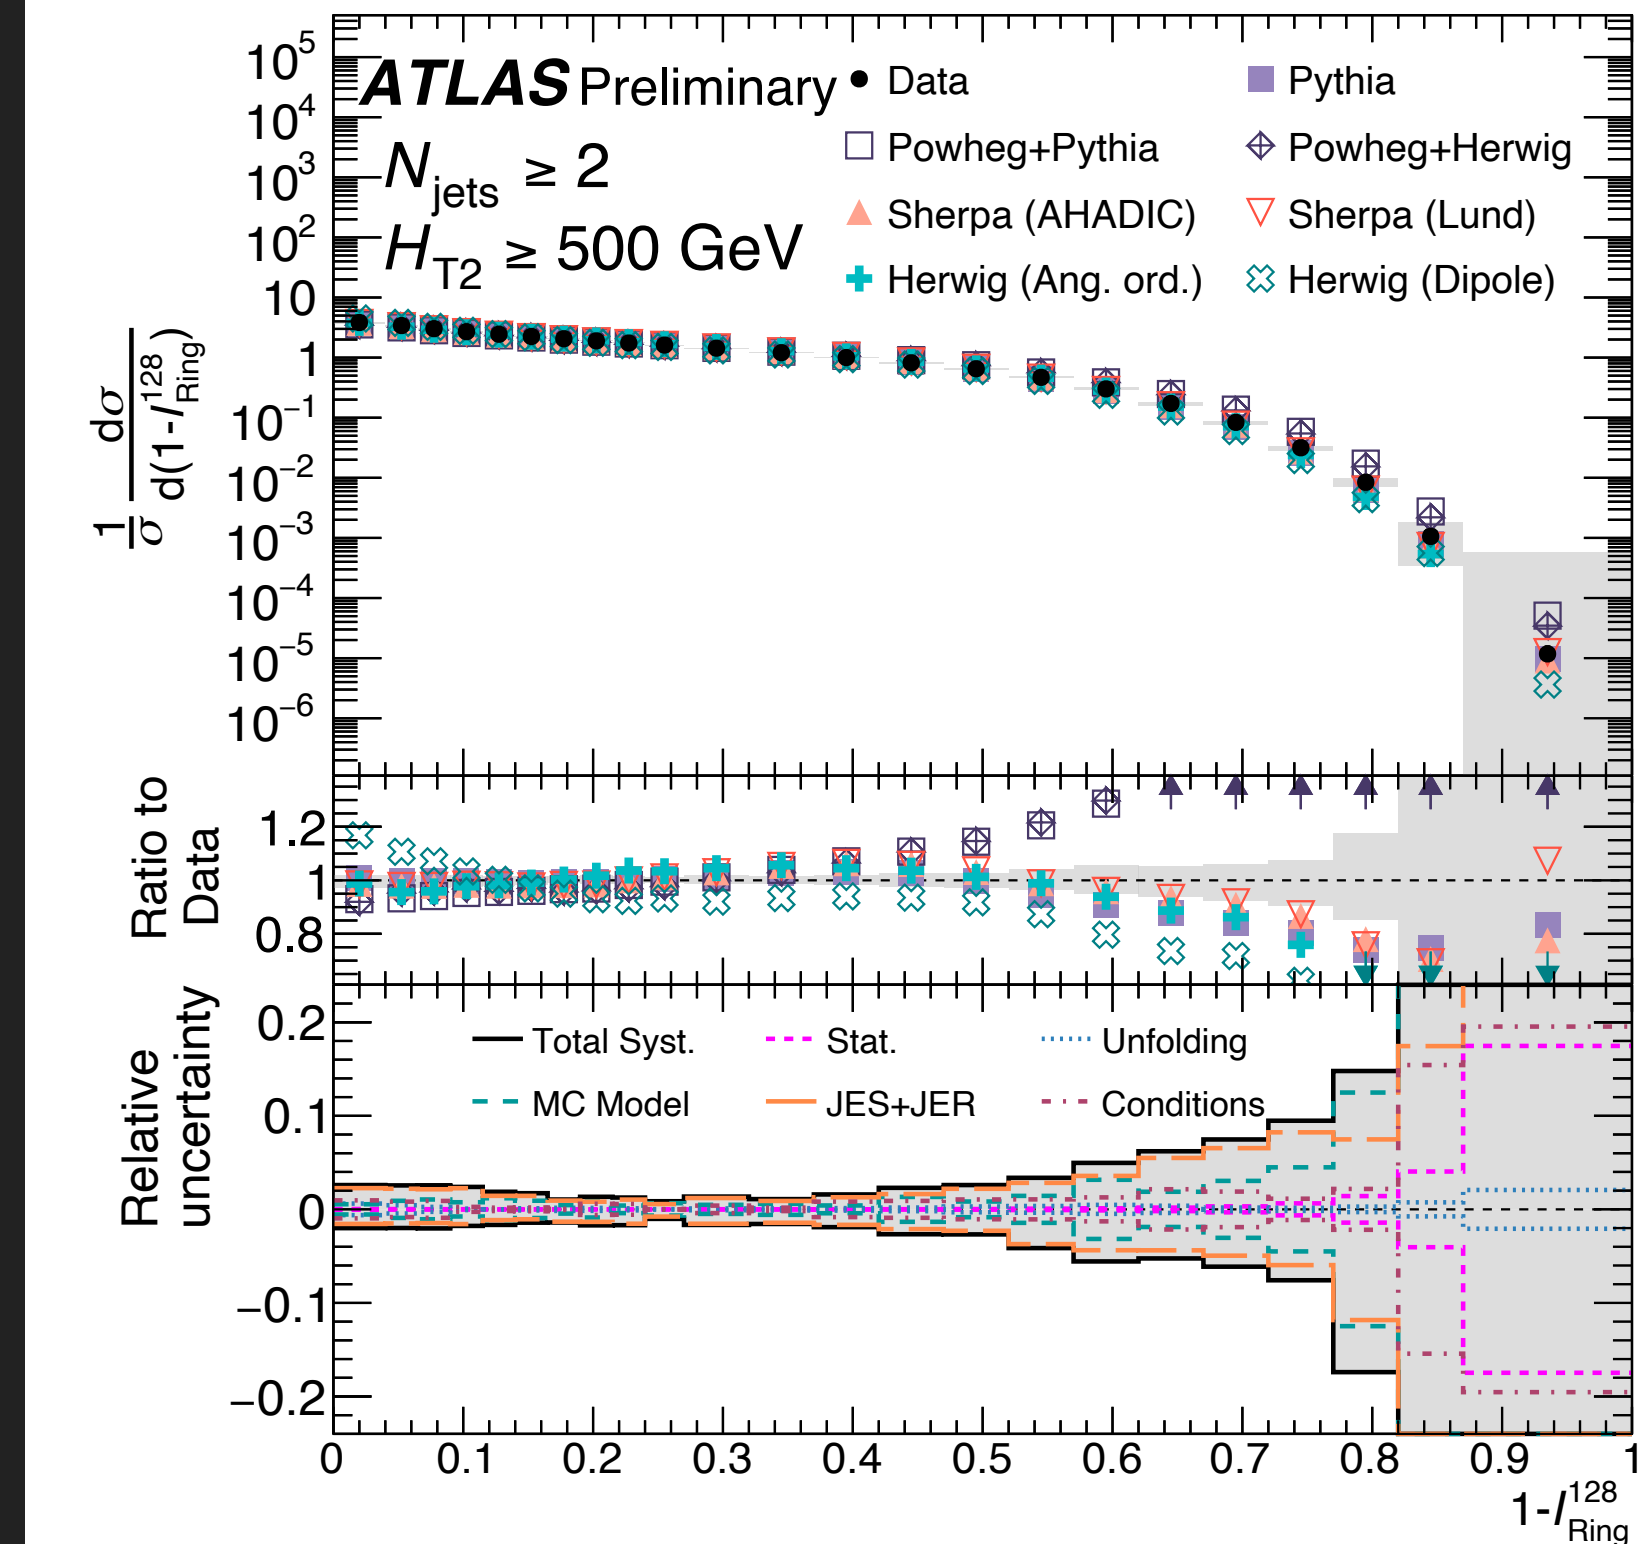

$$1 - |c_{16}^{cy}| = 0.816$$

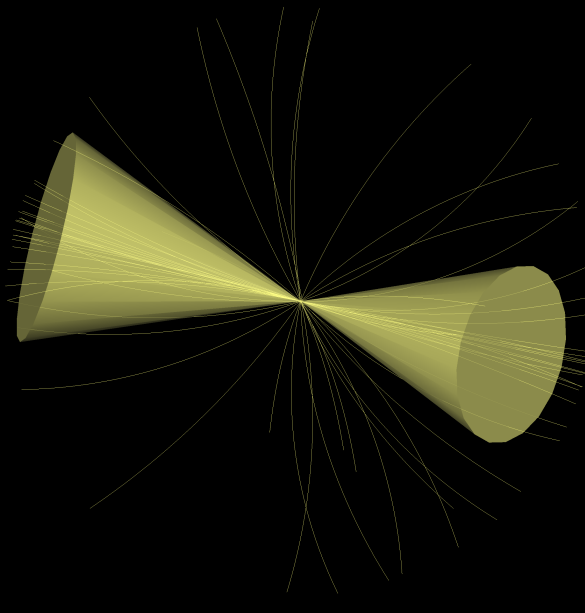

INFLUENCE OF SHOWER MODEL ON JET SHAPE – RINGS

- ▶ For the dipole, minimal values are 2 back to back jets. Maximal values are balanced tri-jets.
- ▶ MC uncertainty rises as the event becomes more isotropic.

- ▶ For the ring, the value used is 1 - EMD, and there is a greater dynamic range.
- ▶ Different showering algorithms give strongly diverging predictions.
- ▶ Statistical uncertainties become large at high isotropies.

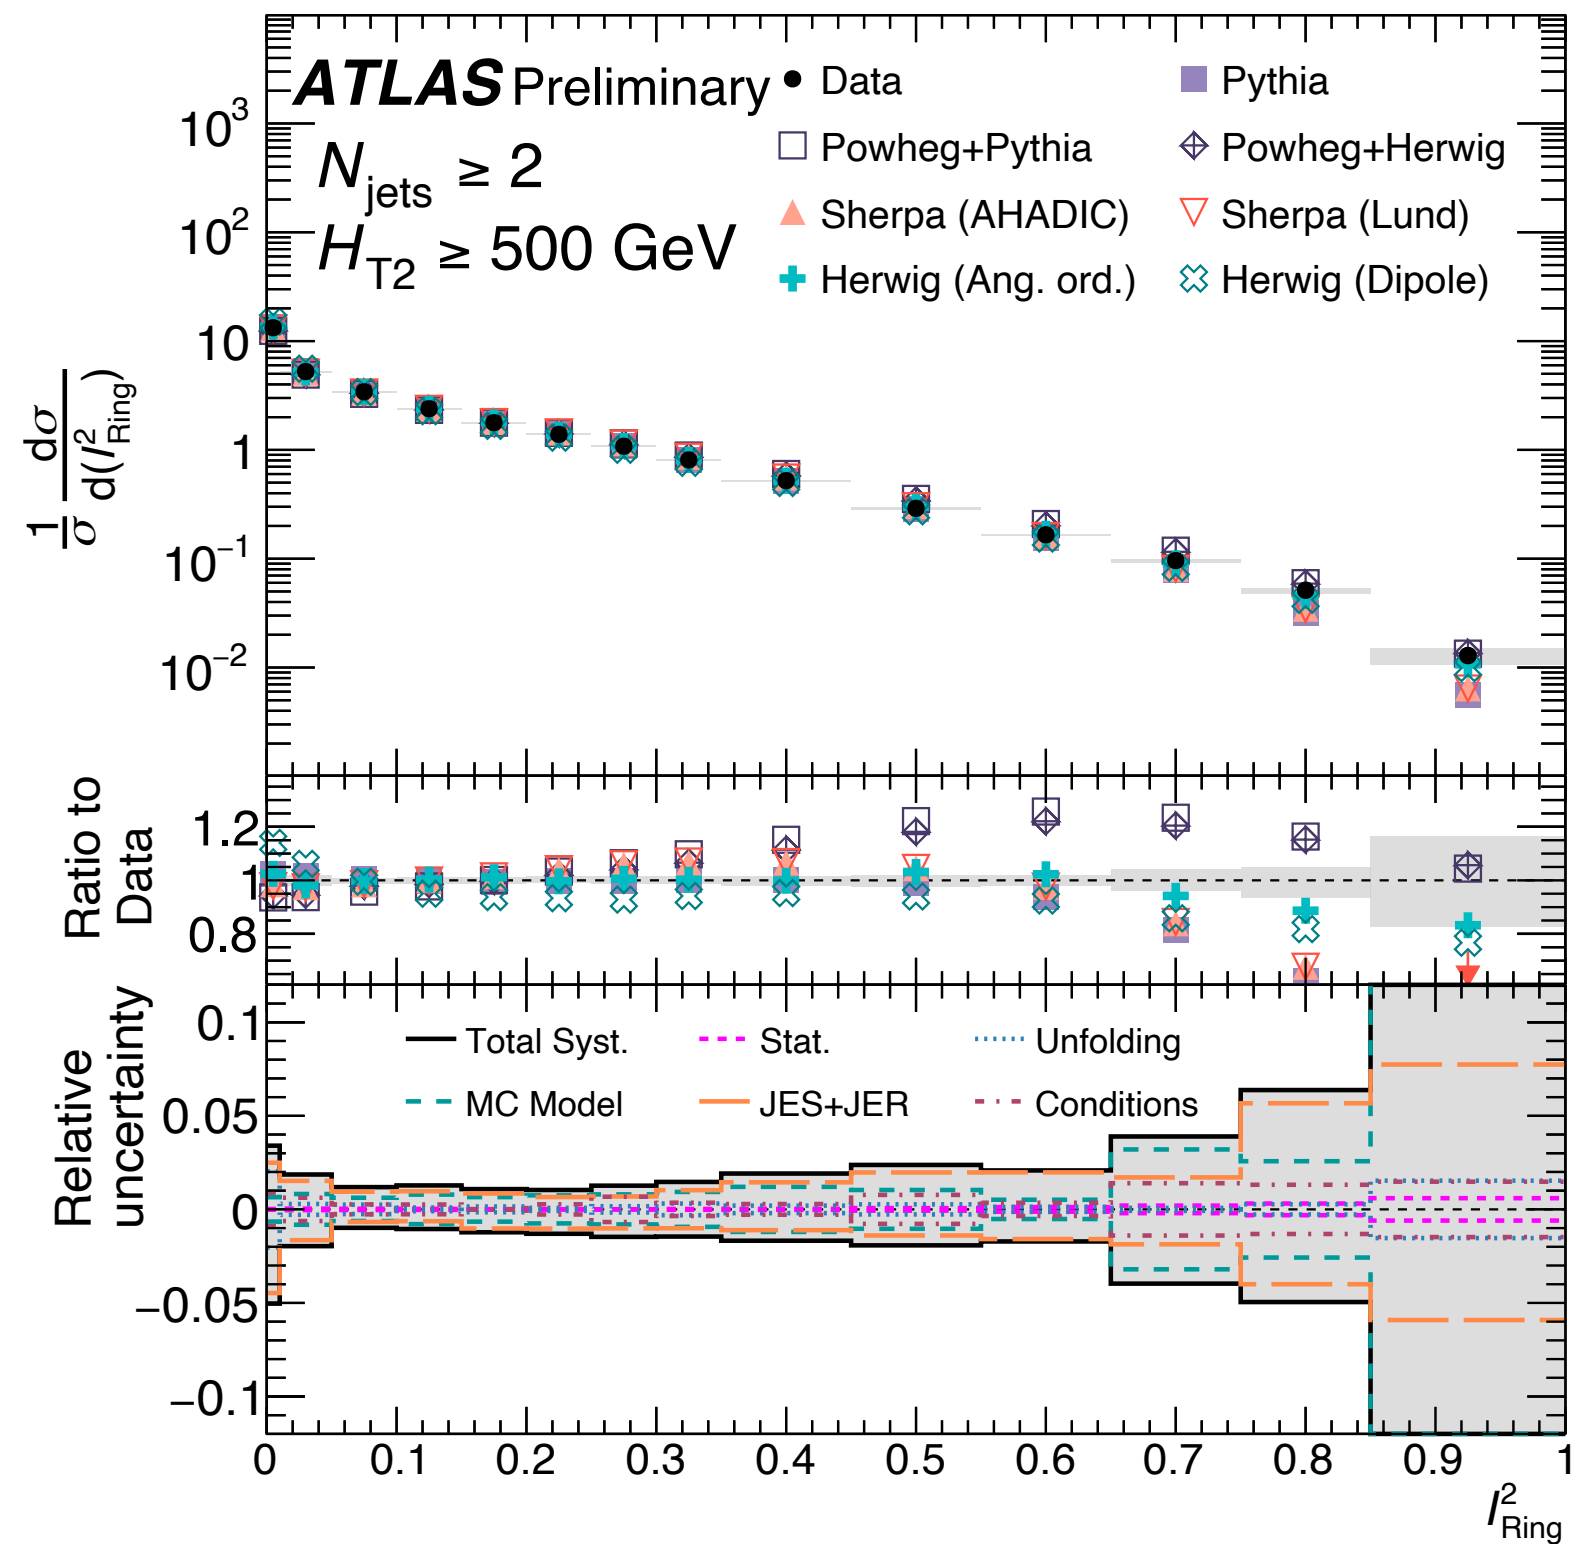

INFLUENCE OF SHOWER MODEL ON JET SHAPE – RINGS

- ▶ For the dipole, minimal values are 2 back to back jets. Maximal values are balanced tri-jets.
- ▶ MC uncertainty rises as the event becomes more isotropic.

- ▶ For the ring, the value used is 1 - EMD, and there is a greater dynamic range.
- ▶ Different showering algorithms give strongly diverging predictions.
- ▶ Statistical uncertainties become large at high isotropies.

INFLUENCE OF SHOWER MODEL ON JET SHAPE – ISOTROPY

- ▶ For the cylinder 3D isotropy, the value measured is 1-EMD.
- ▶ The smaller values correspond to highly collimated uneven events, while larger values are those that distribute energy evenly in the barrel.
- ▶ A unique shape; the location of the peak is correlated with the average number of jets.
- ▶ All the MC generators struggle to match the peak shape.

For this new set of event shapes, no event generator accurately recreates all distributions.

JET SHAPES TEEC AND ATEEC

▶ cds.cern.ch/record/2846586

▶ EEC = Energy-Energy Correlation. Product of jet energies, as a function of the opening angle between each pair of objects.

$$\frac{d\Sigma}{d \cos \phi} = \sum_{i,j} \int \frac{E_i E_j}{s^2} \delta(\cos \phi_{i,j} - \cos \phi)$$

▶ TEEC = Transverse Energy-Energy Correlation. Same as EEC, but only in the transverse plane.

▶ ATEEC = Asymmetry of Transverse Energy-Energy Correlation. Compares the forward (or acute angle) and backward (or obtuse angle) correlations.

$$\frac{d\Sigma'}{d \cos \phi} = \frac{d\Sigma}{d \cos \phi} - \frac{d\Sigma}{d \cos(\pi - \phi)}$$

SHOWER MODEL FITS

- ▶ Jets are Anti- K_T 0.4
- ▶ 3 different MC generators;
 - ➔ Pythia 8; NNPDF 2.3 LO; p_T ordered shower.
 - ➔ Sherpa; CT14NNLO; Catani Seymour Subtraction (CSS) shower.
 - ➔ Herwig 7; MMHT2014 NLO; angle ordered
 - ➔ Herwig 7; MMHT2014 NLO; CSS with dipole
- ▶ Plots shown are low H_{T2} region, all values of $H_{T2} > 1000$ GeV considered.
- ▶ No single MC method works at all values, but Sherpa and Herwig 7 (angle ordered) are preferred.

STRONG COUPLING CONSTANT

- ▶ Predictions for TEEC and ATEEC are fit to each bin of H_{T2} and $\cos(\varphi)$.
- ▶ First fit to use NNLO theory predictions for this measurement.
- ▶ Value of $\alpha_s(m_Z)$ from TEEC = 0.1175 ± 0.0006 (exp.) $^{+0.0034}_{-0.0017}$ (theo.)
- ▶ Value of $\alpha_s(m_Z)$ from ATEEC = 0.1185 ± 0.0009 (exp.) $^{+0.0025}_{-0.0012}$ (theo.)

Z BOSON DRELL-YAN

- ▶ cds.cern.ch/record/2854867
- ▶ Measurement based on 15.3 mill decays $Z \rightarrow e^-e^+$ or $\mu^-\mu^+$
- ▶ Binned in p_T and rapidity (y).
- ▶ Collins-Soper frame is used to simplify the $\theta - \varphi$ dependency.
- ▶ Polynomials with coefficients containing p_T and y dependence are used to create templates for unfolding.
- ▶ This fitting method allows use of predictions from the complete lepton phase space.
- ▶ Excellent sensitivity to the strong coupling constant.

Z BOSON CHANNEL COMPARISON

- ▶ Three samples;
 1. Pair of central ($|\eta| < 2.4$) muons; $\mu\mu_{CC}$
 2. Pair of central electrons; ee_{CC}
 3. One central, one forward ($2.5 < |\eta| < 4.9$) electron pair; ee_{CF}
- ▶ Require mass near m_Z ; $80 < m_{ll} < 100\text{GeV}$
- ▶ All channels are found to be compatible within uncertainties.

FIT IN RAPIDITY BINS

- ▶ Integrating over all p_T bins means that systematic uncertainties dominate.
- ▶ Data uncertainties from;
 - ➔ central electron systematics
 - ➔ muon systematics
 - ➔ forward electron systematics
 - ➔ + other smaller contributions
- ▶ Some theory uncertainties and some from PDF.
- ▶ Acceptable overall fit ($p=11\%$)

FIT FOR STRONG COUPLING CONSTANT

- ▶ Fitted in 2D; p_T and rapidity bins.
- ▶ Used DYTurbo for theory predictions.
- ▶ Interfaced DYTurbo to xFitter to get fits.
- ▶ Resulted in $\chi^2/\text{dof} = 82/72$

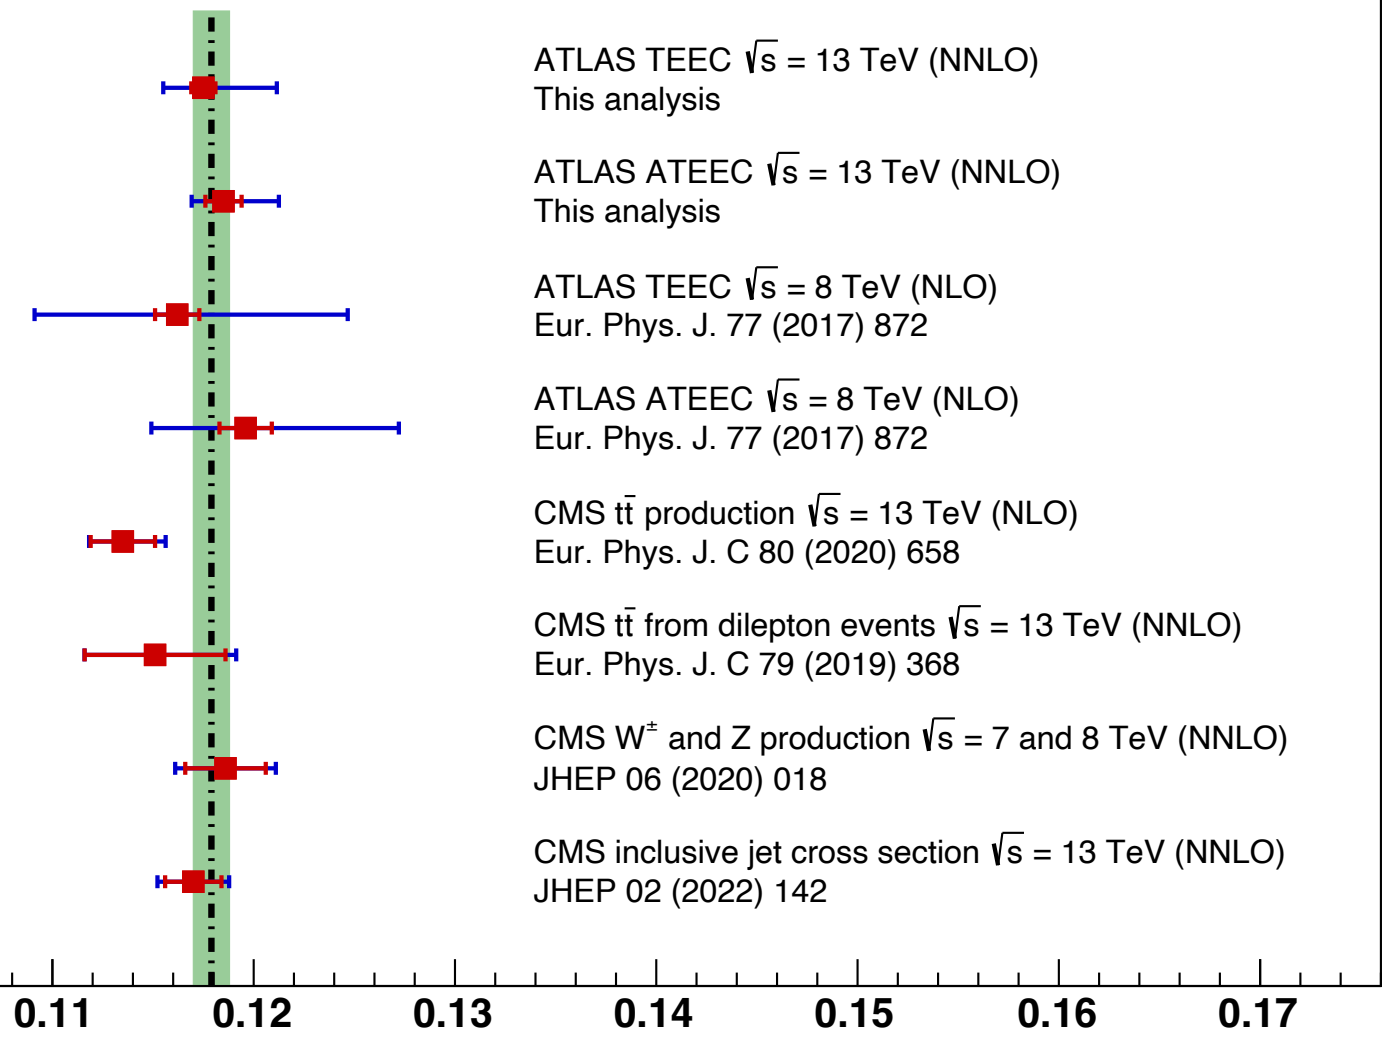

STRONG COUPLING CONSTANT

- ▶ Very precise determination of $\alpha_s(m_Z)$
- ▶ Avoided excessive theory uncertainties by using low-momentum Sudakov region. Not used in other studies.
- ▶ Ultimately dominated by PDF uncertainty.

CONCLUSION

- ▶ New event shapes may provide a handle to improve generators.
- ▶ The strong coupling constant has been derived from both multi-jet events and Z boson recoils.
- ▶ With judicious use of low transverse momentum phase space, The Z boson recoil has yielded the highest precision measurement of $\alpha_s(m_Z)$.

THANK YOU.

MSHT PDF UNCERTAINTIES

- ▶ New generation of PDFs, aN3LO.
- ▶ 'a' indicates additional uncertainty (as in the aNNLO PDFs from 2001)
- ▶ N3LO information available for DIS cross section computation.
- ▶ Worst of the uncertainties have minimal impact on this study.
