A Higgs boson decay

pproxmaximally entangled spin state

Particles with weak decays are their own polarimeters

The charged leptons are emitted in directions that strongly depend on the spin of the parent W boson

More precisely

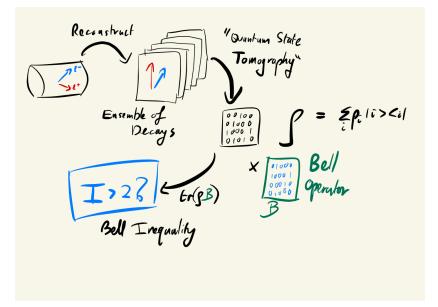

The probability density function for a W^{\pm} boson to emit its charged lepton in the $\hat{\mathbf{n}}$ direction is:

$$p(\ell_{\hat{\mathbf{n}}}^{\pm};\rho) = \frac{3}{4\pi} \operatorname{tr}(\rho \prod_{\pm,\hat{\mathbf{n}}}),$$

where ho is the W boson spin density matrix and the projection operator is

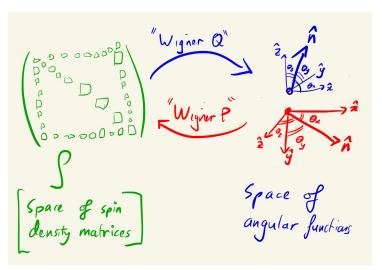

$$\Pi_{\pm,\hat{\mathbf{n}}} \equiv \left| \pm_{\hat{\mathbf{n}}} \right\rangle \left\langle \pm_{\hat{\mathbf{n}}} \right|$$

observe decay \iff measure spin

Parameterise ρ

Symmetrically for qutrits in terms of the Gell-Mann matrices λ_i

Single vector boson

$$\rho = \frac{1}{3}I_3 + \sum_{i=1}^{8} \mathbf{a}_i \lambda_i,$$

 a_i : 8 real parameters $(3^2 - 1)$

- Generalised Gell-Mann matrices $\lambda_i^{(d)}$ exist for any spin
- For spin-half (d = 2) they are the Pauli matrices and we get the Bloch sphere
- For d = 3 they are the eight generators of SU(3)

Other parameterisations, e.g. Cartesian Tensors are good alternatives

Parameterise ρ – bipartite system

Symmetrically for qutrits in terms of the Gell-Mann matrices λ_i

Single vector boson

$$\rho = \frac{1}{3}I_3 + \sum_{i=1}^{\circ} \frac{a_i}{\lambda_i}\lambda_i,$$

 a_i : 8 real parameters $(3^2 - 1)$

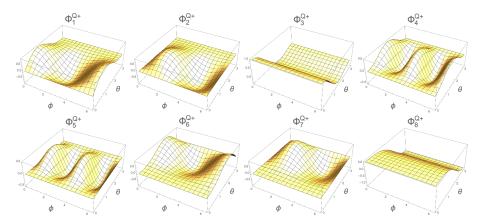

Two vector bosons

8-

$$\rho = \frac{1}{9}I_3 \otimes I_3 + \sum_{i=1}^8 \frac{a_i}{\lambda_i} \otimes \frac{1}{3}I_3 + \sum_{j=1}^8 \frac{b_j}{3}\frac{1}{3}I_3 \otimes \lambda_j + \sum_{i,j=1}^8 \frac{c_{ij}}{\lambda_i} \otimes \lambda_j,$$

-8+64 = 80 real parameters (9² - 1)

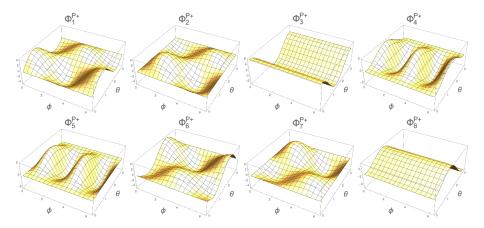

Angular distributions for each parameter

Wigner Q functions for the eight Gell-Mann matrices

Wigner Q 000 Ox. Space of angular functions pace of spin lensity matrices

To get back to the density matrix

Wigner P functions for the eight Gell-Mann matrices

Extracting the parameters experimentally

Parameters of ρ are the experimentally-measurable classical averages of the Wigner ${\it P}$ functions

$$\hat{a}_i = \frac{1}{2} \left\langle \Phi_i^{\mathcal{P}}(\hat{\mathbf{n}}_1) \right\rangle_{\mathrm{av}}$$

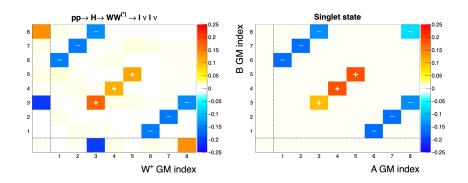

$$\hat{b}_i = \frac{1}{2} \left\langle \Phi_i^P(\hat{\mathbf{n}}_2) \right\rangle_{\mathrm{av}}$$

$$\hat{c}_{ij} = rac{1}{4} \left\langle \Phi^P_i(\hat{\mathbf{n}}_1) \Phi^P_j(\hat{\mathbf{n}}_2) \right\rangle_{\mathrm{av}}$$

< □ > < □ > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Density matrix parameters from simulated Higgs boson decays to vector bosons (Madgraph, no background)

Testing a Bell Inequality

The CGLMP Qutrit inequality

Collins Gisin Linden Massar Popescu (2002)

The optimal Bell inequality for pairs of qutrits

CGLMP function

$$\begin{aligned} \mathcal{I}_3 &= P(A_1 = B_1) + P(B_1 = A_2 + 1) \\ &+ P(A_2 = B_2) + P(B_2 = A_1) \\ &- P(A_1 = B_1 - 1) - P(B_1 = A_2) \\ &- P(A_2 = B_2 - 1) - P(B_2 = A_1 - 1). \end{aligned}$$

 $P(A_i = B_j + k)$ is the probability that A_i and B_j differ by k mod 3

CGLMP limits? In a local realist theory

 $\mathcal{I}_3 \leq 2$

In QM

$$\mathcal{I}_3^{\rm QM} \leq 1 + \sqrt{11/3} \approx 2.9149$$

In QM for a maximally entangled state

$$\mathcal{I}_3^{\mathrm{QM,singlet}} \leq 4/(6\sqrt{3}-9) pprox 2.8729$$

Testing the CGLMP inequality

Knowing elements of ρ calculate

$$\mathcal{I}_3 = \mathsf{tr}(\rho \, \mathcal{B}_{\mathrm{CGLMP}}^{xy})$$

where the CGLMP operator is

$$\mathcal{B}_{\text{CGLMP}}^{xy} = -\frac{2}{\sqrt{3}} \left(S_x \otimes S_x + S_y \otimes S_y \right) + \lambda_4 \otimes \lambda_4 + \lambda_5 \otimes \lambda_5$$

where

$$S_x = \frac{1}{\sqrt{2}}(\lambda_1 + \lambda_6)$$
 and $S_y = \frac{1}{\sqrt{2}}(\lambda_2 + \lambda_7).$

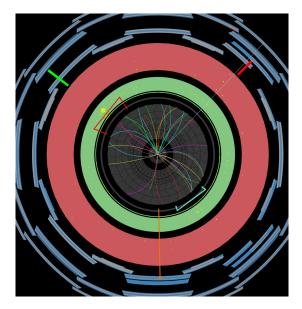

In idealised, numerical simulation of $H \rightarrow W^+W^-$, with finite width effects and relativistic effects:

 $\mathcal{I}_3 \approx 2.6$

Summary

- Weak decays are wonderful quantum probes
- Quantum spin self measurement via chiral weak decays
- Spin density matrix can be reconstructed from angular distributions ('tomography')
- Expect entanglement and even Bell inequality violation

EXTRAS

Weak gauge bosons measure their own spin

SU(2) weak force is chiral: $\gamma^{\mu}(1-\gamma^5)$

W boson

$$W^+ o \ell_R^+ + \nu_L$$

 $W^- o \ell_L^- + \bar{\nu}_R$

Decay of a W^{\pm} boson is equivalent to a projective (von Neumann) quantum measurement of its spin along the axis of the emitted lepton

Z boson

Z bosons also have spin-sensitive decays

Left, right couplings determined by electroweak mixing Equivalent to a non-projective quantum measurement

$\left|\psi_{s}\right\rangle = \frac{1}{\sqrt{3}}\left(\left|+\right\rangle\left|-\right\rangle - \left|0\right\rangle\left|0\right\rangle + \left|-\right\rangle\left|+\right\rangle\right)$

- This is a maximally entangled state of two qutrits
- $|\psi\rangle_{AB} \in (\mathbb{C}^3)^2$
- Basis for each qu $\underline{tr}it$ $\{0,1,2\}$

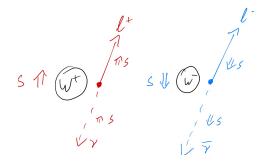

[On the board: qutrits vs 3-state systems]

In case you're curious

The CGLMP operator is¹

¹after a minor tweak – see 2106.01377

Getting the directions right

- ℓ^+ is emitted preferentially along spin direction (of W^+) ℓ^- is emitted preferentially against spin direction (of W^-)
- For $H \to W^+ W^-$ the W^{\pm} spins are in different directions
- So the two leptons prefer to go in the same direction as each other

Spin in the $H \rightarrow W^+W^-$ decay

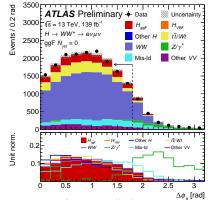

The Higgs boson is a scalar, while W^{\pm} bosons are massive vector bosons, each with three possible spin states (qu<u>tr</u>its)

- $H \rightarrow W^+ W^-$ decays produce pairs of W bosons with zero total angular momentum
- In the narrow-width and non-relativistic approximations:

$$\ket{\psi_s} = \frac{1}{\sqrt{3}} \left(\ket{+} \ket{-} - \ket{0} \ket{0} + \ket{-} \ket{+} \right)$$

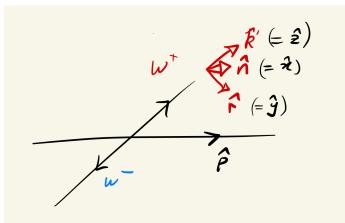

This is a maximally entangled state of two qutrits

$\ell^+\ell^-$ azimuthal correlations observed in $H \to W^+W^-$

- Higgs signal concentrated at small $\Delta \phi_{\ell\ell}$
- Used e.g. in discovery searches

Coordinates

Angular distributions are measured in the rest-frame of the parent gauge boson

Measuring Bell expectation values directly

CGLMP (qutrit) inequality from data for WW

$$\begin{split} \mathcal{I}_{3} &= \mathrm{tr}(\rho \mathcal{B}_{\mathrm{CGLMP}}^{xy}) = \frac{8}{\sqrt{3}} \left\langle \xi_{x}^{+} \xi_{x}^{-} + \xi_{y}^{+} \xi_{y}^{-} \right\rangle_{\mathrm{av}} \\ &+ 25 \left\langle \left((\xi_{x}^{+})^{2} - (\xi_{y}^{+})^{2} \right) \left((\xi_{x}^{-})^{2} - (\xi_{y}^{-})^{2} \right) \right\rangle_{\mathrm{av}} \\ &+ 100 \left\langle \xi_{x}^{+} \xi_{y}^{+} \xi_{x}^{-} \xi_{y}^{-} \right\rangle_{\mathrm{av}} \end{split}$$

Is this Bell inequality violated in data?

 $\mathcal{I}_3 \leq 2?$
