

# Databases for operations of the Injectors – overview, dependencies and strategy for smooth upgrades of the data-driven controls system

*LHC Injectors and Experimental Facilities Committee  
2011 Workshop*

Zory Zaharieva  
on behalf of the DM team

Beams Department  
Controls Group  
Data Management Section

# Outline

- ➔ Overview of the main data domains for the Injectors
- ➔ State and on-going developments
- ➔ Dependencies between the different databases
- ➔ Strategy for smooth upgrades of the data-driven controls system
- ➔ Conclusion

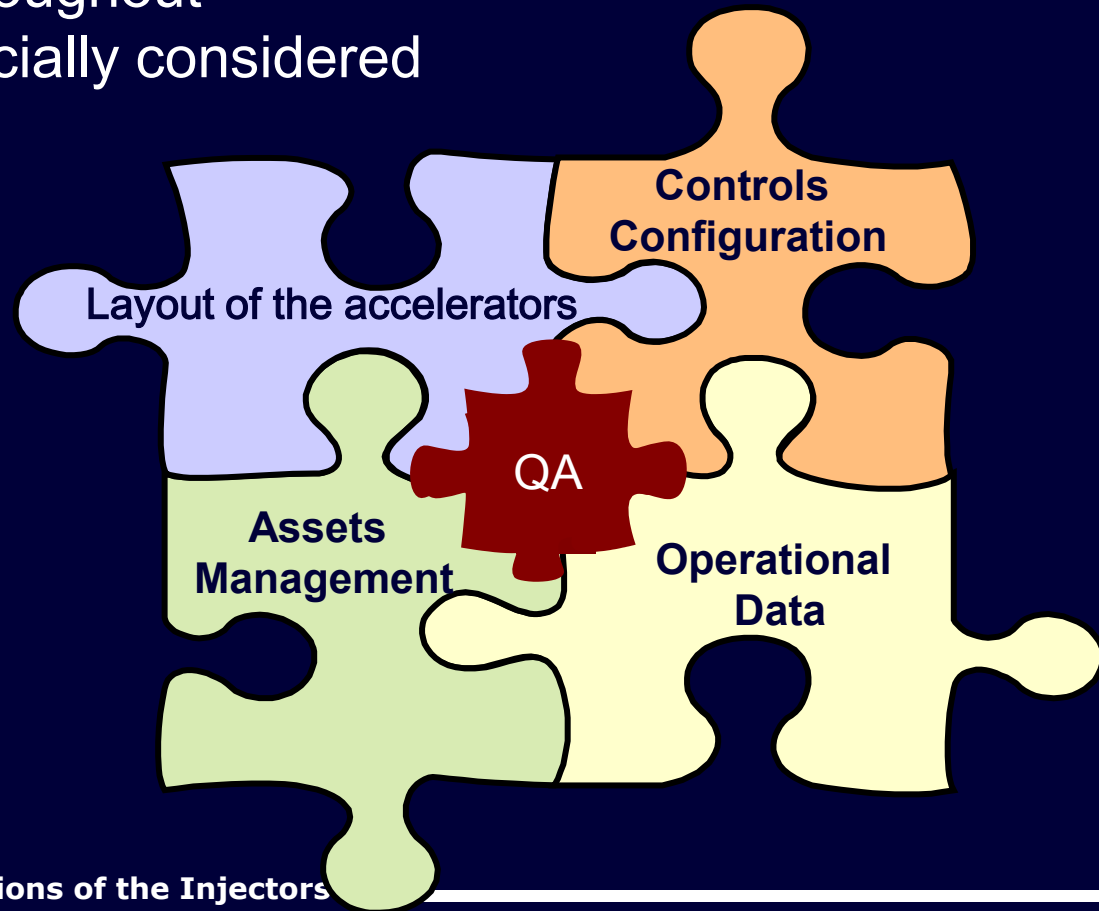

# Data Domains for the Injectors

- ➔ Logical break-down of the data
- ➔ Easier to organize and manage each individual area
- ① Integration of the data throughout the domains must be specially considered

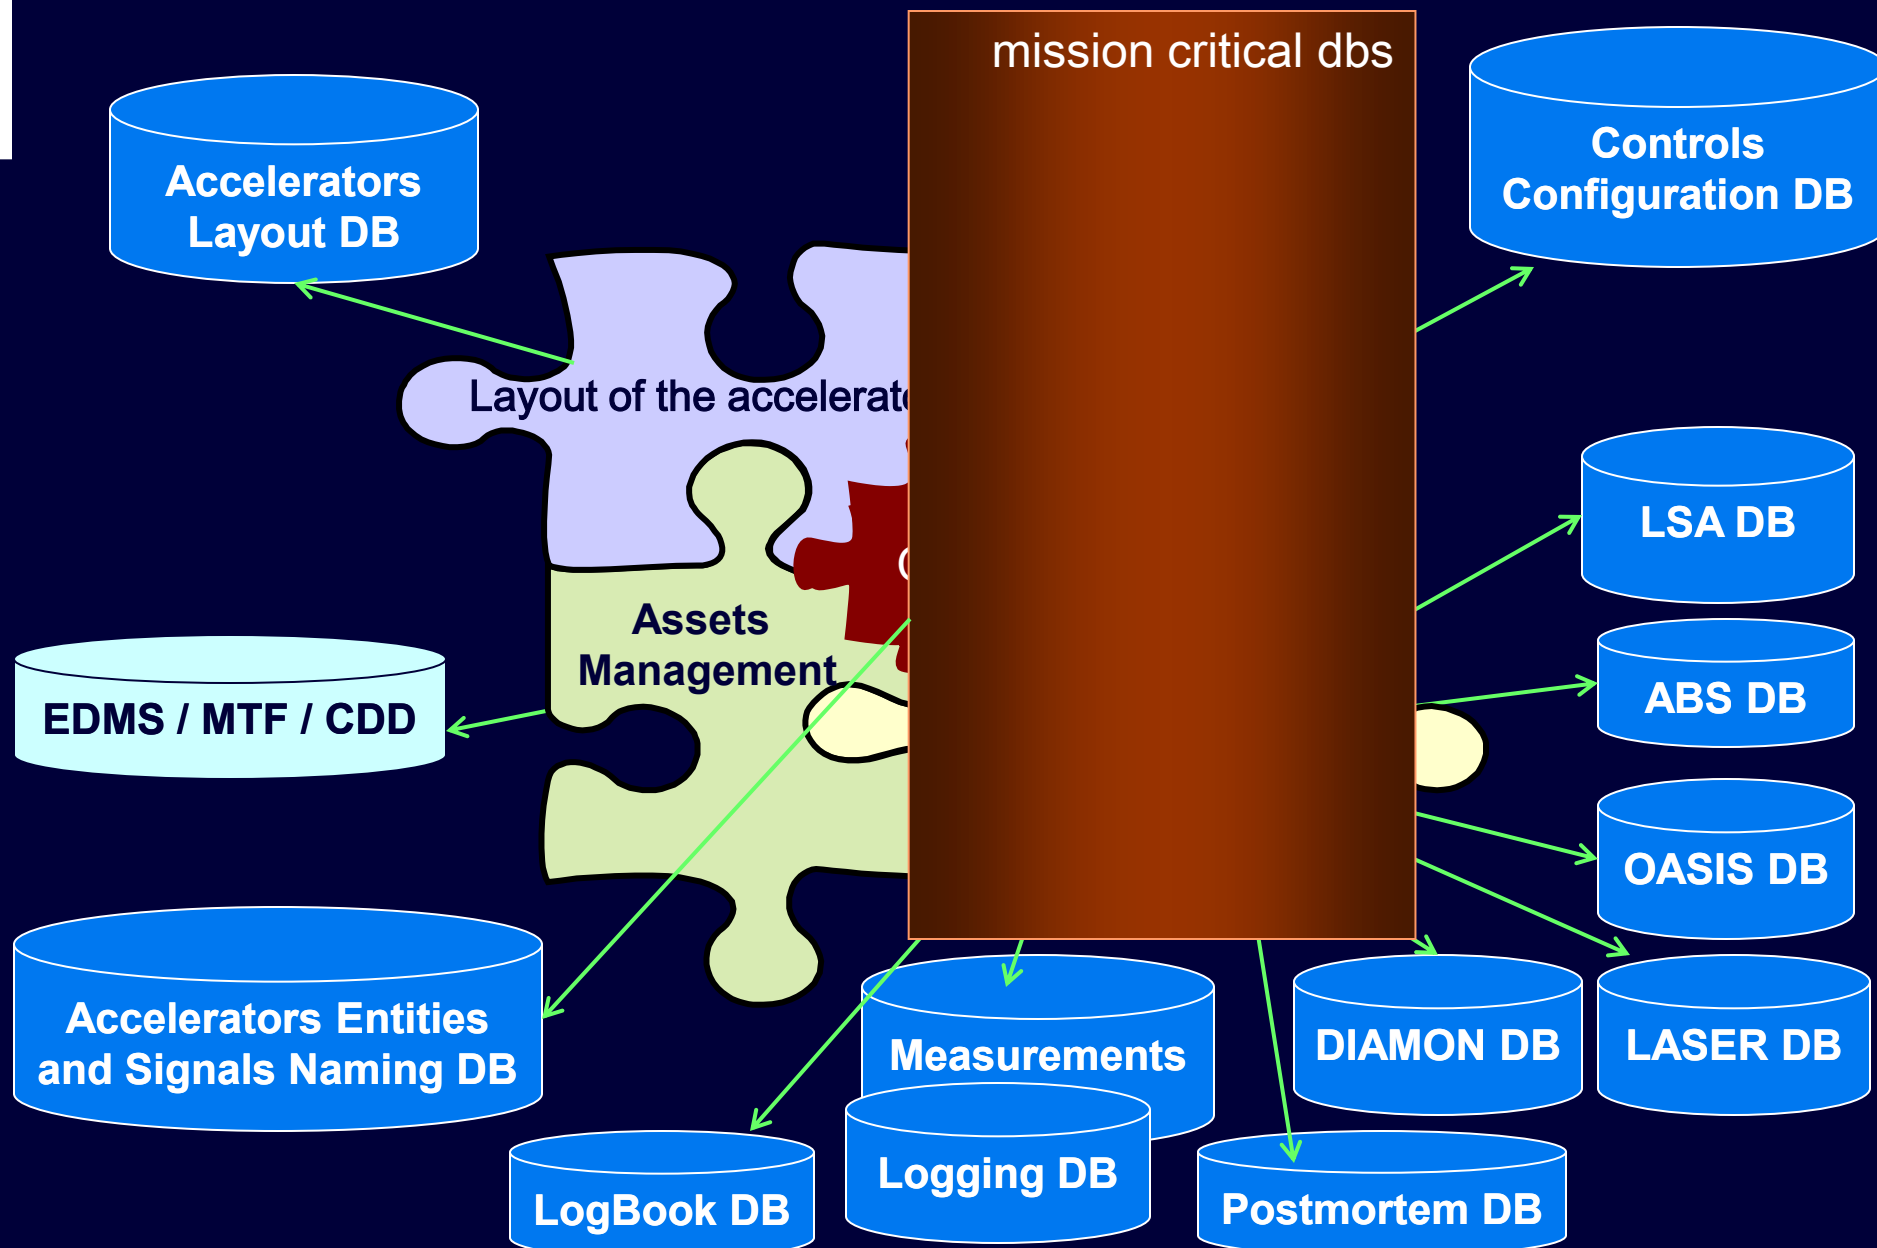

⇒ Common understanding

⇒ Good communication

# List of the Databases in the Data Domains

# Implementation Strategy

## ➔ DB technology

- ➔ Oracle Databases for all technical data

## ➔ Data-driven applications and APIs

- ➔ Java, J2EE

- ➔ Oracle technology applications stack

## ➔ Reliable database services

- ➔ On-line usage of database services for the accelerators control

# Outline

- ➔ Overview of the main data domains for the Injectors
- ➔ State and on-going developments
- ➔ Dependencies between the different databases
- ➔ Strategy for smooth upgrades of data-driven controls system
- ➔ Conclusion

# Layout DB

- ➔ Information scope – data about the **positions (slots) of the installed equipment**
  - ⇒ **Beam line** equipment
  - ⇒ **Assembly break-down** structures of slots
  - ⇒ **Electrical circuits** - connectivity between power converters and their loads (magnets, RF cavities, ...)
  - ⇒ Layout of the **electronics** for the controls system
  - ⇒ Hub to **other data repositories**
    - Design info, drawings, pictures (EDMS);
    - Asset (MTF);
    - Equipment databases (NORMA, TE-EPC ALIM DB)
- ➔ Aim to describe the **complete accelerator complex**

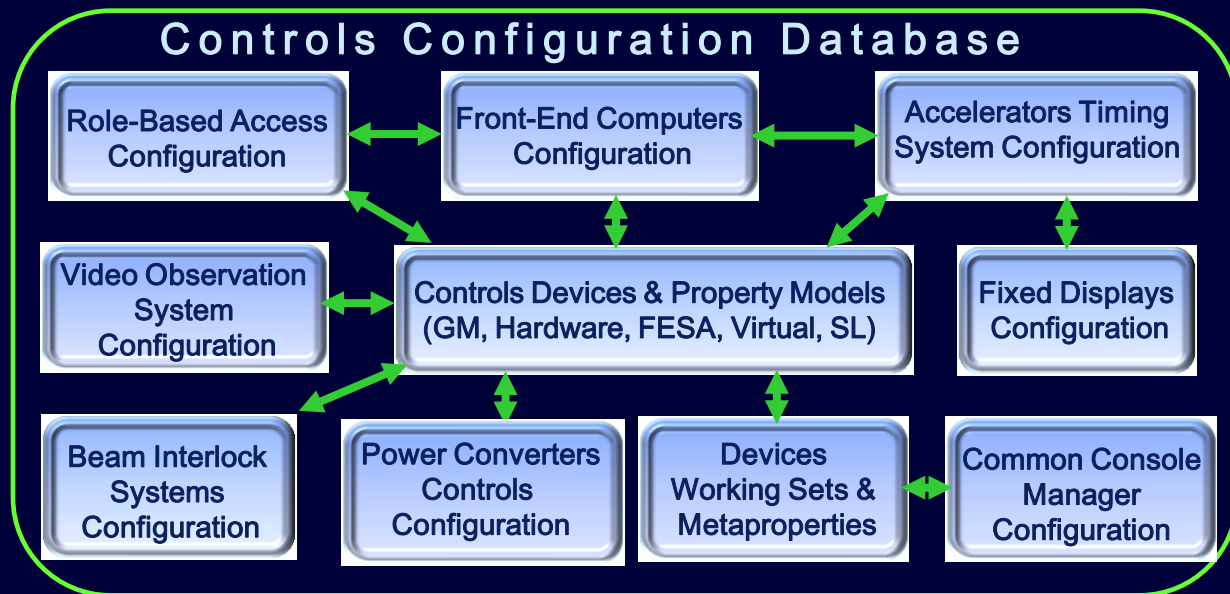

# Layout DB recent work

- ➔ Work on **capturing data** since Sep 2010
  - ➔ **Linac4** (priority 1) - capturing data for the electrical circuits including those related to the accelerating cavities
  - ➔ Work on the installed equipment in the **Transfer Lines towards the Booster [LT, LTB, LBE, LBS, BI]** (priority 2); driving factor LINAC4
  - ➔ Establishing the **Booster electrical circuits** (priority 3)
  - ➔ Work on **TT10** (priority 4) – investigation into the existing sources of data (MAD files, drawings, reality)
  - ➔ Started the feasibility study to link Layout data to the ‘Cablotheque’ DB
- ➔ Data capture and validation
  - ➔ Is **challenging & resource intensive** – reverse engineering from legacy sources
  - ➔ **Needs prioritizing**
- ➔ Internal work on the Layout db structures – **refactoring the db model** due to the expansion in functionality during the last 7 years

# Controls Configuration DB

- ➔ The heart of the Controls System providing configuration data for all accelerators - service with 25 years of history
- ➔ Contains data for the complete **Controls System topology**
  - ⇒ Main users: FESA, CMW, RBAC, Computers Configuration (~3000), Drivers Gen, Accelerators Timing System, Common Console Manager, FixedDisplays, Power Converters Controls ...
  - ⇒ 5 device-property models (GM, FESA, SL, Hardware, Virtual)
  - Total of 1400+ classes & 75000+ devices
  - For the Injectors  
800+ classes & 34000+ devices

# Controls Configuration DB

## ➔ New db developments for:

- ➔ **FESA 3.0** – major effort to restructure the data management part
  - **Structured handling of XML files** (used only for data exchange)
  - Complete **integration** of FESA data into the CCDB relational db model
  - Easier to handle common data management tasks (FESA 2.x)
- ➔ **Renovation projects** – InCA and ACCOR
- ➔ Improvements in the **Front-End Computers Configurations**
- ➔ Renovation of the **Accelerators Timing Configuration**

## ➔ Continuous improvements of:

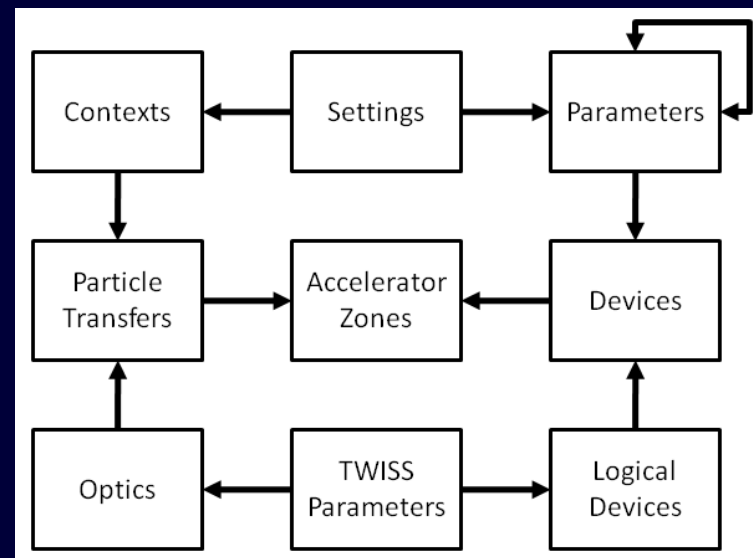

- ➔ Interactive GUIs – 12 data editing applications (200+ forms), reporting tools (150+ reports)
- ➔ Java & PL/SQL APIs

## ➔ Request to OP & Equipment experts – **maintain the data!**

## Operational Domain – LSA DB

- ➔ High level controls and settings management for the accelerators
- ➔ Introducing the LSA DB into the PS Complex – renovation project
  - ⇒ PS in 2010, PSB in 2011
  - ⇒ **Integrate** and **validate** the existing data into the LSA model
  - ⇒ **Extend** and **adapt** the model to cater for the specifics of the Injectors
- ➔ PS Complex Automated Beam Steering DB (ABS)

- ⇒ Migrating ABS data to LSA DB (YASP)
- ⇒ Difficult to model the PS machine
- ⇒ Phasing out the ABS DB in 2013

# Operational Domain - Measurements and Logging

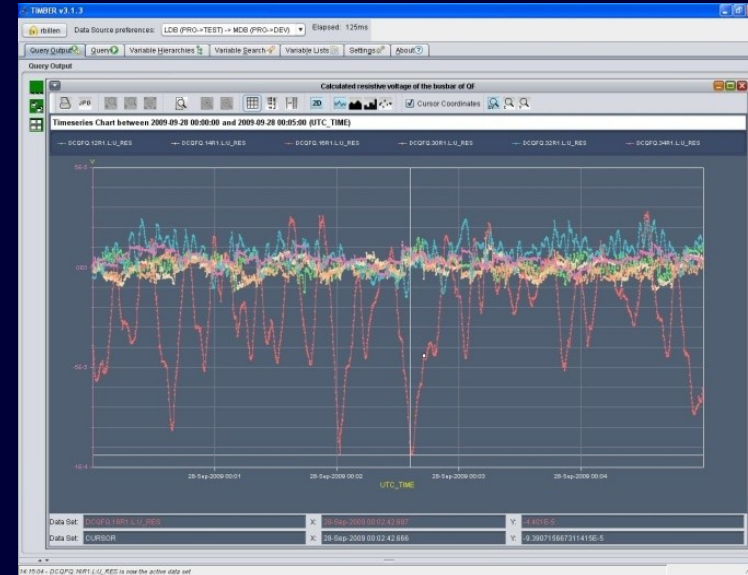

➔ Stores time-series data on beam and equipment measurements

➔ Functionality boost and new developments

➔ Java API for clients

➔ Internal db improvements

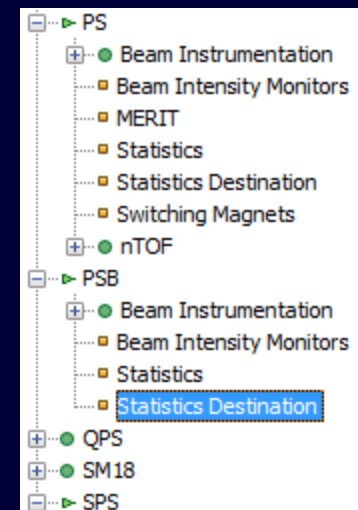

➔ GUI – Timber v.4

➔ Provides some tailored services for the Injectors

➔ Statistics – based on expressed OP requirements

➔ Request to data providers and end-users - check the stored data periodically to ensure correct data has arrived

# Operational Data Domain – Diamon and LASER

- ➔ LASER (Alarms) - capturing, storing and notification of anomalies
- ➔ Diamon - diagnostics and monitoring of the Controls infrastructure
- ➔ **Continuous efforts** in improving the **configuration data set**
  - ⇒ Streamlining the data flow into the Alarms database from the different providers of alarms configuration data
  - ⇒ Enhancing the data set propagated from CCDB to Diamon
  - ⇒ Development of suite of **Data Management Tools** for LASER – give users the possibility to **explore their data and maintain it**
- ➔ Work on new db models for Laser and Diamon - triggered by upcoming changes in both systems

**LASER ALARMS DATABASE - Data Browser**

**LASER BROWSER HOME**

**LASER BROWSER**

**Definition**

**Alarms**

- [General Alarms](#)
- [Reduction Alarms](#)
- [Alarm in Reduction](#)
- [Alarm Location](#)
- [Alarm Status](#)
- [Provider\(TNs\)](#)

**Categories**

- [Categories](#)
- [Categories Tree](#)
- [Categories Per Alarms](#)

**Sources**

- [Sources](#)

**Instructions**

- [Instructions](#)
- [Alarm Instructions](#)

**Analysis Events**

**Charts**

- [TI Fault Family](#)
- [Events per Source](#)
- [Events per Category](#)

**Reports**

- [Active Alarms](#)
- [Activated-Terminated Alarms](#)

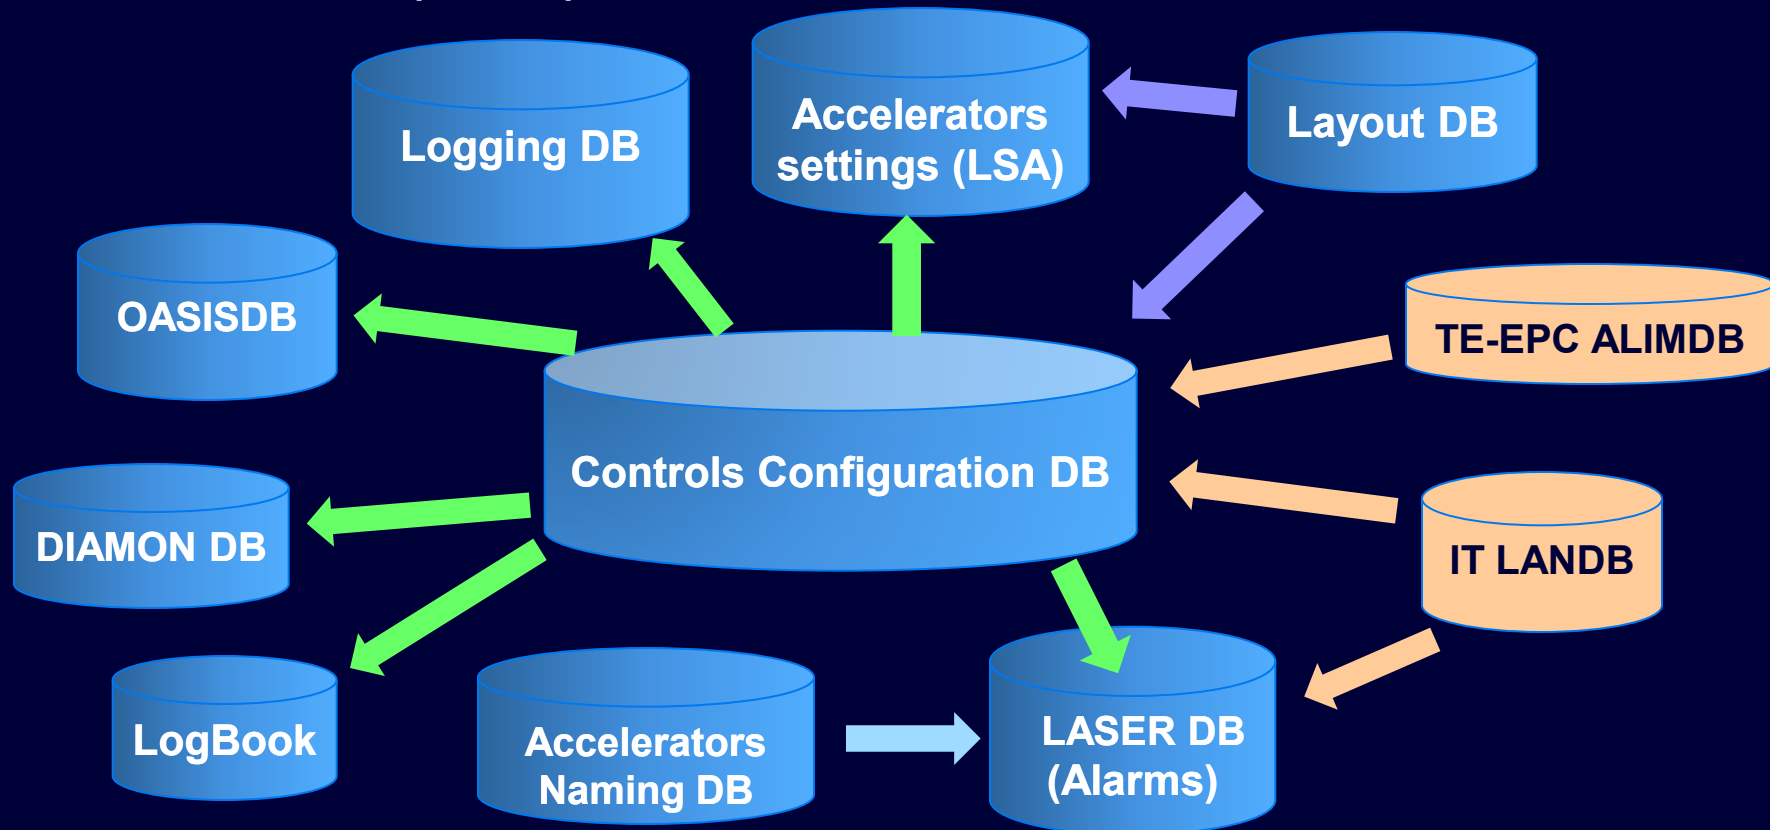

# Outline

- ➔ Overview of the main data domains for the Injectors
- ➔ State and on-going developments
- ➔ Interdependencies between the different databases
- ➔ Strategy for smooth upgrades of data-driven controls system
- ➔ Conclusion

# Interdependencies between the databases

- ➔ Data is maintained only in one place
  - ⇒ Ensuring **single source of consistent data**
  - ⇒ Examples: Controls configuration data in Controls Configuration DB, data for positions of installed components in Layout DB
- ➔ **Data propagation** from one domain to another for the purpose of the accelerator complex operation

# Responsibility

- ➔ DM team responsible for
  - ➔ Database structures
  - ➔ GUIs to modify / visualize the data
  - ➔ Initial data loading
  
- ➔ Data Owners – equipment experts, CO experts and Operators
  - ➔ Responsible for the data – to define data and keep it up-to-date
  
- ➔ A database is only as good as the **correctness of the data** it contains and how **closely it represents reality**

# Outline

- ➔ Overview of the main data domains for the Injectors
- ➔ State and on-going developments
- ➔ Interdependencies between the different databases
- ➔ Strategy for smooth upgrades of data-driven controls system
- ➔ Conclusion

# Types of Upgrade from DM point of view

- ➔ Upgrades of the **database systems and related interfaces**
  - ⇒ Structural / functional changes to the db schema or interfaces
  - ⇒ Under the responsibility of the DM team
  
- ➔ **Changes to the data** stored in the different databases
  - ⇒ Under the responsibility of the data owners

# Upgrades of the Database Systems

## ➔ Strategy for smooth upgrades

- ➔ **Involve end-users** right from the start, throughout the design and development process
- ➔ Provide **4 separate environments** for development, unit and functional testing, integration testing (TestBed), production
- ➔ **Analyze the impact** of a change and try to apply only backward compatible changes
- ➔ Clear **communication** on scheduled intervention and their impact
- ➔ **Coordinate** the upgrades with impacted clients

## ➔ The strategy is working well

- ➔ Proposal to OP & Equipment experts to verify the list of link people, responsible for the different applications and systems each year

# Changes to the data stored in the databases

## ➔ In a data-driven Controls System

- ➔ The data in the different databases represents components and their properties as seen by the Controls System
- ➔ Example: FESA or GM class and its properties

➔ The components of the Controls System need to be upgraded regularly (Front-End Computers, Device Classes, etc), therefore there is a need for regular data changes

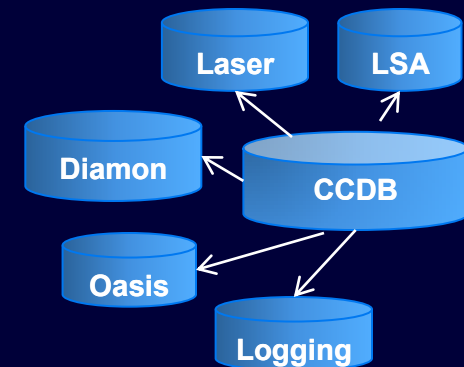

# Safe propagation of data changes

## ➔ Challenges in a distributed db environment

➔ A data change in one database could have an impact in other areas (non-backward compatible data changes)

**Example:** A controls device is renamed in the Controls Configuration DB

- is this device used in LSA by Operations
- are there alarm definitions in LASER
- are there signals to be logged for it in the Logging DB
- are there equipment relations in Oasis

➔ **Need** to know the **data dependencies** between the different systems

➔ **Need** to ensure a **coherent set of data** throughout all **distributed databases** – the Controls system needs a coherent set of data

# Strategy for safe propagation of data changes

- ➔ Changes of data should be addressed in a structured and systematic way
  - ⇒ Knowledge of data dependencies of Operations systems
  - ⇒ Analyze the impact of a data change
  - ⇒ Authorize only backward compatible changes (if possible)
  - ⇒ Non-backward compatible changes allowed with coordination and follow-up
- ➔ Proposed solution: restrict (delay) data modifications for non-backward compatible changes until necessary actions have been taken in the dependent systems
- ➔ Clearly define the visibility (usage) of the data for Operations systems
  - ⇒ Defining public (operations) and private (equipment experts) data for the Configuration of the Controls system

## Conclusion

- ➔ The **databases** for the Injectors Controls and Operation are a **fundamental service** upon which different systems are built
  
- ➔ **Continuous effort** is being put into **rationalizing, improving, federating and developing new functionality** in the existing databases and their interfaces
  - ⇒ Years of history for some of the domains and accelerators – more difficult to impose certain QA rules

## Conclusion

- ➔ **Data management** requires the involvement of the data owners and data users
  - ⇒ Being proactive, maintaining the data up-to-date, cleaning-up obsolete data
  
- ➔ To ensure **smooth upgrades, based on data changes** of the data-driven control system procedures should be followed
  - ⇒ In the Layout domain - Engineering Change Requests
  - ⇒ In the Controls Configuration domain - notify dependent systems, restrict (delay) data modifications for non-backward compatible changes
  
- ➔ **Communication** is an important aspect of the smooth upgrades
  - ⇒ Data owners
  - ⇒ Data users
  - ⇒ DM team
