Particle detectors

Γιάννης Καρυωτάκης Yannis.karyotakis@lapp.in2p3.fr Γενεύη, 20 Απριλιου 2023

Our planet is continuously hit by cosmic rays !

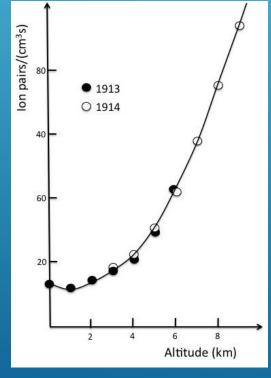

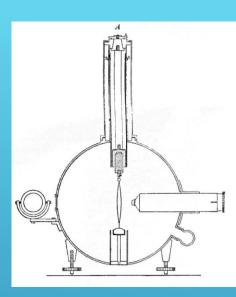

First hints for cosmic rays

- Electrometers discharge because the air is ionised by radiation (Julius Elster and Hans Geitel 1900)
 - ▶ What is the radiation origin ???
 - Radioactive elements on earth's surface ???
 - Viktor Hess : Radiation comes from sky. First balloon experiments. Seven flights.
 - ► The number of ion pairs increases with altitude
 - ► Do not come from sun ! Data taking in an solar eclipse

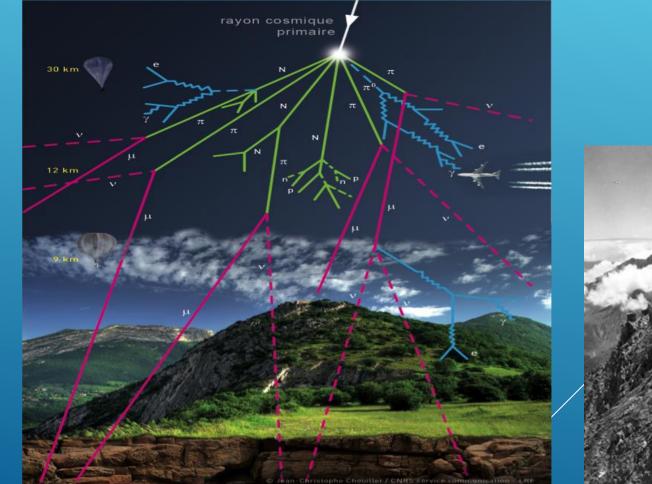

Theodor's Wulf Strahlungsapparg

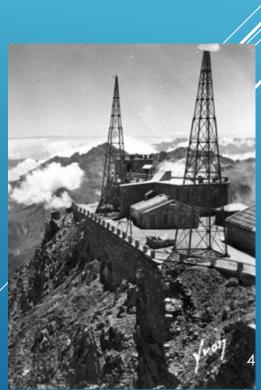

We see showers, particles arrive in group

- ▶ 1937: Pierre Auger positions three Geiger counters separated by 70 m at le Pic du midi
 - Observes coincidences

Pierre Victor Auger (1899-1993)

Searching for new particles

- Many new particles discovered in the cosmic rays
 - ▶ 1932: positron e⁺ (first observation of antimatter)
 - 1936: muon μ
 - ► 1949: pion π
 - ▶ 1949: kaon K
 - ▶ 1949: lamda ∧
 - ▶ 1952: xi Ξ
 - 1953: sigma Σ
- Birth of a new science: Particle Physics!

Pioneers at Aiguille du midi close to thé Mont Blanc submit. Laboratoire des cosmiques. Louis le Prince-Ringuet

Modern experiments

A glimpse to the future

AMS at the international space station looks for anti-matter !

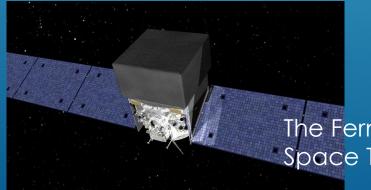

2006-: Pamela Altitude : 400 km

. Malargue

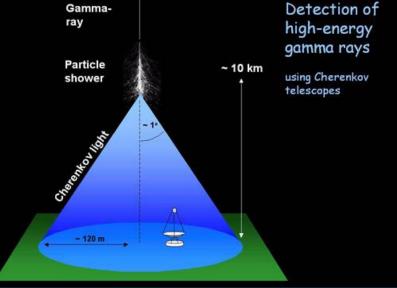

Pierre Auger observatory at Argentina's pampa detects high energy charged particle induced showers using 1600 water tanks of 12K liters separated by 1.5 Km each other. Complemented by fluorescence detectors.

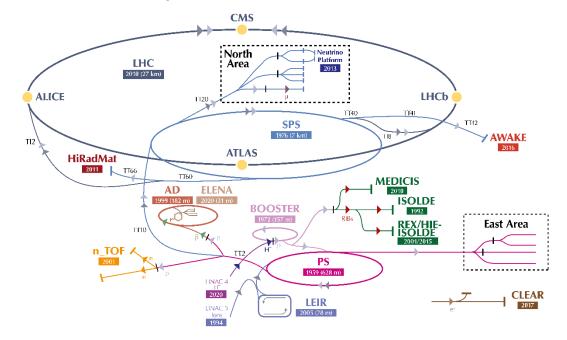

The Fermi Gamma-ray Space Telescope

PARTICLE DETECTORS

- Particles are detected through theirs interactions with matter
- What do we need to measure ?
 - Location and then the path or the track
 - Momentum
 - Energy
 - Missing Energy
 - Time
 - Particle's identity, e, μ , π ,
- For each measurement a dedicated detector
 - Precise position silicon detectors, chambers
 - Magnets
 - Calorimeters
 - Hermetic detectors
 - Cherenkov counters, dE/dx, absorbers.....

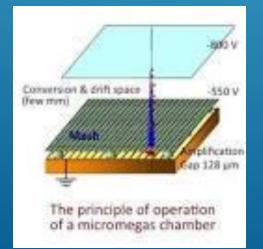

We know how to measure electrical pulses. We do not take (almost) photos !!!

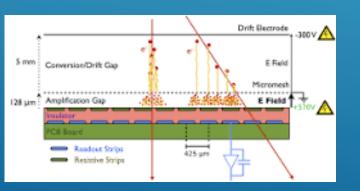

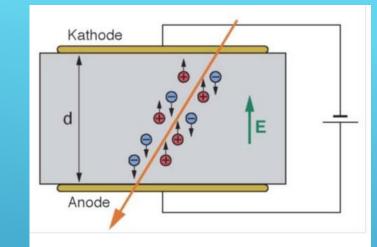

TRACKING DEVICES (CHARGED PARTICLES)

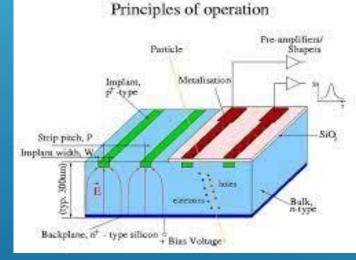

> Principle :

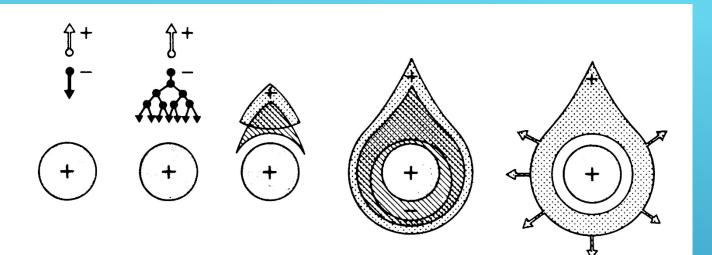

- The incident particle ionizes the detector medium (Si, gas,..) produces e-
- > Detect the electric pulse from e- , may be a challenge
 - > Electron multiplication
 - High performance electronics
- The detector is segmented with sensors of known position in the lab frame. The location precision depends on the sensor's pitch, the electron avalanche size, the sensor's response etc....

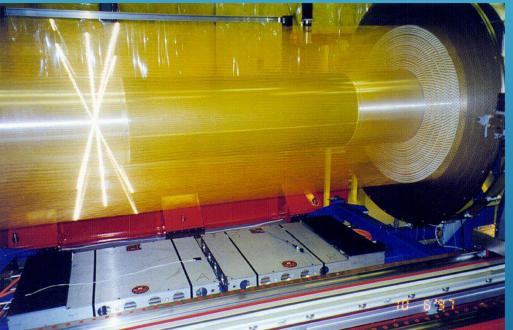

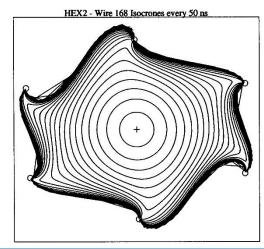

gas	density $\rho[g/cm^3]$	$I_0[eV]$	$W[\mathrm{eV}]$	$n_{\rm p}[{\rm cm}^{-1}]$	$n_{ m T}[m cm^{-1}]$
H_2	$8.99\cdot 10^{-5}$	15.4	37	5.2	9.2
He	$1.78\cdot10^{-4}$	24.6	41	5.9	7.8
N_2	$1.25\cdot 10^{-3}$	15.5	35	10	56
O_2	$1.43\cdot 10^{-3}$	12.2	31	22	73
Ne	$9.00\cdot10^{-4}$	21.6	36	12	39
Ar	$1.78\cdot 10^{-3}$	15.8	26	29	94
Kr	$3.74\cdot 10^{-3}$	14.0	24	22	192
Xe	$5.89\cdot 10^{-3}$	12.1	22	44	307
CO_2	$1.98\cdot 10^{-3}$	13.7	33	34	91
CH ₄	$7.17\cdot 10^{-4}$	13.1	28	16	53
C_4H_{10}	$2.67\cdot 10^{-3}$	10.8	23	46	195

given energy loss is much smaller in colid state detectors then in -

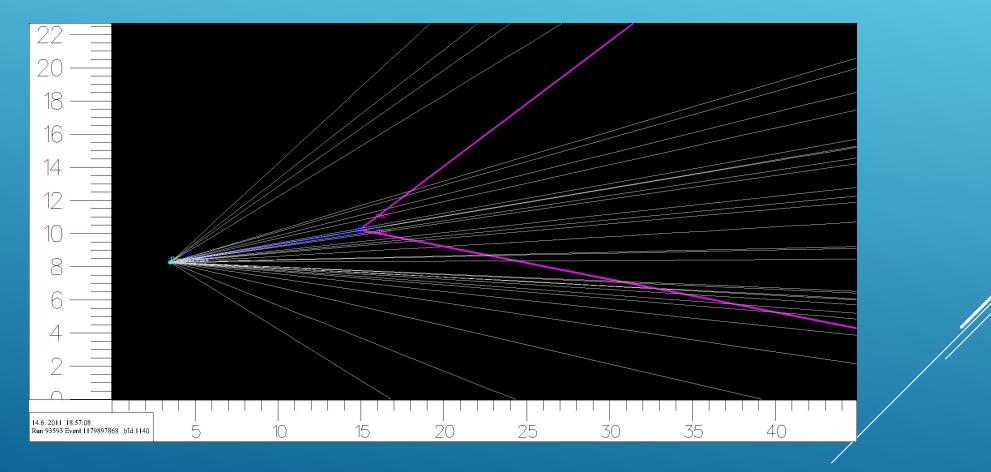

Gas Detectors

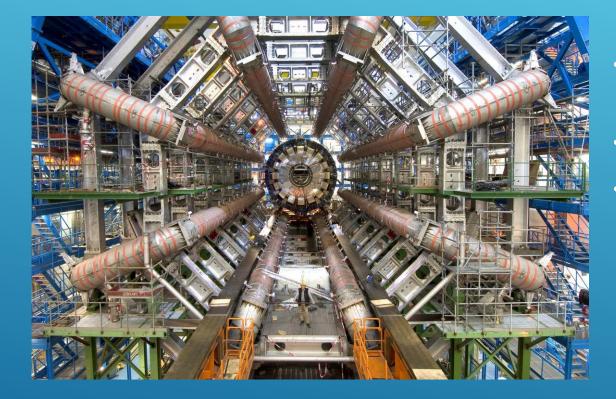

LHCb: B⁰->µµ

The tracking is able to identify the B meson decaying few mm after is was created by the pp colision

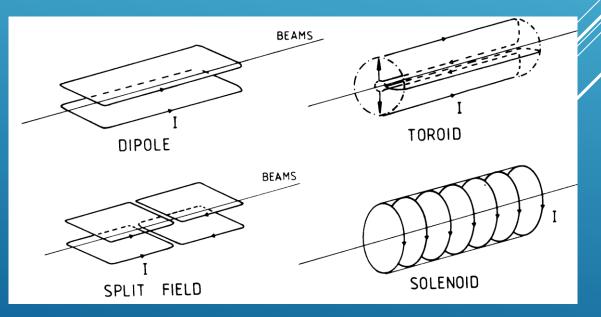

MOMENTUM MEASUREMENT (CHARGED PARTICLES)

We need a magnet

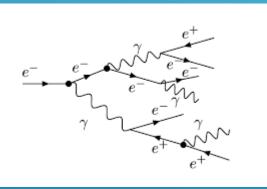

- The particle's trajectory is bent inside the magnet
- We measure the curvature p
- $p_{t}(GeV/c) = 0.3B(Tm) \rho$

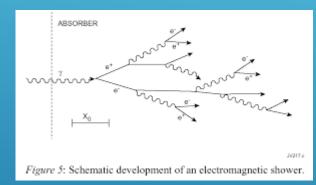

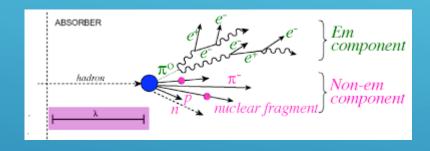

ENERGY AND POSITION MEASUREMENT (NEUTRAL AND CHARGED PARTICLES) CALORIMETERS

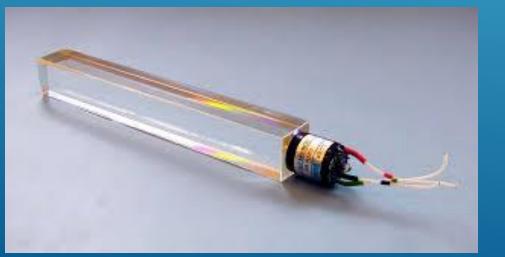

Principle :

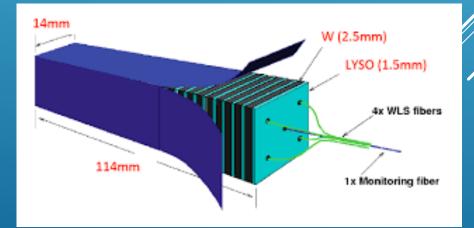

- Particles loose their energy in an absorber. We measure that energy
 - If the absorber = detector we measure the total energy
 - If the absorber is inactive we sample the energy losses and compute the energy
 - We detect light produced inside the detection media

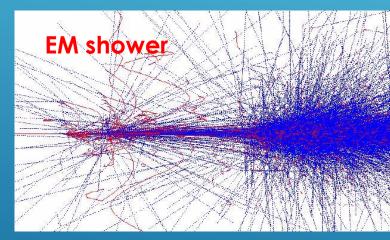

Calorimeters

Heavy, dense detectors, stop almost (but energetic muons) all particles which loose their energy inside

- Electromagnetic for e⁻⁺ and photons
 - Radiation length X₀, Moliere Radius
- Hadronic for pions, protons
 - Interaction length λ_l , compensation

Energy Resolution

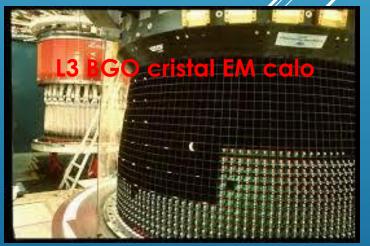

a: stochastic term

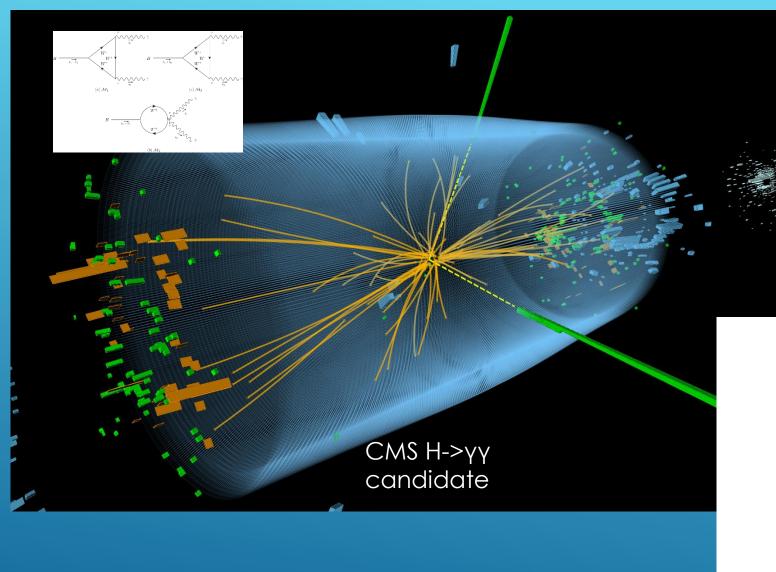

b: Noise

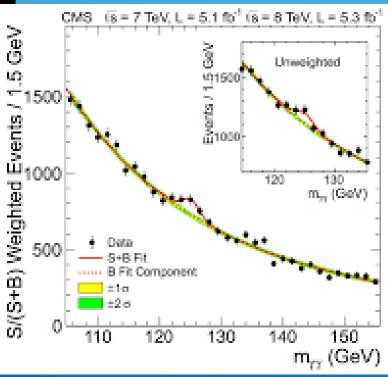

c: constant

$$\frac{\sigma(E)}{E} = \frac{a}{\sqrt{E}} \oplus \frac{b}{E} \oplus c$$

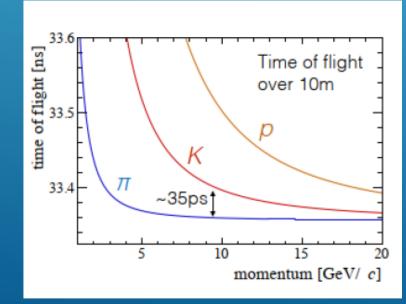

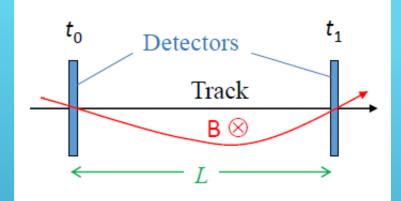

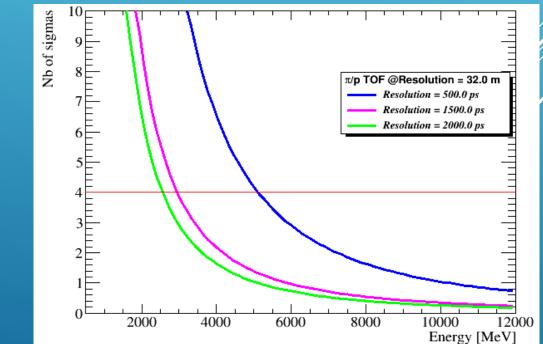

PARTICLE IDENTIFICATION

- TOF heavy particles travel slowly !!! Less than few ns time difference between p and π over 30 m !
- Able today to measure ps !

$$\Delta t = \frac{L}{c} \left(\frac{1}{\beta_1} - \frac{1}{\beta_2} \right) = \frac{L}{c} \left\{ \sqrt{1 + \frac{m_1^2 c^2}{p^2}} - \sqrt{1 + \frac{m_2^2 c^2}{p^2}} \right\} \approx \frac{Lc}{2p^2} \left(m_1^2 - m_2^2 \right)$$

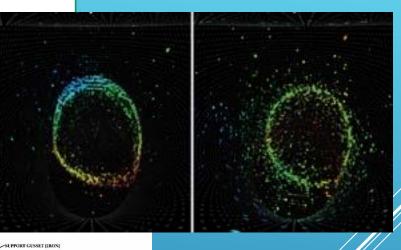

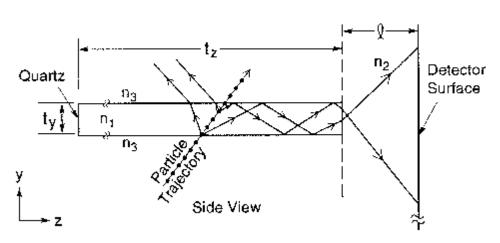

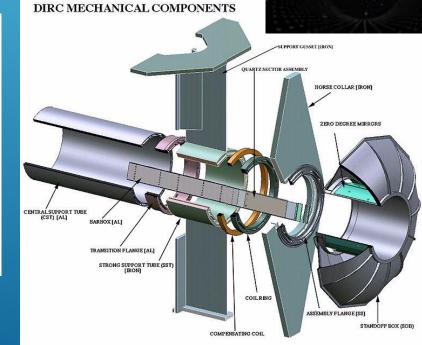

PID CHERENKOV COUNTERS

Particles crossing a medium will emit light at an angle $\cos\theta_c = 1 / (n b)$ n = refractive index of the medium

- Measuring θ_c we know the particle
- We need a radiator and a photo detector

Muons and the matter

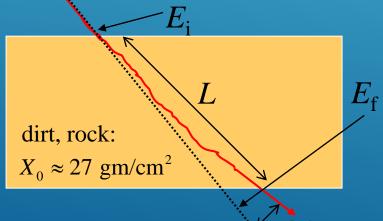

Muons will :

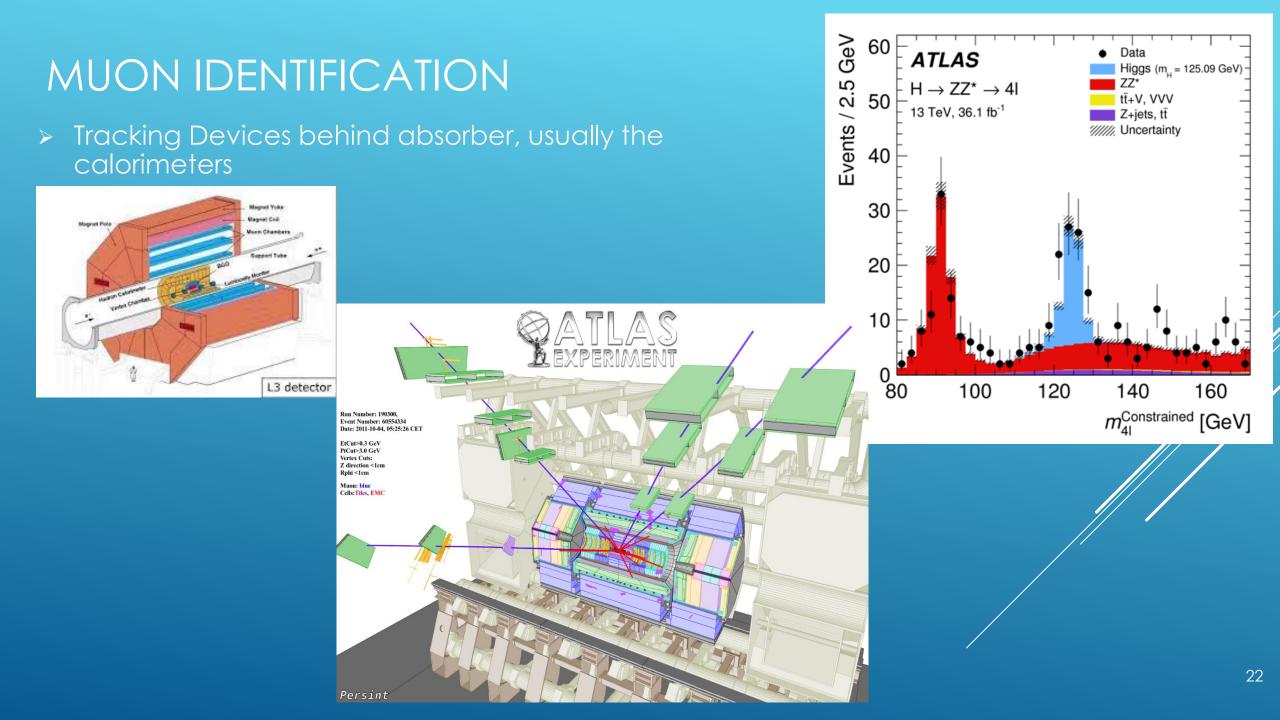

Interact with matter and will loose their energy by ionization

 $\frac{dE}{dx} \approx 2.3 \text{ MeV/gm/cm}^2 \approx 0.6 \text{ GeV/m} \text{ in rock}$

Change their direction because of multiple scattering

$$\delta\theta = \frac{13.6 \text{ MeV}}{\sqrt{E_i E_f}} \sqrt{\frac{L}{X_0}}$$
$$E_i - E_f = L \frac{dE}{dx}$$

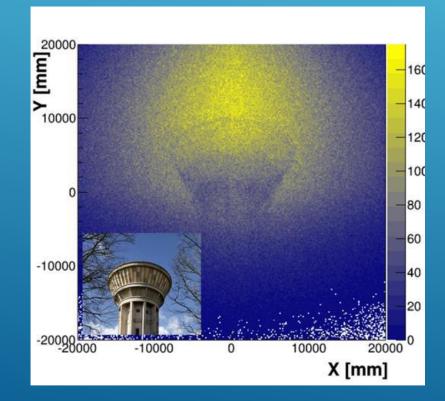

SUMMARY

- Particle detection is based on interactions of incident particles with matter
- We collect charges or light and form an electrical pulse
- Front end electronics + electronics + raw data handling
- Raw data transmission, higher level data samples and decisions
- Data reconstruction, tracks, energies etc, physics objects
- In parallel simulation !

A FUN APPLICATION

Using muons for scanning !

- Muons are very penetrating particles
- Muons will be absorbed by heavy structures or may cross large voids without stopping.
- Muon variation density should image the structures they cross !

The birth of the idea

Luis Alvarez* invented muon tomography in 1960's to study the 2nd Pyramid of Chephren

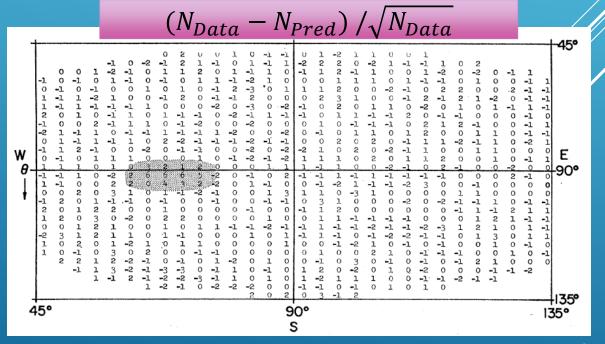

L.W. Alvarez, et al, Search for Hidden Chambers in the Pyramids Using Cosmic Rays, Science **167**, 832-839, 1970.

Search for Hidden Chambers in the Pyramids

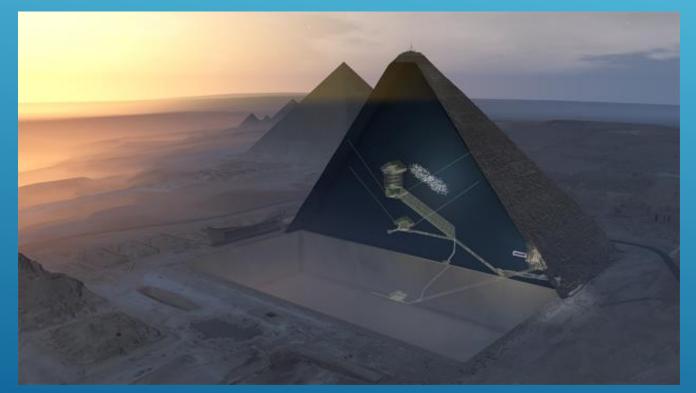

The structure of the Second Pyramid of Giza is determined by cosmic-ray absorption.

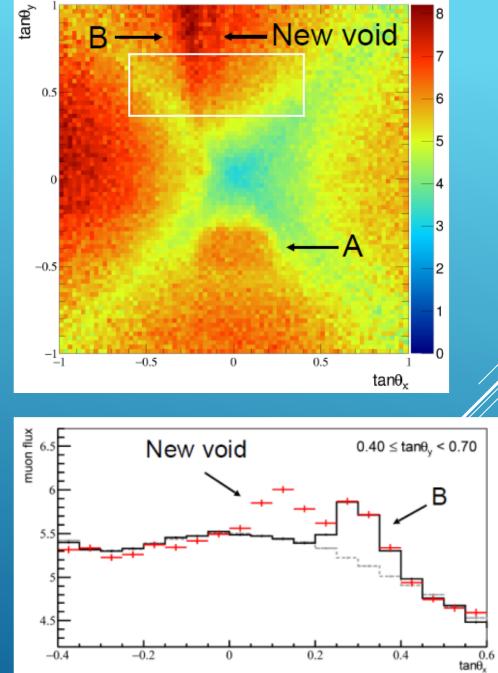

Luis W. Alvarez, Jared A. Anderson, F. El Bedwei, James Burkhard, Ahmed Fakhry, Adib Girgis, Amr Goneid, Fikhry Hassan, Dennis Iverson, Gerald Lynch, Zenab Miligy, Ali Hilmy Moussa, Mohammed-Sharkawi, Lauren Yazolino

Discovery of a big void in Khufu's Pyramid by observation of cosmic-ray muons

A MORE DIFFICULT CASE : TUMULUS

The Apollonia tumulus as a benchmark for the method

- Existing monument
- Density anomalies detected by other methods

Difficulties :

- Looking for an object with similar density as the surrounding materials ρ ~2.3 gr/cm³ for dirt and 2.5 for marble !
- If any monument, it must be at the horizon level. Very low number of muons, wait a LONG time !
- Muons must cross a lot of dirt. Need high energy muons, their number is even less !

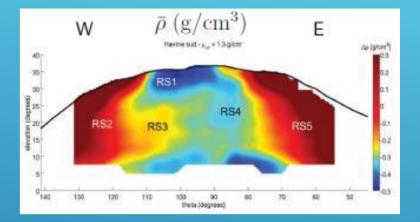

Other applications for muon scanning

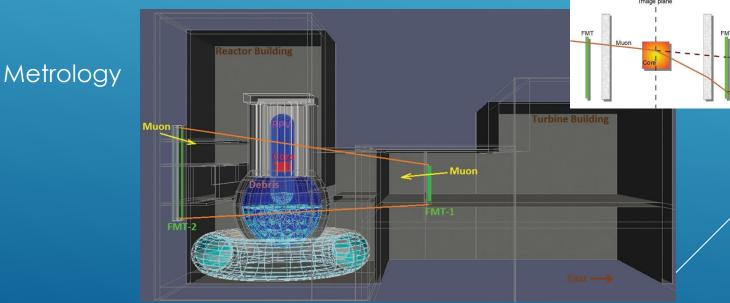

remote detector Volcano surveillance, looking to its internal density

Civil engineering

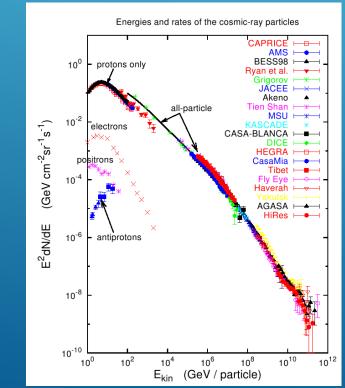

CONCLUSION

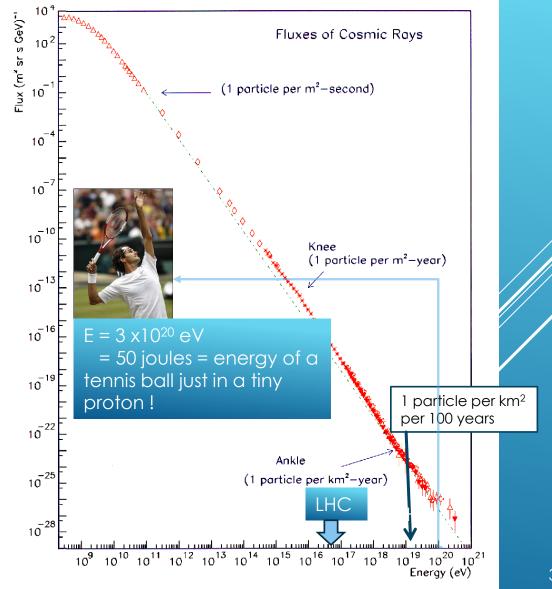

Progress in particle physics, astroparticle and cosmology is closely related with new detectors' developments !

What we know today !

How many particles and what energy ???

- The energy spans over 12 orders of magnitude
 - Energy spectrum follows $E^{-\gamma}$ where $\gamma = 2.7-3.5$
- The flux spans over 32 orders of magnitude !
 - Sea level : 150 particles per m² per second

Where do they come from ??
