

FoCal-H: Performance & Analysis Update

I.G. Bearden*

HEHI

Niels Bohr Institute, University of Copenhagen

27 February 2023

*on behalf of the hardworking students from Copenhagen and Sofia who didn't get to come to Japan

The Forward Calorimeter (FoCal):

$$3.4 < \eta < 5.8$$

FoCal-E: high-granularity Si-W sampling calorimeter for photons and π^0

FoCal-H: absorber-scintillator sampling calorimeter for photon isolation and jets

FoCal-H development team

Niels Bohr Institute
UNIVERSITY OF
COPENHAGEN

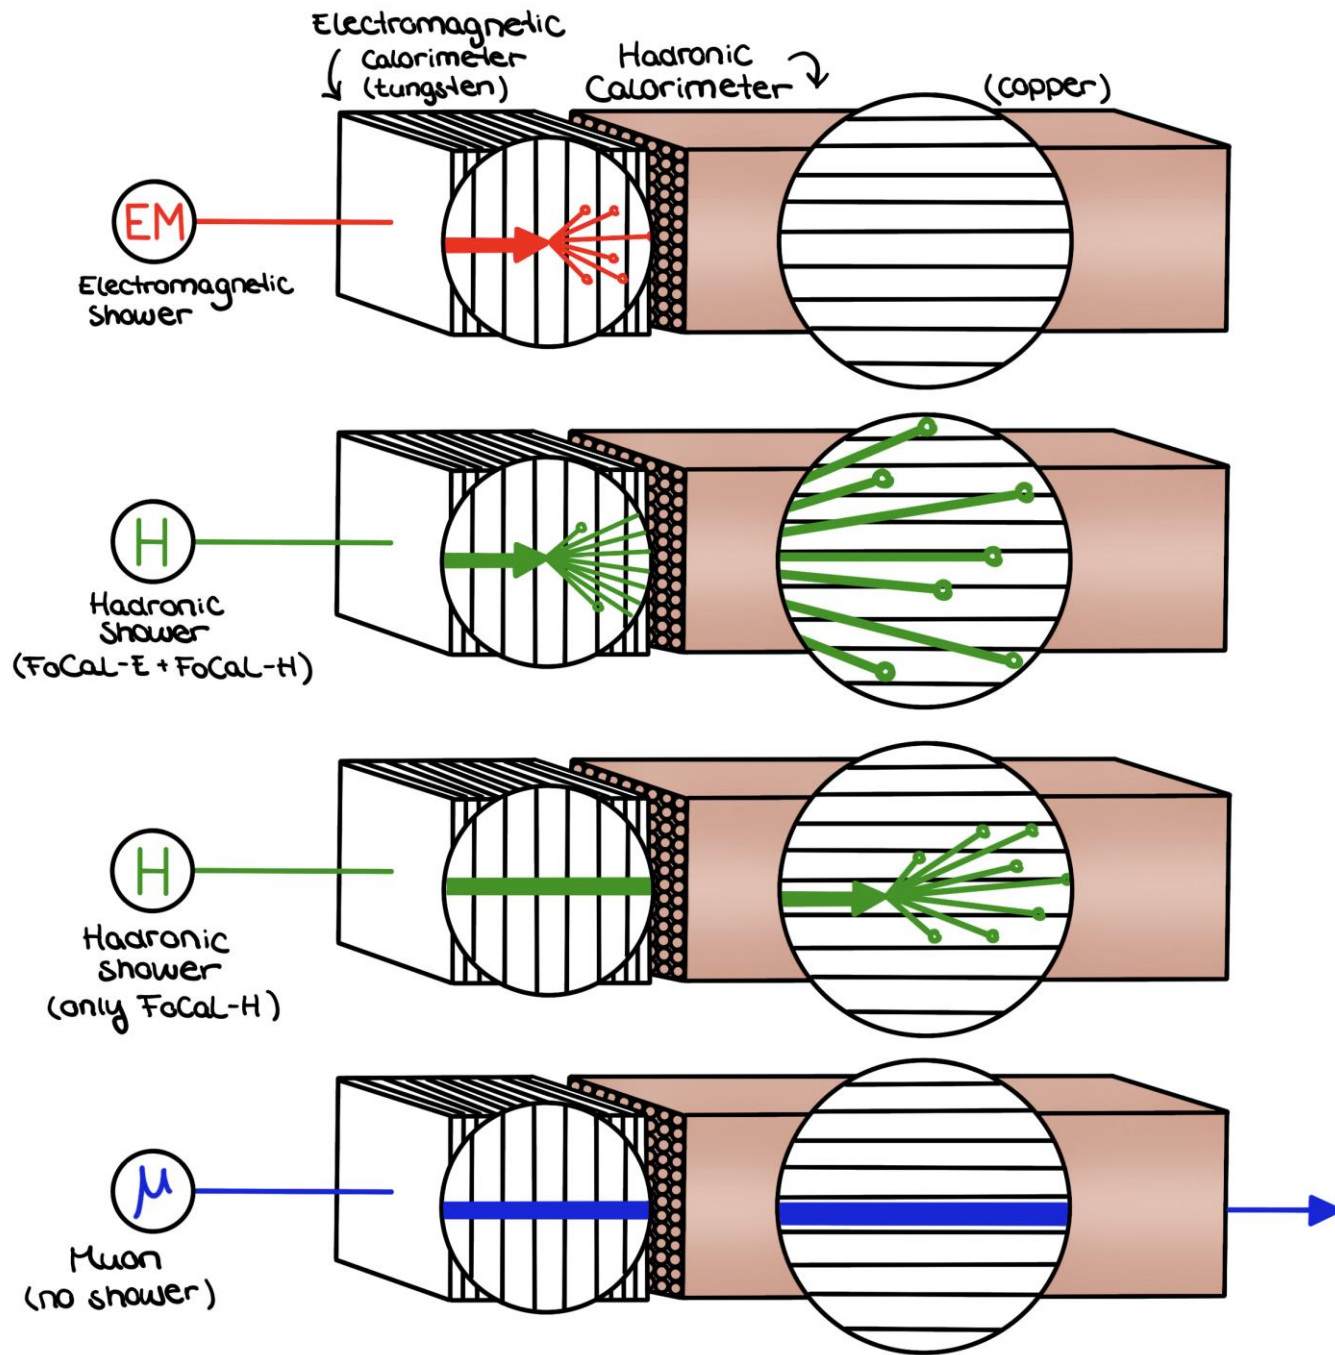

Focal-H funded by:

CARLSBERG FOUNDATION
CF21-0606, Hadronic Calorimeter for Forward Physics

Instrument Center for
CERN Experiments

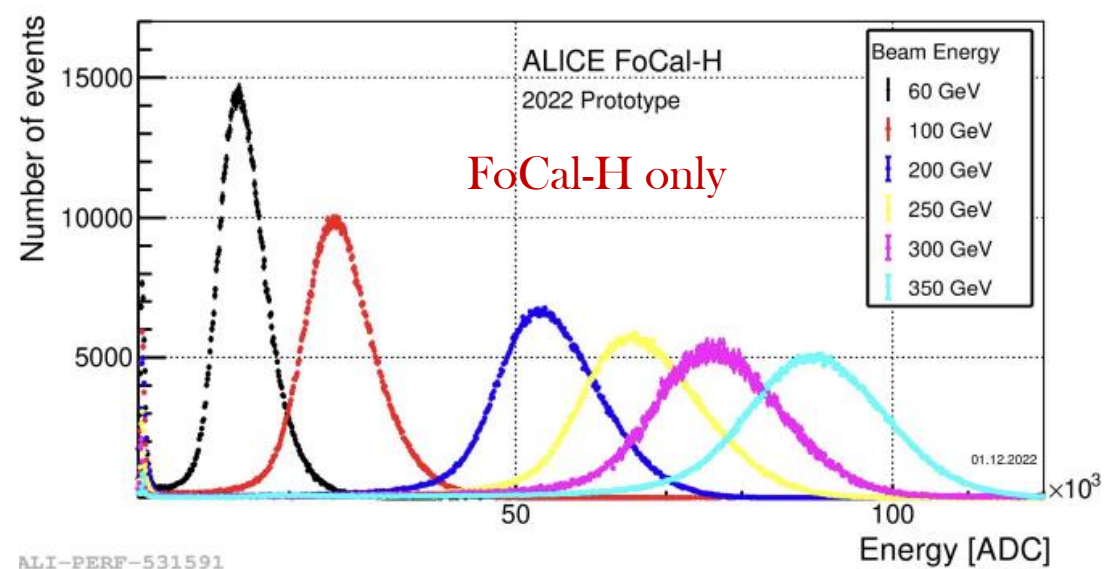

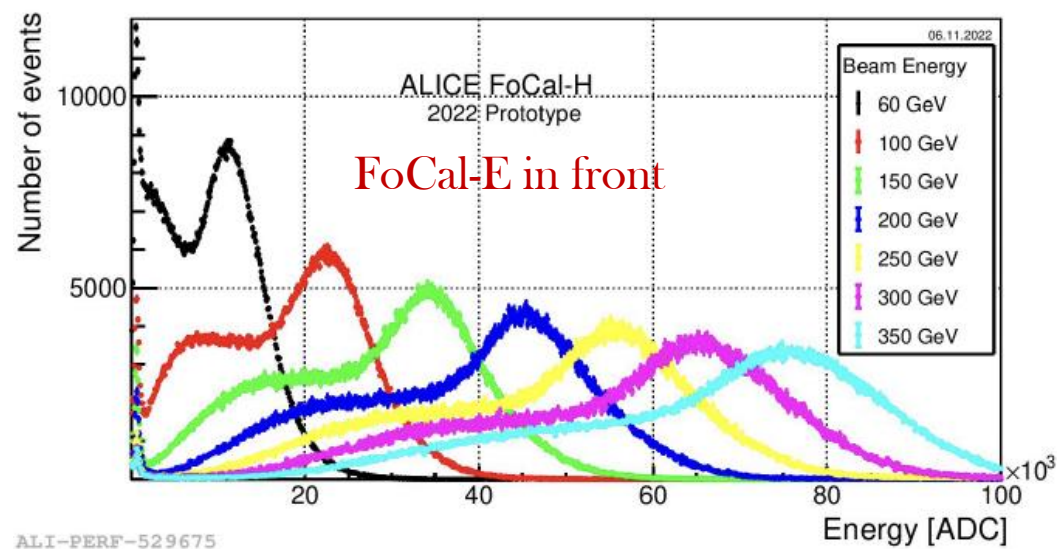

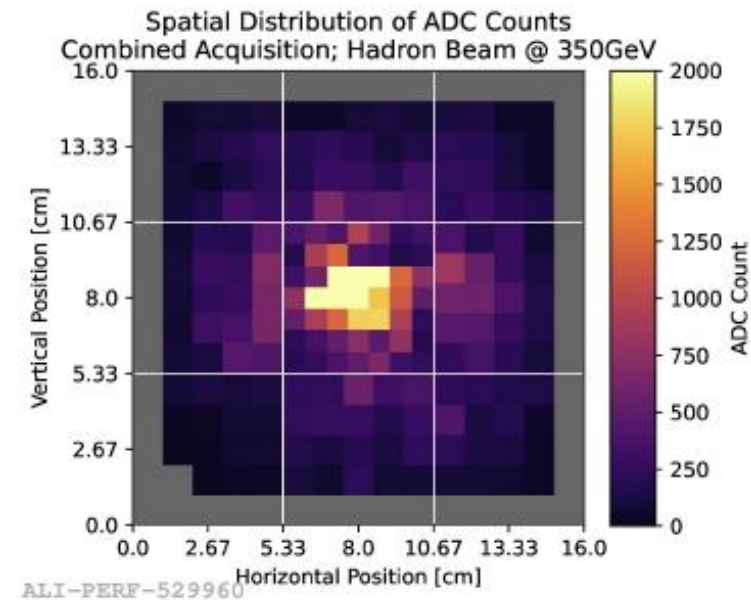

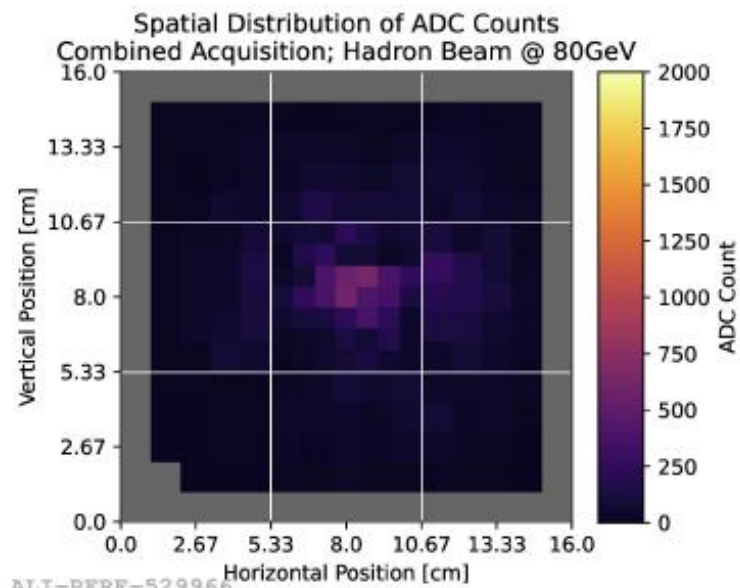

The program so far:
 Prototype 1: Test beams at SPS & PS 2021
 5-120 GeV electrons & hadrons
 Prototype 2: Test beams at SPS & PS 2022
 1-350 GeV hadrons (electrons)

FoCal-H

CAEN DT5202 based on
 CITIROC-1A

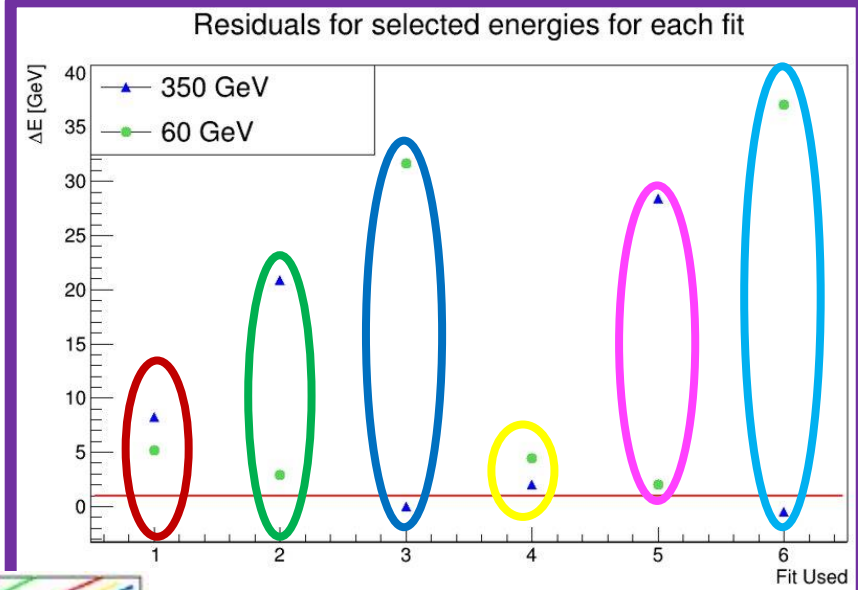

Questions: Linearity? Resolution?

E calibration w/o FoCal-E:

All fits $ADC = p_0(E_{\text{beam}}) + p_1$

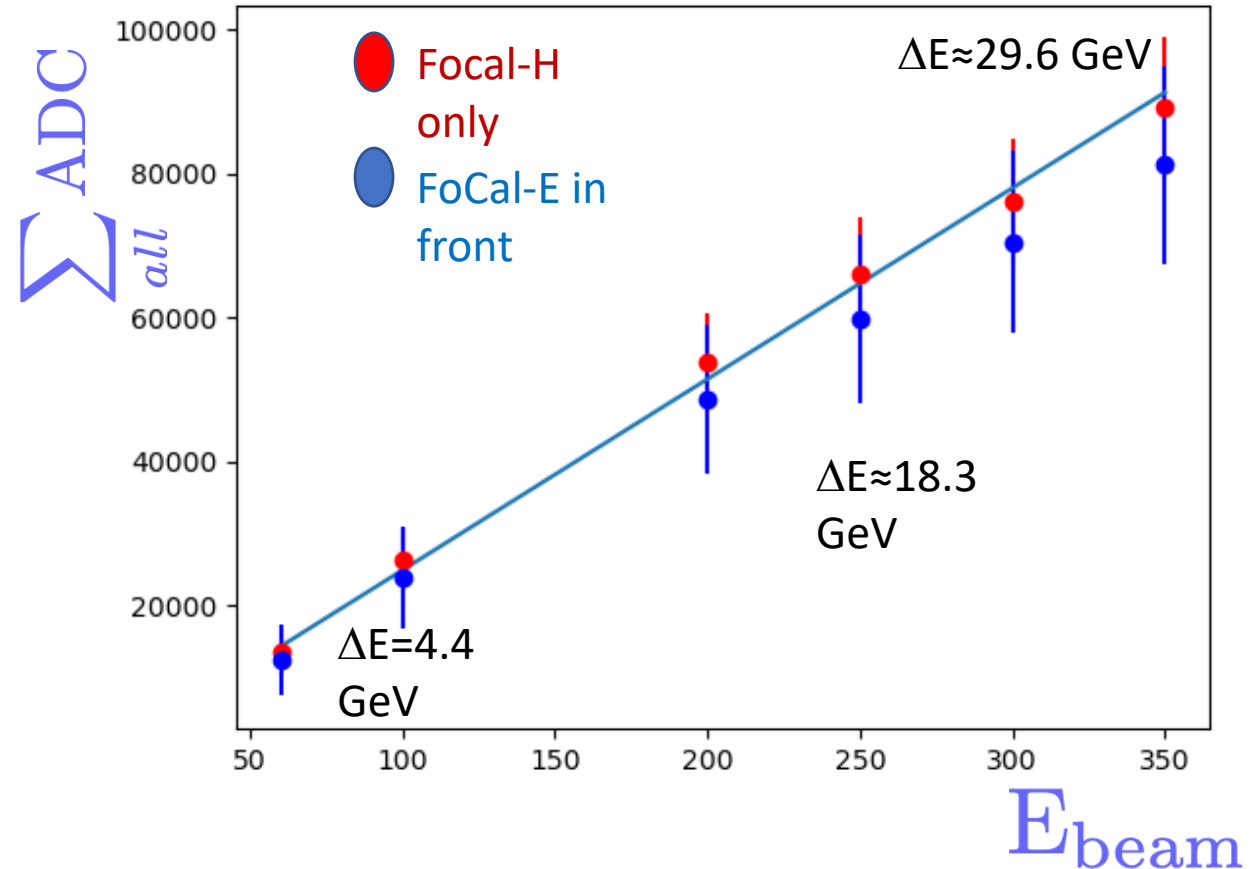

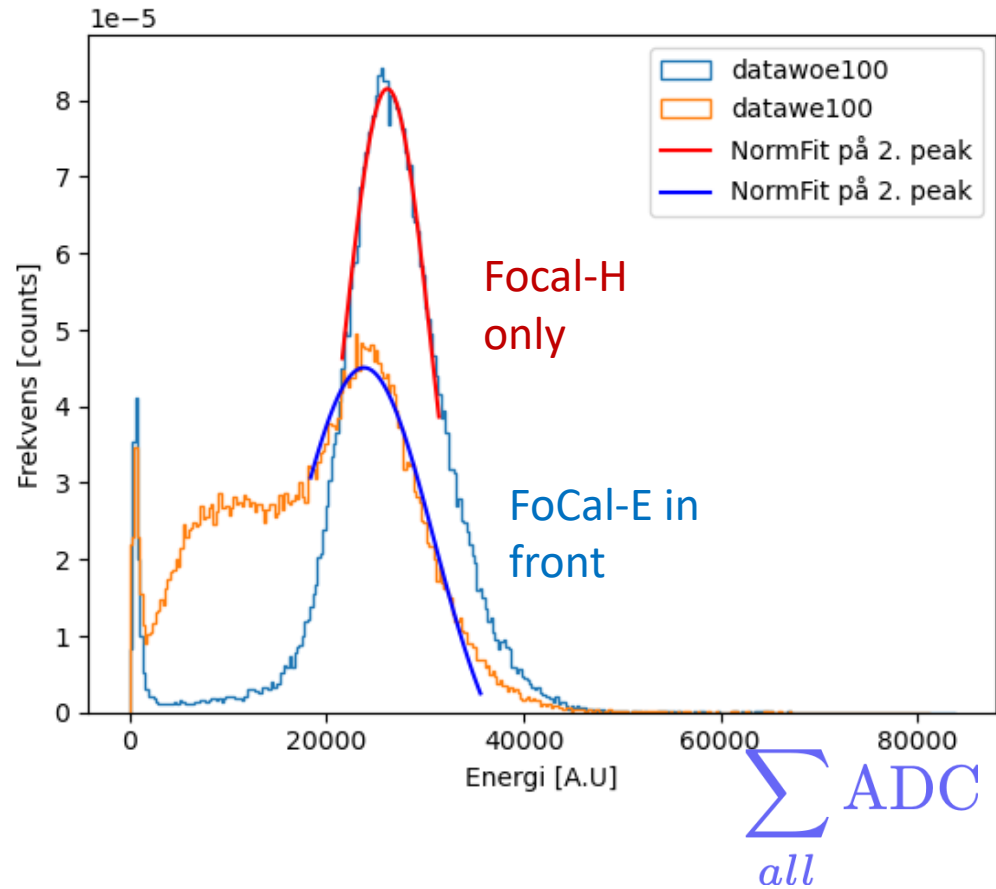

$\Delta E (E_{\text{beam}} - E_{\text{cal}})$:
60 & 350 GeV
for the 6 fits

1: all data points
2: 60, 100, 200, 250
3: 200, 250, 300, 350
4: 60, 100, 300, 350
5: 60, 100, 200
6: 250, 300, 350

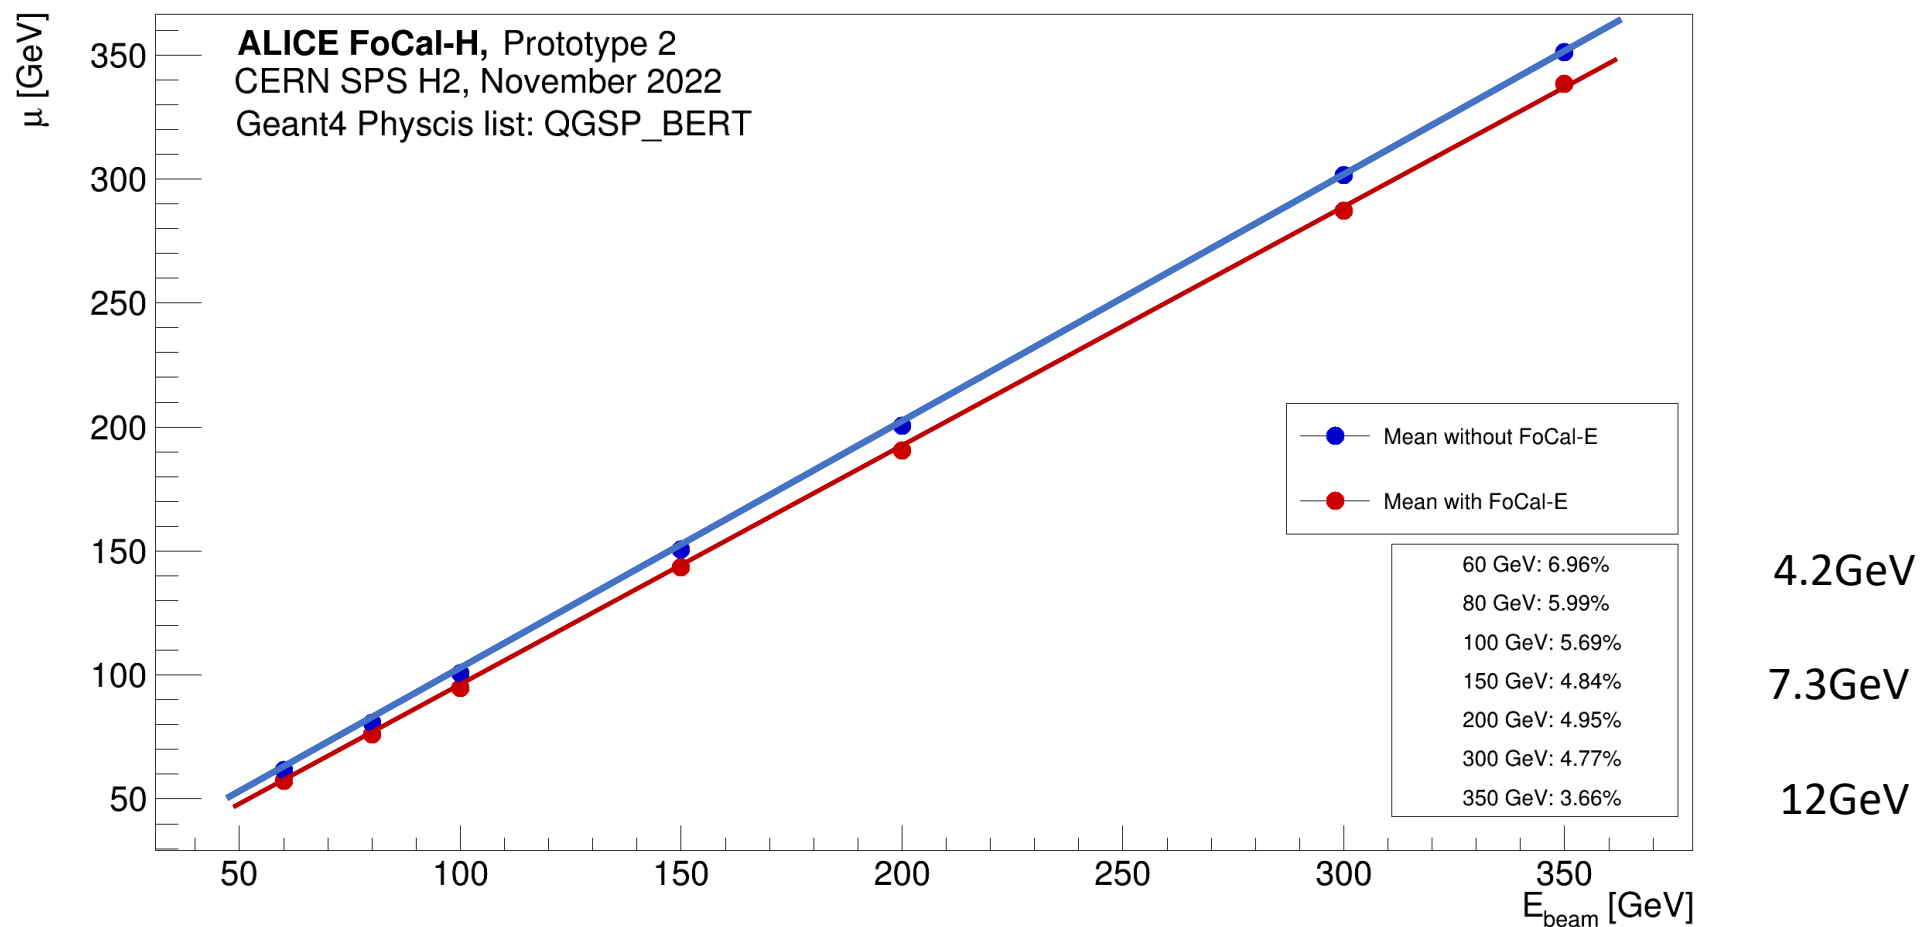

Data with & w/o FoCal-E in front

this analysis done by Alexander, Frederik, and Jonas for their 1st year project

Simulation with & w/o FoCal-E in front

Total Energy - Simulations with/without FoCal-E

Is gain stable over time?

NB: we only had a few hours w/o FoCal-E on the last day
No 150GeV data as we prioritized VMM data.

Energy Deposition Comparison 60 GeV

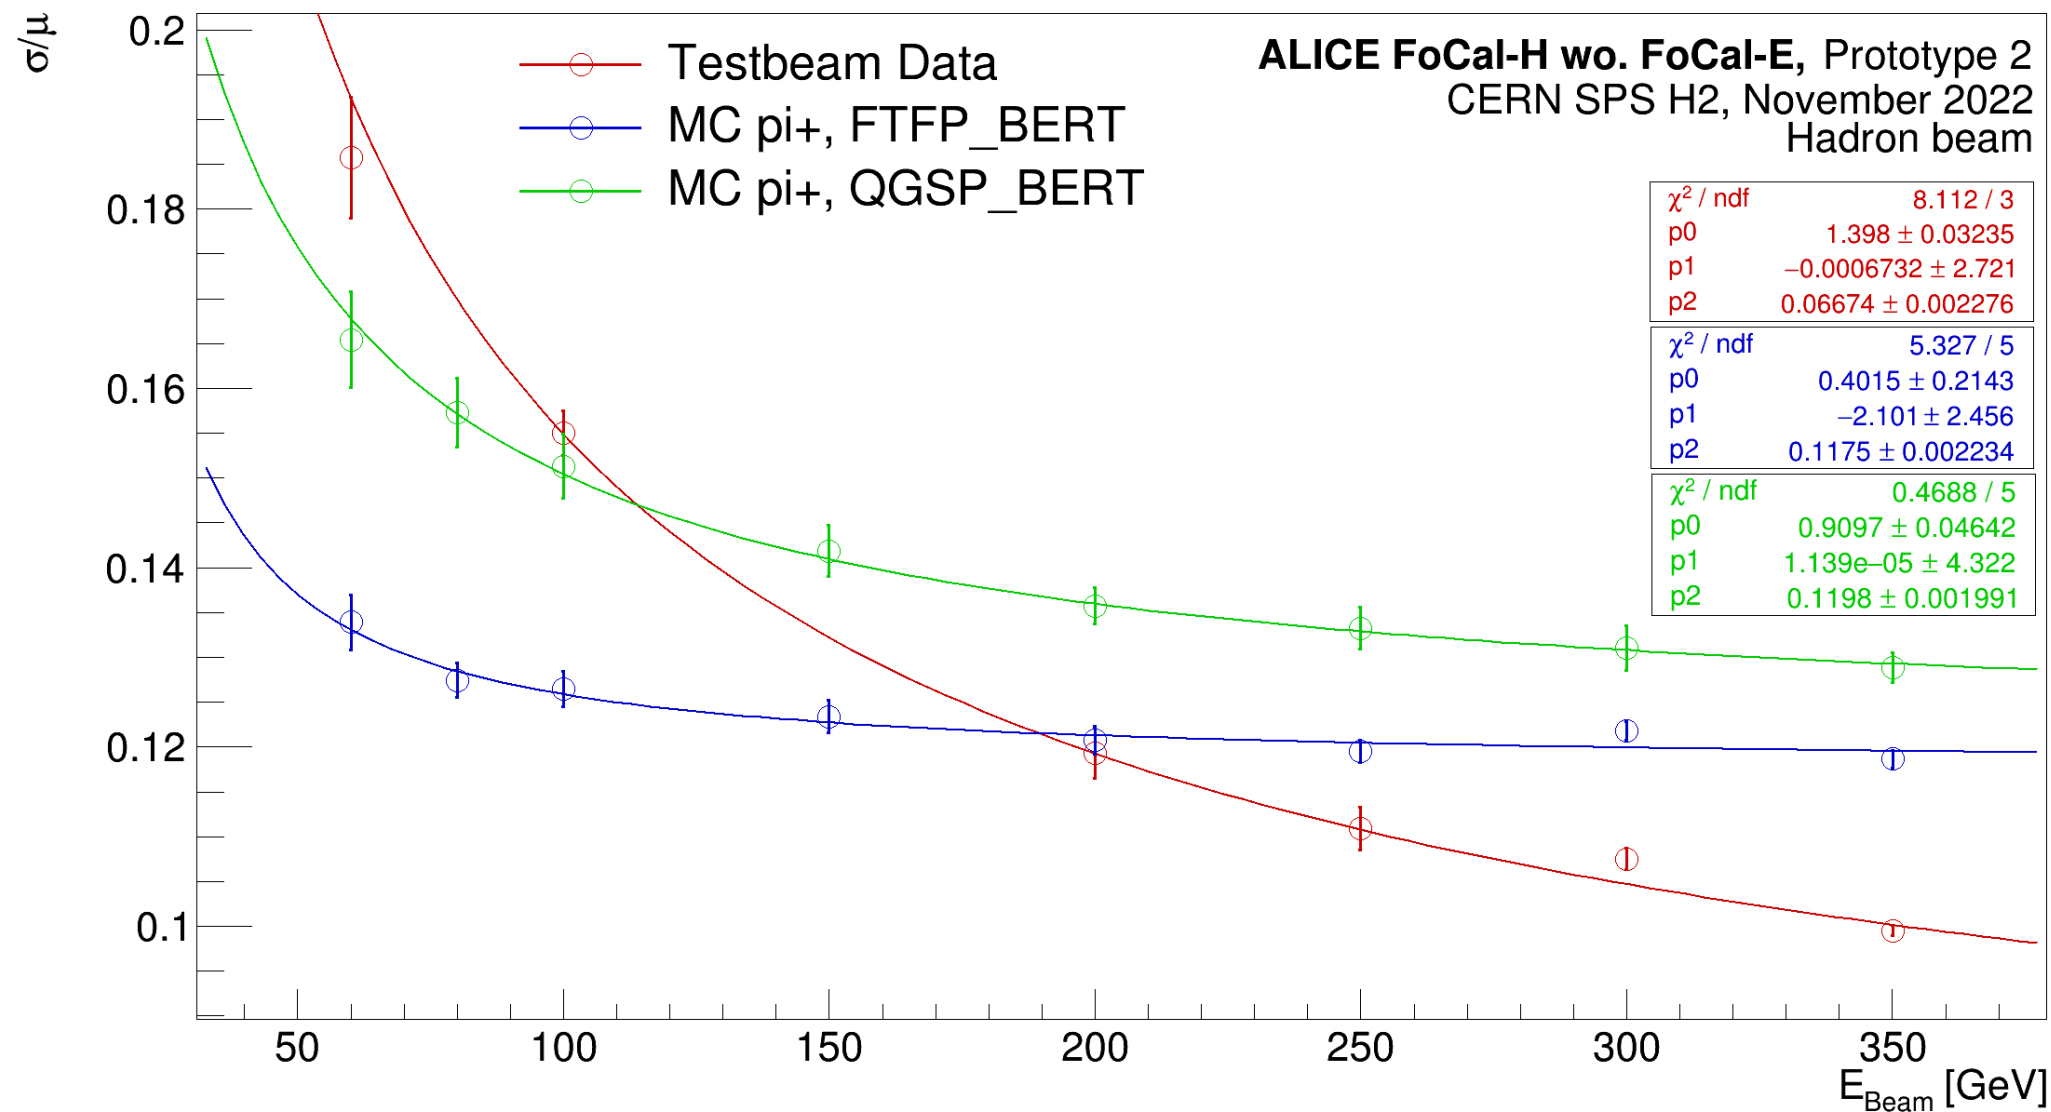

Both plots,
BLUE is November 3
RED is November 6

Energy Deposition Comparison 350 GeV

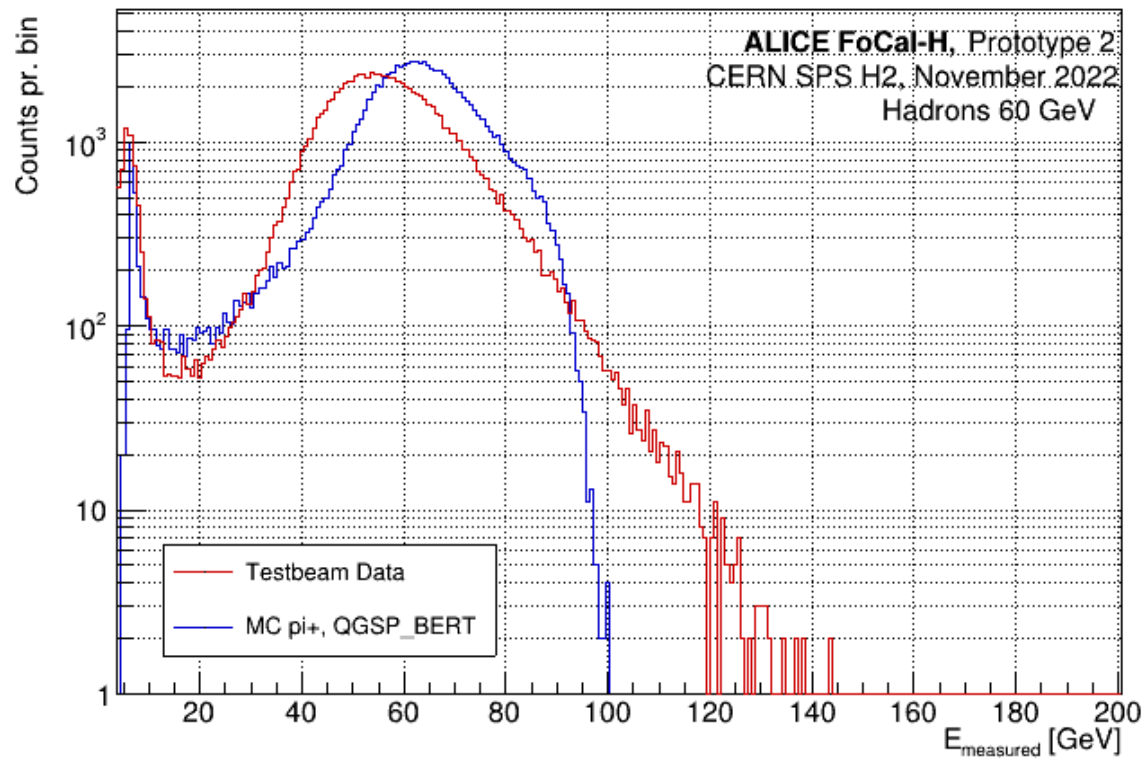

Resolution (FoCal-H only):

Energy Resolution

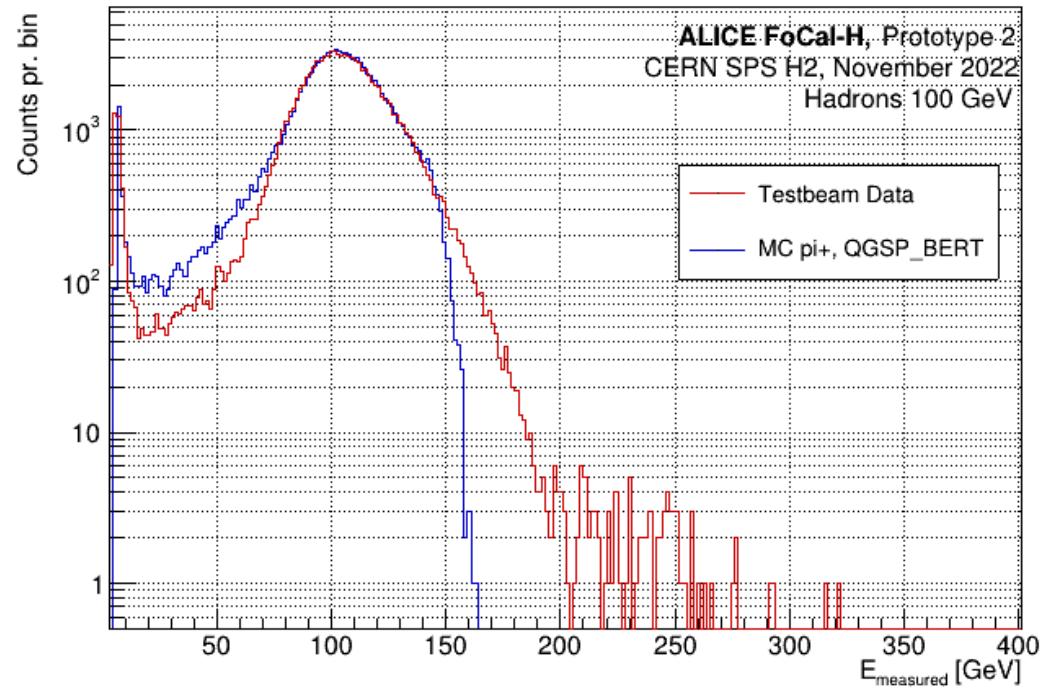

60 GeV

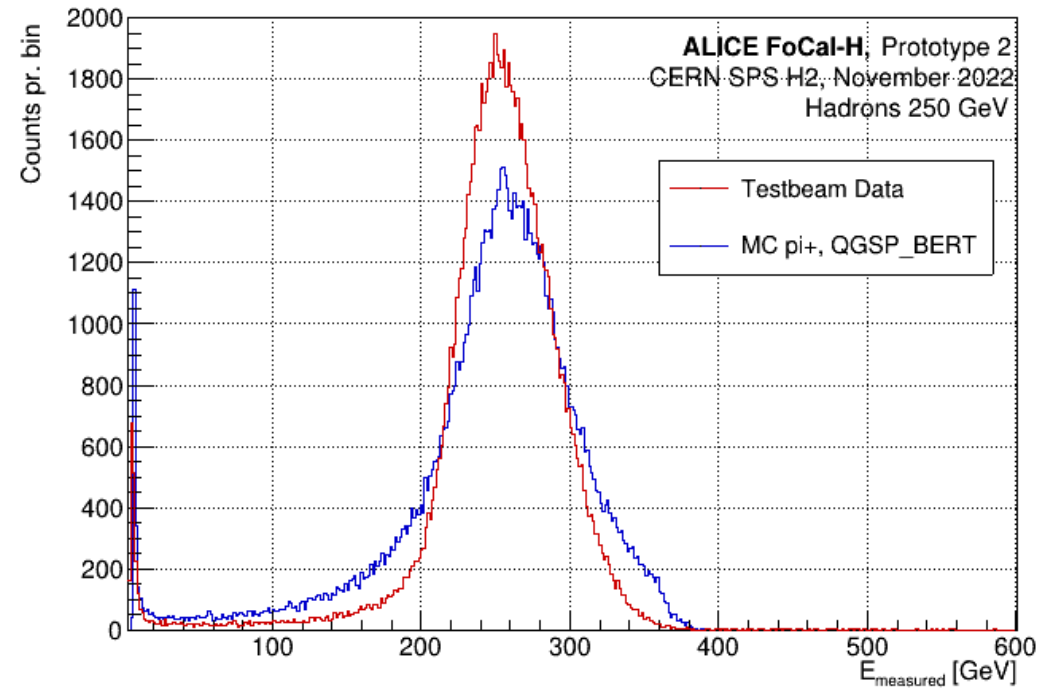

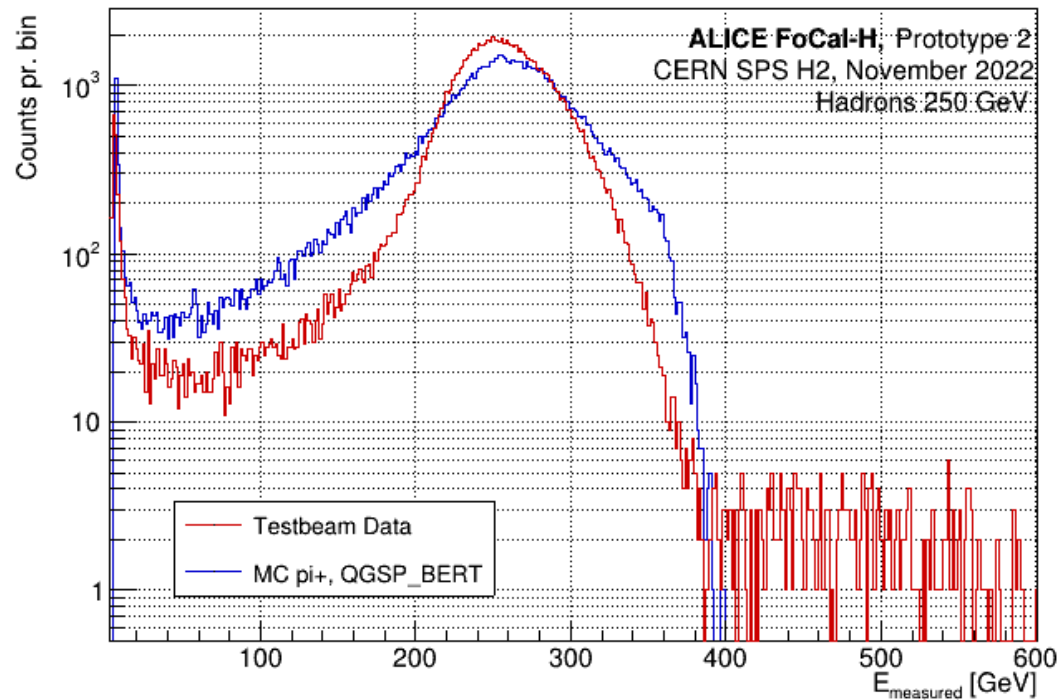

100 GeV

This plots is with the saturation study.

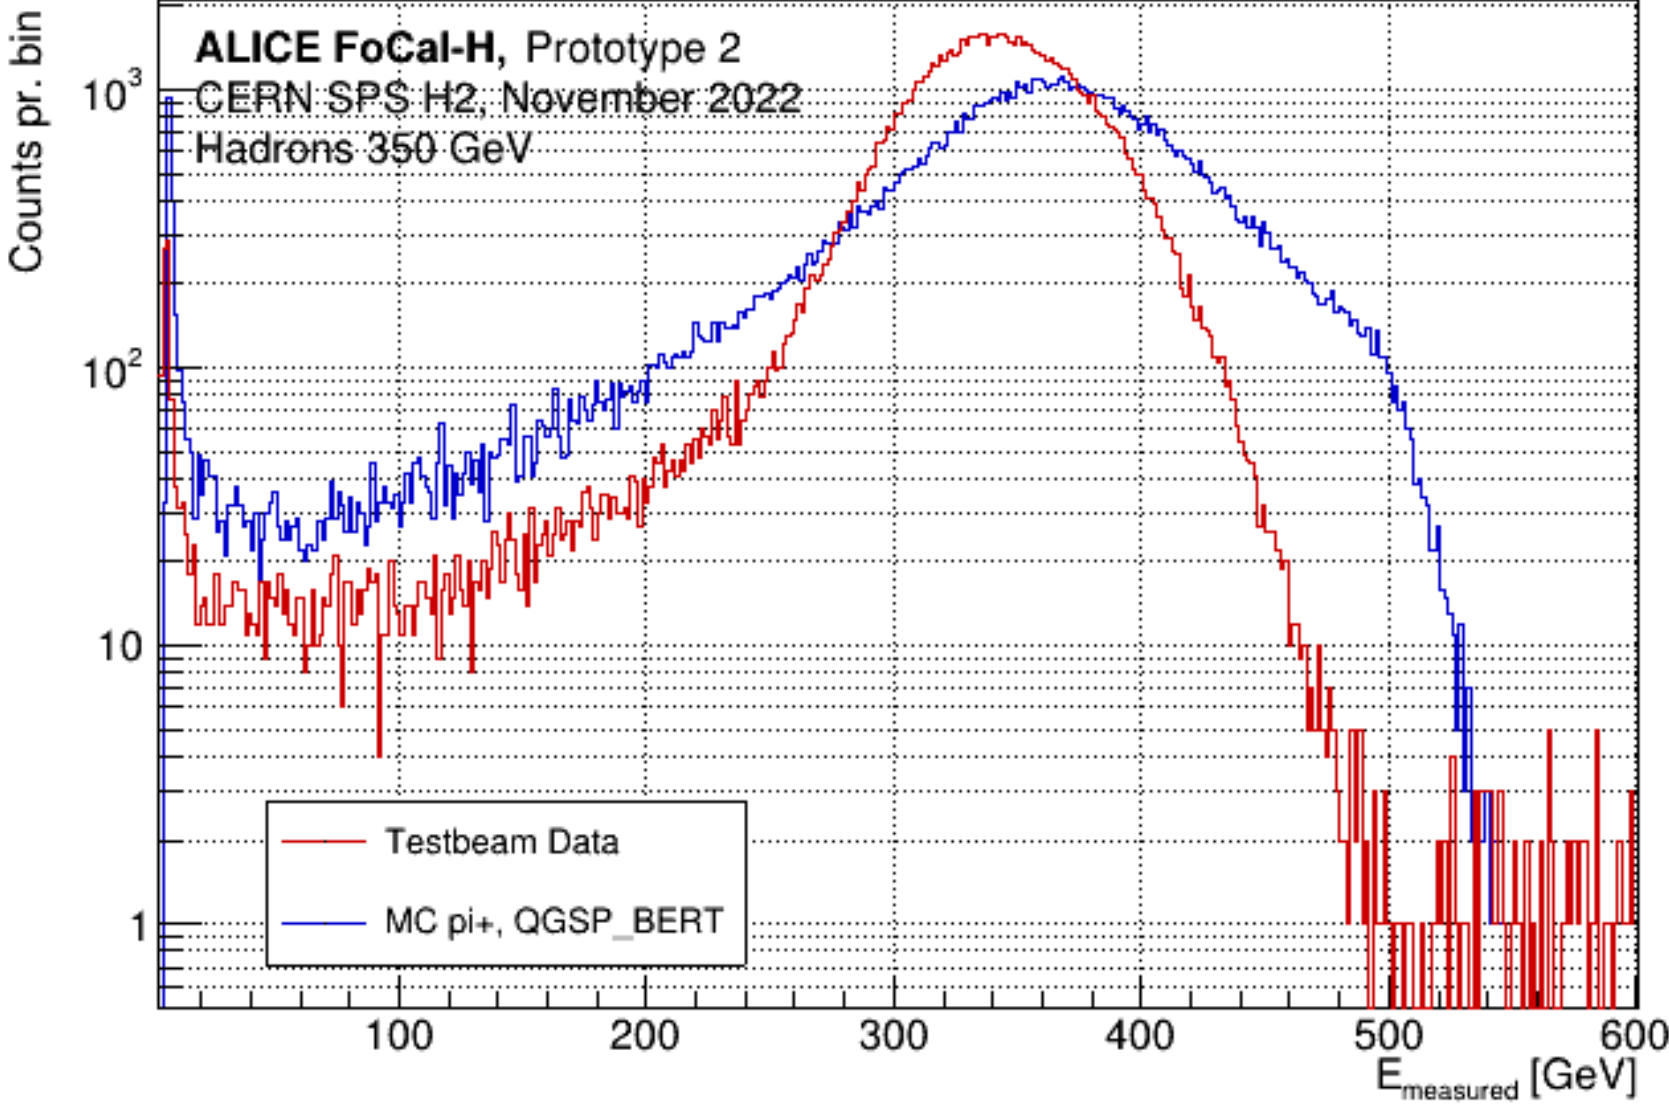

250 GeV

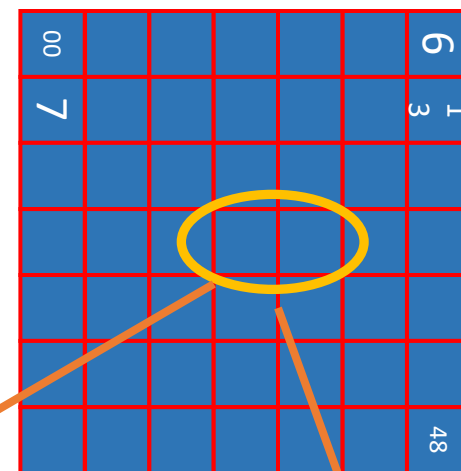

This plots is with the saturation study.

350 GeV

Saturation: how bad is it?

Channel saturation frequency, run 1504

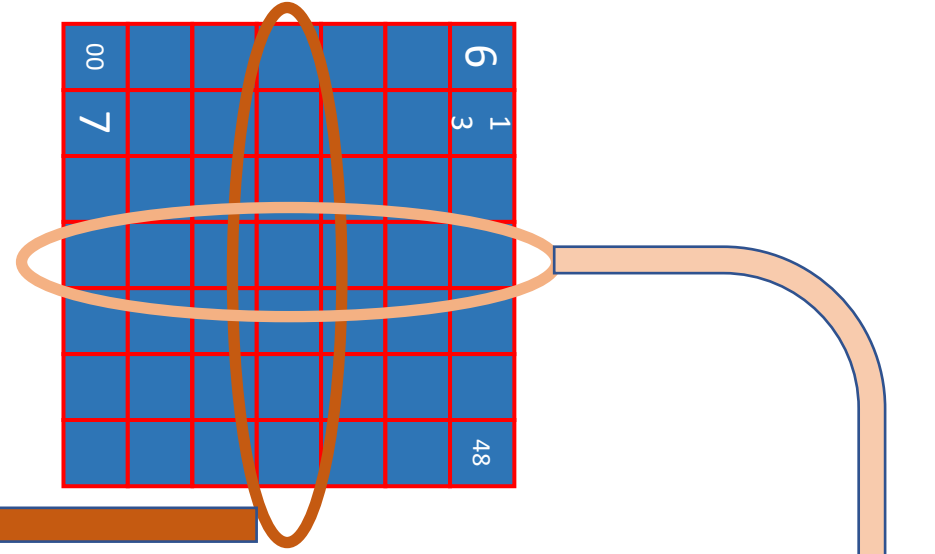

Channel saturation frequency, run 1502

Channel saturation frequency, run 1500

350 GeV

ADC distribution for channels in 'hit column'

ADC distribution for channels in 'hit row'

Saturation: how bad is it?

Number of saturated channels per event, 60GeV

Number of saturated channels per event, 350GeV

Conclusion(!?) on resolution & saturation

- Saturation is clearly a problem!
- Due to the limited dynamic range of CAEN DT5202.
- Fix: H2GCROC (which we hope to test at PS in May/June & SPS this autumn)
- Meanwhile, work on 2D fits to minimize effect of saturation.
- Not the only story: note the sharper peak in data compared to simulations on the low energy shoulder of the peak.
- Gain matching individual channels will improve resolution.

2D: CoM; RMS. 60GeV FoCal-E in front (AB)

Center of Mass Distribution, 60GeV, WECal

RMS, 60GeV, WECal

2D: CoM; RMS. 300 GeV FoCal-E in front

Center of Mass Distribution, 300GeV, WECal

RMS, 300GeV, WECal

2D: CoM; RMS. 60 GeV FoCal-H only

Center of Mass Distribution, 60GeV, WoECal

RMS, 60GeV, WoECal

2D: CoM; RMS. 300 GeV FoCal-H only

Center of Mass Distribution, 300GeV, WoECal

RMS, 300GeV, WoECal

2D: Fit Gaussian to each event...

Side View (X = 0 in back)

Overview

Top-down View

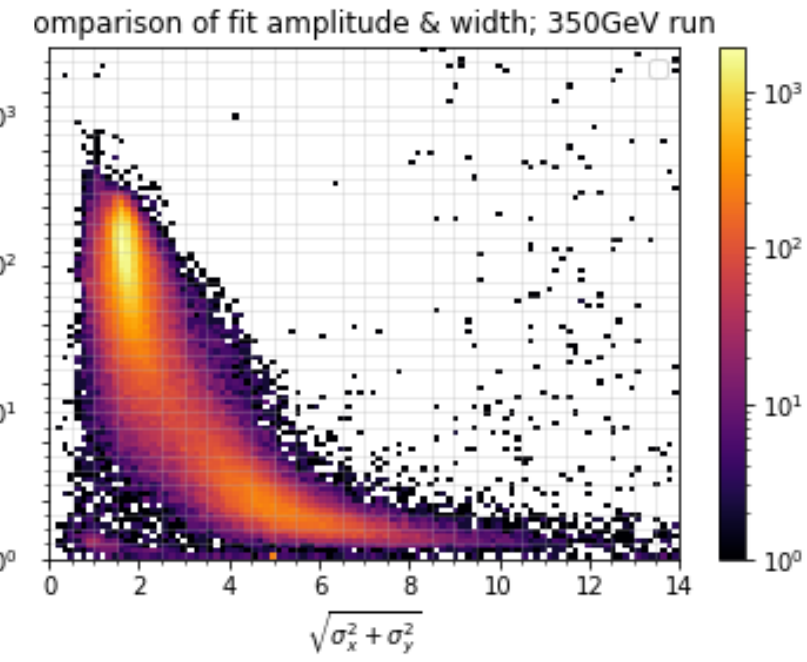

2D: Fit Gaussian to each event (IPM)

Widths of 2d Gaussian fits of events; various beam energies
All events included

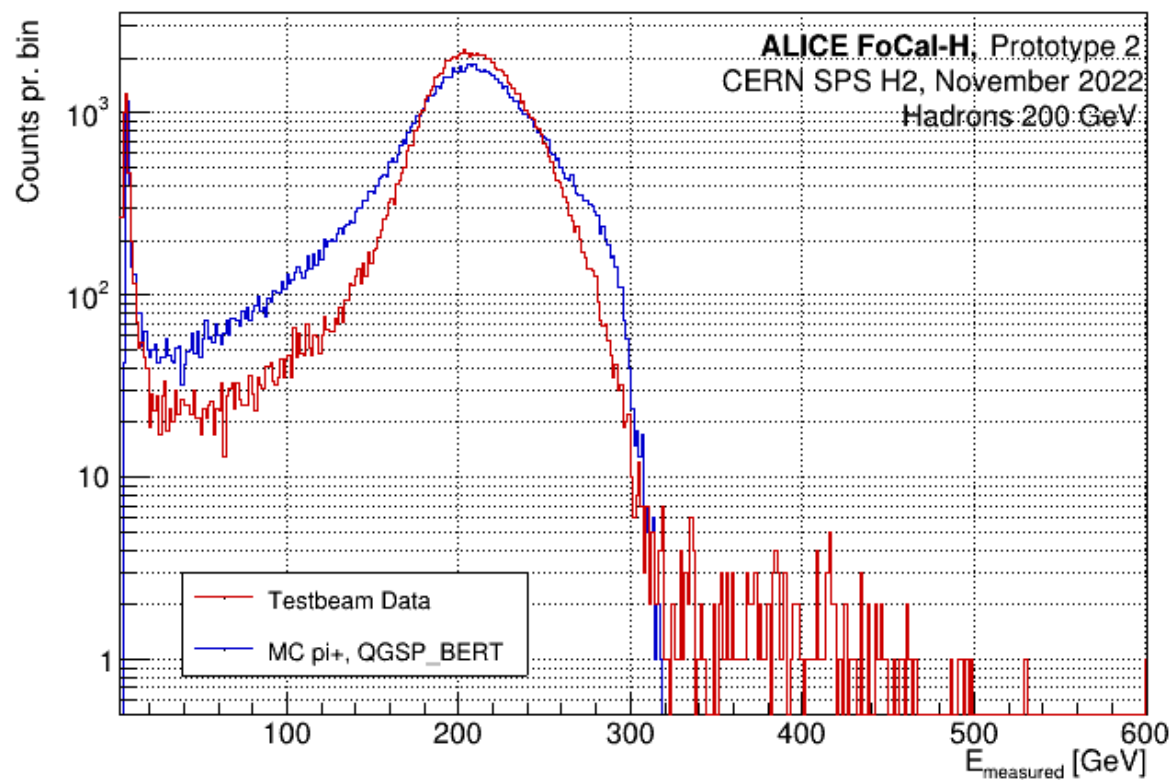

2D: Fit Gaussian to each event...

Summary

- Saturation is clearly a problem!
- Points to the urgency of H2GCROC
- Still, we have a working detector...and we are working on a better understanding of its performance.
- Spatial resolution good, perhaps can be improved with better fitting?
- **Critical: look at FoCal-H performance for events with ToT in Pads 0.**
- **Critical: construct E from FoCal-E+FoCal-H.**

200 GeV

300 GeV

This plots is with the saturation study.

54	01	02	03	04	05	06	07	08	09	10	11	12	13	14	

Evidence for saturation of ADC:

NB: these runs were with FoCal-E in front.
Presumably, the number of saturated channels is larger w/p FoCal-E

How does saturation affect signal?

- Compare “high side” tails at various energies. 
- Is our energy calibration linear? (See LMD plot of calibration residuals. Question: what are uncertainties?) 
- Compare fitting showers to simple ADC sum. 
 - Hypothesis: fitted energy should be more linear than ADC sum if saturation is a large negative effect.
 - Hypothesis: resolution from fitted showers may be more accurate estimate than simple ADC sum IF saturation is important.
 - Assertion: saturation is in the CAEN ADC, not in the SiPM; action: check this empirically! 

Residuals - Beam Data

Residuals - Simulation Data (Old FTFP)

Let's look at high-side tails 350 GeV:

Calibrated Total Charge, without FoCal-E
