

# CERN Beamlines for Fixed Target Experiments

Alexander Gerbershagen

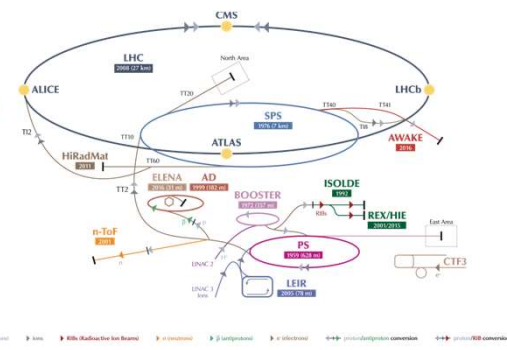

partrec  university of groningen  University Medical Center Groningen

a.ge@cern.ch

1

## Overview

- Introduction: Purpose and users
- Targets and particle production
- Design of secondary/tertiary beamlines
- Experiments at CERN

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 2

2

## Introduction

### Fixed Target (FT) setup

- Easier installation, easier access
- Less space restrictions
- Larger flexibility
  - Large momentum range
  - Flexible particle types

But only fraction of beam energy available for physics:

$$E_{CM} \approx \sqrt{(2 m_0 E_{beam})}$$

### Collider

- All beam energy available for producing new particles/physics
- $E_{CM} \approx 2 E_{beam}$

**Physics at FT and collider are both useful and needed**

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 3

3

## Purpose and Users

Secondary Beam Areas (SBA) are hosting:

- **FT experiments:** COMPASS, NA61, NA62, NA63, NA64, CLOUD, ...
  - Precision studies (QCD, standard model, BSM physics)
  - Stable beam conditions for weeks and weeks
- **Radiation facilities:** HiRadMat, Charm, Irrad, GIF++
- **Test beams:**
  - Detector prototype tests
  - Detector calibration
    - e.g. for LHC, linear colliders, space & balloon experiments
  - Outreach
  - Usually require a large spectrum of beam conditions within few days

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 4

4

## Targets and particle production

- Principle taken from cosmic radiation
  - Primary proton beam initiating hadronic cascade
  - Always followed by an electro-magnetic cascade

Top of the atmosphere

Proton collides with an atmosphere molecule.

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 5

5

## Targets and particle production

- Principle taken from cosmic radiation
- Particles are produced in a large momentum range

Position	Material	Length (mm)	Height (mm)	Width (mm)
0	Air/OUT	-	-	-
1	Be	500	2	160
2	Be	300	2	160
3	Be	180	2	160
4	Be	100	2	160
5	Be	40	2	160

5x plates, 40 mm inter-plate distance

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 6

6

## Target length and production rates

- Beryllium has
  - radiation length  $X_0 = 35.3$  cm,
  - nuclear interaction length  $\lambda_i = 42.1$  cm,  $\Rightarrow$  high  $X_0/\lambda_i$  ratio
  - low density (1.848 g/cm<sup>3</sup>)
  - high melting point (1560 K)
- The  $e/\pi$  ratio increases approx. linearly with the target length
- Hadrons
  - are produced via  $p + N \rightarrow$  hadron (rate  $\sim L$ )
  - reabsorbed (rate  $\sim e^{-L}$ )
  - $\Rightarrow$  Overall rate  $\sim Le^{-L}$  (maximum at  $L \approx \lambda_i$ )
- Electrons are mainly produced via
  - $p + N \rightarrow \pi^0 \rightarrow \gamma \gamma$  (rate  $\sim L$ )
  - $\gamma$  converts to  $e^+ + e^-$  (rate also  $\sim L$ )
  - reabsorbed (rate  $\sim e^{-L}$ )
  - $\Rightarrow$  Overall rate  $\sim L^2 e^{-L}$  (maximum at  $L \approx 2\lambda_i$ )

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 7

7

## Targets and hadron production

### Atherton parameterisation (CERN 80-07):

$$\frac{d^2N}{dpd\Omega} = A \left[ \frac{B}{p_0} e^{-Bp/p_0} \right] \left[ \frac{2Cp^2}{2\pi} e^{-C(p\theta)^2} \right]$$

$$\frac{d^2N}{dpd\Omega} = A \left[ \frac{(B+1)}{p_0} \left( \frac{p}{p_0} \right)^B \right] \left[ \frac{2Cp^2}{2\pi} e^{-C(p\theta)^2} \right]$$

with primary momentum  $p_0$  and production angle  $\theta$   
 Flux per solid angle [steradian], per interacting proton, and per dp [GeV/c]

	A	B	C
$p$	0.8	-0.6	3.5

	A	B	C
$\pi^+$	1.2	9.5	5.0
$\pi^-$	0.8	11.5	5.0
$K^+$	0.16	8.5	3.0
$K^-$	0.10	13.0	3.5
$\bar{p}$	0.06	16.0	3.0

Note: Valid for primary interactions only!  
 Extrapolation for momenta below 60 GeV/c

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 8

8

### Targets and particle production

	Name	Q	Mass [MeV/c <sup>2</sup> ]	Mean life (τ) [s]	cτ [m]	Mean decay distance [m/GeV/c]	Decays					
Leptons	Electron	e	±e	0.511		stable						
	Muon	μ	±e	105.6	2.2×10 <sup>-6</sup>	659.6	6.3×10 <sup>3</sup>	μ <sup>+</sup> → e <sup>+</sup> ν <sub>e</sub> ν <sub>μ</sub> (100%)

(\* for 10 GeV/c)

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 9

9

- ### Beamlines
- Experiments and test beams require “clean” beams with high purity (one particle type) and small momentum spread
  - Beam lines design (“optics”)
    - Collect produced particles from target
    - Select momentum
    - Select particle type
    - Transport beam to experiment
    - Select beam spot size for experiment
- partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 10

10

11

### Dipoles

Basic beam design

- Transport and momentum (p) selection: bending magnets

Dipole electro-magnets:

$$\vec{F} = q \cdot \vec{v} \times \vec{B}$$

$$B = \frac{\mu_0 n I}{h}$$

$$\theta [\text{mrad}] = \frac{299.79 BL [T \cdot m]}{p [\text{GeV}]}$$

Dispersion =  $\frac{dp}{p}$

For example:

- 1 GeV
- 2 GeV
- 3 GeV

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 12

12

## Momentum selection

Basic beam design

- momentum selection in the vertical plane
- two sets of bending magnets
- Upstream BENDS
  - Between the primary target and the momentum slit
  - Vertical focus of monochromatic beam at the momentum slit
- Downstream BENDS
  - the main spectrometer for the beam momentum definition

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 13

13

## Secondary beamlines - collimators

- TAX (Target attenuator)
  - Define initial acceptance of the beam line
- Acceptance collimators
- Cleaning collimators
  - Absorb secondary particles produced on the jaws of acceptance collimators

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 14

14

## Secondary beamlines – muon sweepers

### SCRAPERS (Magnetic Collimators)

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 15

15

## Secondary beamlines – muon sweepers

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 16

16

## Secondary beamlines - intensities

Basic beam design

- Selection of particle types

Primary beam  
400 GeV/c p  
Few  $10^{12}$  ppp

Primary Target (Be)

Secondary beam  
Mixed (e+h+ $\mu$ )  
Typically ~100 GeV/c  
Flux ~  $10^7$  ppp

Secondary Target

Tertiary beam  
Typically 10-80 GeV/c  
Flux up to  $10^4$  ppp, e.g.

Absorber (few mm Pb)

Tertiary beam  
Pure hadrons

- Intensities

$x \cdot 10^{12}$  ppp

$< 10^8$  ppp

$< 10^4$  ppp

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 17

17

## Selection of particle type - Converter

Primary protons

Primary Target

Collimator

Converter

Hadrons, muons, electrons

-polarity

+polarity

Neutral beam

Electrons from  $\gamma$  conversion or hadrons from  $K^0$  or  $\Lambda$ -decay

Collimator

Protons

Electrons or hadrons

Experiment

Where to find at CERN:  
North Area: H2, H4  
East Area: T9

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 18

18

## Selection of particle type - Synch. rad.

- Synchrotron radiation  
(for one full revolution)

$$P_s = \frac{e^2 c}{6\pi\epsilon_0 (m_0 c^2)^4} \frac{E^4}{\rho^2}$$

Magnet

Synchrotron Light

- E.g.  $e^\pm$  at 200 GeV lose in  $1^\circ$  bending magnet of 1 T field 590 MeV
  - => With beamline momentum acceptance of  $\Delta p/p < 0.3\%$  it is possible to separate them from (heavier) hadrons and muons. So set up the following bends either
    - at the constant energy to select heavier particles or
    - scale it with energy loss of electrons.

Works only for  $p_e > 120-150$  GeV/c

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 19

19

## Selection of particle type - Absorber

Primary protons

Primary Target

Absorber (e.g. 6 mm Pb)

Hadrons, muons, electrons

Large energy loss for electrons, very little for hadrons and muons

Collimator

Experiment

Both bends set to the same beam momentum

$e^+$

$e^-$

Hadrons, muons

Where to find at CERN:  
North Area: H2, H4, H6, H8  
East Area: T9, T10

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 20

20

## Selection of particle type - Radiator

Radiator  
(e.g. 1 mm Pb, Cu, W)

Photons

Experiment

Secondary electrons (e)

Electrons (e')

Electrons

Profile monitor

Photons are created via Bremsstrahlung

- Time resolution - electron by electron
- Transverse position gives information on e- momentum
- $p_\gamma = p_e - p_{e'}$
- Result : tagged photon beam

Where to find at CERN:  
(Ad hoc installation, but usually used at)  
North Area: H2, H4  
East Area: T9

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 21

21

## Beams from PS

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 22

22

## East Area

Area under renovation

After LS2

- Secondary beams:
  - Momentum < 15 GeV/c
  - Irradiation facilities CHARM and IRRAD
  - Test beamlines T9 and T10
  - T11 beamline for CLOUD experiment
  - Horizontal momentum selection
- Particle types and intensity
  - Pure electrons, hadrons, muons
  - Max.  $\sim 5 \cdot 10^6$  particles per spill
- Spill structure from PS
  - 400ms spill length
  - Typically 1 spill every 18s (15bp), more on request
- Quick access from control room to experimental area (< 1 minute)
- Short cables

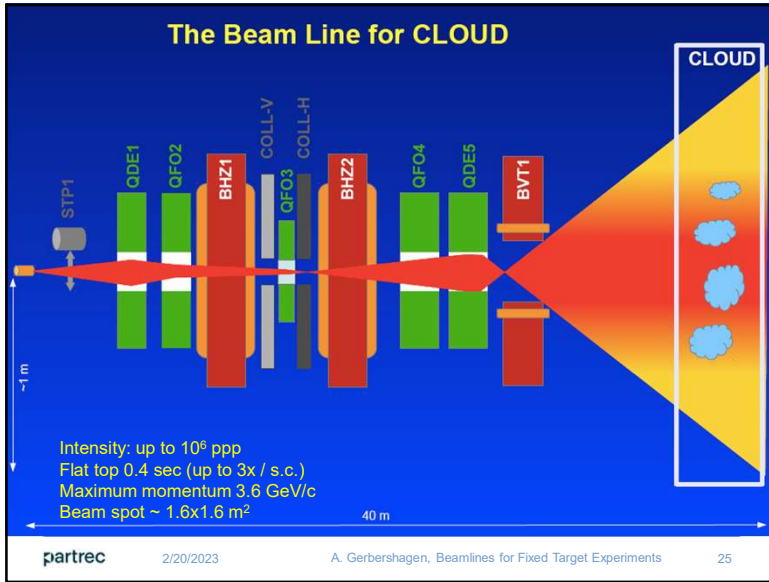

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 23

23

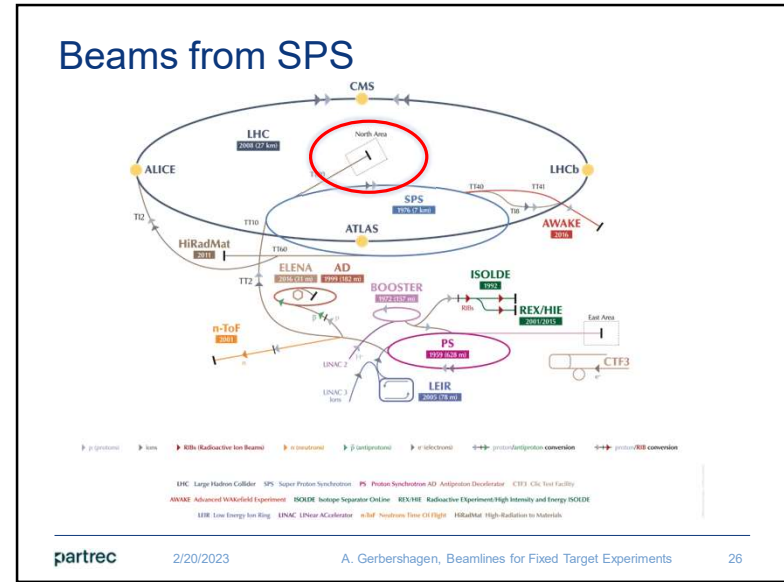

## The CLOUD Experiment in T11 Beam

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 24

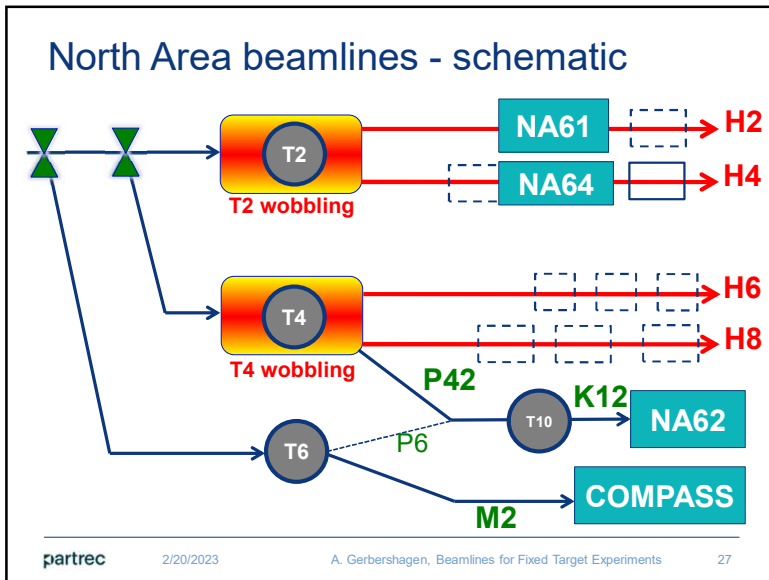

24

25

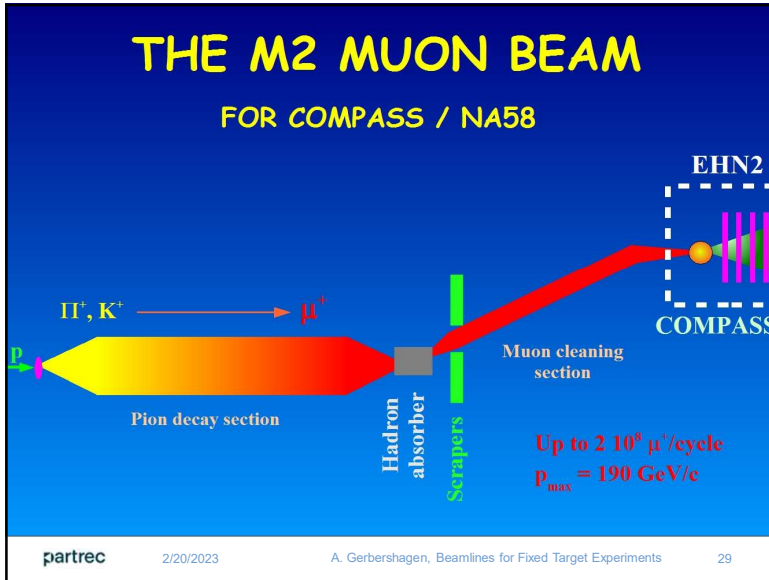

26

27

28

29

## Muons from pion decay

- Pion decay in  $\pi$  center of mass:
 
$$p^* = \frac{m_\pi^2 - m_\mu^2}{2 m_\pi} = 30 \text{ MeV}/c$$

$$E^* = \frac{m_\pi^2 + m_\mu^2}{2 m_\pi} = 110 \text{ MeV}$$
- Boost to laboratory frame:
 
$$E_\mu = \gamma_\pi (E^* + \beta_\pi p^* \cos \theta^*) \text{ with } \beta_\pi \approx 1$$
- Limiting cases:
 
$$\cos \theta = +1 \rightarrow E_{max} = 1.0 E_\pi$$

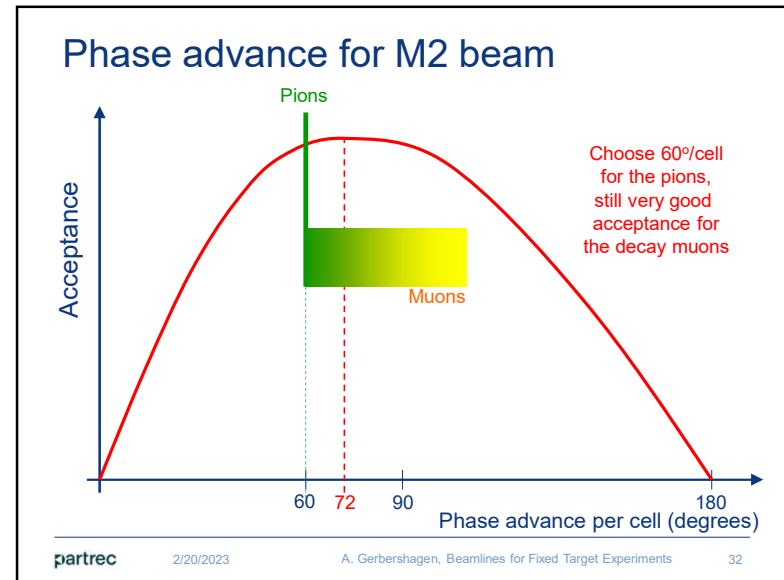

$$\cos \theta = -1 \rightarrow E_{min} = 0.57 E_\pi$$

partrec 2/20/2023 A. Gerbershagen, Beamlines for Fixed Target Experiments 30

30

31

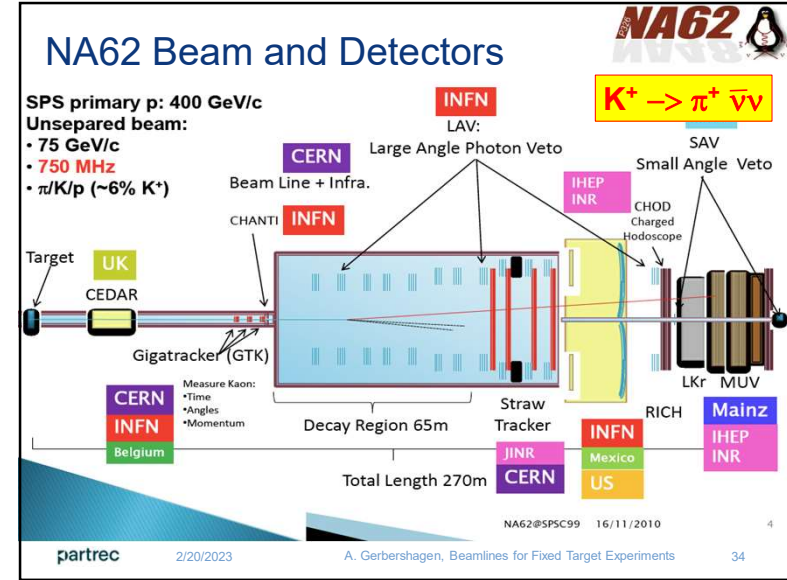

32

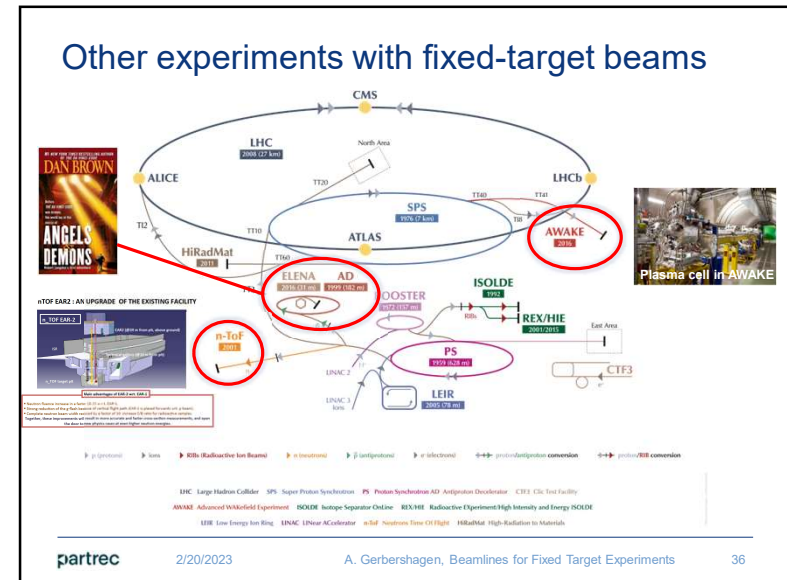

33

34

35

36

## Summary

- Many physics experiments can be performed (only) with fixed targets
- CERN has a rich fixed target complex
  - Beams from PSB, PS or SPS
    - Momenta : <math><1.4\text{ GeV}/c</math>, <math><15\text{ GeV}/c</math>, <math><400\text{ GeV}/c</math>
  - Capable to provide:
    - Protons, electrons, hadrons, pions, tagged kaons, muons, tagged photons
  - Beamlines designed for high flexibility in:
    - Particle type, beam size, divergence, momentum, intensity, (polarization) etc.
