Dataset

- Pythia 8 simulation
- u-quark decay
- 800k events
- m, p_T, η, ϕ as input features

Architecture

- NRI architecture as a foundation;
- Improved by EdgeConv and factorized final MLP

Truth

Predicted

Summary

- Particle decay reconstruction can be solved for low number of leaf nodes. But this is left tail of distribution.
- Proposed model shows better performance than baseline in both metrics.
- `Exact` match metric is not good enough, need to invent another.
