 millibarn

This talk: $t(t) + Z$ Boson Production

[arXiv:2405.18661](https://arxiv.org/abs/2405.18661) - Stairway to discovery: a report on the CMS programme of cross section measurements from millibarns to femtobarns

tWZ Production

- ❖ Sensitive to the top quark **electroweak couplings**
- ❖ Allows for investigation of **interference** effects within the SM (e.g. **with ttZ**)
- ❖ Shows increased **sensitivity** for some **SMEFT** operators
- ❖ Challenges:
 - Signal simulation: interference with ttZ
 - Discrimination from the overwhelming ttZ background

- ❖ Measurement performed in **final states with three or four leptons**
 - Z boson is reconstructed via its decays to electron or muon pairs
 - W boson decays either to leptons or hadrons
- ❖ Analysis is performed in **two regions** of the phase space
 - Top quark is almost at rest: sensitive to the SM tWZ production
 - Top quark with $p_T > 270$ GeV: enhanced sensitivity for new phenomena (SMEFT)
- ❖ Signal (SR) and control regions (CR) based on the number of leptons and (b-tag) jets
 - **Binned maximum likelihood fit of 7 distributions**

❖ SR in low energy

➤ 3 leptons

- $2j, \geq 1b$: binary classifier for **tWZ** vs Others
- $\geq 3j, \geq 1b$: Multiclass classifier for **tWZ** (1b) vs. **ttZ** ($\geq 2b$) vs Others

➤ 4 leptons, $\geq 1b$: b-tagged jet multiplicity

❖ SR in high energy: event yields

- Leptonic top tagger (leptonic decays) or Fat jets (hadronic decays)

❖ CR for diboson backgrounds: event yields

- 4 leptons (ZZ)
- 3 leptons, 0b (WZ)

❖ Observed (expected) significance of 3.4σ (1.4σ) → **first evidence!**

➤ $\sigma_{tWZ} = 354 \pm 54$ (stat) ± 95 (syst) fb, two s.d. above the SM

❖ Dominant systematic uncertainties

➤ **ttZ normalization**: 18%

➤ bkg normalization (other than ttZ): 12%

➤ Experimental sources: 10%

➤ Signal modeling: 5%

❖ **Anti-correlation** is observed with the ttZ process

❖ **Fixing the ttZ cross section** to the measured value, the statistical significance of the signal stays above **three s.d.**

ttZ, tWZ, and tZq - [CMS-PAS-TOP-23-004](#)

- ❖ tZq and ttZ already measured (also differentially)
- ❖ Evidence for tWZ production
- ❖ Strong interplay between ttZ and tWZ: similar experimental signature and significant interference beyond leading order
- ❖ tZq also important from the experimental point of view

⇒ Goals: measure ttZ and tWZ processes together and reduce common systematic uncertainties, and simultaneously with tZq

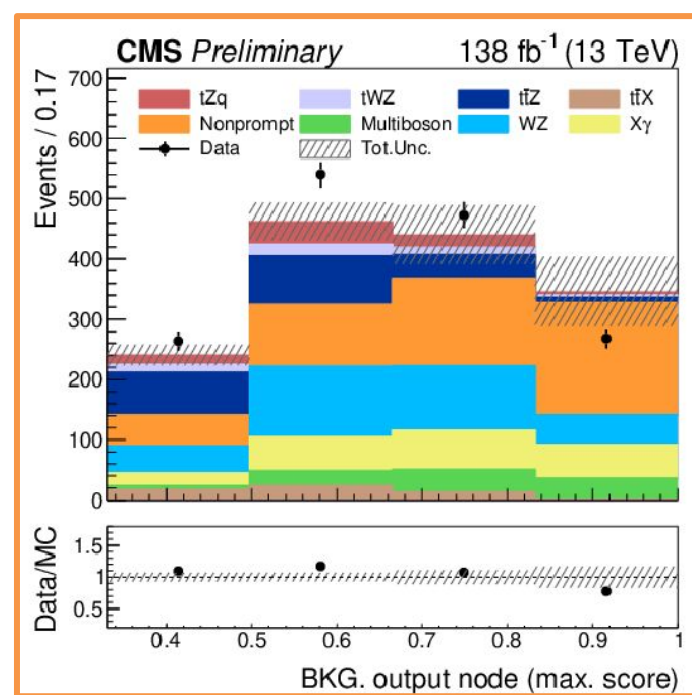

ttZ + tWZ and tZq - CMS-PAS-TOP-23-004

- ❖ First simultaneous measurement of single and pair production of top quarks in association with a Z boson
- ❖ Events with 3 leptons, ≥ 2 jets and ≥ 1 b-tagged jet are selected

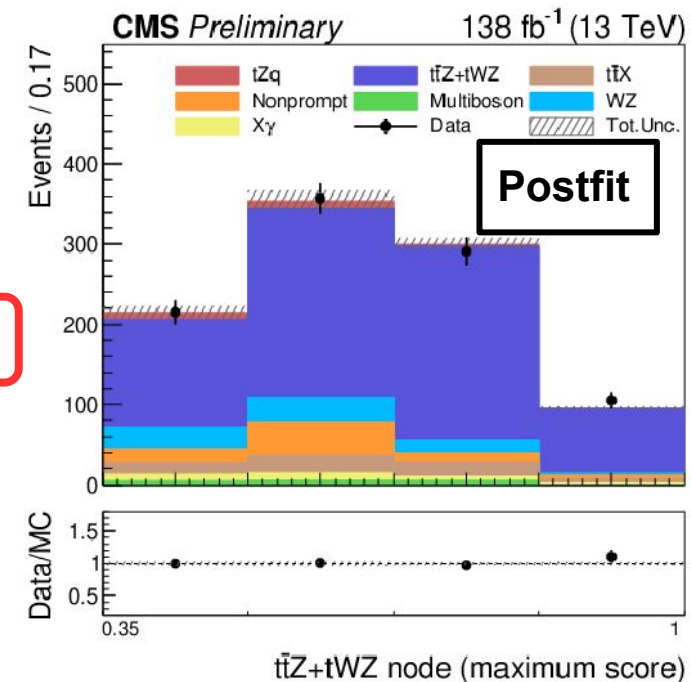

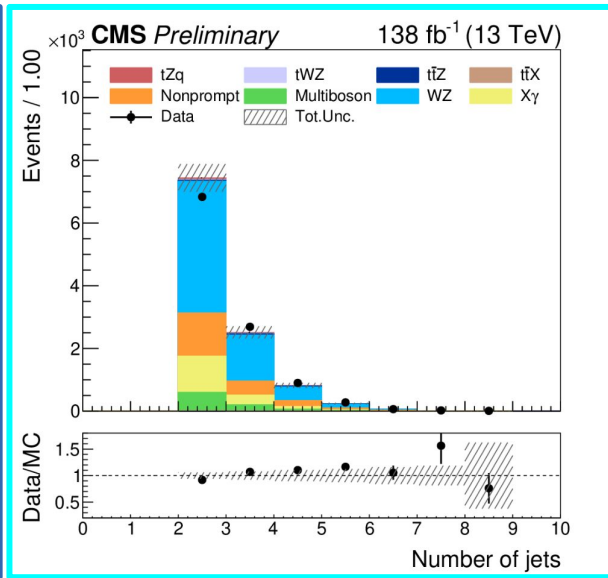

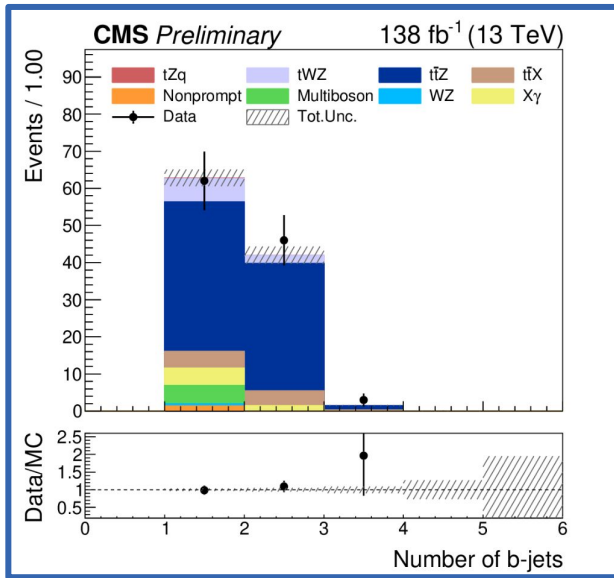

ttZ + tWZ and tZq - CMS-PAS-TOP-23-004

- ❖ The separation between the signals is achieved using a deep neural network classifier with three output nodes for the **tZq** process, the combined **ttZ** and **tWZ** processes, and **backgrounds**

ttZ + tWZ and tZq Inclusive - CMS-PAS-TOP-23-004

- ❖ For the inclusive cross sections, 2 CRs are used
 - 4 leptons (high purity in ttZ): b-tagged jet multiplicity
 - 0 b jets (enriched in WZ): jet multiplicity

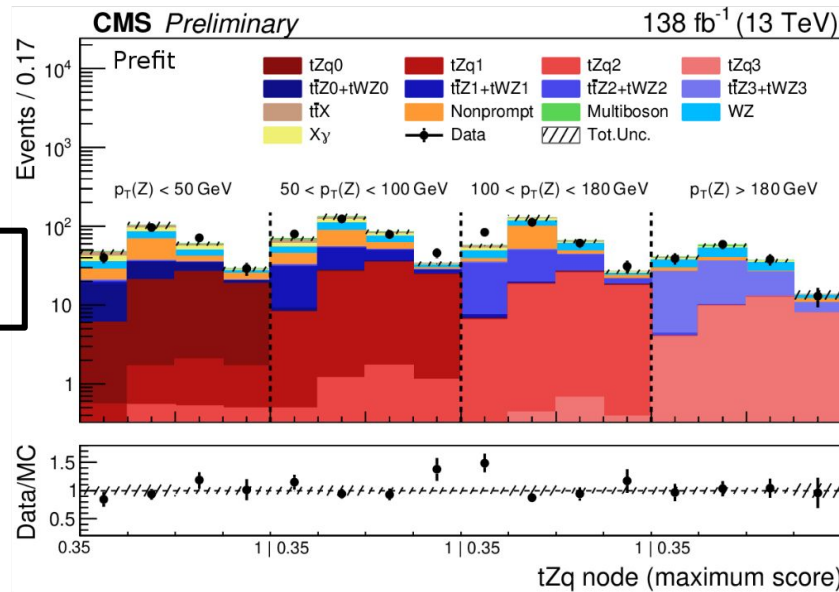

- ❖ Profile likelihood-ratio scan
- ❖ The inclusive cross sections are measured to be $\sigma(\text{ttZ}+\text{tWZ}) = 1.14 \pm 0.07 \text{ pb}$ and $\sigma(\text{tZq}) = 0.81 \pm 0.10 \text{ pb}$
 - Consistent with SM for tZq, small excess for ttZ+tWZ
- ❖ Statistically limited
 - Main syst: background modeling, (b-)jets

ttZ + tWZ and tZq Differential - CMS-PAS-TOP-23-004

- ❖ The cross sections are measured differentially as functions of several observables
- ❖ Combined profile likelihood used for unfolding

Prefit

Postfit

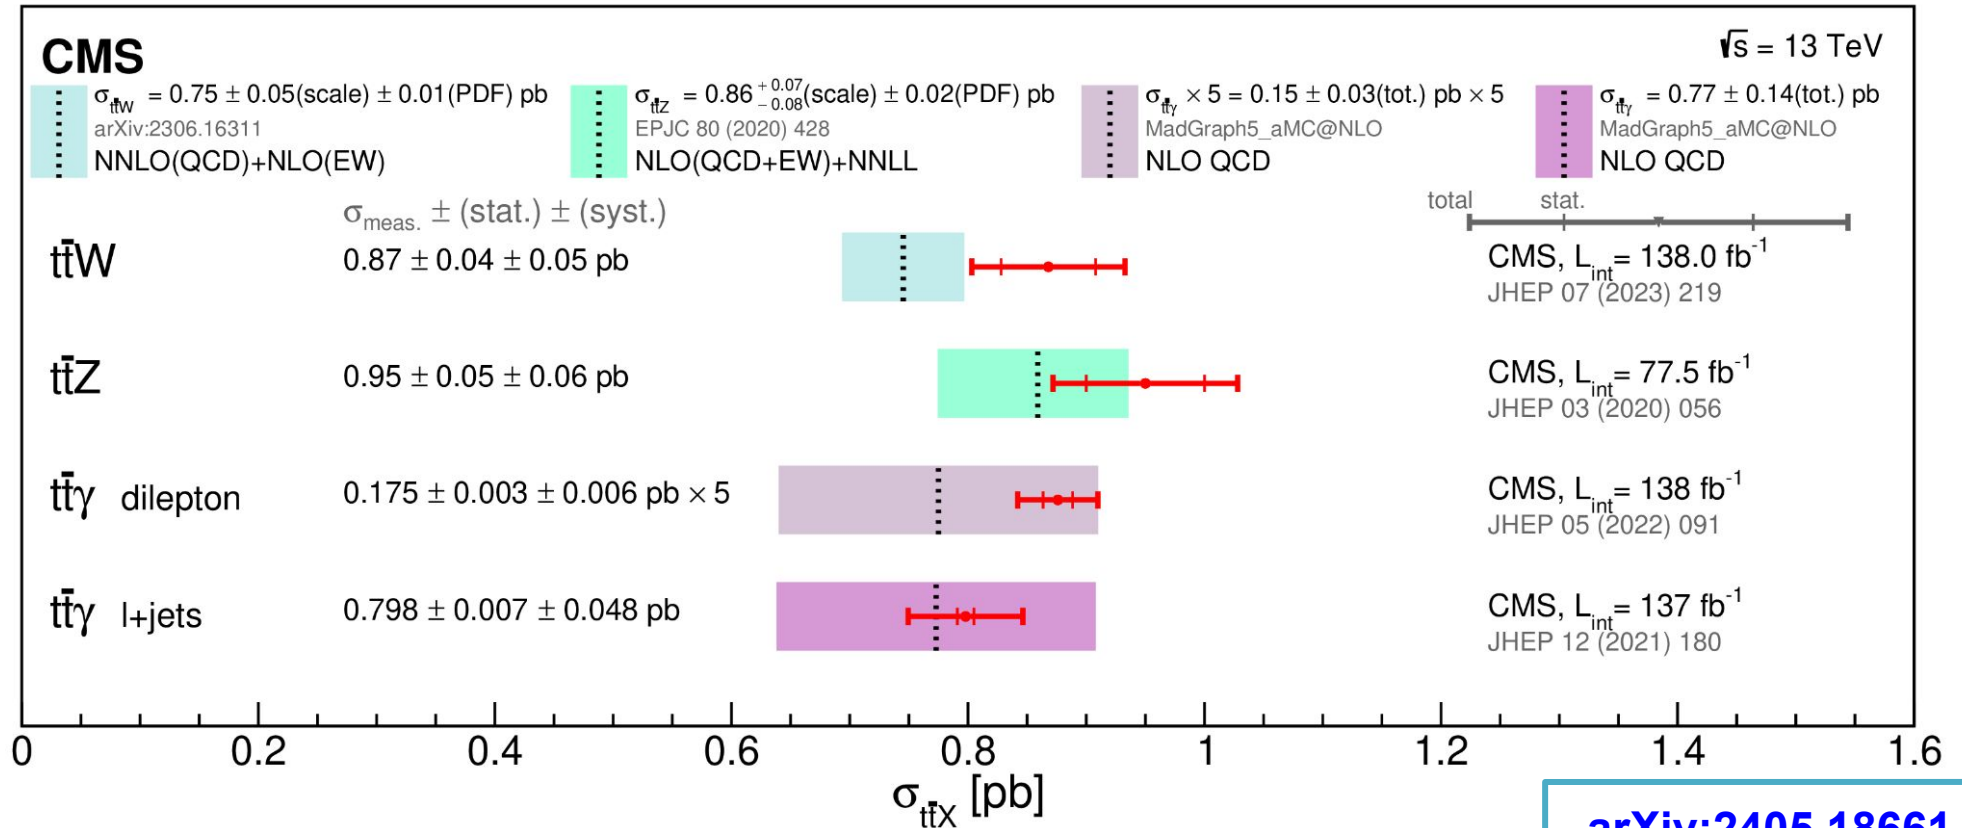

ttZ + tWZ and tZq Differential - [CMS-PAS-TOP-23-004](#)

- ❖ Unfolding performed simultaneously for tZq and ttZ+tWZ

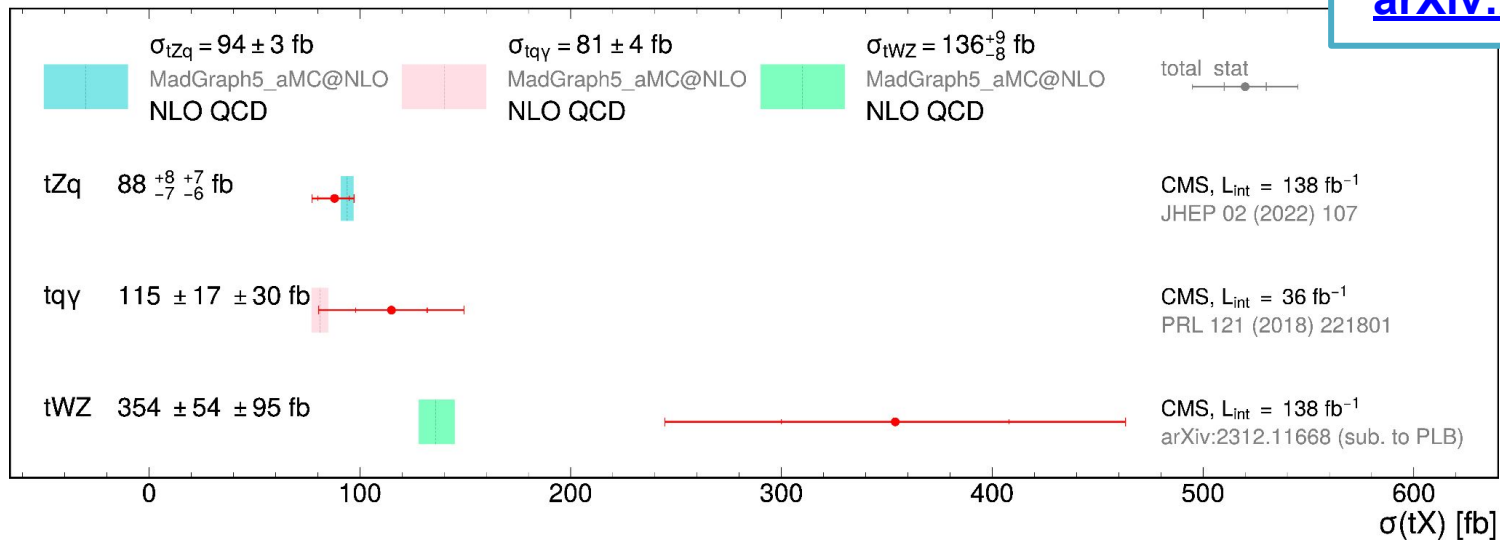

- ❖ Generally good agreement is found for the tZq process
- ❖ For ttZ+tWZ, a clear trend is observed as a function of the p_T of the lepton from the top quark, significant excess of the data over expectation at low values of p_T

Other t(t)+X

[arXiv:2405.18661](https://arxiv.org/abs/2405.18661)

Summary

- ❖ The large amount of LHC data recorded up to date allows probing **very rare SM processes**, very small production cross sections (**t/tt + V**)
- ❖ First evidence for **tWZ** production
- ❖ **First simultaneous differential measurement of tZq and ttZ + tWZ**

- ❖ **Stay tuned:** New results with more data are on their way...

Back-up Slides

- ❖ LO → NLO (QCD): one extra QCD vertex can give rise to tt/ttZ diagrams, intermediate top becomes resonant ⇒ **overlap with tt/ttZ** that needs to be removed
- ❖ [MadSTR](#) plugin used for removal through diagram removal schemes
- ❖ Amplitude A divided into A(res) and A(non-res)
 - **DR1**: removes A(res) in A, used for **nominal**
 - DR2: removes $|A(\text{res})|^2$ in $|A|^2$, for uncertainty
 - DS: subtraction term, lies between DR1 and DR2

Overview of diagram removal/subtraction schemes [Frixione et al., JHEP12\(2019\)008](#)

NLO process

$$a + b \longrightarrow \delta + \gamma + X$$

with a possible resonance

$$\beta \longrightarrow \delta + \gamma$$

$$\mathcal{A}_{ab \rightarrow \delta\gamma X} = \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta')} + \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)}$$

non-resonant

resonant

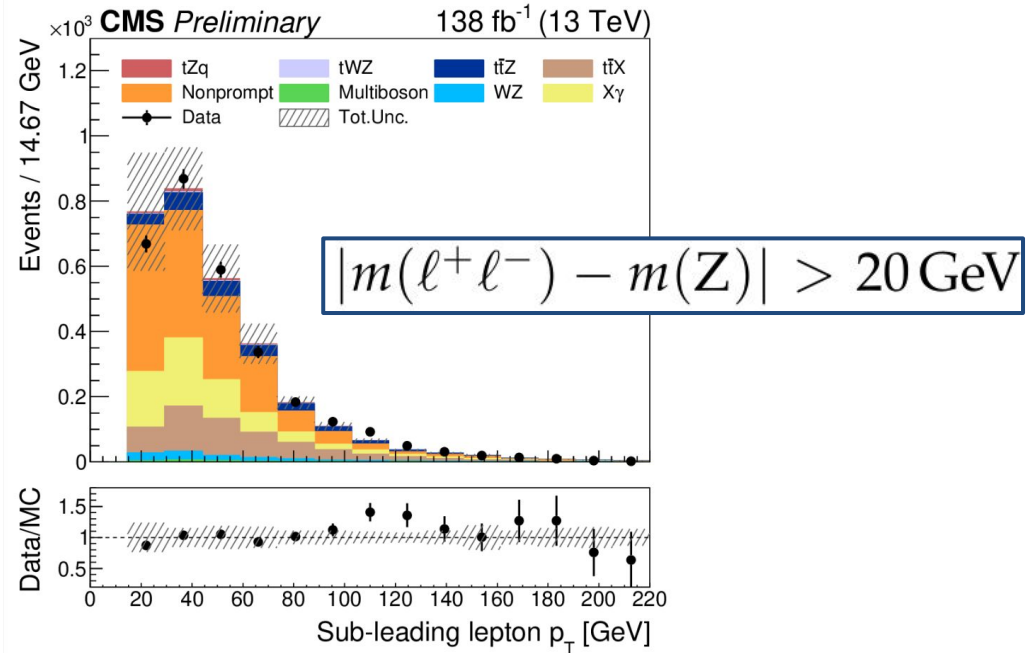

$$|\mathcal{A}_{ab \rightarrow \delta\gamma X}|^2 = \left| \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta')} \right|^2 + 2\Re \left(\mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta')} \cancel{\mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)\dagger}} \right) + \left| \cancel{\mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)}} \right|^2$$

- DR+I (DR1): removes both resonance and interference term
- DR2: removes only the resonant term
- The diagram subtraction (DS) scheme implements removal at the cross section level
