

The W mass and beyond (30' talk + 15' discussion)

Thursday 20 April 2023 16:00 (45 minutes)

In this talk I consider the W mass, assuming that a measured value different from the SM prediction is due to BSM physics, within the bigger picture of signs for new physics (anomalies). In particular, a positive shift in the W mass can be obtained with leptoquarks, vector-like quarks, Z' bosons and a scalar triplet ($Y=0$). I discuss which anomalies can be explained by these particles as well and to which interesting experimental signals these SM extensions lead.

Presenter: CRIVELLIN, Andreas (University of Zurich (CH))
