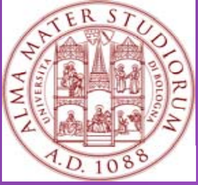
Deep levels induced by very high dose neutron irradiation in 4H-SiC

A Cavallini # ,A.Castaldini #, **Filippo Fabbri** #, F.Nava*, P.Errani* and V.Cindro**
University of Bologna, Italy
* INFN and University of Modena, Italy
**Jozef Stefan Institute of Ljubljana, Slovenia



Research objectives

Dept. of Physics
UNIVERSITY of
BOLOGNA

- to contribute to the characterization and understanding of defects in 4H SiC by their controlled generation

- to straightforwardly relate them to device performance, specifically the efficiency of high energy radiation detectors

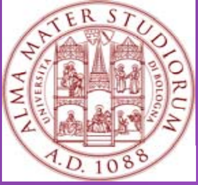
Filippo Fabbri
University of Bologna, ITALY

Outline

Dept. of Physics
UNIVERSITY of
BOLOGNA

- ✓ device structure and irradiation conditions
- ✓ EBIC mapping
- ✓ detailed characterization as a function of dose by:
  - I-V
  - junction spectroscopy
  - charge collection efficiency
- ✓ correlation to charge collection efficiency, CCE
- ✓ summary and conclusions

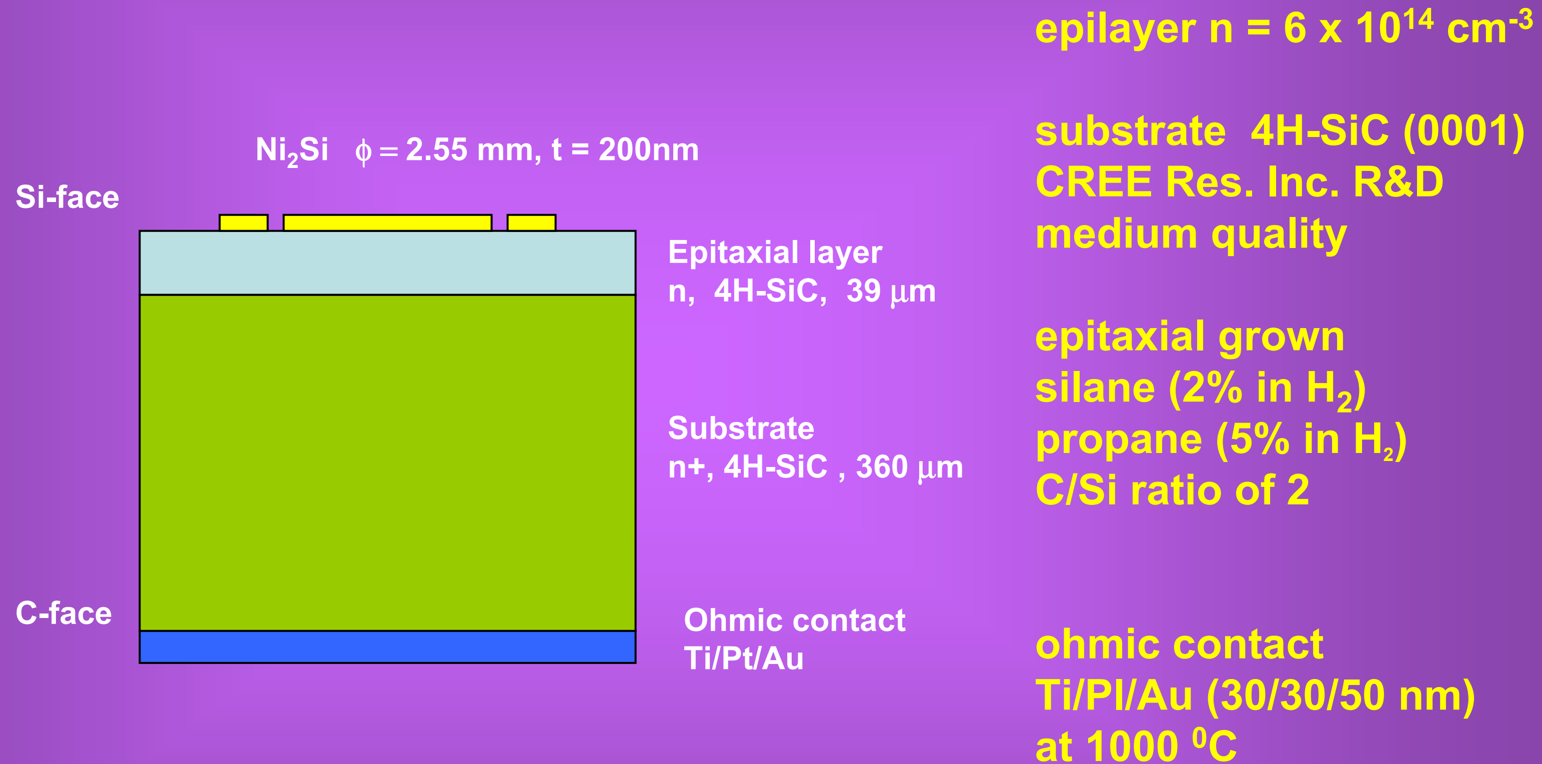
Filippo Fabbri
University of Bologna, ITALY



4H SiC device structure

schematic

Dept. of Physics
UNIVERSITY of
BOLOGNA



epilayer n = 6 x 10^{14} cm^{-3}

substrate 4H-SiC (0001)
CREE Res. Inc. R&D
medium quality

epitaxial grown
silane (2% in H_2)
propane (5% in H_2)
C/Si ratio of 2

ohmic contact
Ti/Pl/Au (30/30/50 nm)
at 1000 ^{0}C

neutron irradiation: E = 1 MeV (Niel equivalent in Si), fluence $\Phi \leq 8 \times 10^{15}$ cm^{-2}

Evaluation of trap concentration from PICTS

Dept. of Physics
UNIVERSITY of BOLOGNA

$$N_t = \frac{2.718 t_1 \beta(\lambda) I_a \lambda}{d \times hc} \frac{\mu_0 \tau_0}{\mu_1 \tau_1} i_N(t_1, T_m)$$

where

$$i_N(t_1, T_m) = \frac{\Delta i(t_1)}{i_L(0)}$$

$$I_a = I_0 - I_r - I_T$$

I_0 = incident light, I_r = reflected light, I_T = transmitted light

$\beta(\lambda) = quantum \quad efficiency$

$$\beta(\lambda) = \frac{(1-R) \times \alpha \times d}{1 - R \times (1 - \alpha \times d)}$$

$R = Reflectivity = 2.95$

$\alpha = absorption$

$d = thickness = 38 \mu m$

$\lambda = wavelength = 372 nm \Rightarrow 3.314 eV$

with

$$\alpha(T) = A\left[\frac{(h\nu - E_g(T) - k\theta)^2}{1 - \exp(-\theta/T)} + \frac{(h\nu - E_g(T) + k\theta)^2}{\exp(\theta/T) - 1}\right]$$

$$E_g(T) = E_g(0K) - 3.5 \times 10^{-4} \times T^2/(T + 1.1 \times 10^3)$$

$k\theta = 0.07 eV \quad phonon \quad energy$

$A = 6200 cm^{-1} eV^{-2}$

$E_g(0K) = 3.285 eV$

A.Galeckas, Phis.Stat.Sol, (a), 191, n2, 613-620, (2002)

$$\frac{\mu_0 \tau_0}{\mu_1 \tau_1} = \left(\frac{I_t}{I_0}\right)^{1-\gamma} \approx \frac{i_L(0, T_m)}{i(t_1, T_m)}$$

$from \quad transient \quad at\, Tm$ with $0.5 < \gamma < 1$

Filippo Fabbri
University of Bologna, ITALY

Summary and Conclusions (1)

Dept. of Physics
UNIVERSITY of
BOLOGNA

- ✓ irradiation modifies the defect electrical activity
- ✓ at $\Phi \geq 4x10^{14}$ cm^{-2} the material becomes semi-insulating
- ✓ irradiation dramatically affects the concentration of deep levels
- ✓ at $\Phi > 3 \times 10^{15}$ cm^{-2} SN6, E_T=1.16 eV, becomes dominant (what about SN7, E_T = 1.50 eV ?)
- ✓ estimate of the trap concentration at high fluences
- ✓ charge collection efficiency is mostly affected by SN5 and SN6

Filippo Fabbri
University of Bologna, ITALY

Dept. of Physics
UNIVERSITY of
BOLOGNA

Conclusions (2)

✓capture kinetics evidences point-like defects

✓some of them are located in the strain field of the dislocations (electrical activity of partial dislocations at SFs)

but

✓they are not at the dislocation core, i.e. inside the potential barrier, as demonstrated by their capture kinetics

future plans:

MCTS measurements

annealing treatments

nature of the traps
