# Double Parton Scattering

Multiparton interaction (MPI) can contribute to the, pp and pA, cross section @ the LHC:

Transverse distance between two partons

A formal all-order proof of the factorization formulae in perturbative QCD has been achieved for DPS in the case of a colorless final state, both for the TMD and the collinear case. Current status is at the same level as for the SPS counterpart.

## DPS in $\gamma - p$ interactions

We consider the possibility offered by a DPS process involving a photon FLACTUATING in a quark-antiquark pair interacting with a proton:

ek

M. R. and F. A. Ceccopieri, PRD 105 (2022) L011501

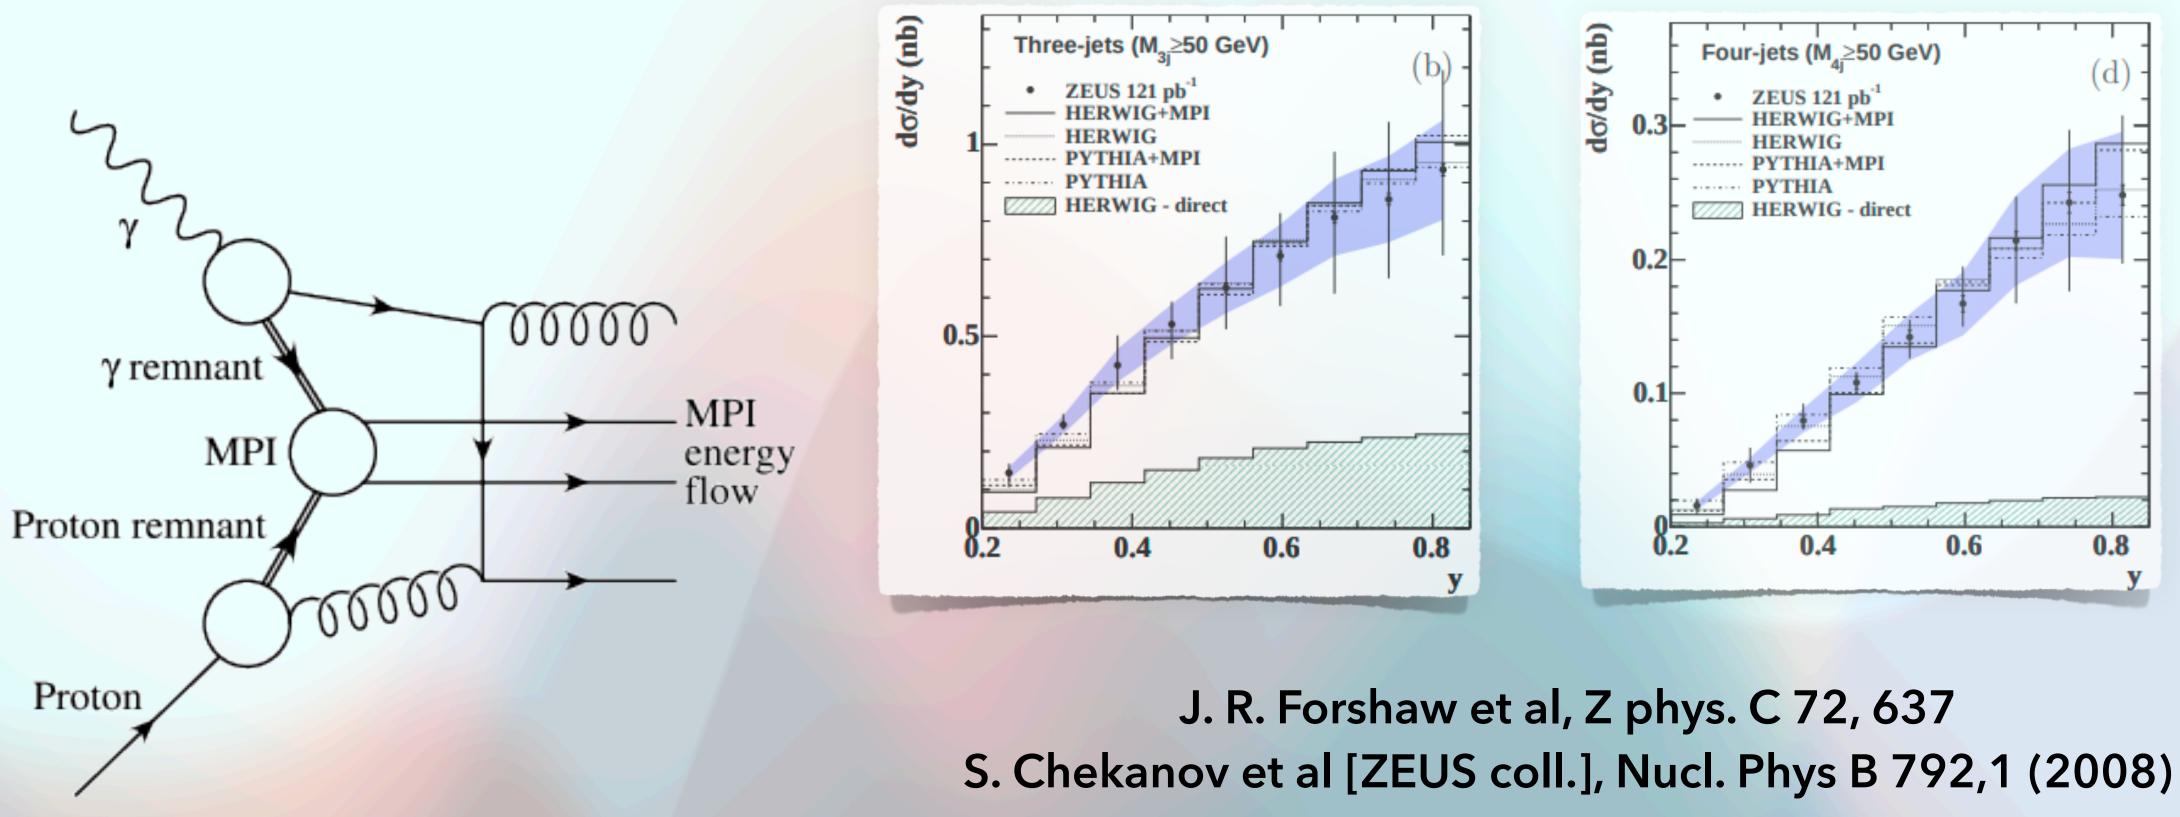

Matteo Rinaldi

## DPS in $\gamma - p$ interactions

Already at HERA the importance of MPI for the **3**,**4 jets photo-production** has been addressed:

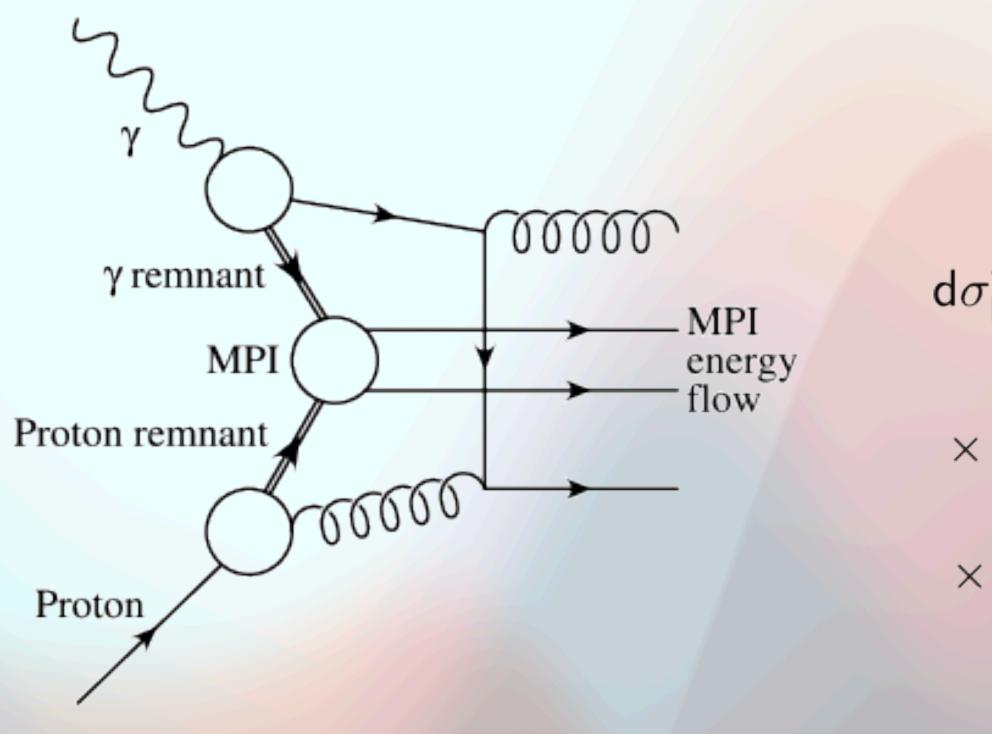

Matteo Rinaldi

# DPS in $\gamma - p$ interactions

In order to study the impact of the DPS contribution to a process initiated via photon-proton interactions we evaluated the 4-JET photo-production at HERA (S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008))

Proton PDF (J. Pumplin et al. JHEP 07, 012 (2002)

Matteo Rinaldi

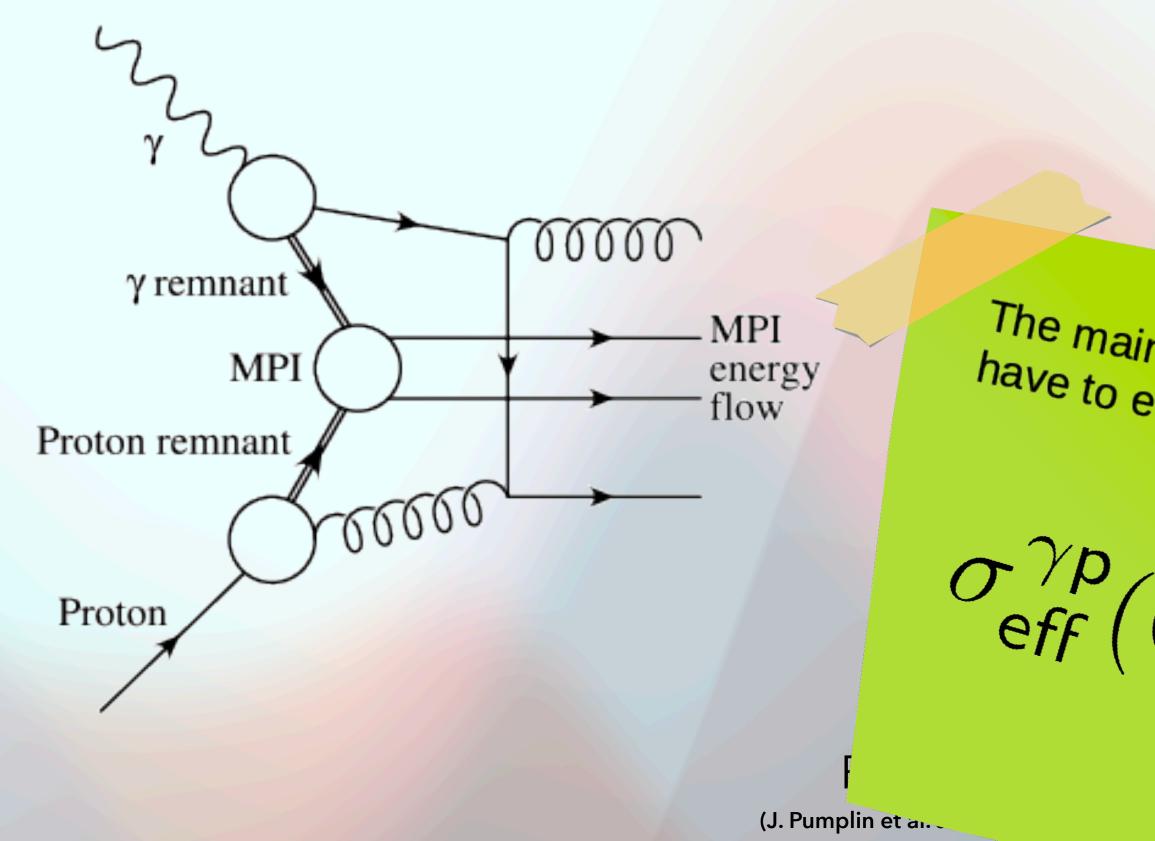

For this first investigation, we make use of the **POCKET FORMULA:** Flux Factor P. Nason et al, PLB319  $d\sigma_{\text{DPS}}^{4j} = \frac{1}{2} \sum_{\text{ab of}} \int dy \, dQ^2 \frac{f_{\gamma/e}(y, Q^2)}{\sigma_{\text{off}}^{\gamma p}(Q^2)}$  $\times \int dx_{p_a} dx_{\gamma_b} f_{a/p}(x_{p_a}) f_{b/\gamma}(x_{\gamma_b}) d\hat{\sigma}_{ab}^{2j}(x_{p_a}, x_{\gamma_b}) \\ \times \int dx_{p_c} dx_{\gamma_d} f_{c/p}(x_{p_c}) f_{d/\gamma}(x_{\gamma_d}) d\hat{\sigma}_{cd}^{2j}(x_{p_c}, x_{\gamma_d}) \right\}$ SPS \* SPS Photon PDF

(M. Gluck et al. PRD46, 1973 (1992)

## DPS in $\gamma - p$ interactions

In order to study the impact of the DPS contribution to a process initiated via photon-proton interactions we evaluated the 4-JET photo-production at HERA (**S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008**))

Matteo Rinaldi

Electron-ion Collider User Group Meeting 2023

For this first investigation, we make use of the **POCKET FORMULA:** 

 $\sigma_{\rm eff}^{\gamma \rm p}(Q^2)$ 

The main quantity we have to evaluate is:

 $\begin{aligned} &(\mathsf{x}_{\gamma_{\mathsf{b}}})\mathsf{d}\hat{\sigma}_{\mathsf{ab}}^{2\mathsf{j}}(\mathsf{x}_{\mathsf{p}_{\mathsf{a}}},\mathsf{x}_{\gamma_{\mathsf{b}}}) \\ &\gamma(\mathsf{x}_{\gamma_{\mathsf{d}}})\mathsf{d}\hat{\sigma}_{\mathsf{cd}}^{2\mathsf{j}}(\mathsf{x}_{\mathsf{p}_{\mathsf{c}}},\mathsf{x}_{\gamma_{\mathsf{d}}}) \end{aligned}$ SPS \* SPS

Photon PDF (M. Gluck et al. PRD46, 1973 (1992)

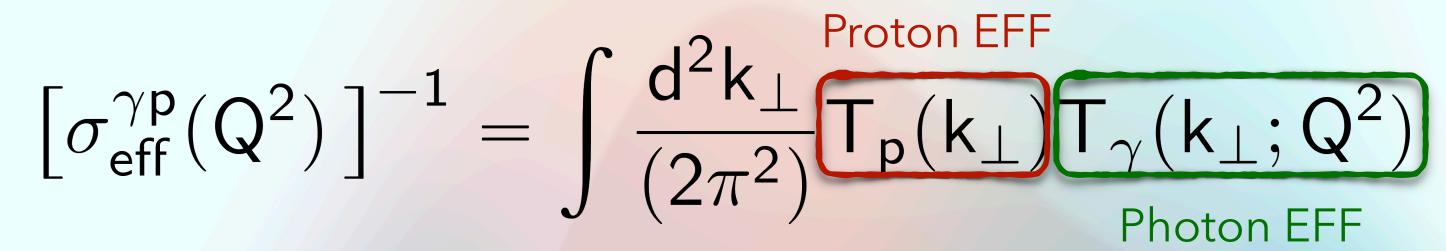

# The $\gamma - p$ effective cross-section

The expression of this quantity is very similar to the proton-proton collision case and can be formally derived by comparing the product of SPS cross sections and the DPS one obtained in Gaunt, JHEP 01, 042 (2013) and

describing a DPS from a vector bosons splitting with given Q<sup>2</sup> virtuality

The full DPS cross section depends on the amplitude of the splitting photon in a  $q - \bar{q}$  pair. The latter can be formally described within a Light-Front (LF) approach in terms of LF wave functions

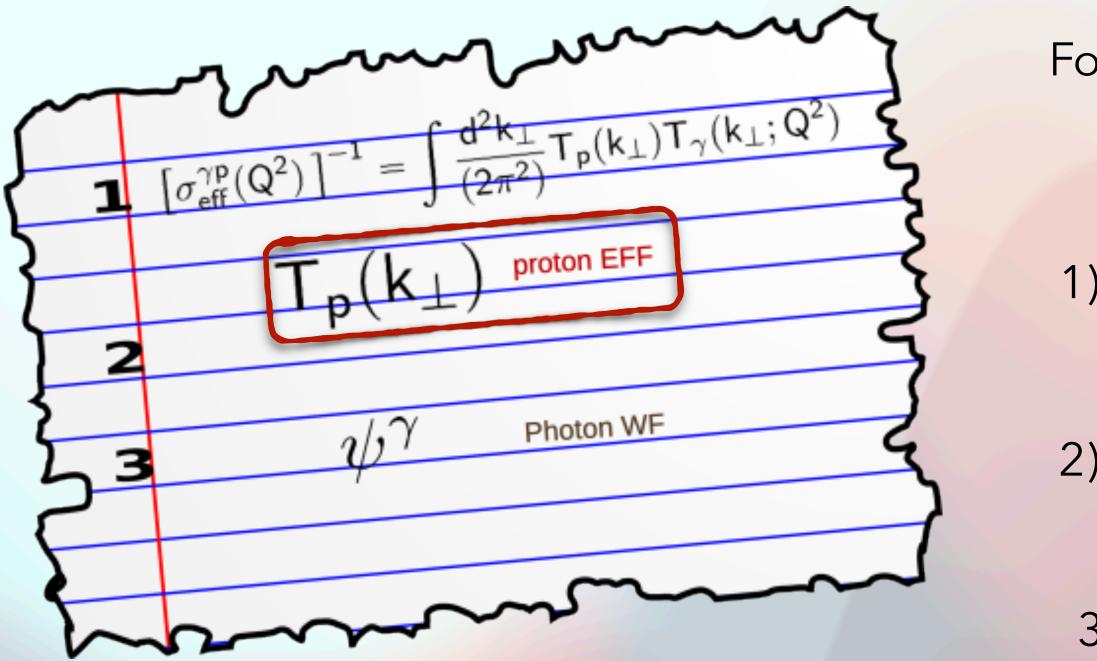

Matteo Rinaldi

## The $\gamma - p$ effective cross-section

The main ingredients of the calculations:

Matteo Rinaldi

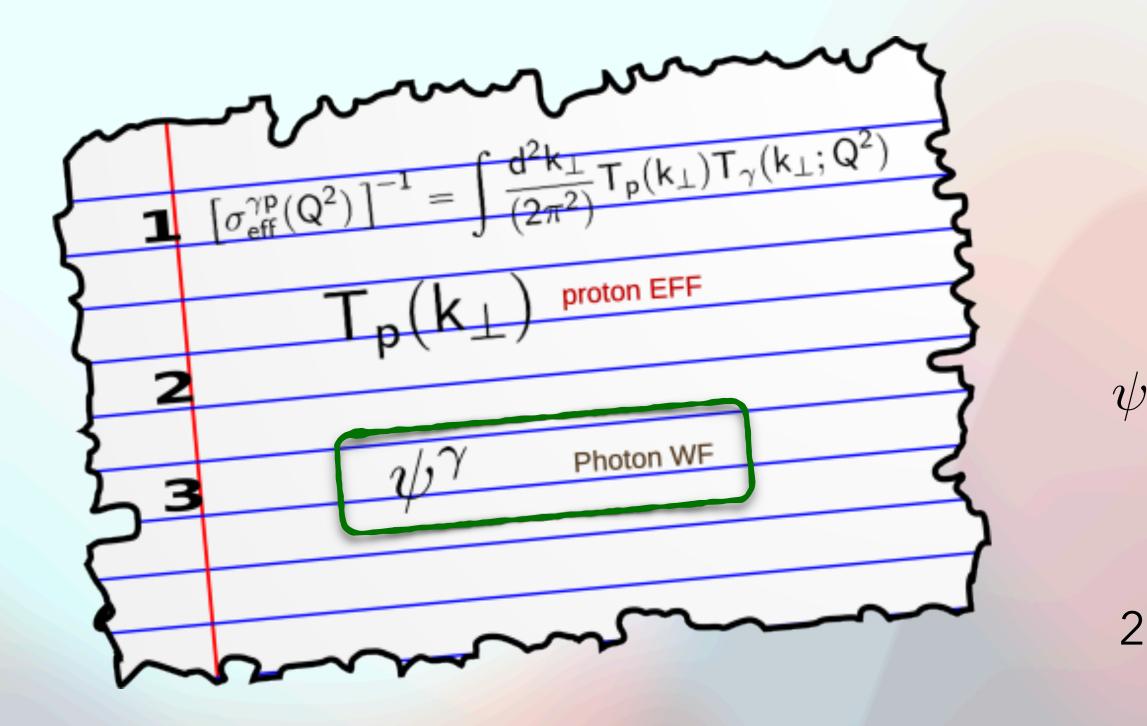

For the proton EFF use has been made of three choices:

G1 
$$e^{-\alpha_1 k_\perp^2}$$
,  $\alpha_1 = 1.53 \text{ GeV}^{-2} \Longrightarrow \sigma_{\text{eff}}^{\text{pp}} = 15 \text{ mb}$   
G2  $e^{-\alpha_2 k_\perp^2}$ ,  $\alpha_2 = 2.56 \text{ GeV}^{-2} \Longrightarrow \sigma_{\text{eff}}^{\text{pp}} = 25 \text{ mb}$   
(1 +  $\frac{k_\perp^2}{m_g^2}$ )<sup>-4</sup>,  $m_g^2 = 1.1 \text{ GeV}^2 \Longrightarrow \sigma_{\text{eff}}^{\text{pp}} = 30 \text{ mb}$ 

## The $\gamma - p$ effective cross-section

The main ingredients of the calculations:

Matteo Rinaldi

**Electron-ion** Collider User Group Meeting 2023

For the photon W.F. use has been made of two choices representing two extreme cases:

1) QED at LO (S.J. Brodsky et al. PRD50, 3134 (1994)):

$$\begin{split} & \overset{\lambda=\pm}{_{\mathbf{q},\bar{\mathbf{q}}}}(\mathbf{x},\mathbf{k}_{1\perp};\mathbf{Q}^2) = -\mathbf{e}_{\mathbf{f}} \frac{\bar{\mathbf{u}}_{\mathbf{q}}(\mathbf{k}) \ \gamma \cdot \varepsilon^{\lambda} \ \mathbf{v}_{\bar{\mathbf{q}}}(\mathbf{q}-\mathbf{k})}{\sqrt{\mathbf{x}(1-\mathbf{x})} \left[\mathbf{Q}^2 + \frac{\mathbf{k}_{1\perp}^2 + \mathbf{m}^2}{\mathbf{x}(1-\mathbf{x})}\right]} \end{split}$$

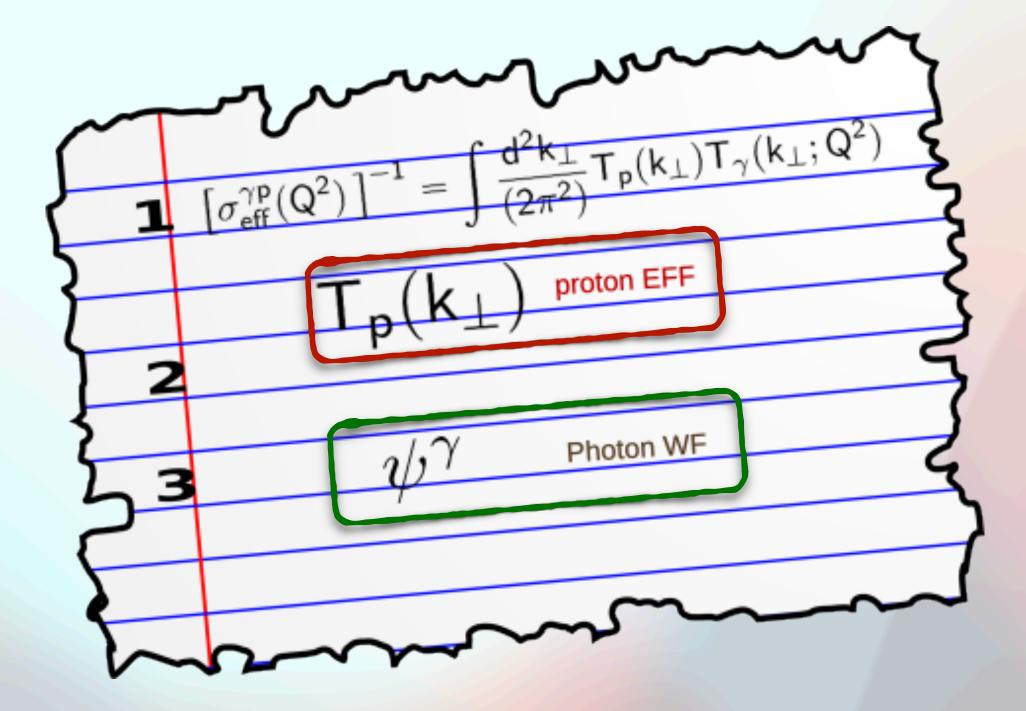

2) Non-Pertubative (NP) effects (E.R.Arriola et al, PRD74,054023 (2006))

$$\begin{split} \psi_{\mathsf{A}}^{\gamma}(\mathsf{x},\mathsf{k}_{\perp 1};\mathsf{Q}^2) &= \frac{6(1+\mathsf{Q}^2/\mathsf{m}_{\rho}^2)}{\mathsf{m}_{\rho}^2 \left(1+4\frac{\mathsf{k}_{\perp 1}^2+\mathsf{Q}^2\mathsf{x}(1-\mathsf{x})}{\mathsf{m}_{\rho}^2}\right)^{5/2}} \end{split}$$

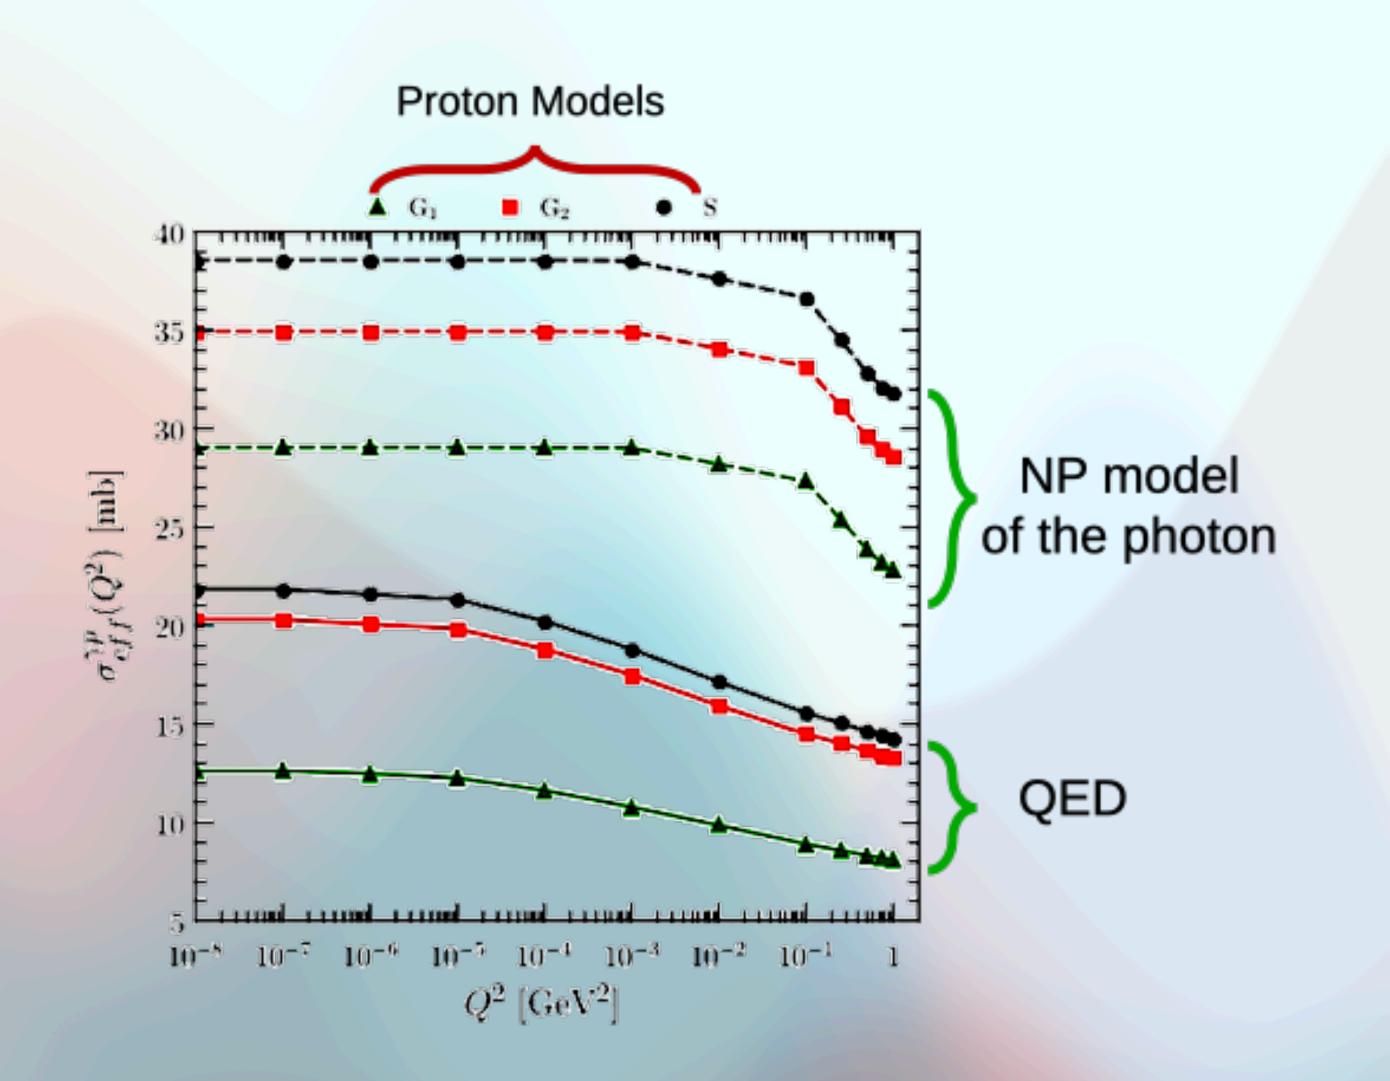

#### The $\gamma - p$ effective cross-section M. R. and F. A. Ceccopieri, PRD 105 (2022) L011501

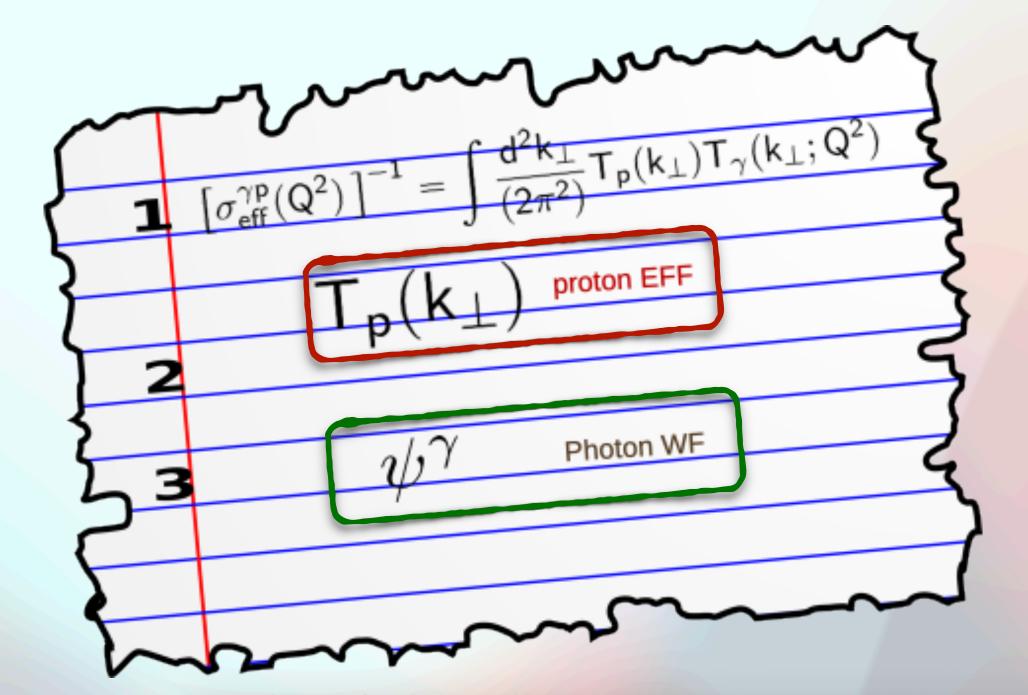

Matteo Rinaldi

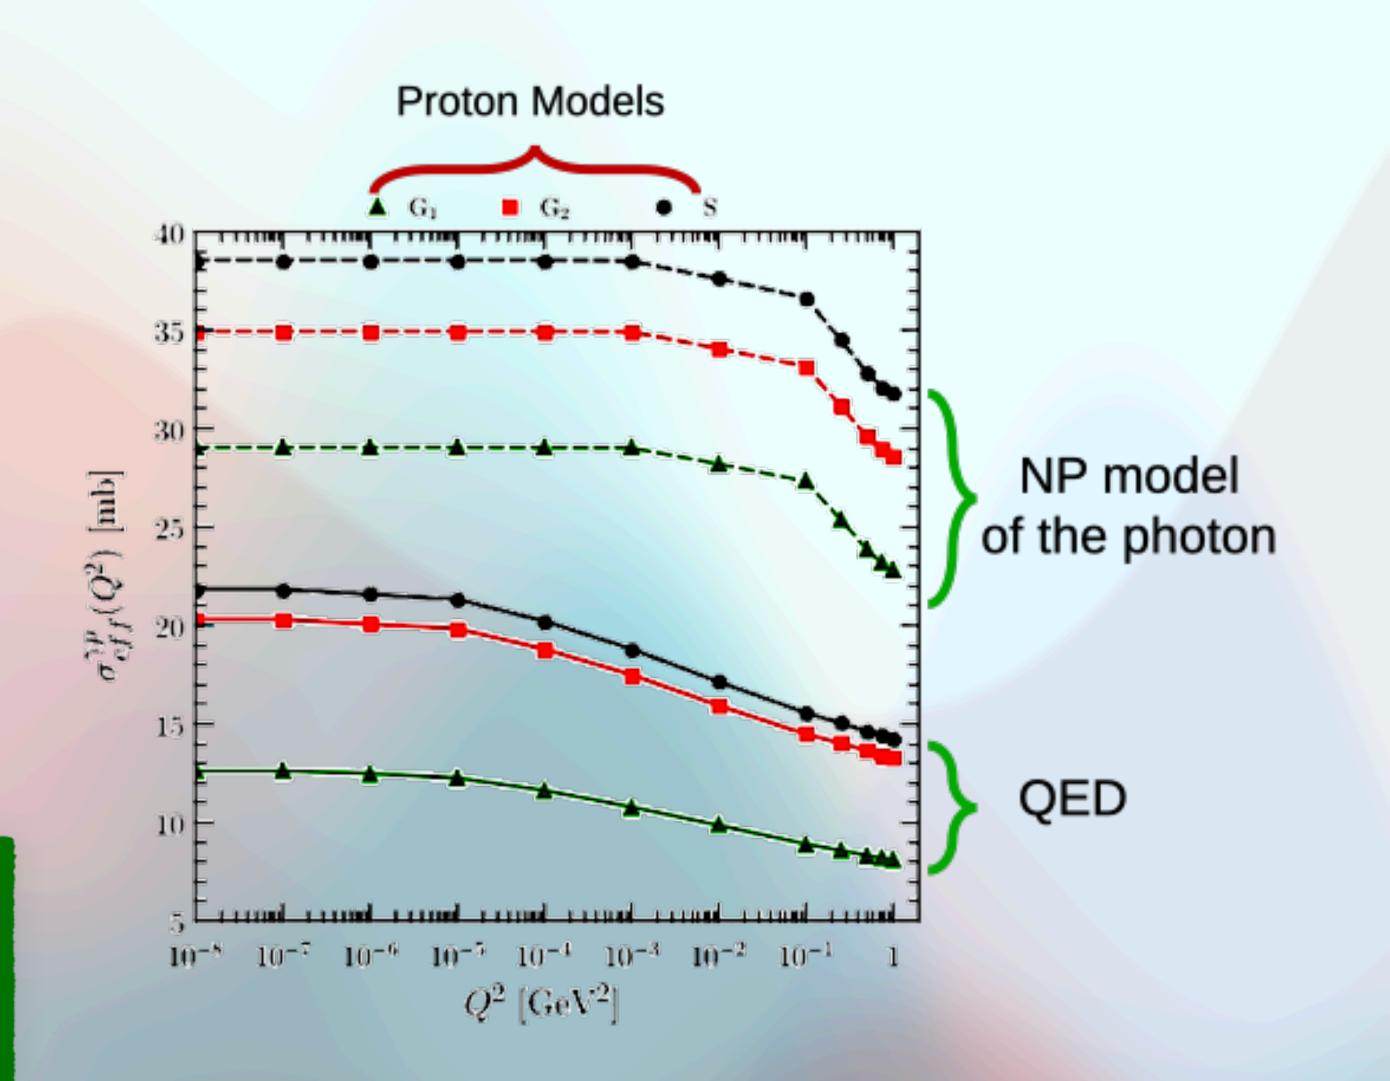

#### The $\gamma - p$ effective cross-section M. R. and F. A. Ceccopieri, PRD 105 (2022) L011501

The effective cross-section depends on the photon virtuality! (NEW)

Matteo Rinaldi

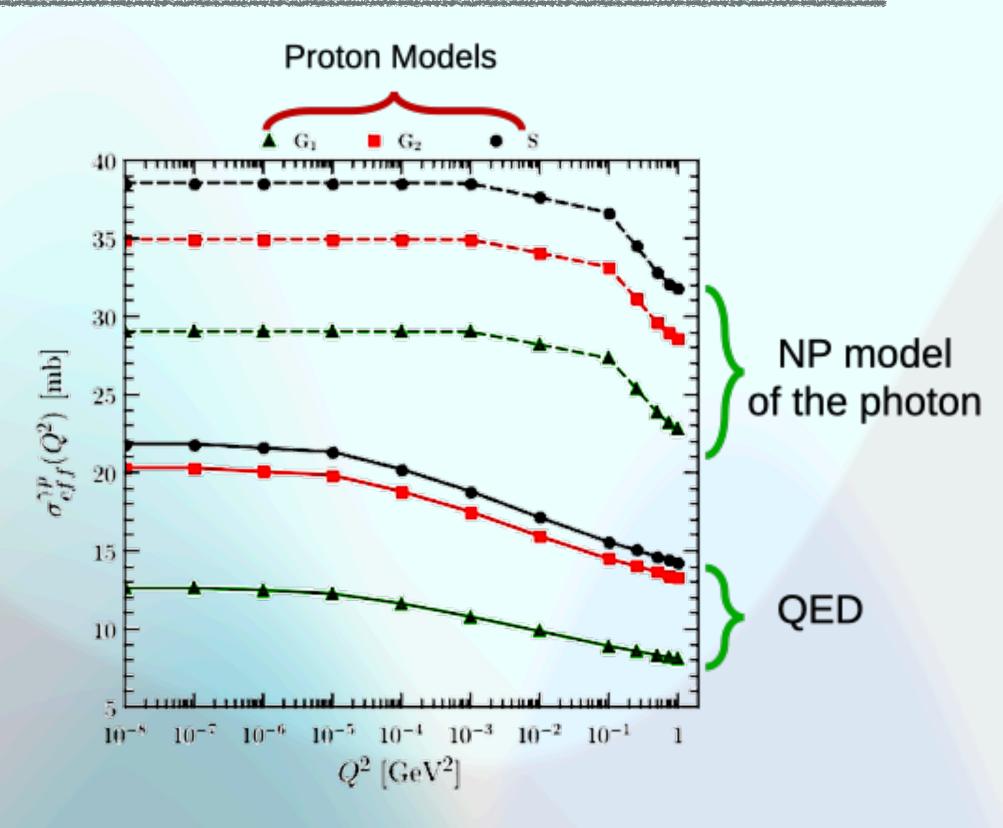

### The 4-jets DPS cross-section

$$\begin{split} &d\sigma_{\text{DPS}}^{4j} = \frac{1}{2} \sum_{ab,cd} \int dy \ dQ^2 \ \frac{f_{\gamma/e}(y,Q^2)}{\sigma_{\text{eff}}^{\gamma p}(Q^2)} \times \\ & \times \int dx_{p_a} dx_{\gamma_b} f_{a/p}(x_{p_a}) f_{b/\gamma}(x_{\gamma_b}) d\hat{\sigma}_{ab}^{2j}(x_{p_a},x_{\gamma_b}) \\ & \times \int dx_{p_c} dx_{\gamma_d} f_{c/p}(x_{p_c}) f_{d/\gamma}(x_{\gamma_d}) d\hat{\sigma}_{cd}^{2j}(x_{p_c},x_{\gamma_d}) \end{split}$$

**KINEMATICS**:  $E_T^{jet} > 6 \text{ GeV}$  $|\eta_{\rm jet}| < 2.4$  $Q^2 < 1 \ {\rm GeV}^2$  $0.2 \leq y \leq 0.85$ 

S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008)

Matteo Rinaldi

The ZEUS collaboration quoted an integrated total 4-jet cross section of 136 pb

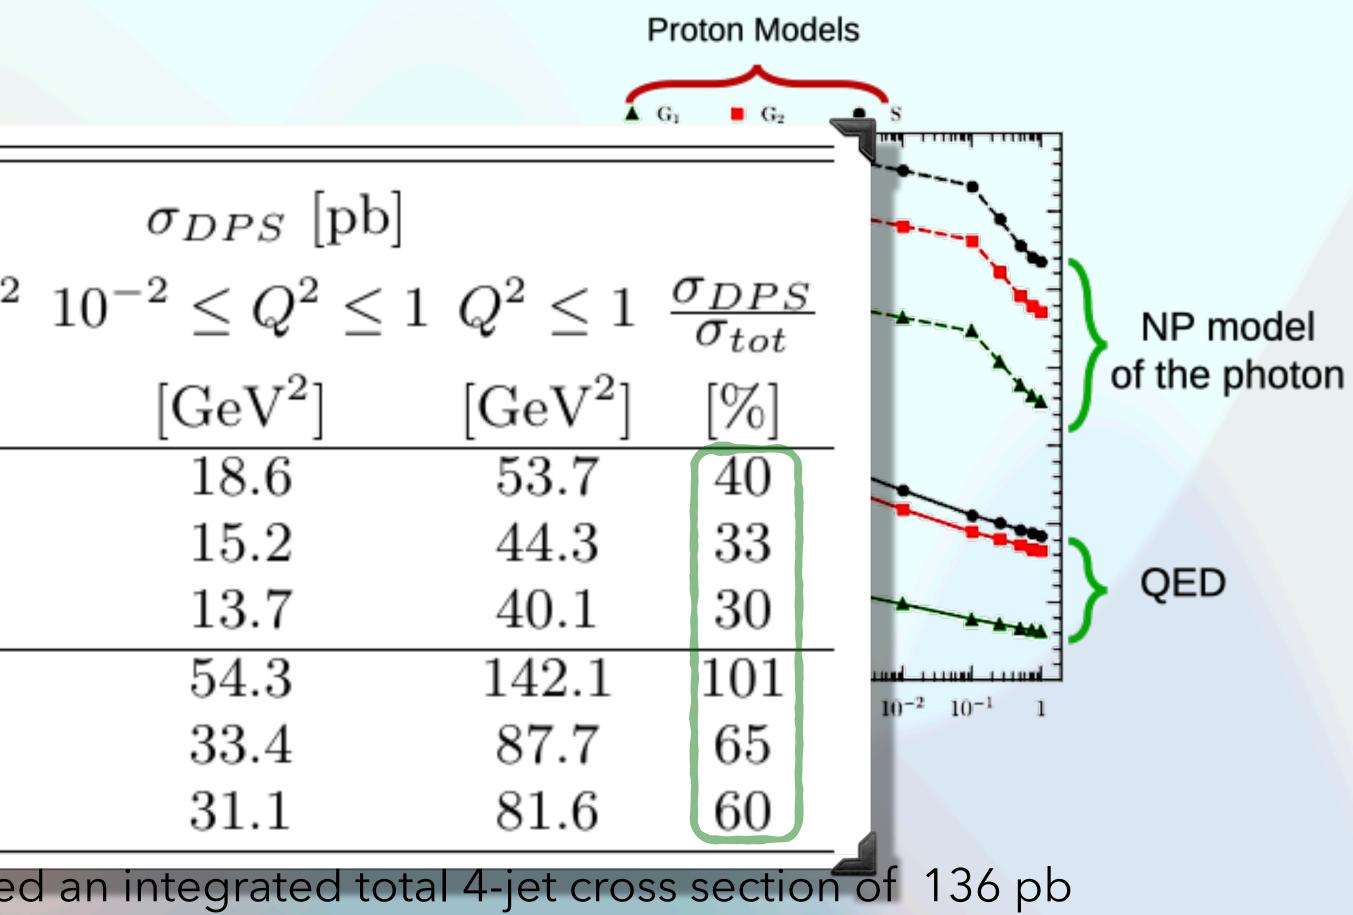

### The 4-jets DPS cross-section

$$\begin{split} d\sigma_{DPS}^{4j} &= \frac{1}{2} \sum_{ab,cd} \int \\ &\times \int dx_{p_a} dx_{\gamma_b} f_{a/p} (\\ &\times \int dx_{p_c} dx_{\gamma_d} f_{c/p} (\\ &KINEMATICS: \\ E_T^{jet} &> 6 \text{ GeV} \\ &|\eta_{jet}| &< 2.4 \\ Q^2 &< 1 \text{ GeV}^2 \end{split}$$

#### **POSSIBLE SOLUTION?**

background that can be evaluated if we properly treat the photon (as previously discussed) and the Nuclear geometry

Matteo Rinaldi

2) for heavy nuclei is difficult to perform calculation with wave-function obtained from realistic potentials

1) In γA the DPS2 will not contain any DPD of the proton \_\_\_\_\_\_ this mechanism can now be viewed as a

2) For light nuclei these calculations can be done starting from realistic wave-function (Av18 or chiral potential)!

For example in DPS1:

$$\tilde{\mathsf{F}}_{\mathsf{a}_1\mathsf{a}_2}^1(\mathsf{x}_1,\mathsf{x}_2,\mathsf{k}_\perp) = \sum_{\mathsf{N}=\mathsf{p},\mathsf{n}} \int \frac{1}{\xi} \tilde{\mathsf{F}}_{\mathsf{a}_1\mathsf{a}_2}^\mathsf{N}\left(\frac{\mathsf{x}_1}{\xi},\frac{\mathsf{x}_2}{\xi},\mathsf{k}_\perp\right) \rho_\mathsf{A}^\mathsf{N}(\xi,\mathsf{p}_{\mathsf{t},\mathsf{N}}) \frac{\mathsf{d}\xi}{\xi} \mathsf{d}^2\mathsf{p}_{\mathsf{t},\mathsf{N}}$$

The nuclear light-cone distribution can be evaluated with realistic wave-function In a fully relativistic and Poincaré covariant approach for:

1) H<sup>2</sup> in E. Pace and G. Salmé, TNPI2000 (2001), arXiv:nucl-th/0106004

3) He<sup>4</sup> work in progress

Matteo Rinaldi

#### 2) He<sup>3</sup> in e.g. A. Del Dotto et al, PRC 95, 014001 (2017)

For example in DPS2:

$$\begin{split} \tilde{F}_{a_1a_2}^2(x_1,x_2,\vec{k}_{\perp}) \propto & \int \frac{1}{\xi_1\xi_2} \prod_{i=1}^{i=A} \frac{d\xi_i d^2 p_{ti}}{\xi_i} \delta\Biggl(\sum_i \xi_i - A\Biggr) \delta^(\\ & \times G_{a_1}^{N_1}\Biggl(\frac{x_1}{\xi_1},|\vec{k}_{\perp}|\Biggr) G_{a_2}^{N_2}\Biggl(\frac{x_2}{\xi_2},|\vec{k}_{\perp}|\Biggr); \end{split}$$

if we approximate:  $\xi_i \sim 1$  we get:

Matteo Rinaldi

 $\psi_{A}^{(2)}\left(\sum_{i} \mathbf{p}_{ti}\right)\psi_{A}^{*}(\xi_{1},\xi_{2},\mathbf{p}_{t1},\mathbf{p}_{t2})\psi_{A}\left(\xi_{1},\xi_{2},\mathbf{p}_{t1}+\vec{k}_{\perp},\mathbf{p}_{t2}-\vec{k}_{\perp}\right)$ 

For example in DPS2:

Nuclear 2-body form factor  $F_2(\vec{k}_{\perp}, -\vec{k}_{\perp})$ 

Matteo Rinaldi

 $\psi_{A}^{*}(\xi_{1},\xi_{2},\mathsf{p}_{t1},\mathsf{p}_{t2})\psi_{A}(\xi_{1},\xi_{2},\mathsf{p}_{t1},\mathsf{p}_{t2})\psi_{A}(\xi_{1},\xi_{2},\mathsf{p}_{t1}+\vec{\mathsf{k}}_{\perp},\mathsf{p}_{t2}-\vec{\mathsf{k}}_{\perp})$ 

 $(2) \left( \sum_{i} \mathbf{p}_{ti} \right) \psi_{A}^{*}(\xi_{1}, \xi_{2}, \mathbf{p}_{t1}, \mathbf{p}_{t2}) \psi_{A} \left( \xi_{1}, \xi_{2}, \mathbf{p}_{t1} + \vec{k}_{\perp}, \mathbf{p}_{t2} - \vec{k}_{\perp} \right) \right]$ 

For example in DPS2:

$$\begin{split} \tilde{F}_{a_{1}a_{2}}^{2}(x_{1},x_{2},\vec{k}_{\perp}) \propto & \int \frac{1}{\xi_{1}\xi_{2}} \prod_{i=1}^{i=A} \frac{d\xi_{i}d^{2}p_{ti}}{\xi_{i}} \delta\left(\sum_{i} \xi_{i} - A\right) \delta^{(2)}\left(\sum_{i} p_{ti}\right) \psi_{A}^{*}(\xi_{1},\xi_{2},p_{t1},p_{t2}) \psi_{A}\left(\xi_{1},\xi_{2},p_{t1} + \vec{k}_{\perp},p_{t2} - \vec{k}_{\perp}\right) \\ & \times G_{a_{1}}^{N_{1}}\left(\frac{x_{1}}{\xi_{1}},|\vec{k}_{\perp}|\right) G_{a_{2}}^{N_{2}}\left(\frac{x_{2}}{\xi_{2}},|\vec{k}_{\perp}|\right); \\ & \underset{\xi_{i}\sim 1}{\sim} G_{a_{1}}^{N_{1}}\left(x_{1},|\vec{k}_{\perp}|\right) G_{a_{2}}^{N_{2}}\left(x_{2},|\vec{k}_{\perp}|\right) \\ & \times \left[\int \frac{1}{\xi_{1}\xi_{2}} \prod_{i=1}^{i=A} \frac{d\xi_{i}d^{2}p_{ti}}{\xi_{i}} \delta\left(\sum_{i} \xi_{i} - A\right) \delta^{(2)}\left(\sum_{i} p_{ti}\right) \psi_{A}^{*}(\xi_{1},\xi_{2},p_{t1},p_{t2}) \psi_{A}\left(\xi_{1},\xi_{2},p_{t1} + \vec{k}_{\perp},p_{t2} - \vec{k}_{\perp}\right)\right] \end{split}$$

## Backup - Luminosity I

To test if in future a dependence of the effective cross section on the photon virtuality could be observed, we considered again the 4 JET photoproduction:

1) We divided the integral of the cross section on Q<sup>2</sup> in two intervals:

$$Q^2 \leqslant 10^{-2}$$
 and

2) We have estimated for each photon and proton models a constant effective cross section (with respect to Q<sup>2</sup>) such that the total integral of the cross section on Q<sup>2</sup> reproduce the full calculation obtained by means of  $\sigma_{eff}^{\gamma p}(Q^2)$ 

3) We estimate the minimum luminosity to distinguish the two cases

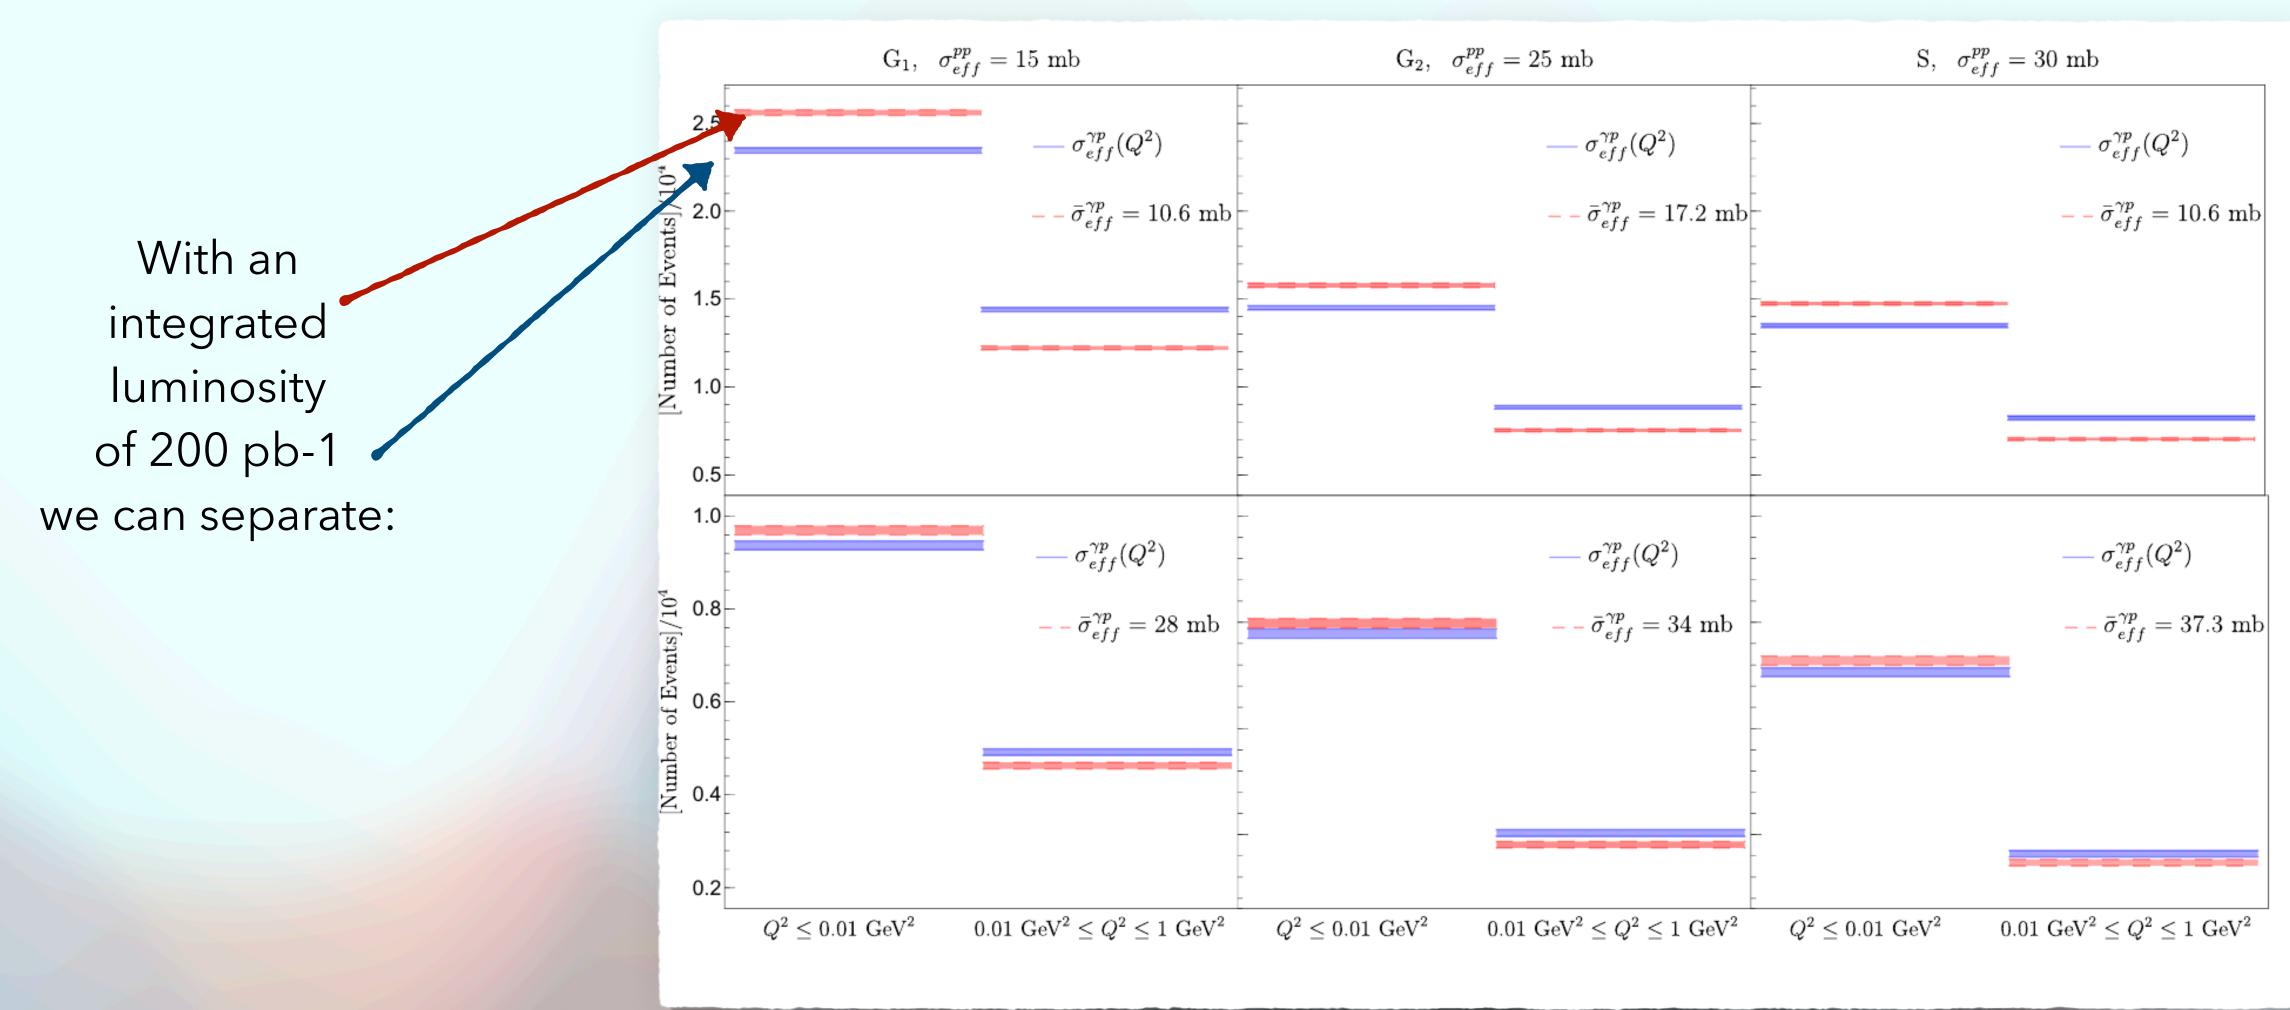

Matteo Rinaldi

Electron-ion Collider User Group Meeting 2023

 $10^{-2} \leqslant Q^2 \leqslant 1$  GeV<sup>2</sup>

### Backup - Luminosity II

Matteo Rinaldi

#### **Backup** - $\sigma_{eff}^{\gamma p}(Q^2 \rightarrow \infty)$

1) we show that high virtual behavior of the effective cross sections correctly follows the result in **J.R. Gaunt JHEP 01, 042 (2013)**, i.e.:

$$\sigma_{eff}^{\gamma p}(Q^2 \to \infty) = \sigma_{1v2}^{pp} = \left[ \int \frac{d^2 k_\perp}{(2\pi)^2} T_p(k_\perp) \right]^-$$

2) In Ref. M.Rinaldi and F.A: Ceccopieri JHEP 09, 097 (2019), we prove, in a general framework:

Being: 
$$\sigma_{\text{eff}}^{\gamma p}(\mathbf{Q}^2 \to \mathbf{\infty}) = \sigma_{\text{eff}}^{2v1}$$

$$\frac{\sigma_{eff}^{pp}}{6} \le \sigma_{eff}^{\gamma p}(Q^2 \to \infty) \le 2\sigma_{eff}^{pp}$$

Matteo Rinaldi

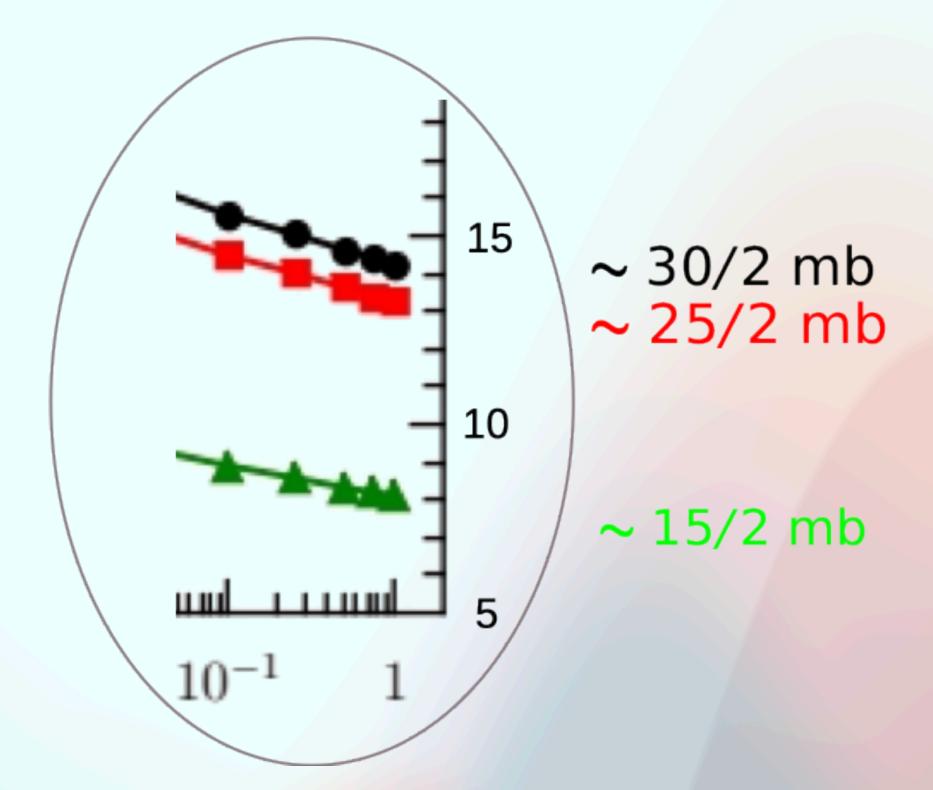

Electron-ion Collider User Group Meeting 2023

 $\frac{\pi}{2} \langle b^2 \rangle \le \sigma_{eff}^{\gamma p} (Q^2 \to \infty) \le 2\pi \langle b^2 \rangle$ 

Extracted from data

**Backup** -  $\sigma_{eff}^{\gamma p}(Q^2 \rightarrow \infty)$ 

Thus for QED:  $Q^2 > > 1 \text{ GeV}^2$ 

Matteo Rinaldi

Electron-ion Collider User Group Meeting 2023

$$[\sigma_{eff}^{\gamma p}(Q^{2})]^{-1} = \int \frac{d^{2}k_{\perp}}{(2\pi)^{2}} T_{p}(k_{\perp}) T_{\gamma}(k_{\perp};Q^{2})$$
$$[\sigma_{eff}^{\gamma p}(Q^{2})]^{-1} \sim \int \frac{d^{2}k_{\perp}}{(2\pi)^{2}} T_{p}(k_{\perp}) \times 1$$

For the proton models we have used:

$$\int \frac{d^2 k_{\perp}}{(2\pi)^2} T_p(k_{\perp}) \sim 2 \int \frac{d^2 k_{\perp}}{(2\pi)^2} T_p(k_{\perp})^2$$

$$\sigma_{eff}^{\gamma p}(Q^2 >> 1 \text{ GeV}^2) \sim \sigma_{eff}^{p p}/2$$

almost approximates the asymptotic
