November 25th, 1996

A PBS technique was used to treat a cancer patient for the first time

Static tumour

November 25th, 1996

A PBS technique was used to treat a cancer patient for the first time

Static tumour

Moving tumour

Conventional motion mitigation techniques

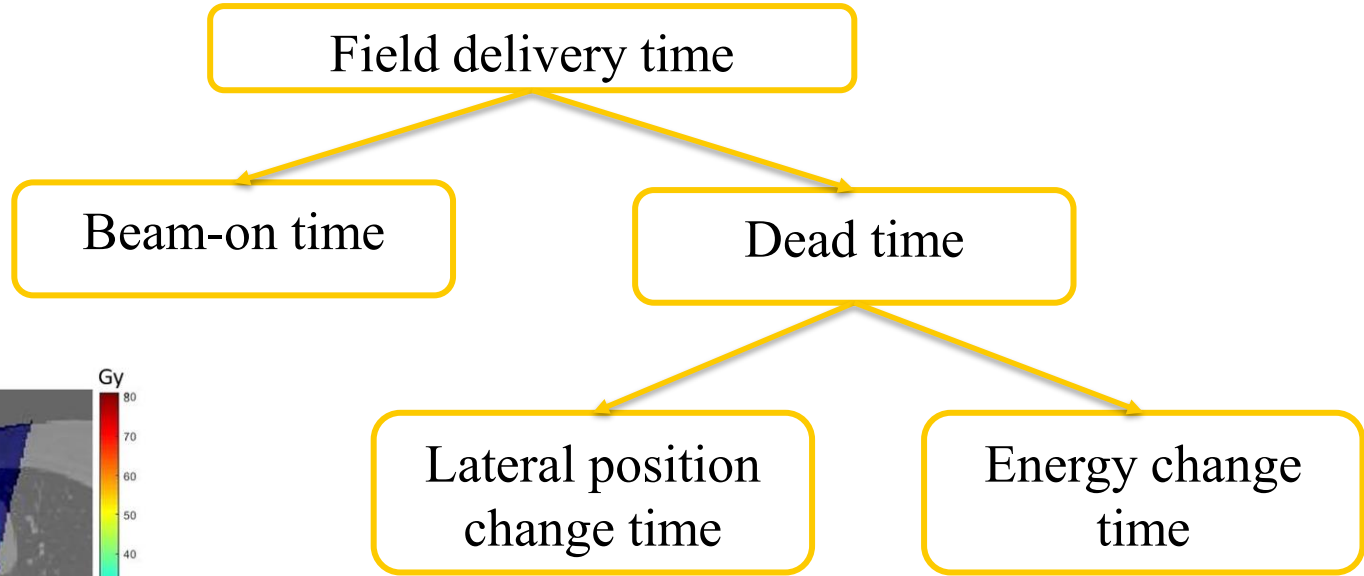

What if we flip the problem around?

What if the treatment is delivered so fast that all the motion is frozen?

Ultra-fast treatment delivery

Field delivery within a single breath-hold (5-10 sec)

PBS field delivery time

Lung case PTV: $\sim 400 \text{ cm}^3$

Field delivery time : 46 sec

Beam on time reduction

Cyclotron based proton therapy facility

250 MeV

Emittance:

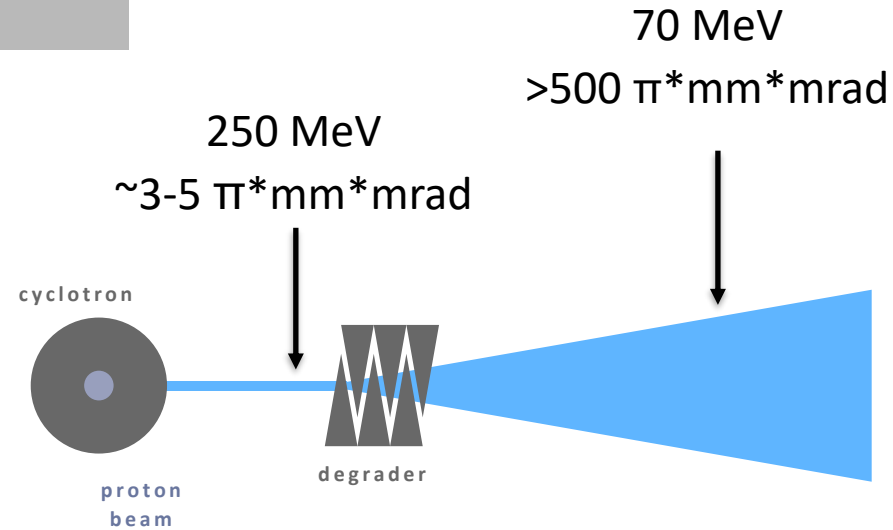

$\sim 3-5 \pi \cdot \text{mm} \cdot \text{mrad}$

Cyclotron based proton therapy facility

Cyclotron based proton therapy facility

Cyclotron based proton therapy facility

Most of the facilities transports
30 $\pi \cdot \text{mm} \cdot \text{mrad}$ or less emittance

Cyclotron based proton therapy facility

Factor 6-10 beam loss

(Depending on the energy of the beam)

Range Straggling

in the degrader increases the momentum spread of the beam.

For 70 MeV beam, it is about $\pm 4.5\%$

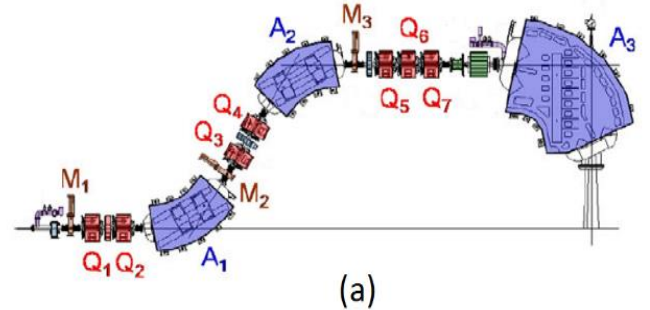

PSI Gantry 2

Cyclotron based proton therapy facility

At gantry entrance:
Emittance = Beam Size * Divergence

To achieve gantry angle independent beam at isocenter, we need to have same emittance in both planes at gantry entrance.

1:1 imaging

Beam size : 3 mm
Divergence : 10 mrad
Emittance : $30 \pi \cdot \text{mm} \cdot \text{mrad}$
Transmission : 57%

Cyclotron based proton therapy facility

Transmission in commercial systems

Varian medical system : ~factor 10 less compared to PSI G2

IBA systems : similar to PSI

Beam size in commercial companies

Varian medical system : similar to PSI G2

IBA systems : ~1.7 times larger

We have developed a simulation model in **BDSIM** and validated with our clinical tune.

Transmission comparison for 70 MeV beam

| | M1 | M2 | M3 | Coupling point | isocenter |
|------------------|------------------|-------------------|--------------------|--------------------|--------------------|
| BDSIM Simulation | $10 \pm 0.3\%$ | $1.47 \pm 0.04\%$ | $0.23 \pm 0.007\%$ | $0.22 \pm 0.007\%$ | $0.13 \pm 0.004\%$ |
| Measurements | $10.1 \pm 0.7\%$ | $1.46 \pm 0.1\%$ | $0.21 \pm 0.015\%$ | $0.21 \pm 0.015\%$ | $0.13 \pm 0.002\%$ |

How to achieve higher transmission?

Higher transmission

Higher emittance
transport

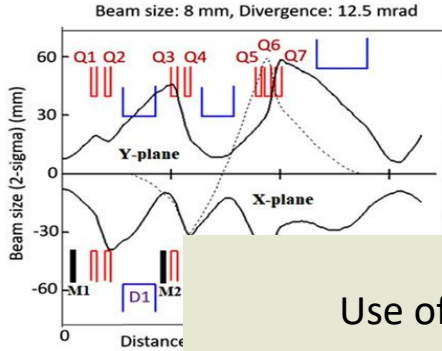

Higher emittance transport
through gantry

Maradia et al. 2022,
Medical physics

Gantry beam optics (Emittance: $100 \pi \cdot \text{mm} \cdot \text{mrad}$)

1:1 imaging

1.25:1 imaging

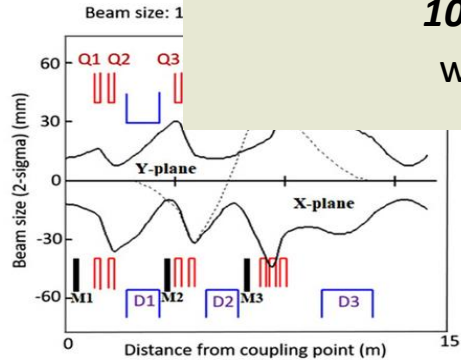

1.5:1 imaging

Use of **large beam size & small divergence** at gantry entrance together with **2:1 imaging** beam optics will allow to transport **$100 \pi \cdot \text{mm} \cdot \text{mrad}$** through gantry while having **60%** transmission.

1.7

(d)

(e)

How to achieve higher transmission?

Higher transmission

Higher emittance transport

Higher emittance transport through gantry

Maradia et al. 2022,
Medical physics

Higher emittance through fixed beamline (degrader to gantry)

Maradia et al. 2021,
Medical physics

Fixed beamline

Beam size selection
Collimator (only round shaped)

Beam divergence selection
Collimator (1 round, 4 elliptical shaped)

Degrader +
collimators

Emittance selection collimators

Beam size selection
Collimator (only round shaped)

Beam divergence selection
Collimator (1 round, 4 elliptical shaped)

Emittance:
 $100 \pi \text{ mm} \cdot \text{mrad}$

Asymmetric collimator

Y-axis:
Beam size: 4 mm
Divergence: 25 mrad

X-axis:
Beam size: 10 mm
Divergence: 10 mrad

Transmission gain with asymmetric collimator

For 70 MeV beam

Clinical beam optics : **0.13%**

Asymmetric collimator + 2:1 imaging : **0.72%**

(1.5 times larger beam size compared to clinically used beam size at PSI)

Gain : ~ factor 6

How to achieve higher transmission?

Higher transmission

Higher emittance transport

Momentum/energy spread reduction

Higher emittance transport through gantry

Maradia et al. 2022,
Medical physics

Higher emittance through fixed beamline (degrader to gantry)

Maradia et al. 2021,
Medical physics

Momentum/energy spread reduction with new ESS

Maradia et al. 2023,
Nature Physics

Energy/momentum spread selection

Conventional ESS

Gantry with momentum cooling capabilities

250 MeV  70 MeV

Momentum spread: $\pm 4.5\%$

Momentum spread: $\pm 0.4\%$

Transmission and beam size

For 70 MeV beam

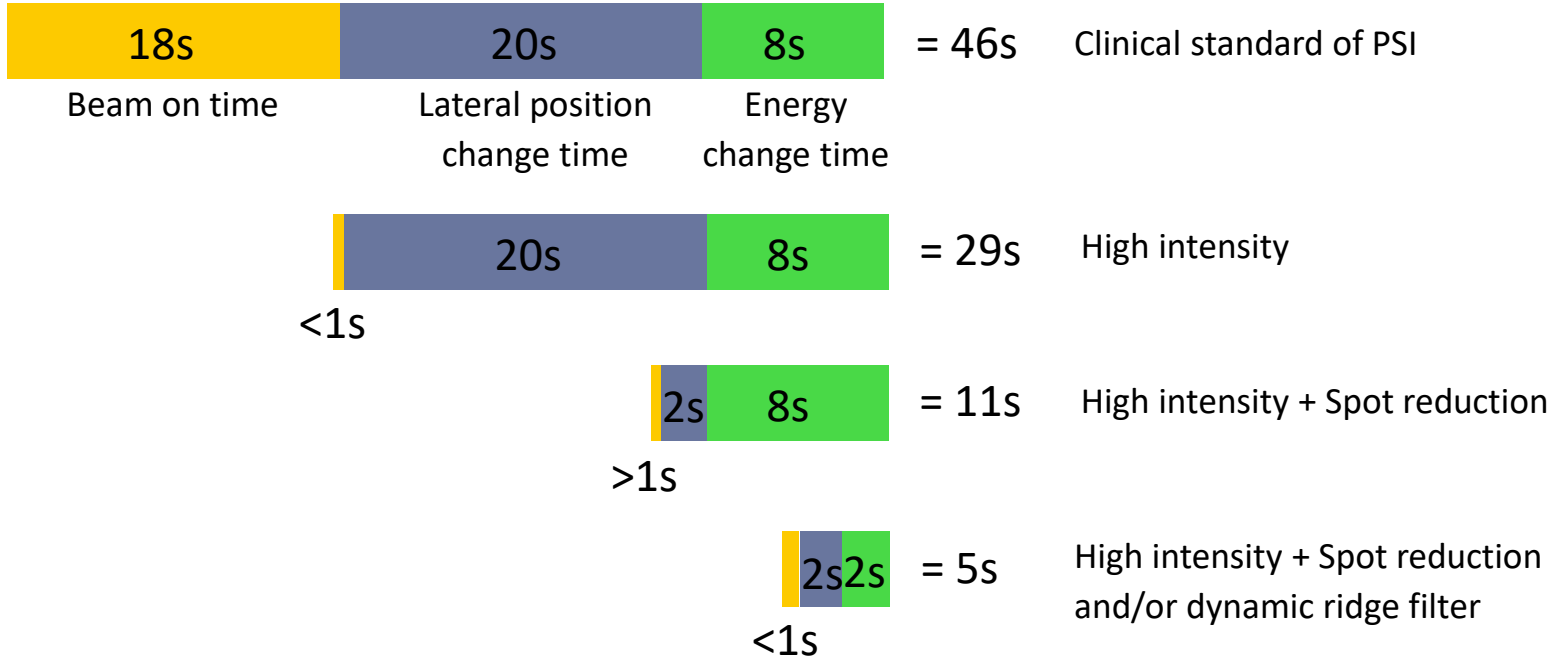

Clinical beam optics : **0.13%**

Momentum cooling + 2:1 imaging : **10%**
(1.7 times larger beam size compared to clinically used beam size at PSI)

Gain : ~ factor 80

(proof of principle measurement performed in PSI's OPTIS2 beamline)

Ultra-fast treatment delivery

Conclusion: Ultra-fast treatment delivery

Possible to deliver a single field within a single breath-hold (5-10 sec).

Towards cost effective personalized cancer care

Based on the clinical requirement one could choose different combination of techniques to shorten delivery time.

Impact of ultra-fast treatment delivery

Efficient treatment delivery (increased patient comfort)

Field delivery within a single breath-hold (5-10 sec)

Treatment of new indications with protons

Treatment planning with ridge filter

**>40 Gy/s
Spare healthy tissues**

**Conformal FLASH
Delivery with patient specific ridge filter**

Possibility to achieve Ultra-high dose rates

**10% transmission
For 70 MeV beam**

Cyclotron current limited to 50 nA

Reduced shielding requirement

Reduced shielding requirement (investment cost reduction)
