Introduction

Aim: Study the production of a top antitop quark pair produced in association with a H or W boson using full run 2 dataset (13 TeV, 138 fb⁻¹)

t \bar{t} H allows to study directly the Yukawa coupling

- $y_t \sim 1$
- **BSM physics** could introduce **modified couplings**, in particular **CP-violating coupling**

Will summarize the studies from [EPJC 81, 378 \(2021\)](#) and [arXiv:2208.02686](#) (accepted by JHEP)

t \bar{t} W production is one of the **main background for t \bar{t} H, t \bar{t} t \bar{t} ...**

- Measured $\sigma(\text{t}\bar{\text{t}}\text{W})$ **consistently above theory** value (both in ATLAS and CMS)
- Active discussion about the modelling of this background

Will summarize the studies from [arXiv:2208.06485](#) (accepted by JHEP)

Strategy

Using **multilepton final states**, categorize events depending on the lepton multiplicity

- For $t\bar{t}H$ analysis, 12 categories (focusing on the 3 most sensitive)
- For $t\bar{t}W$ analysis, 2 categories (2 same-sign (ss) leptons (ℓ) and 3ℓ)

Dedicated MVA to select isolated leptons from H, W and τ decays is crucial in this analysis. →

Reduce one of the main backgrounds

Dedicated **selection on each category**. Using Jet and b-tagging multiplicities and vetoing opposite charge leptons within Z peak

Backgrounds:

Reducible backgrounds:

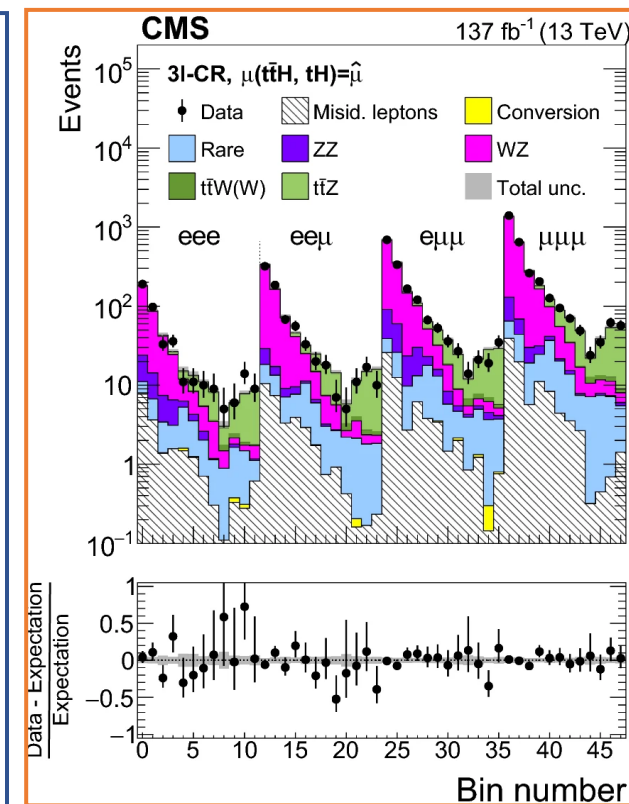

- Non prompt leptons
- Electron charge flips
- Photon Conversions

Estimated
with data-
driven
techniques

Irreducible backgrounds:

- $t\bar{t}Z$, $t\bar{t}W$ (for $t\bar{t}H$ analysis)
- Dibosons

Control regions to constrain these backgrounds

$t\bar{t}W$ MC

[Hand book of LHC cross sections](#) (Yellow Report 4):

- $t\bar{t}W$ @ NLO QCD
- NLO EWK term $\alpha_s\alpha^3$ considered negligible \rightarrow in fact found to be $\sim 10\%$

The MC used in both studies presented in this talk include these EWK corrections:

MG5 aMC@NLO 2.6.0+Pythia8 FxFx NLO QCD + $\alpha_s\alpha^3$ EW (+0,1j@NLO)

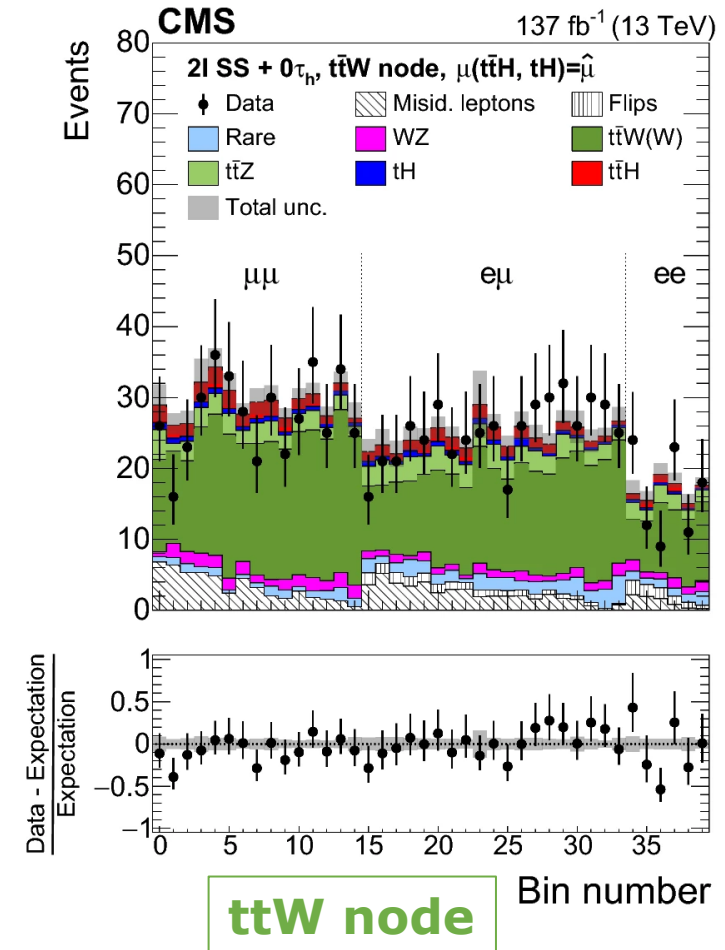

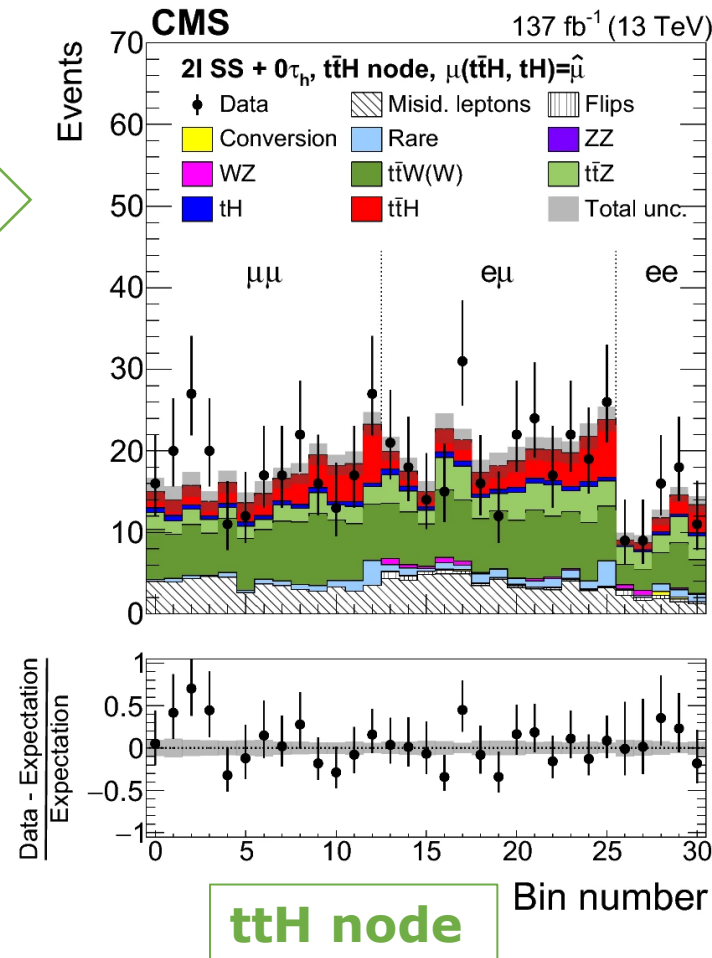

- $t\bar{t}W$ shows large scale dependence even after including NLO+NNLL (different from $t\bar{t}H$) \rightarrow new structures at NLO [[arXiv:2001.03031](#)]

- **NEW FxFx** merging procedure [[JHEP 11 \(2021\) 29](#)]:
 - Treats QCD and EW jets separately
 - Stabilization of scale dependence

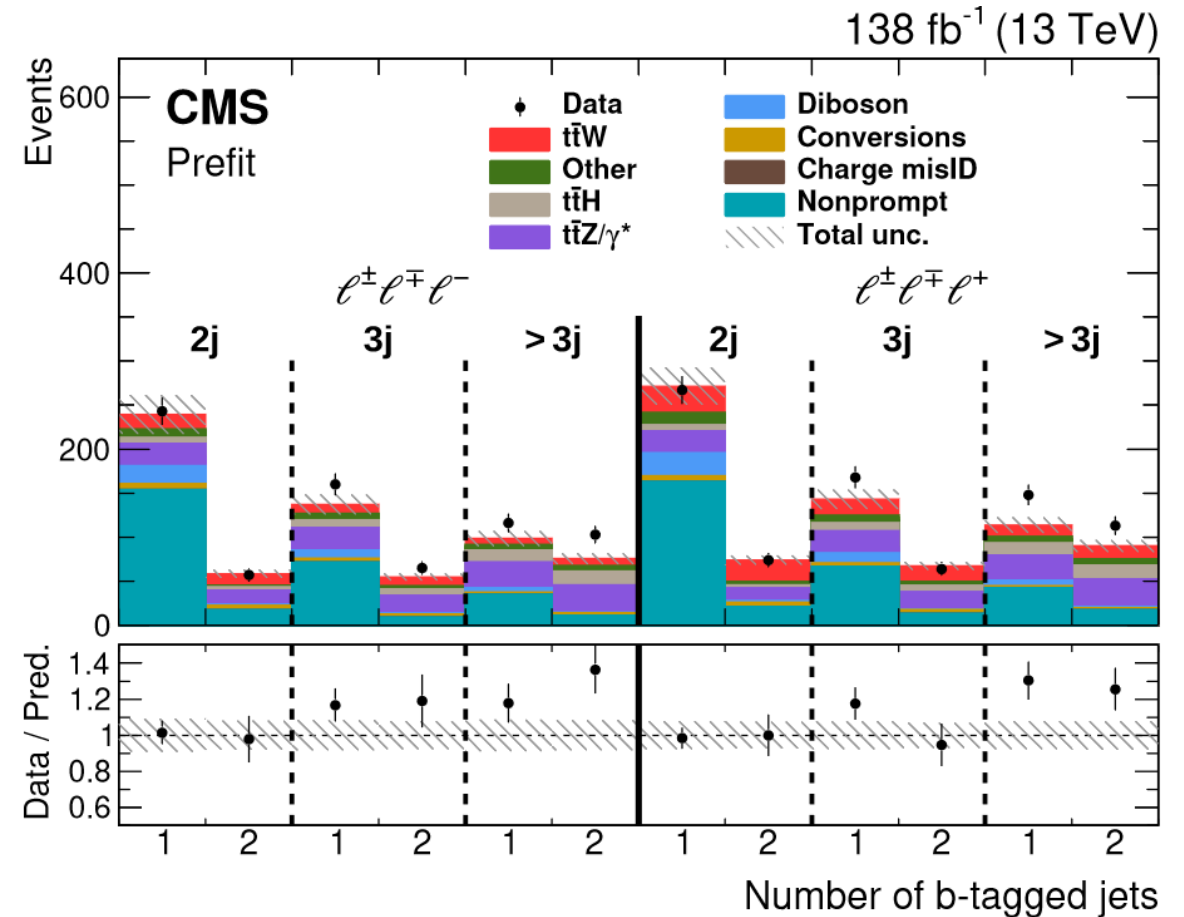

$t\bar{t}H$ event classification

- **Dedicated NN** in each of the 12 signal categories in order to discriminate signal from background
- Dedicated **node to target $t\bar{t}W$** in $2\ell ss+0\tau$ category
- Further classification depending on flavor, b-tag multiplicity...

$t\bar{t}W$ event classification

- **$2\ell ss$** : a NN is used to distinguish signal from background
 - Further classification depending on flavor and **charge** of the leptons
- **3ℓ** : Events categorized using charge of the leptons, jet and b-tag multiplicities.
 - Invariant mass of the 3ℓ is used as discriminating variable

$t\bar{t}H$ result

- Simultaneous **maximum likelihood fit** in the signal region categories as well as the control regions
- $t\bar{t}W$ and $t\bar{t}Z$ signal strengths (μ) freely floated in the fit
 - CP interpretation:** using kinematic differences between $t\bar{t}H$ CP-even and CP-odd components
 - dedicated BDT in each of the 3 most sensitive $t\bar{t}H$ enriched categories
 - Yields parametrized using: κ_t and $\tilde{\kappa}_t$ (ratio of the CP-even and CP-odd terms to SM expectation, respectively)

Small tension on $\mu(t\bar{t}W)$

Exclude pure CP-odd with 3.7 σ

$t\bar{t}W$ Results

Simultaneous **maximum likelihood fit** performed using signal regions as well as control regions

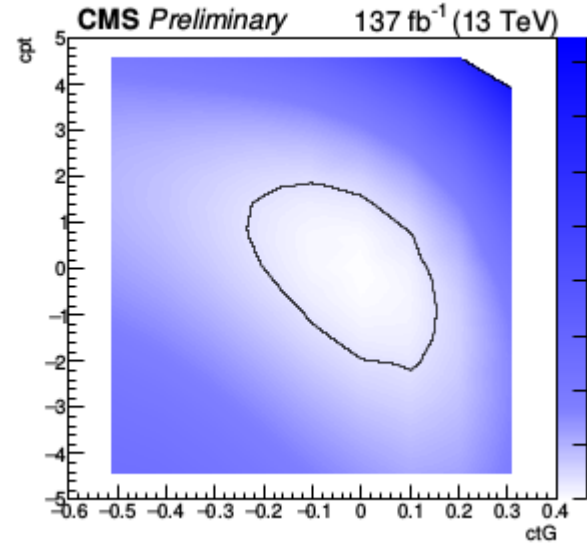

- $t\bar{t}Z$ normalization is freely floated in the fit
- $\sigma_{t\bar{t}W} = 868 \pm 40 \pm 51 \text{ fb}$ (reducing syst. unc. by a factor >2 wrt. previous CMS measurement)
- $\mu(t\bar{t}W) = \mathbf{1.47 \pm 0.11}$
- Compatible with [EPJC 81, 378 \(2021\)](#) and [ATLAS-CONF-2023-019](#)
- Also perform a simultaneous extraction of $t\bar{t}W^+$ and $t\bar{t}W^-$
- The ratio is found to be $1.61 \pm 0.15 \text{ (stat)}_{-0.05}^{+0.07} \text{ (syst)}$

Prospects

Aim to perform differential measurements using full Run 2 dataset

Work in progress

$t\bar{t}H$

Study differentially: p_T^H , $m_{t\bar{t}H}$ and η_H

- NN used to regress the p_T (several strategies tried)
- Use maximum likelihood fit unfolding

Plan to include EFT interpretation:

- ctp, cpt, ctG

$t\bar{t}W$

Study several observables, useful to provide feedback to theorist

- Use maximum likelihood fit unfolding

$t\bar{t}W$ can be used to measure $t\bar{t}$ asymmetry

Will use updated state-of-the-art MC including

new **FxFx** merging [[JHEP 11 \(2021\) 29](#)]

Summary

- Run 2 allowed to measure low cross section processes with high precision:
 - Unprecedented amount of data
 - Improvement on nonprompt background rejection
 - Better control of systematic uncertainties
- $t\bar{t}H$ process allowed to study the top-Higgs interaction, results are in good agreement with the SM
 - More extensive BSM interpretation can be performed in terms of EFT
- $t\bar{t}W$ cross section observed to be above predictions → need to improve modelling of this process
- Amount of data available also allows to perform differential measurements of both $t\bar{t}H$ and $t\bar{t}W$ processes → **coming soon!**

Back-up

Strategy

- Data taken by the CMS experiment at 13 TeV during Run 2 (138 fb⁻¹).
- Using multilepton final states, categorize events depending on the lepton multiplicity
 - For ttH analysis 12 categories (focusing on the 3 most sensitive)
- Select isolated muons from H, W and tau decays is crucial in this analysis
 - Use a dedicated MVA to distinguish those leptons from nonprompt leptons -> reduce one of the main backgrounds
- Dedicated selection on each category:

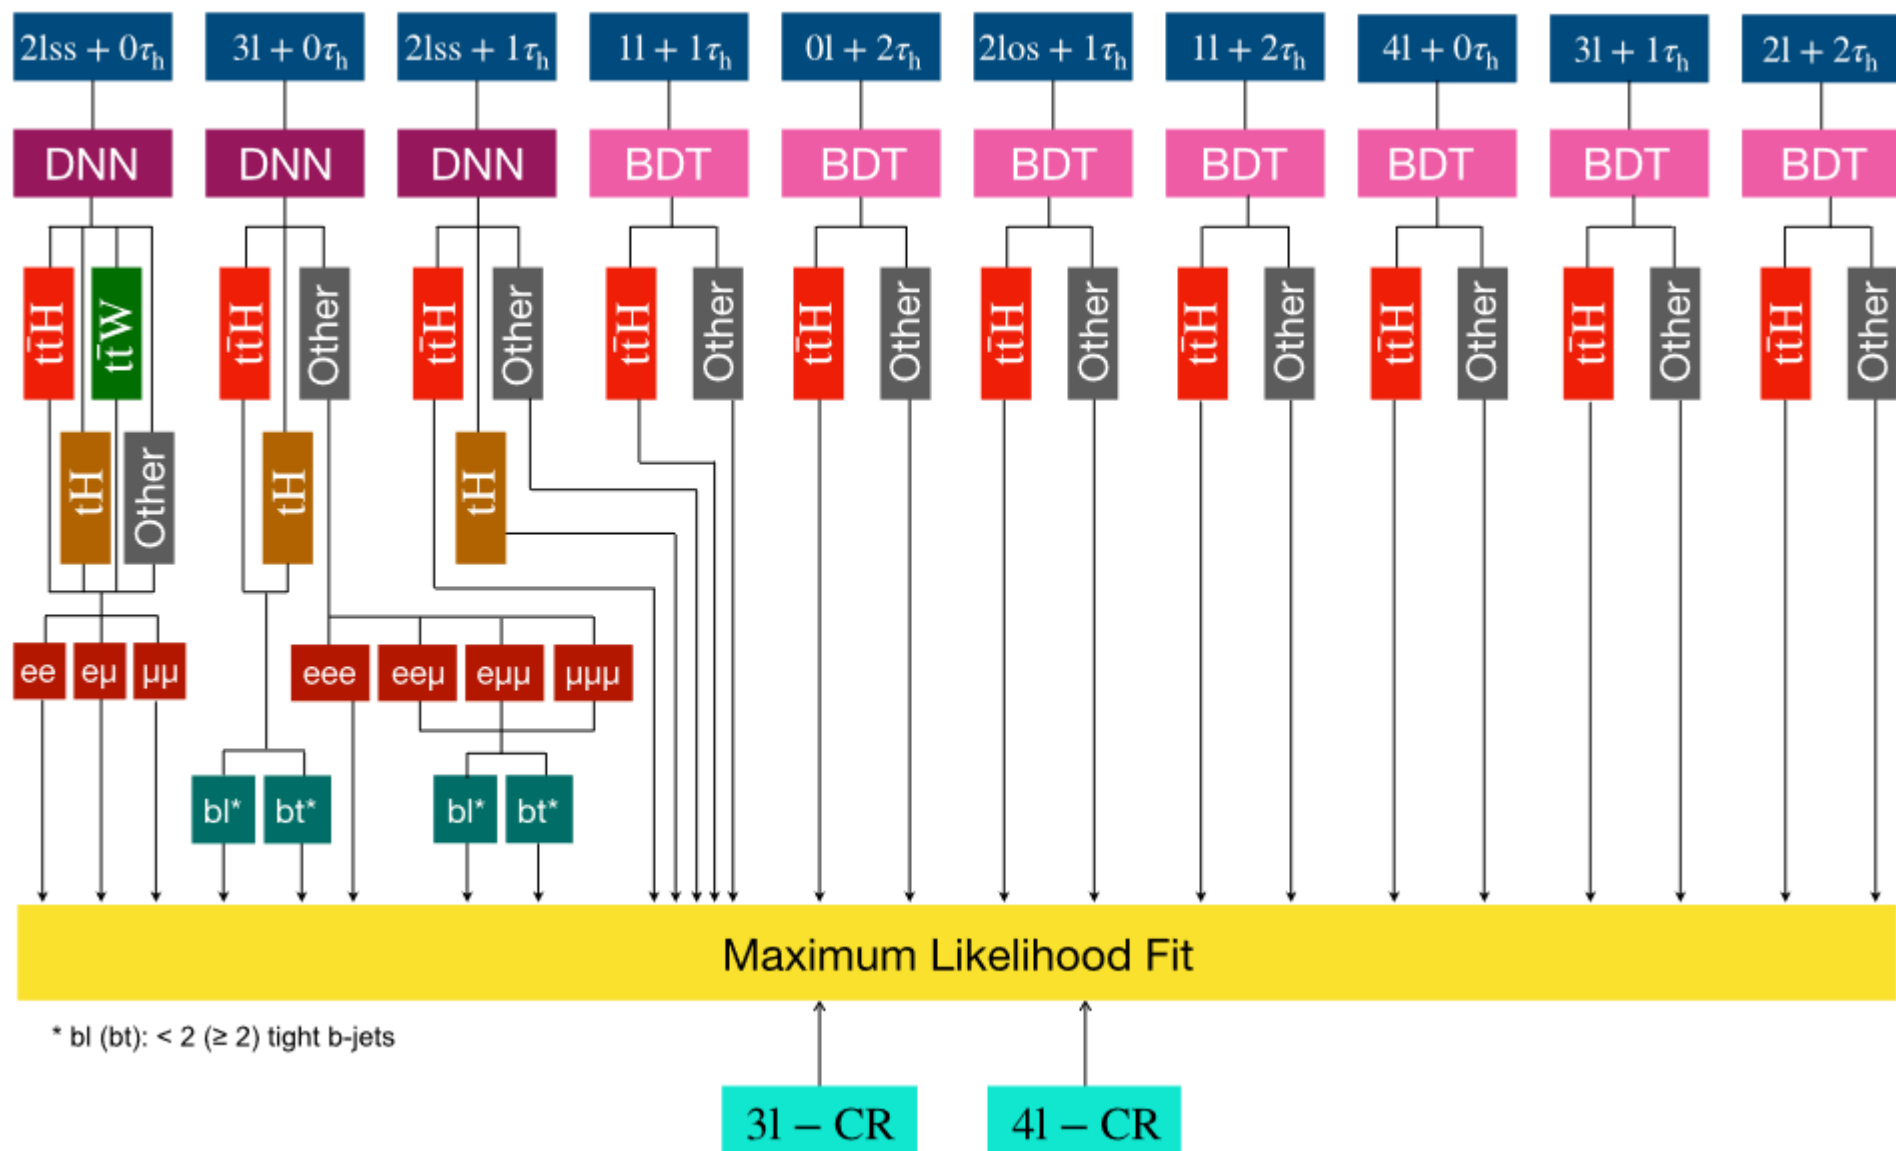

ttH				ttW	
	2lss+0tau	2lss +1 tau	3l	2lss+0tau	3l
nJets	≥ 2		≥ 3	≥ 2	
nbttag	≥ 1 medium b-tagged Jet or ≥ 2 loose b-tagged Jet				
MET	> 30 GeV		>30 * > 45 GeV **	>30 GeV	-
$\sum q_l^i$			±1	±1	±1
	Veto os leptons within Z peak (10 GeV mass window)				

* If NJet ≤ 3 and 1 SFOS

* NJet ≤ 3 and 0 SFOS

After selection still dominated by background → Use NN to classify events

t \bar{t} H categories

		Simulation statistical uncertainty	1.8
		Total systematic uncertainty	5.8

Htt coupling

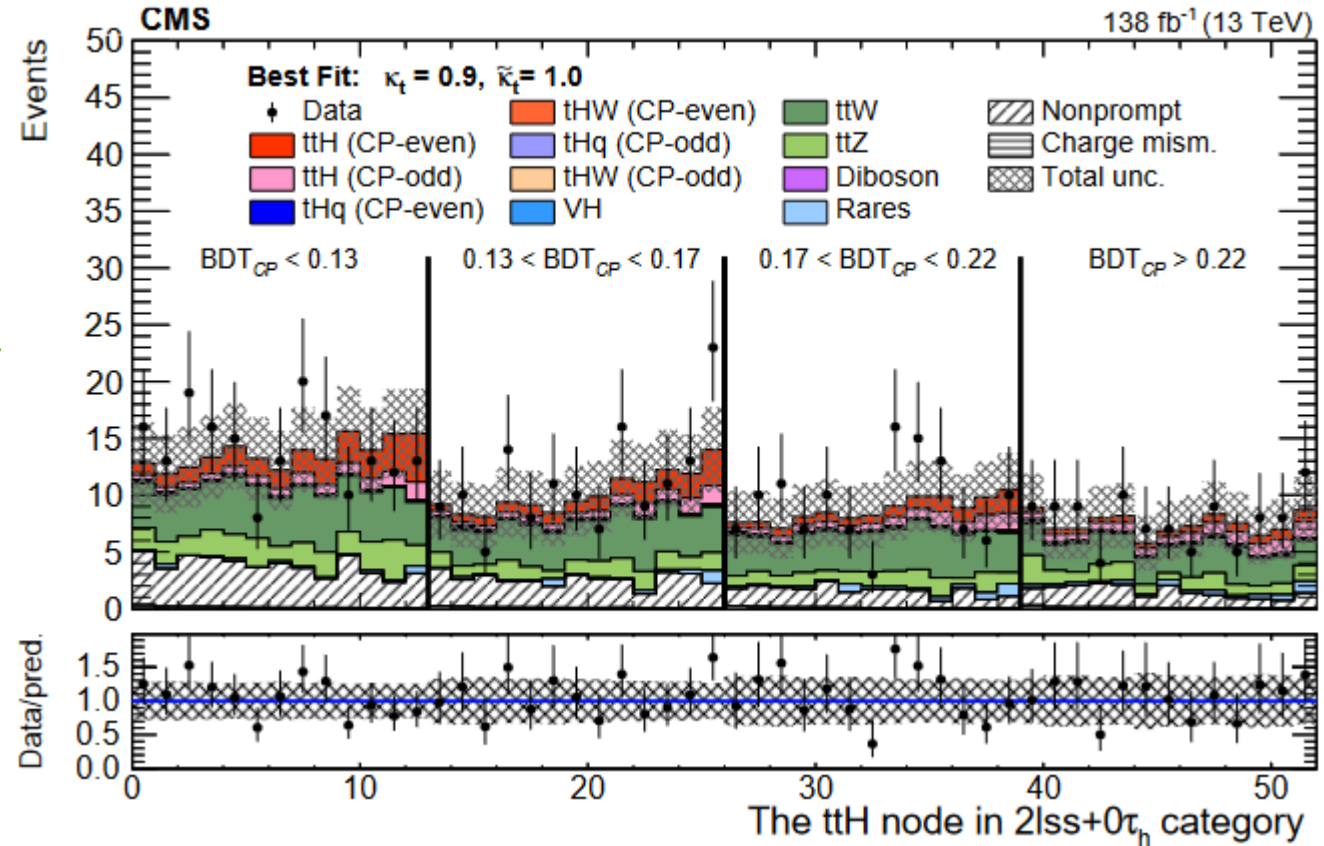

- $\kappa_t = y_t / y_t^{SM}$ in good agreement with SM
- tH sensitive to the relative sign of κ_V κ_t
 - BSM $y_t = -1 \rightarrow$ constructive interference $\rightarrow \sigma_{tH} \sim 0.8$ pb (10 times greater than in the SM)

CP interpretation

Kinematic differences between ttH CP-even and CP-odd components are exploited → dedicated BDT in each of the 3 most sensitive ttH enriched categories

Inputs: momentum of leptons and jets, angular variables, masses, object multiplicities and a specific tagger targeting hadronic top quark decays.

CP interpretation

Yields are parametrized using:

- κ_t and $\tilde{\kappa}_t$ (ratio of the CP-even and CP-odd terms to SM expectation, respectively)

$$f_{CP} = \frac{|\tilde{\kappa}_t|^2}{|\tilde{\kappa}_t|^2 + |\kappa_t|^2}$$

The result is combined with already published ttH measurements:

- ZZ, [Phys. Rev. D 104, 052004](#)
- $\gamma\gamma$, [Phys. Rev. Lett. 125, 061801](#)

$|f_{CP}^{Htt}| = 1$ excluded with **3.7 σ**

Total	21	-

Table 19: Input variables to DNN used for p_T regression.

Neural Network for p_T^H regression input variables:

Name	Operator	Comments
ctp	$\bar{q}_i u_j \tilde{\phi}(\phi^\dagger \phi)$	Effects on tHq
cpt	$(\phi^\dagger i \overleftrightarrow{D}_\mu \phi) (\bar{u}_i \gamma^\mu u_j)$	Effects on $t\bar{t}H$, $t\bar{t}W$, $t\bar{t}Z$, and tZq
cptb	$(\tilde{\phi}^\dagger i D_\mu \phi) (\bar{u}_i \gamma^\mu d_j)$	Effects on tHq and tZq
ctG	$(\bar{q}_i \sigma^{\mu\nu} T^A u_j) \tilde{\phi} G_{\mu\nu}^A$	Effects on every process with a top quark
cpG	$(\phi^\dagger \phi) G_{\mu\nu}^A G^{A\mu\nu}$	Effects on every QCD process

ttW diff/EFT

We are exploring several observables

- Number of jets
- HT (scalar sum of jet pt)
- Number of b-jets
- Leading b-jet pt
- Leading lepton pt
- Minimum ΔR (leading lepton, jet)
- ΔR (leptons)
- Maximum $|\eta(\text{lepton})|$
- Leading lepton pt and eta
- Leading jet pt
- Leading b-jet pt
- Number of jets
- $\Delta\eta(l\bar{l})$
