

From Raw data to Physics Results (1/3)

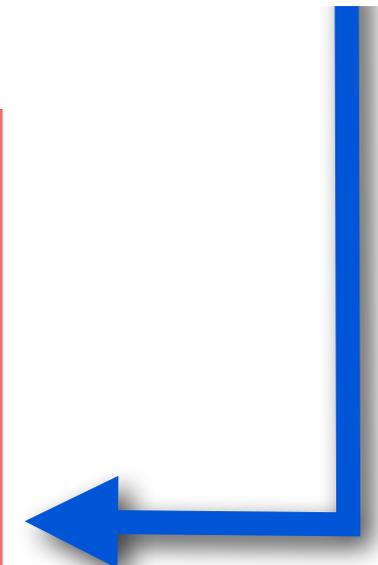

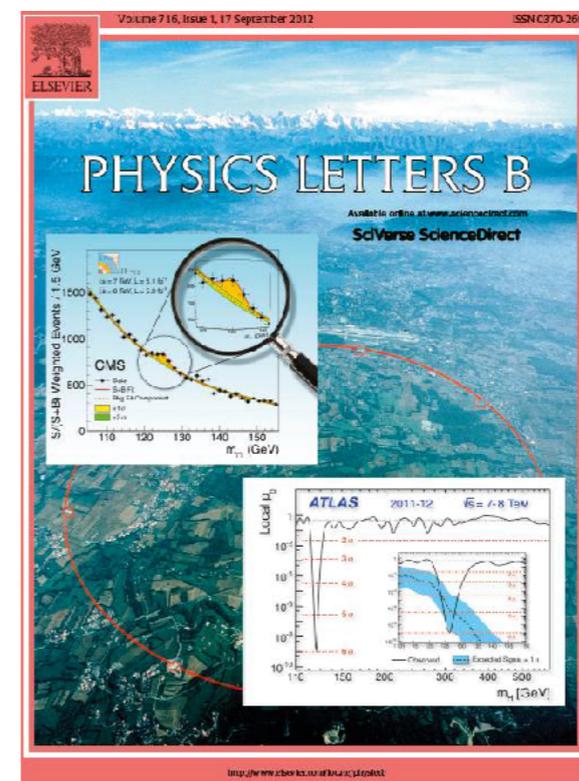

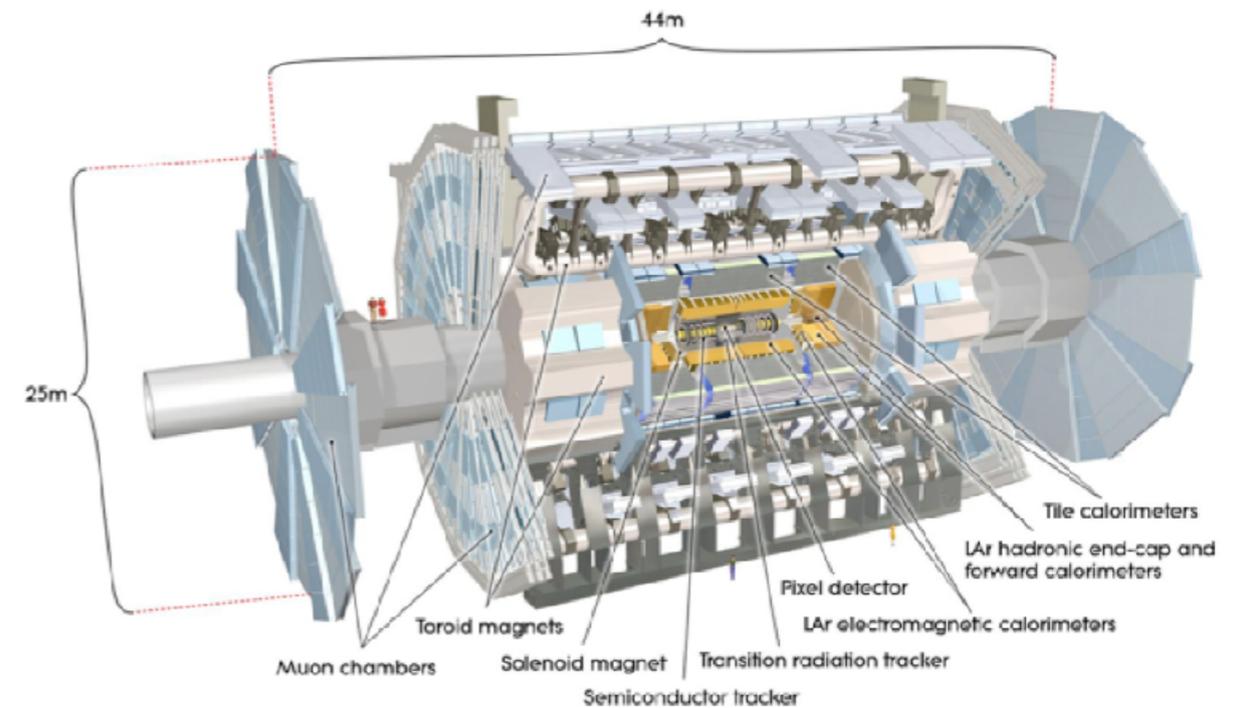

Dr Paul Laycock

The particle physics cycle

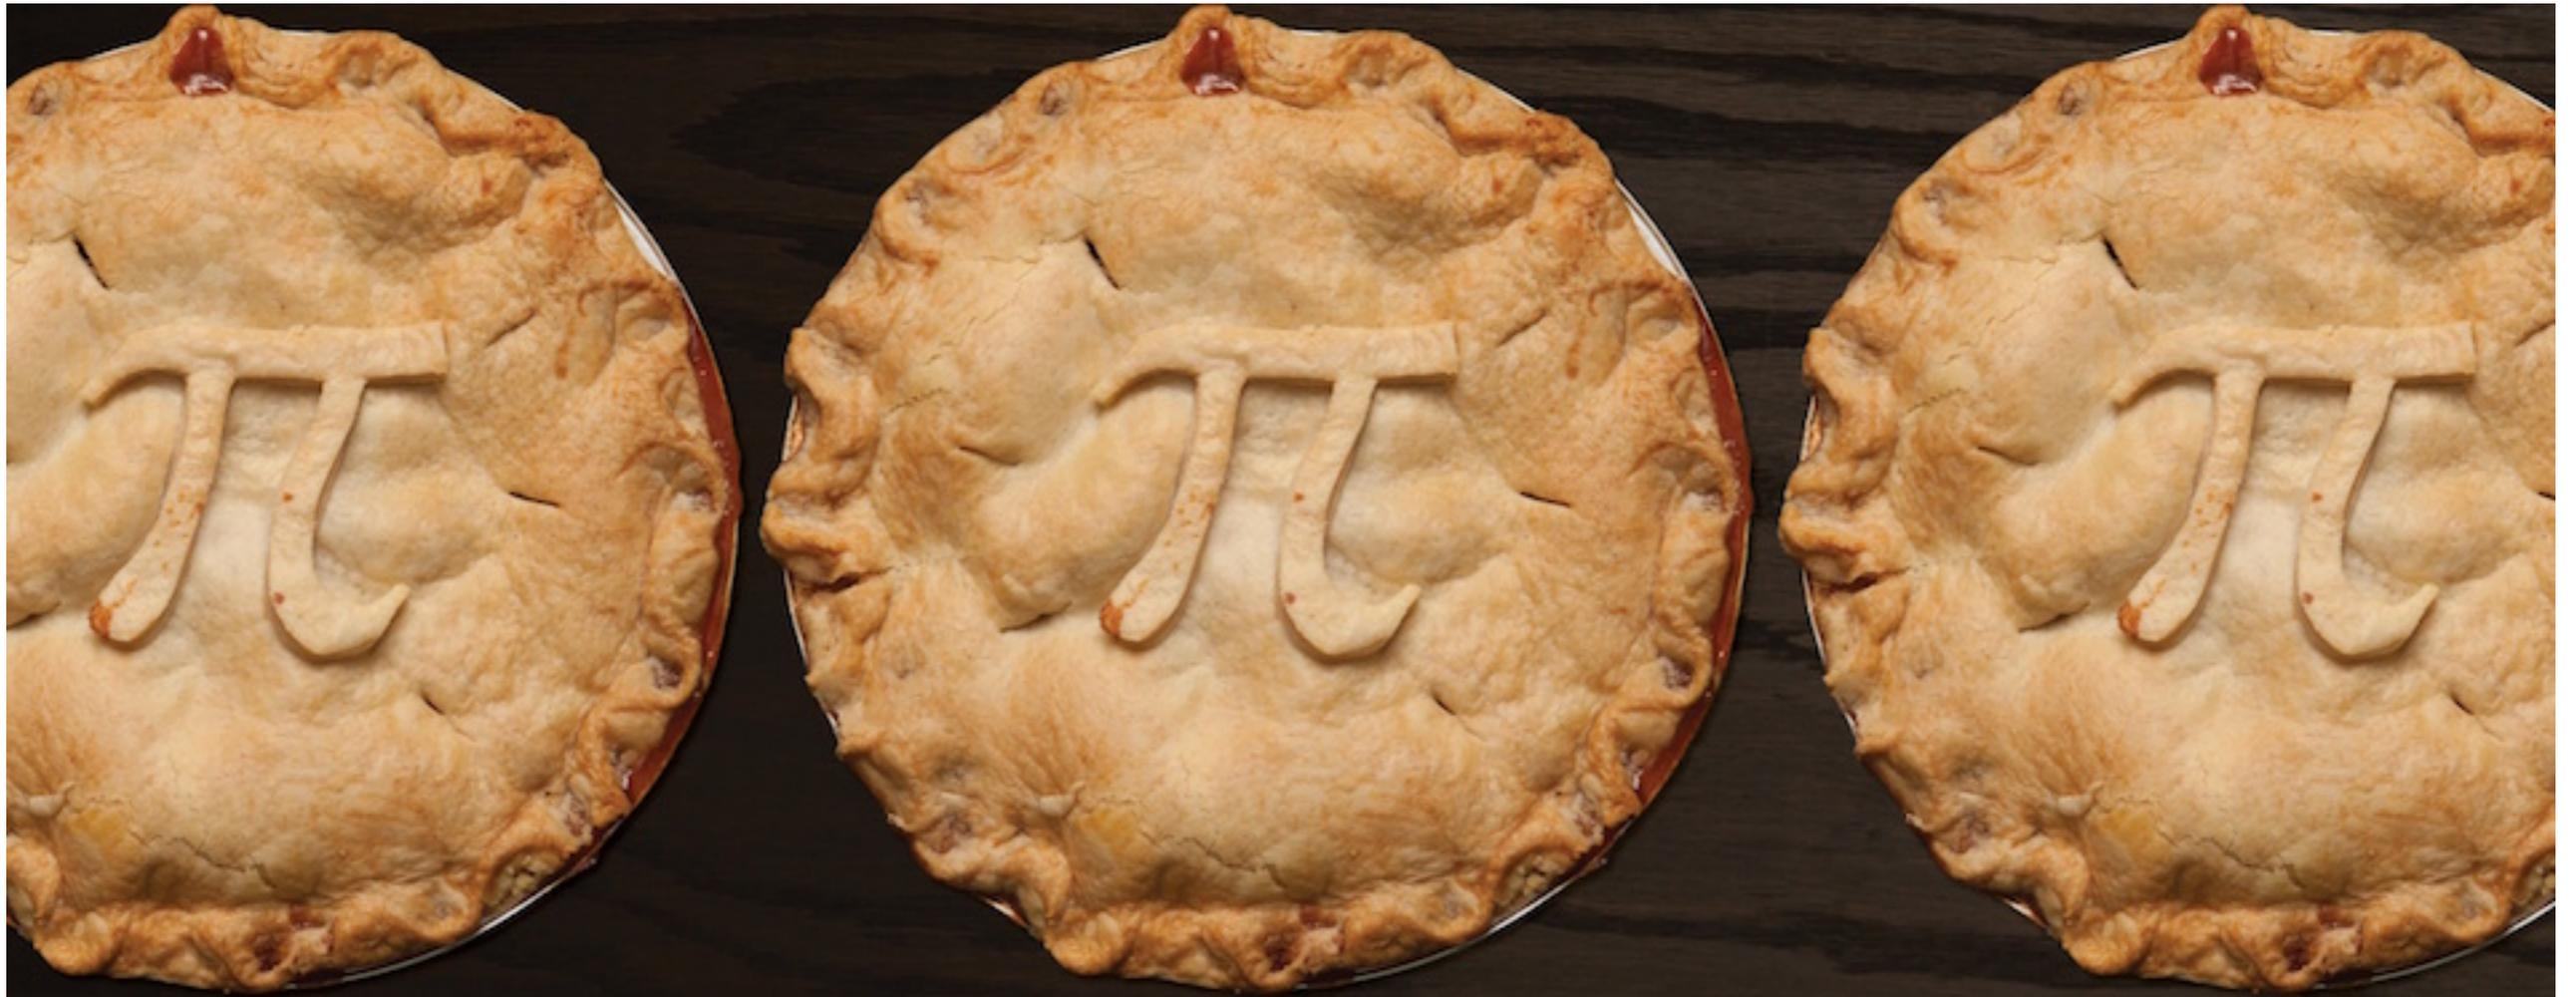

Experimental physics

- Much of the work of the experimental physicist is running experiments and extracting measurements from them
- **Note** - *Experimental physicists also need to propose, design and build new experiments (see previous slide)*
- These lectures are focused on understanding how we turn raw experimental detector data into physics results that we can publish
 - Results must be **accurate**
 - with well understood **precision**
 - It's important to understand the difference between these two words, we often confuse them

Accuracy and precision

$$3.1416 \pm 0.0001$$

$$22/7 \pm 1$$

$$3.14159265 \pm 0.1$$

Course outline

- **Lecture 1**

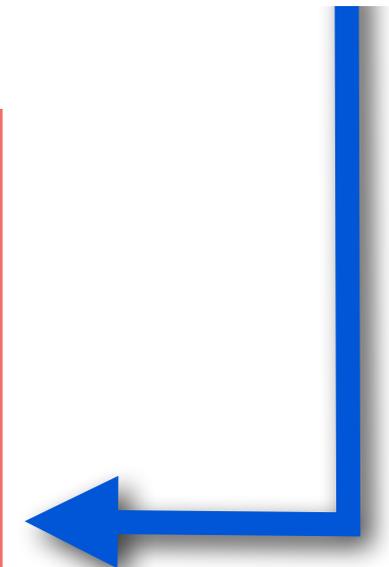

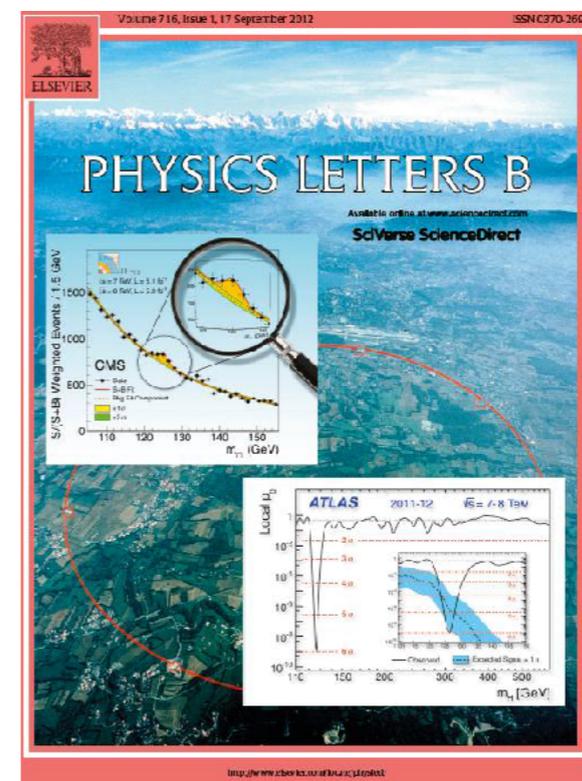

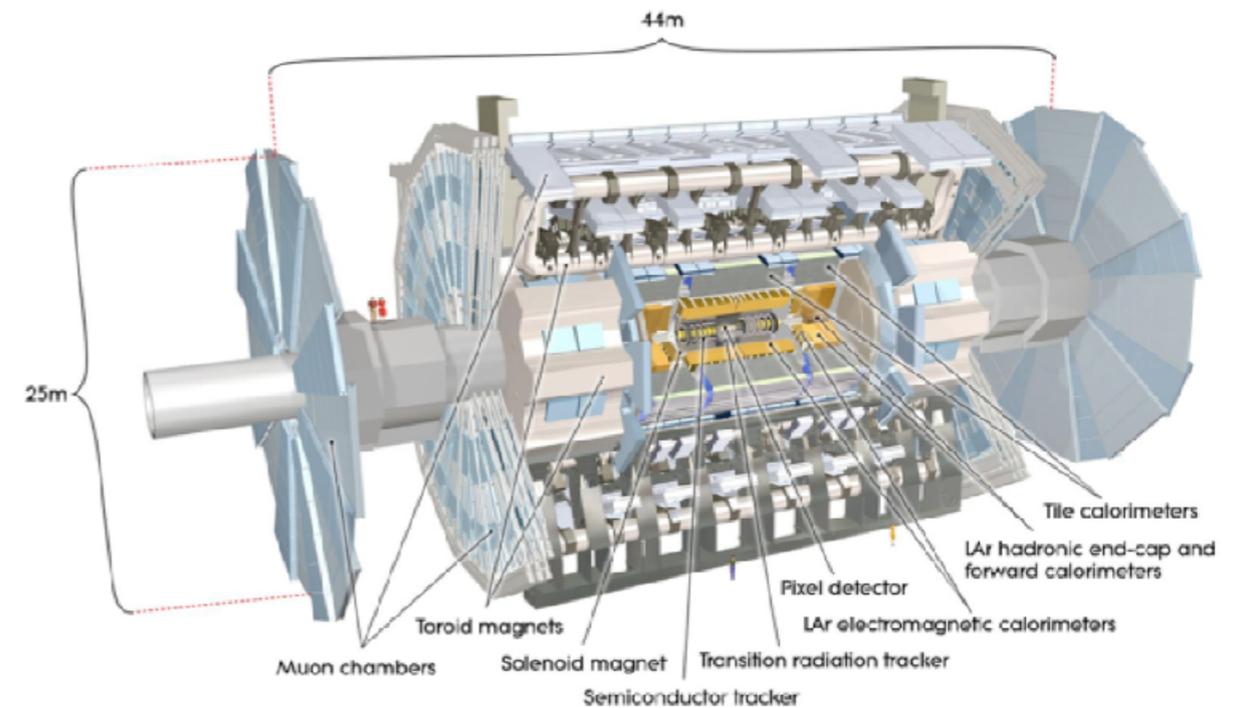

- The journey of raw data from the detector to a publication

- **Lecture 2**

- How we reconstruct fundamental physics processes from raw detector data

- **Lecture 3**

- How we extract our signals from the mountain of data, finding needles in the haystack

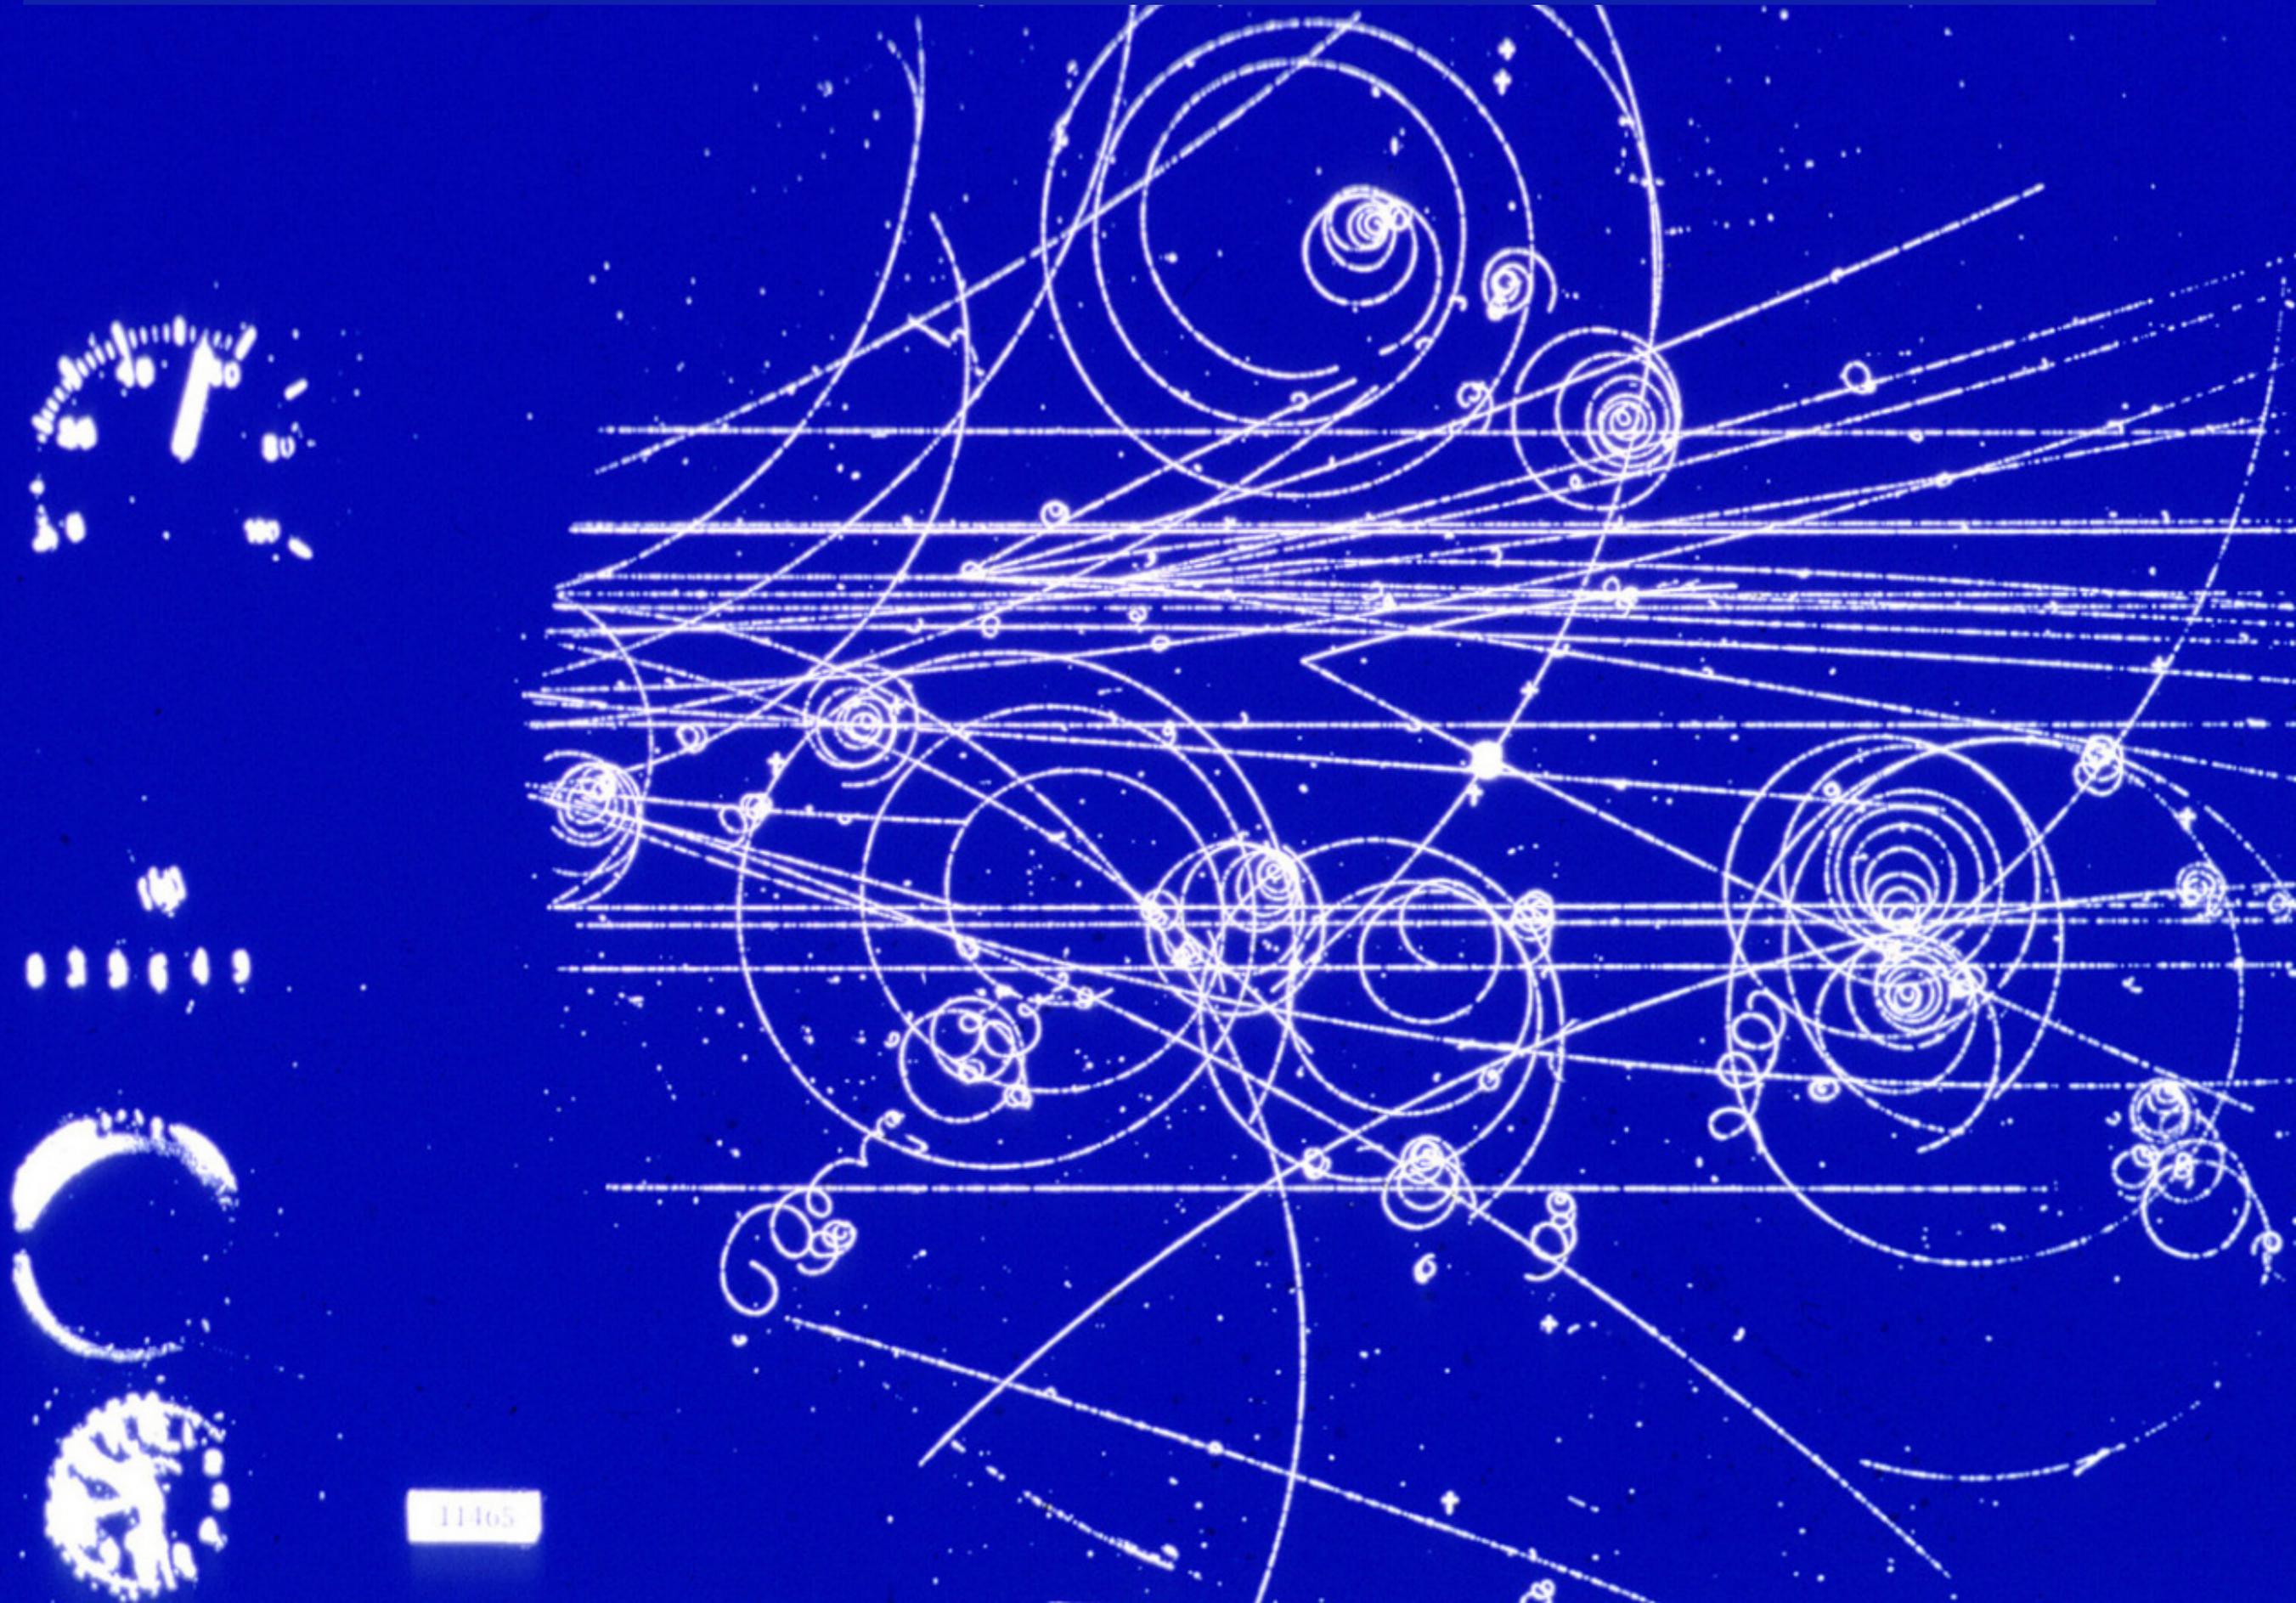

Experiments at CERN

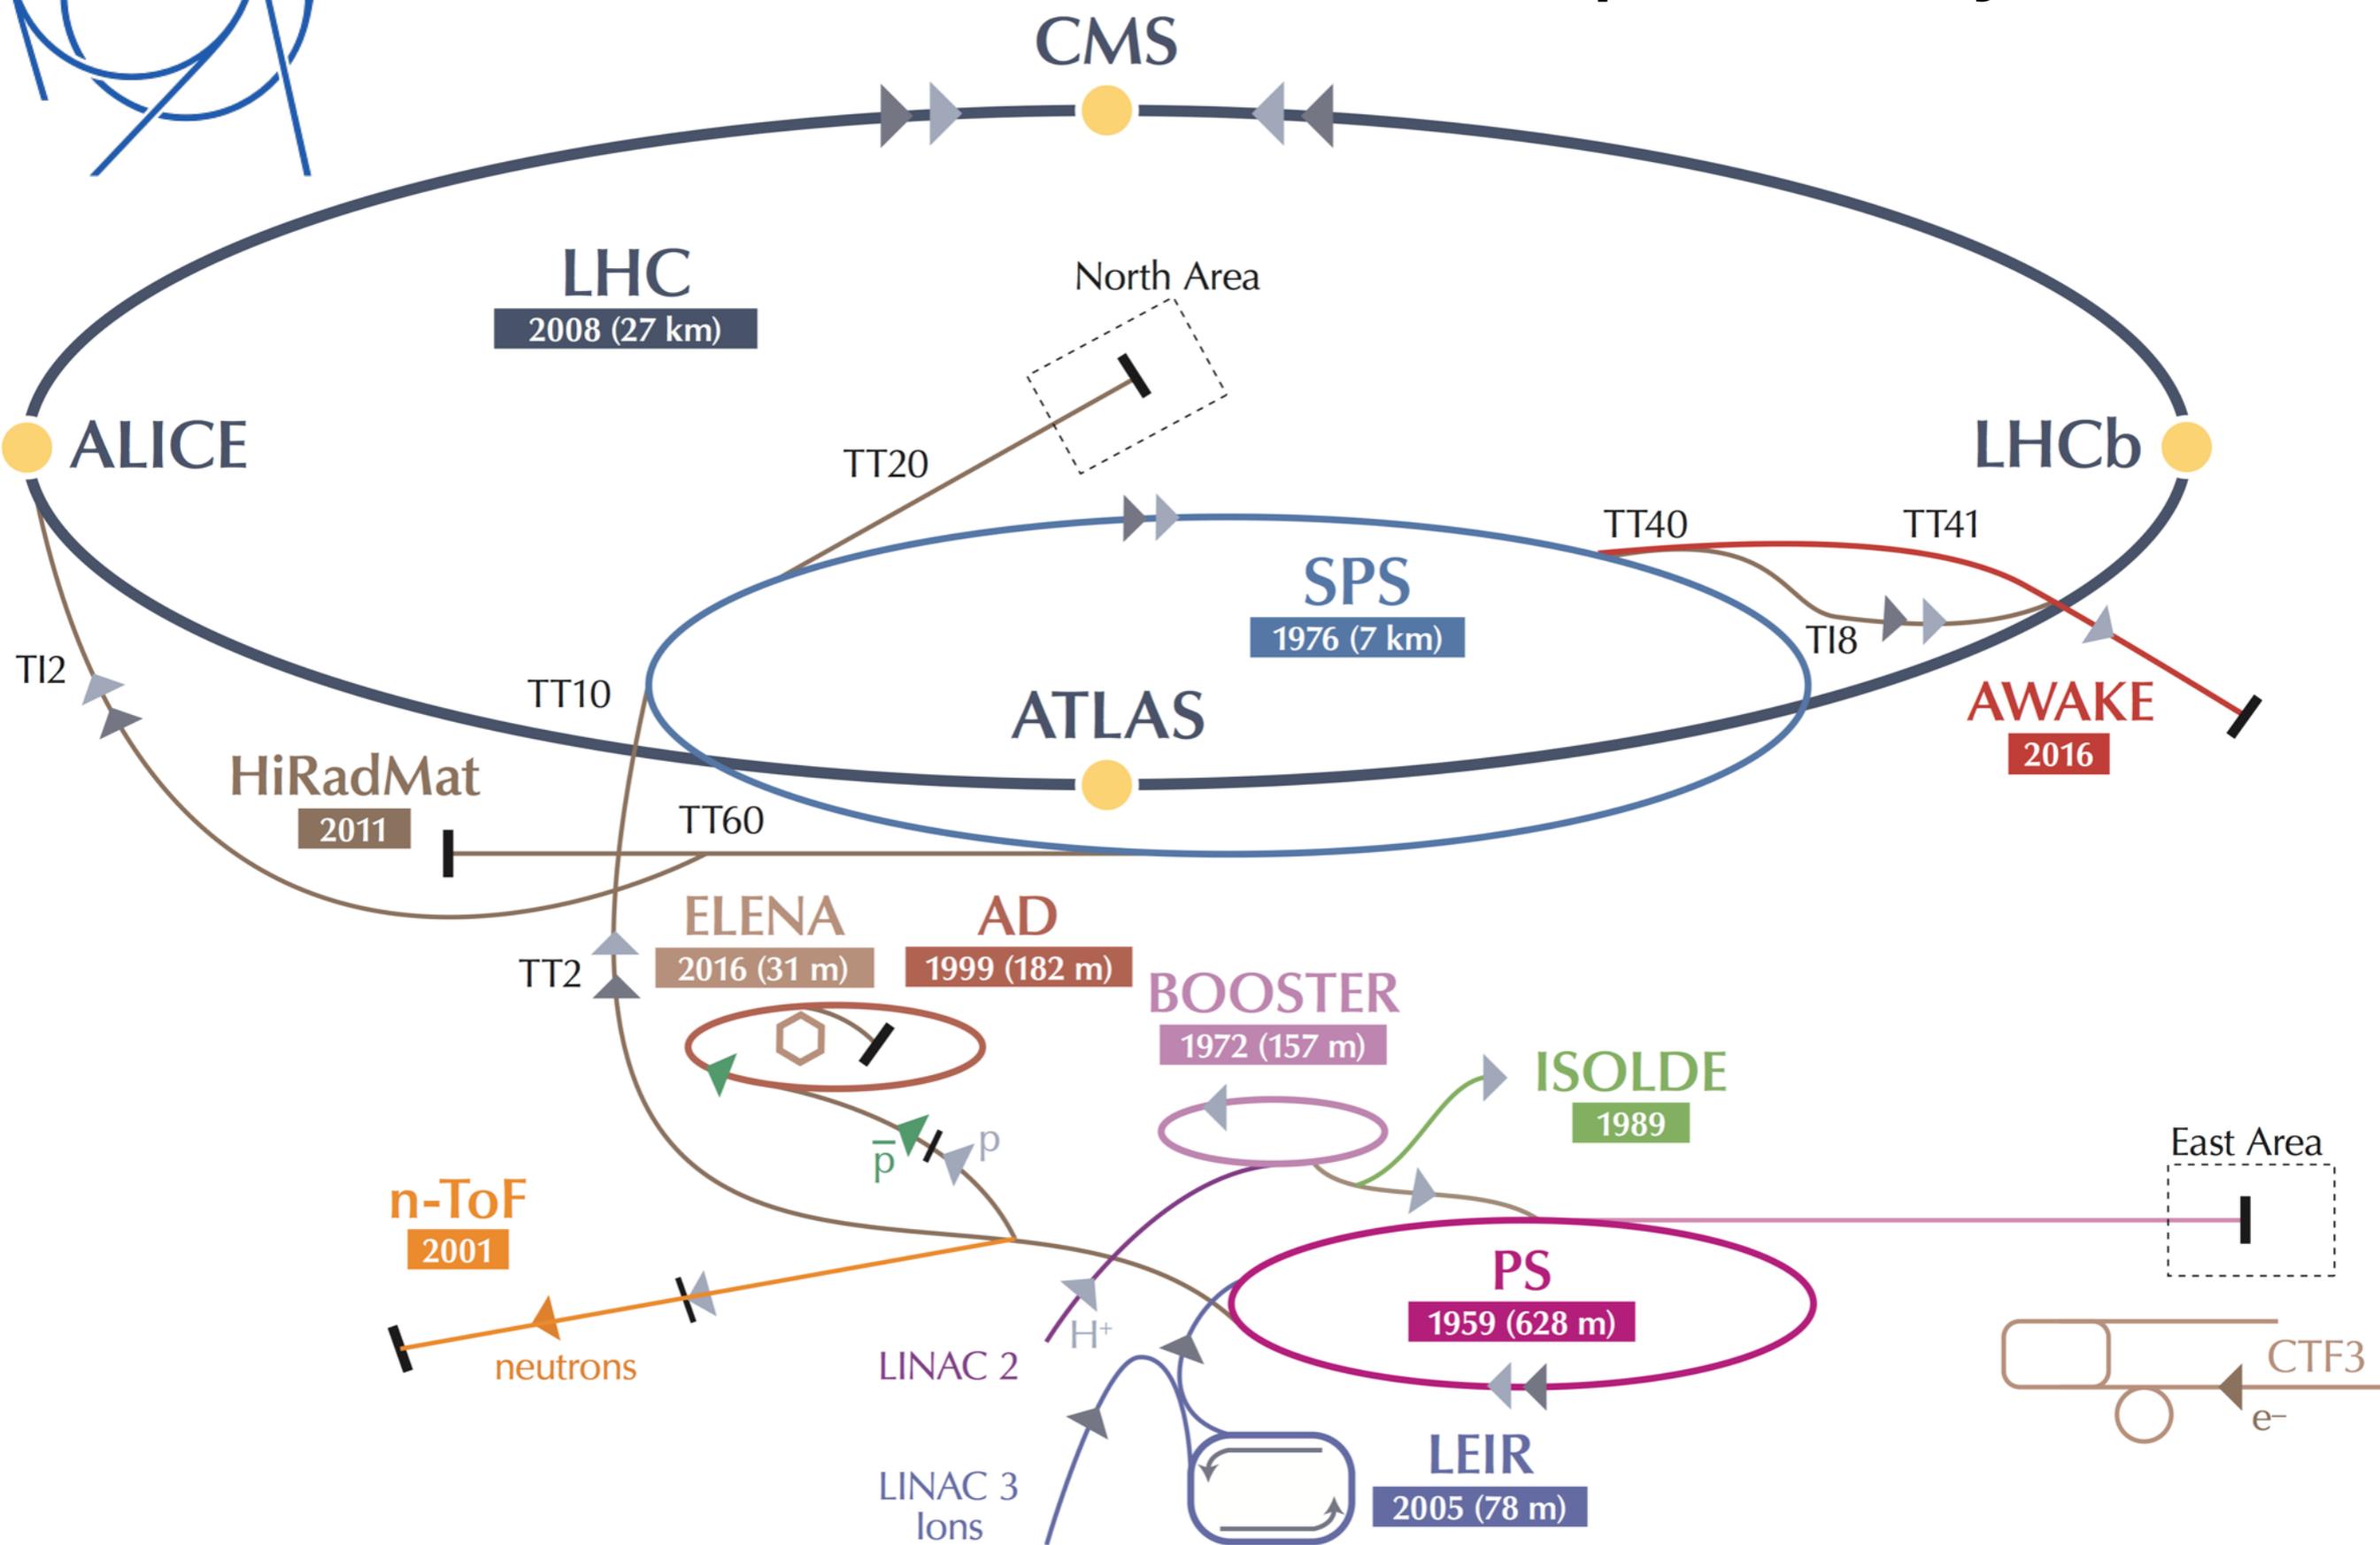

- In the 1960s we used Bubble chambers, the one that you can see in the Microcosm was used...

... data analysis used to involve a person looking at pictures

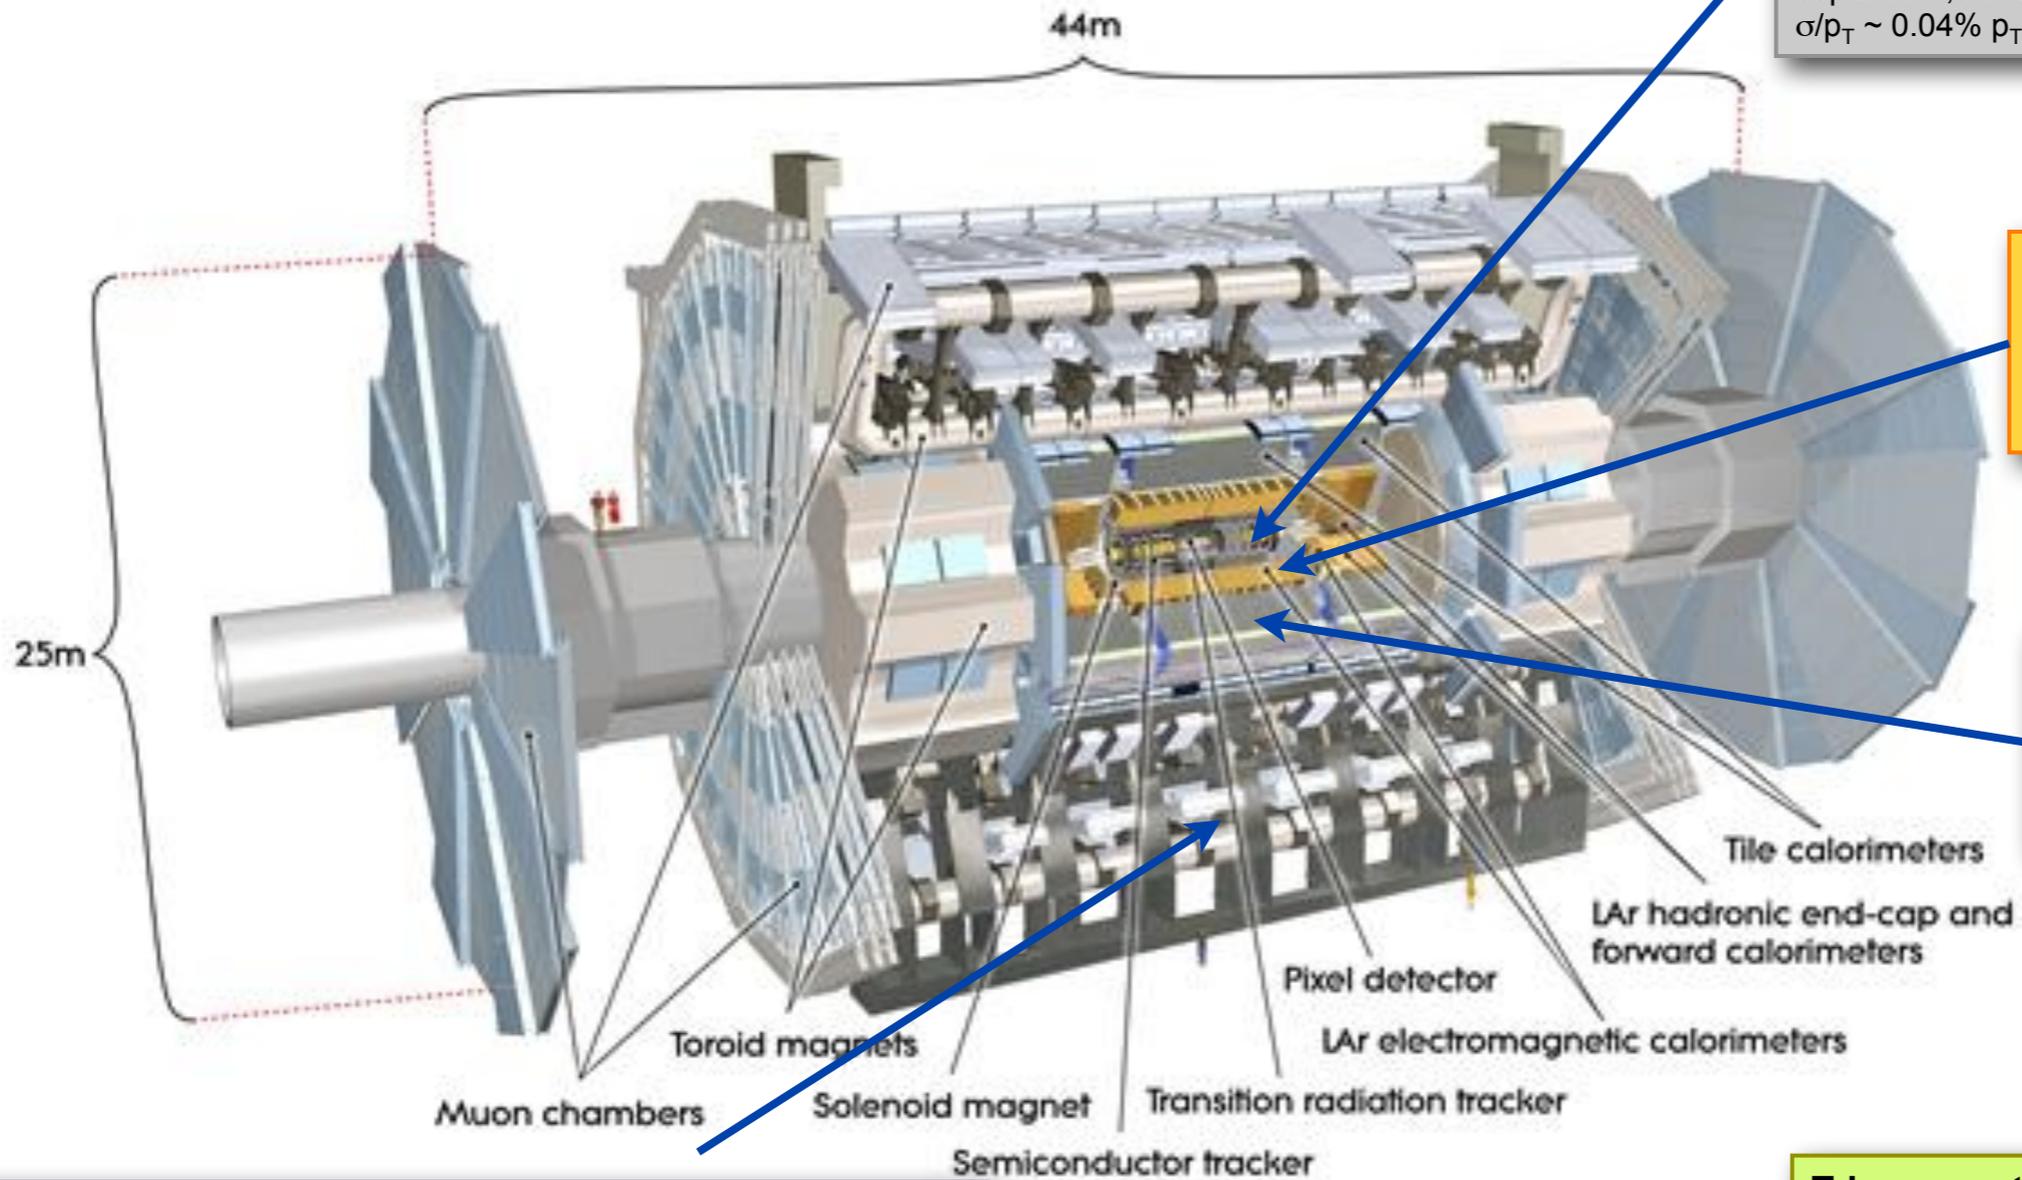

Today @ CERN we have huge rates of collisions so that we can produce very rare events

The ATLAS Detector @ LHC

L ~ 46 m, \varnothing ~ 22 m, 7000 tons
~ 10^8 electronic channels

Inner Tracker ($|\eta| < 2.5$, $B=2T$):
Si Pixels, Si strips, Trans. Rad. Det.
Precise tracking and vertexing, e/π
separation, momentum resolution:
 $\sigma/p_T \sim 0.04\% p_T (\text{GeV}) \oplus 1.5\%$

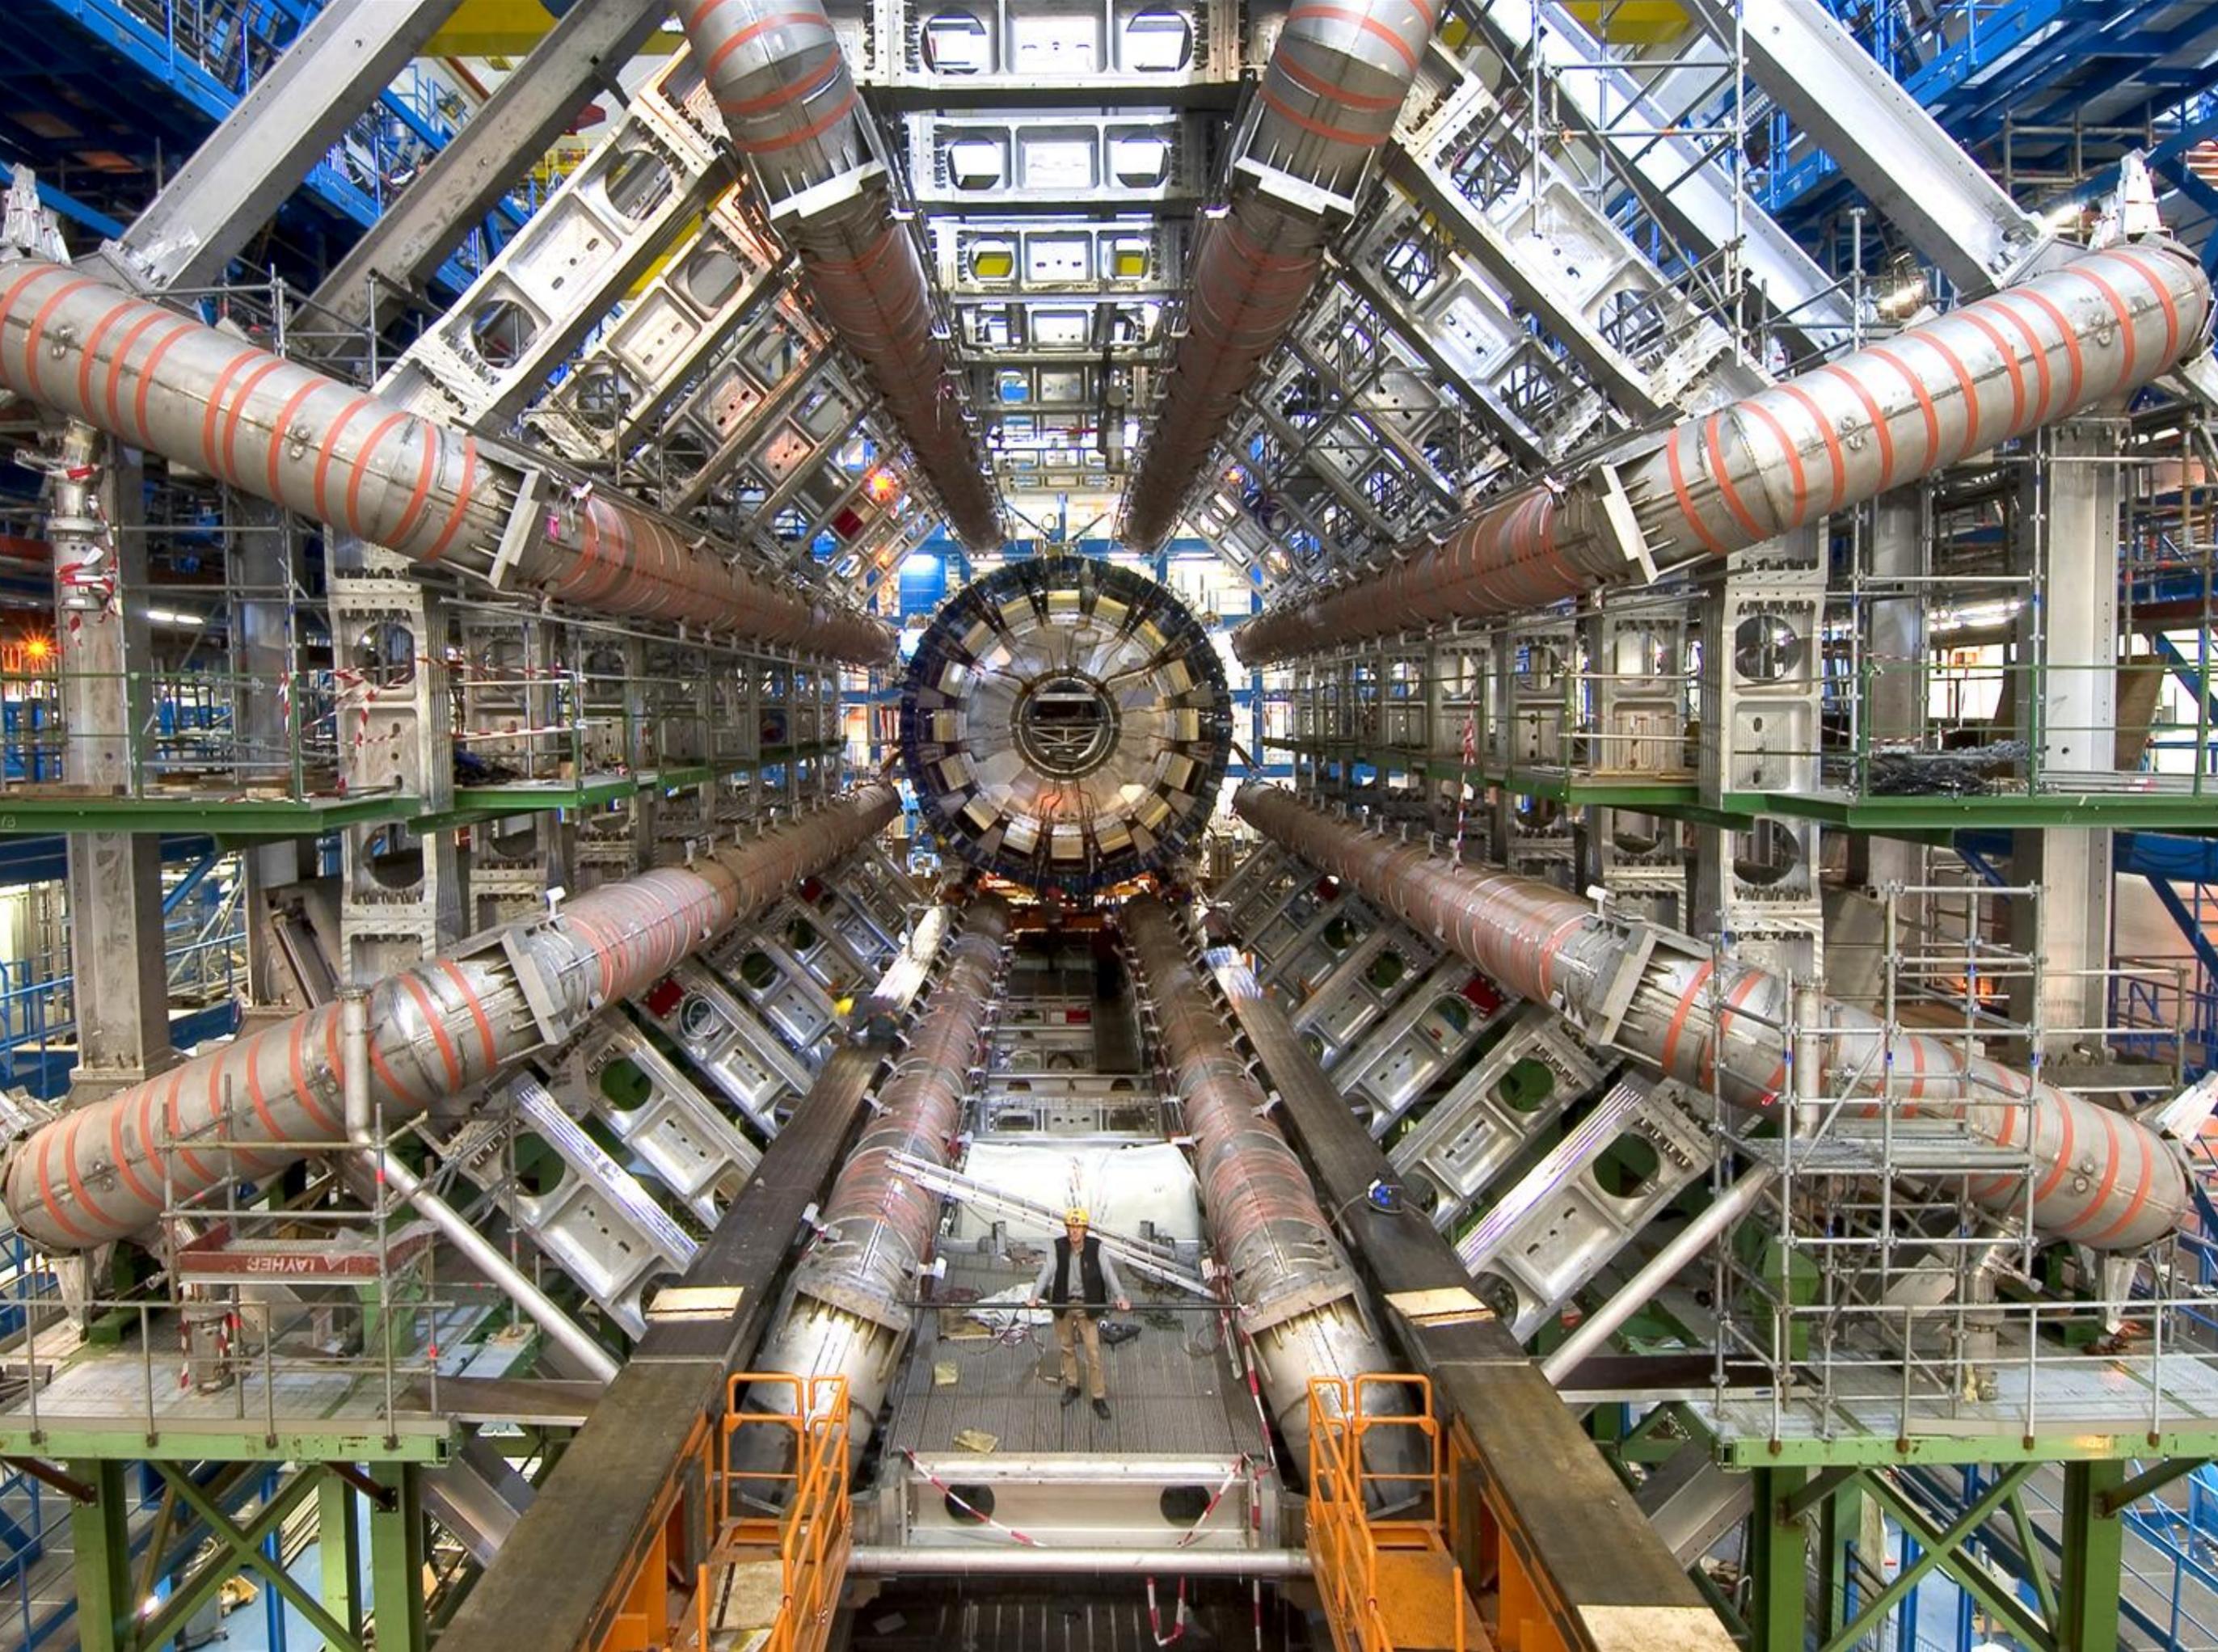

EM calorimeter:
Pb-LAr Accordion, e/γ
trigger, id. and meas.,
energy res.: $\sigma/E \sim$
 $10\%/\sqrt{E} \oplus 0.7\%$

HAD calorimetry ($|\eta| < 5$): Fe/
scintillator Tiles (cen), Cu/W-LAr
(fwd). trigger and meas. of jets
and $E_{T,miss}$, energy res.: $\sigma/E \sim$
 $50\%/\sqrt{E} \oplus 3\%$

Muon Spectrometer: air-core toroids with gas-based muon chambers.
trigger and meas. with momentum resolution $< 10\%$ up to $E_\mu \sim 1 \text{ TeV}$

Trigger system: 3-levels reducing
the IA rate from 40 MHz to ~200 Hz

Millions of detector readout channels read out to reconstruct one “event”

Photon

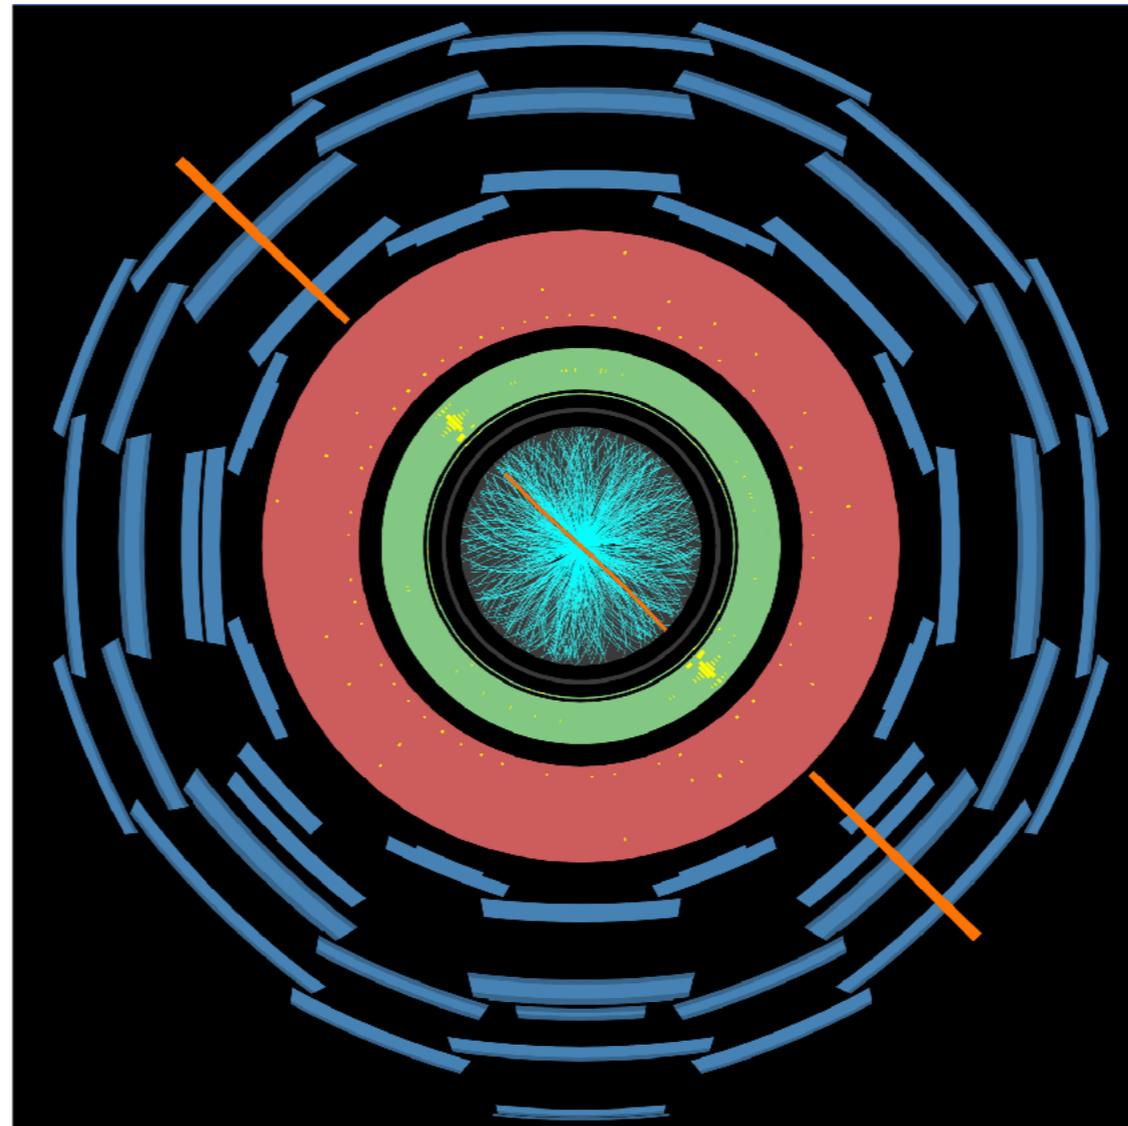

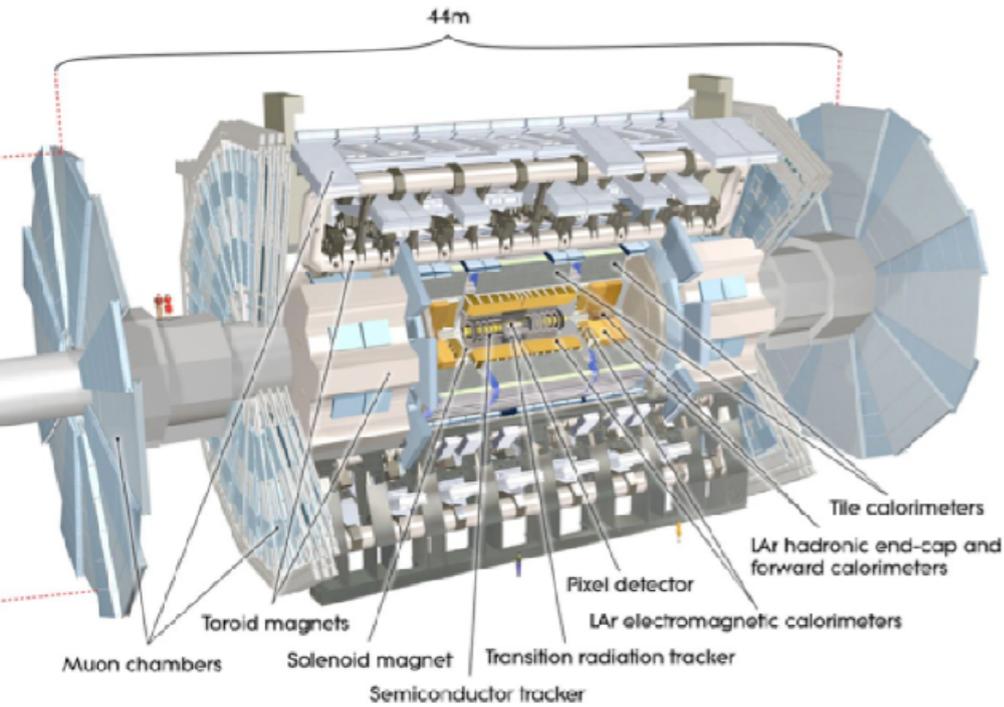

Neutrino

The dashed tracks are invisible to the detector

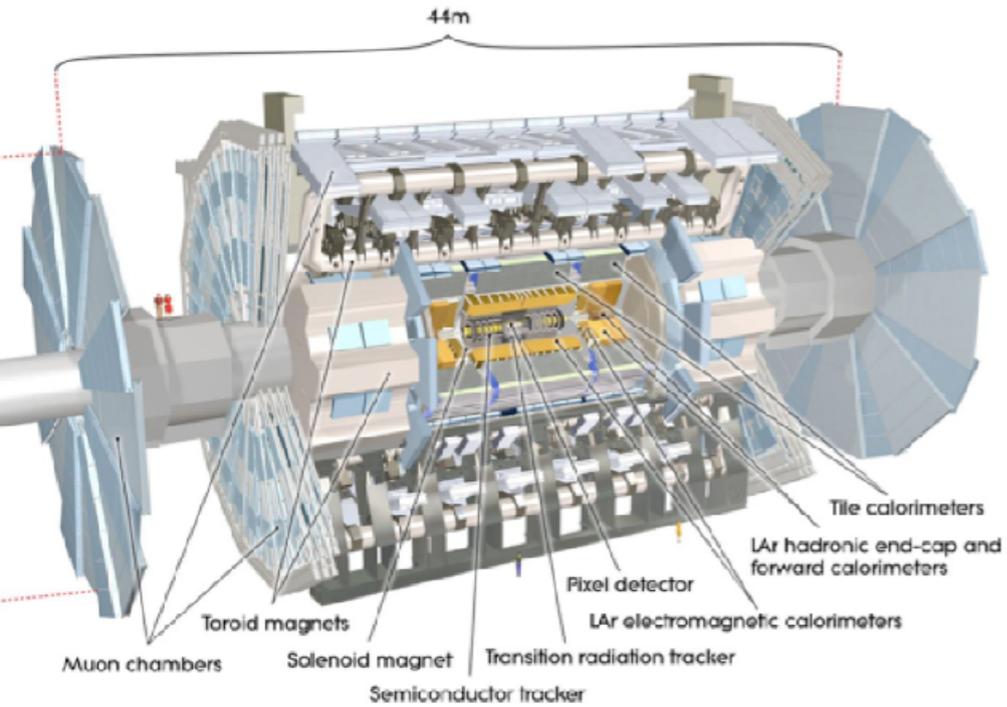

Event displays

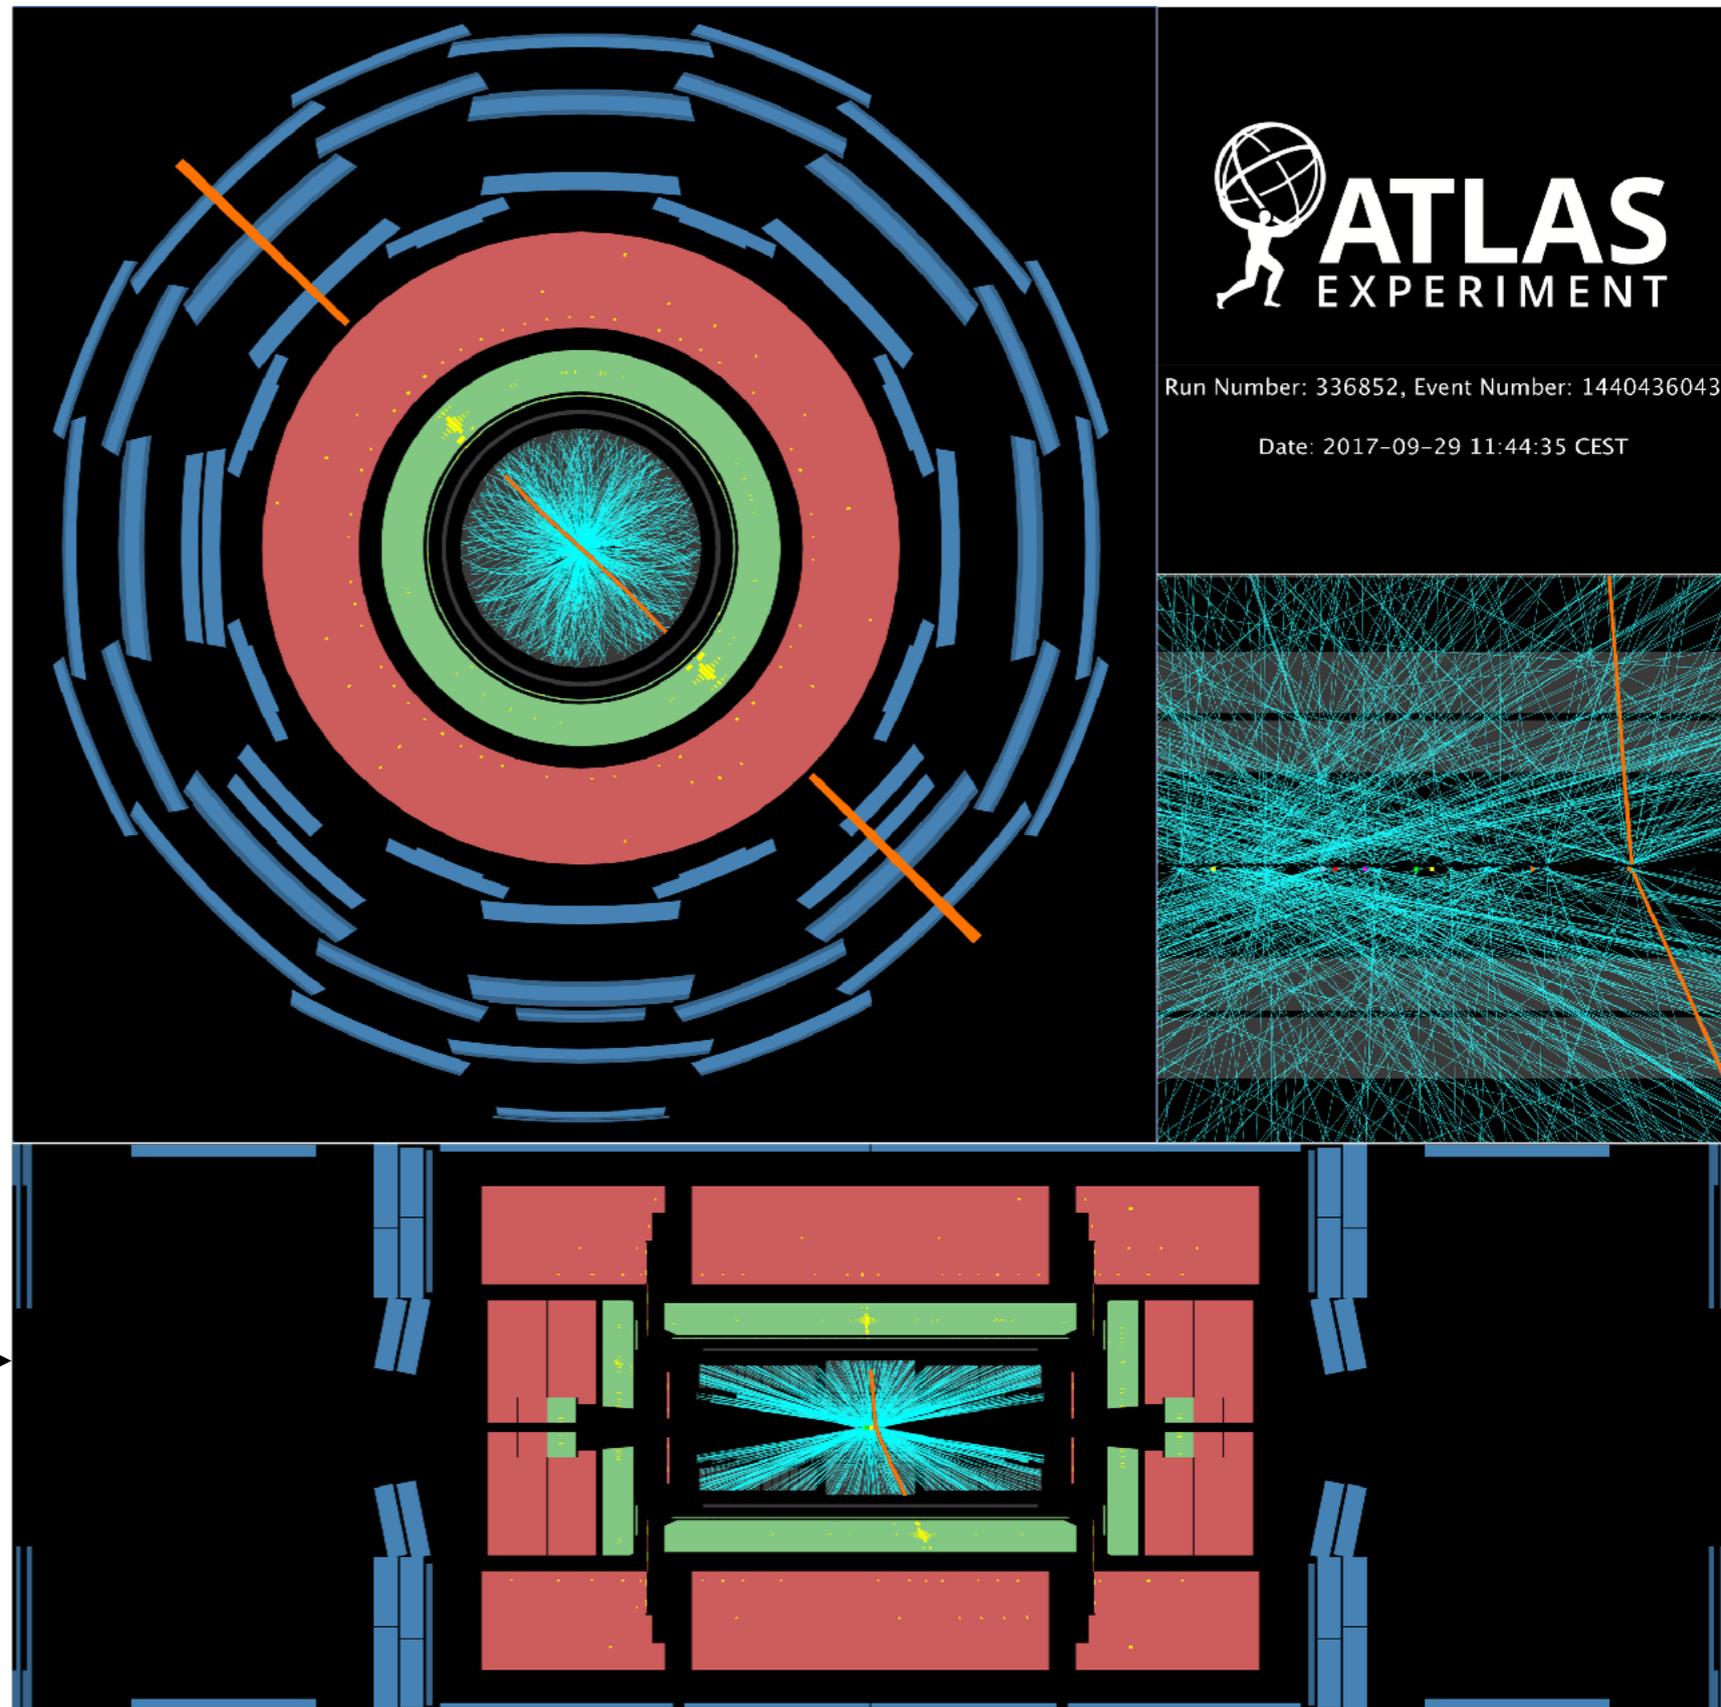

- Event displays are great ways for us to visualise what happened in a particle collision
- In this **ATLAS event display** (*right*) of a real proton collision, we are looking down the beam pipe, so the plane of the display is transverse to the proton beam direction
- **Question:** Can you quantify the momentum in this plane **before** the proton collision
 - What does that tell you about the distribution of momentum **after** the collision?
 - Can you say which fundamental particle(s) is (are) observed in the event?

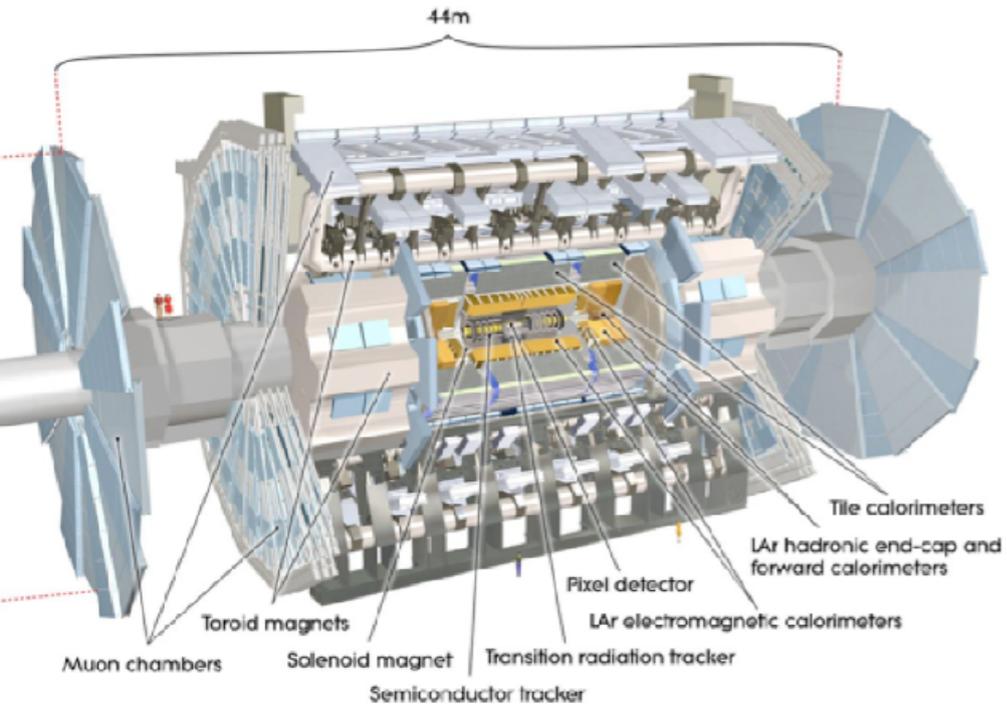

Event displays

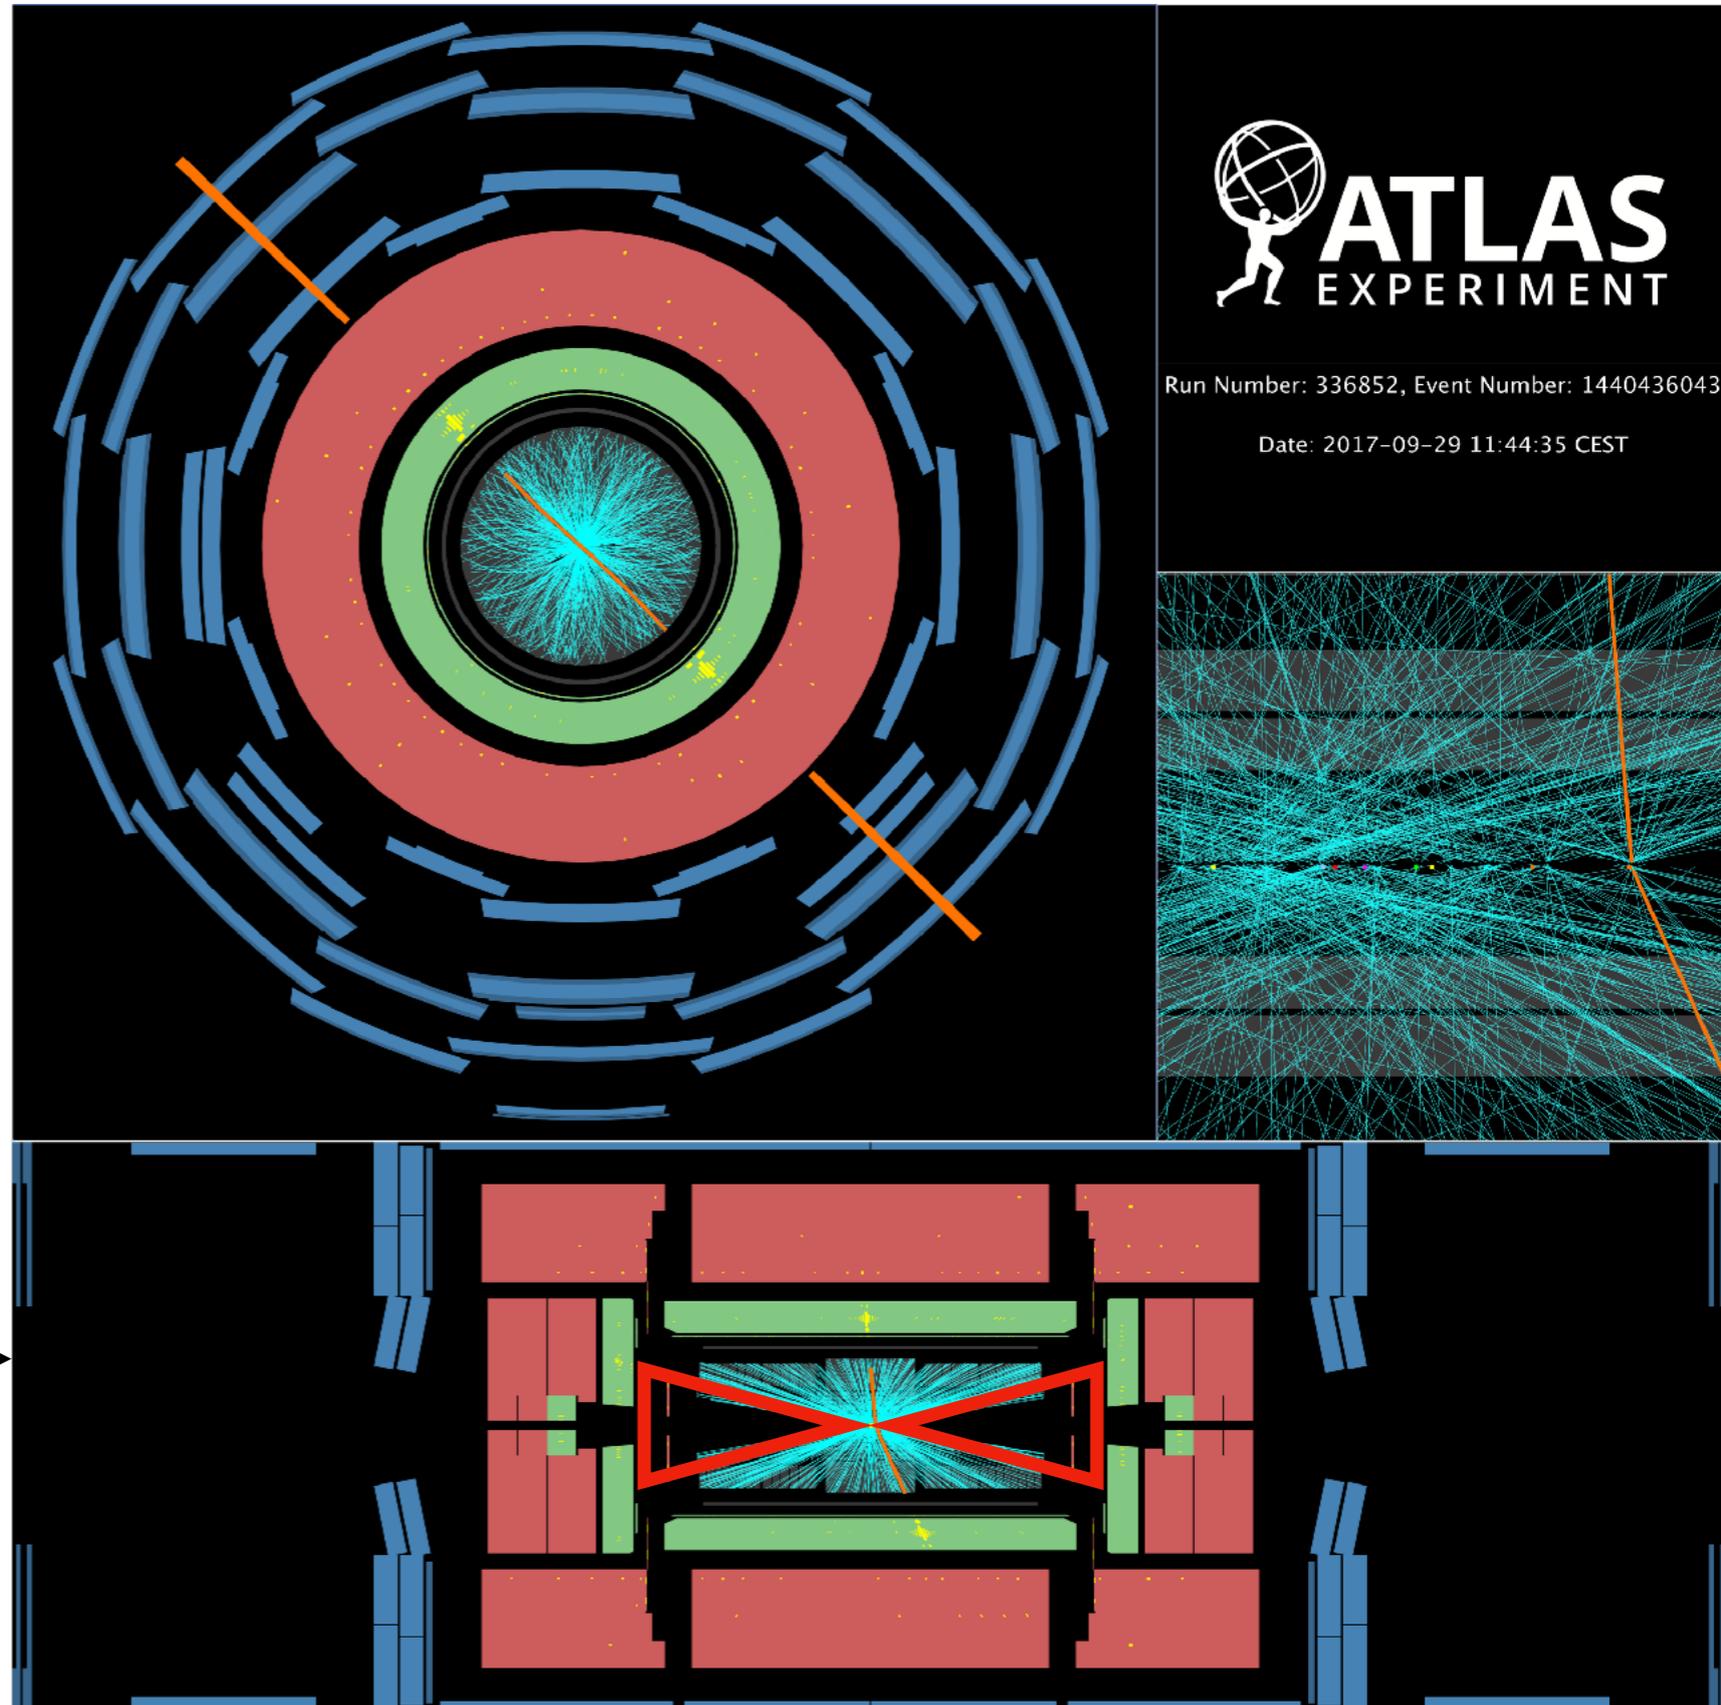

- This view shows the plane in the proton beam direction
- Both **2D** views are often used to provide complementary information

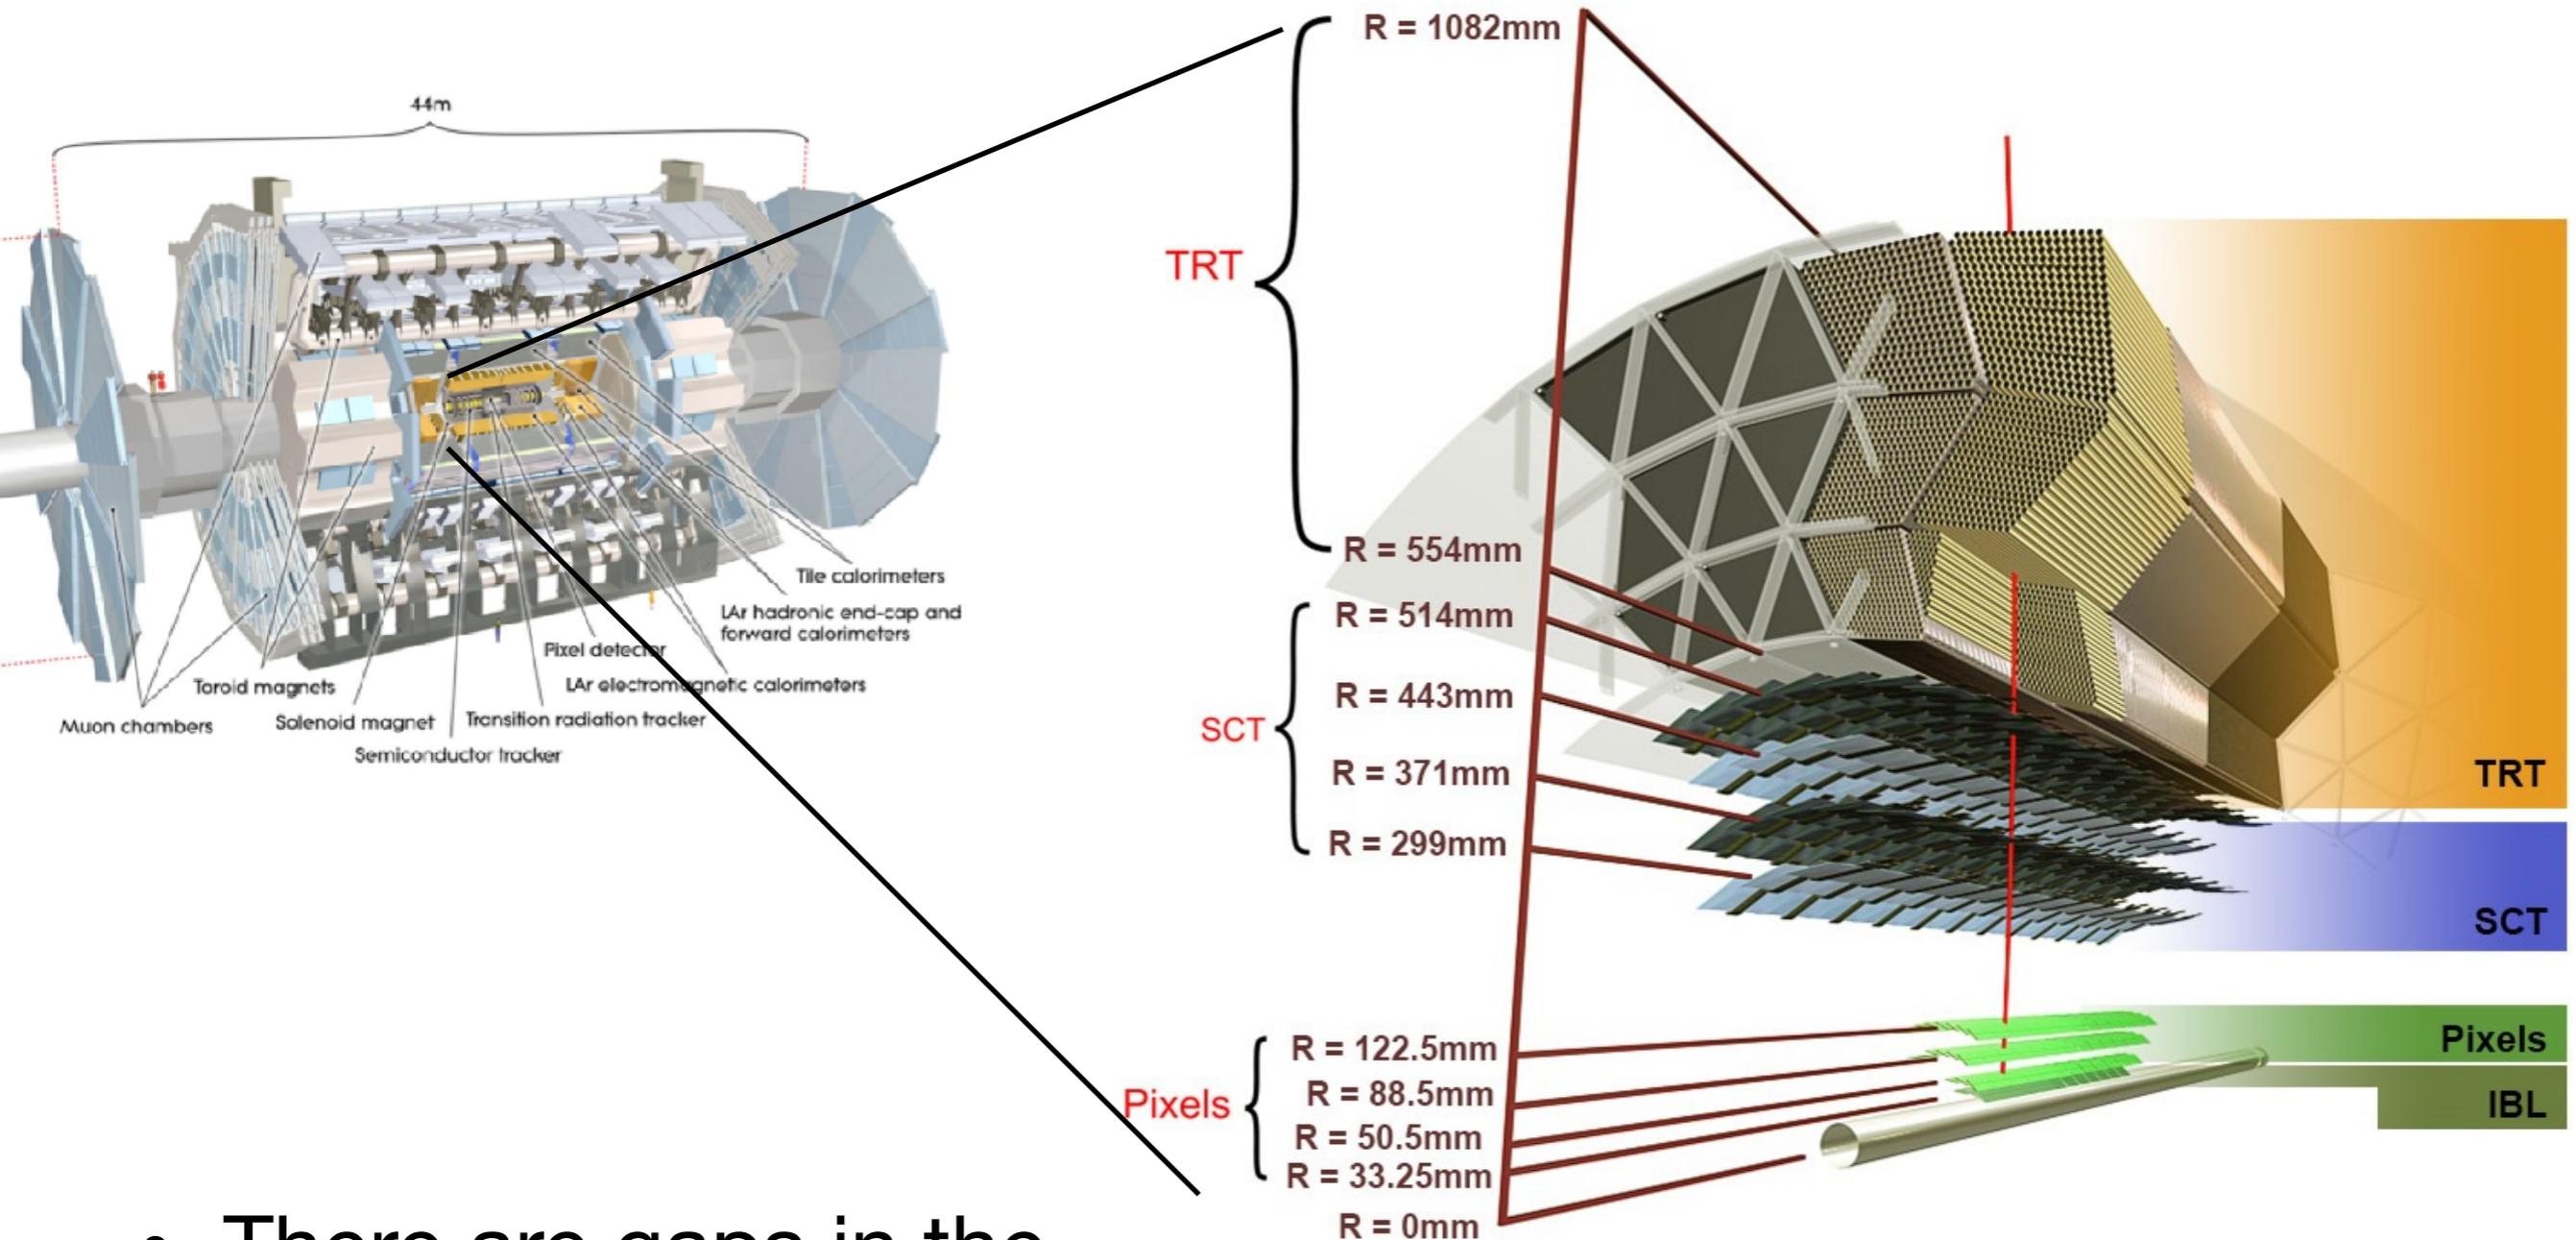

Event displays

- Why are there gaps in the event display?

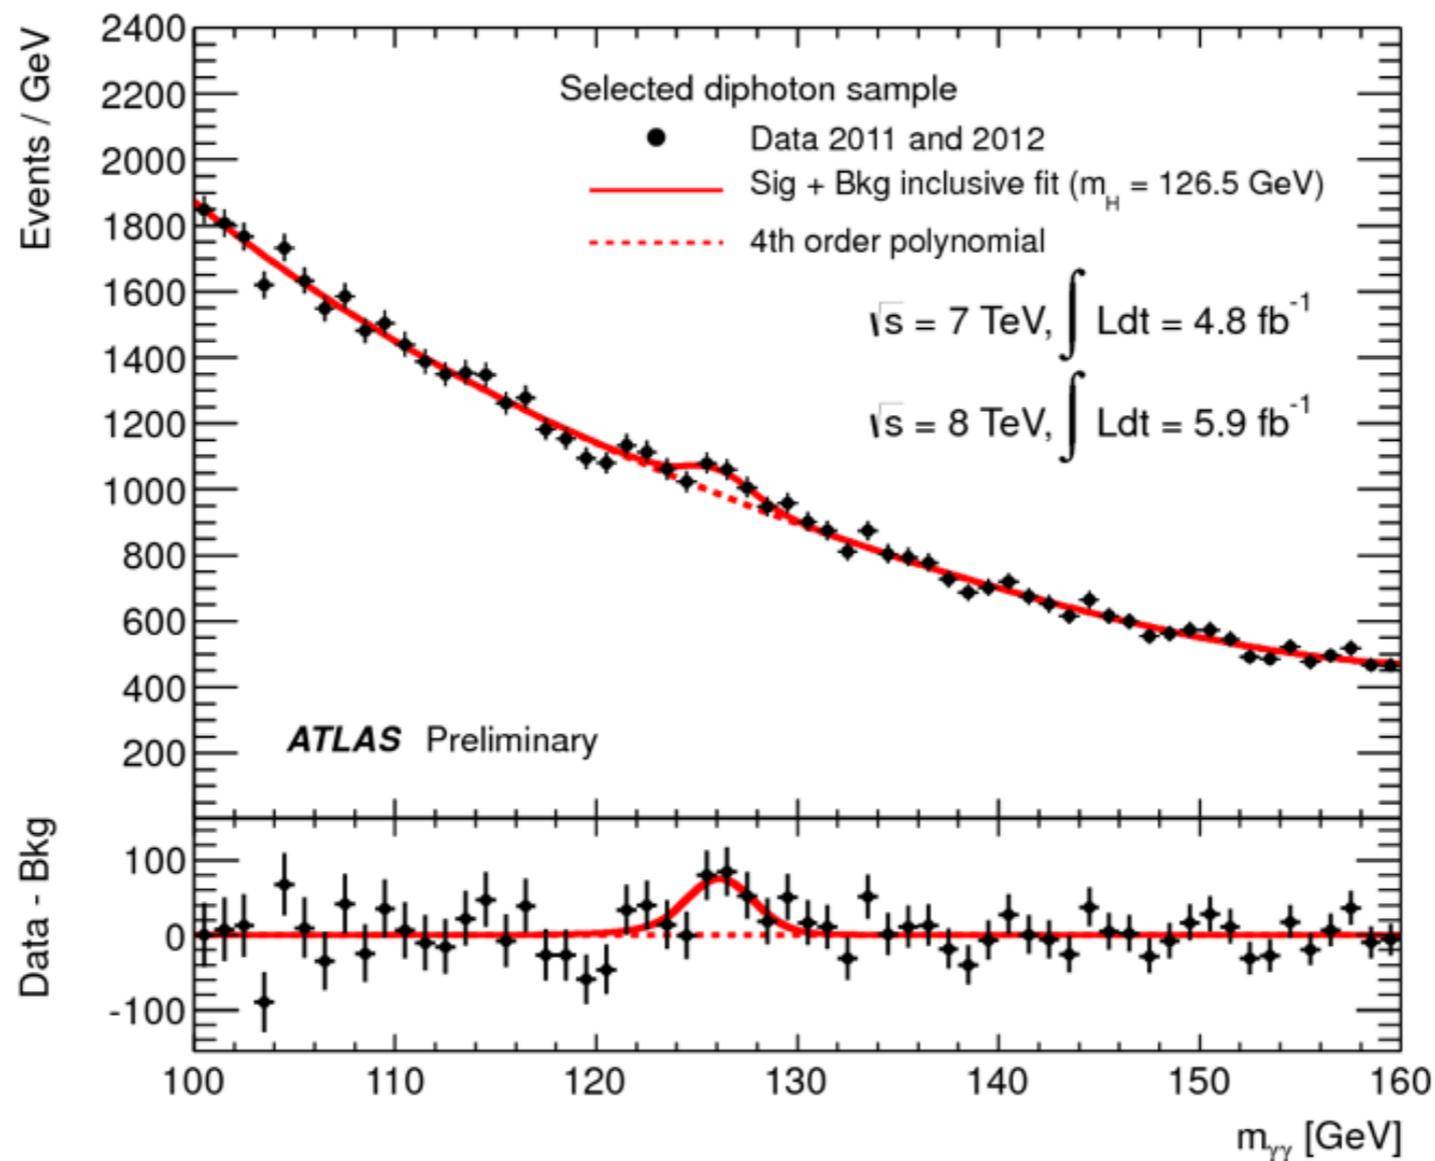

Detectors are real !

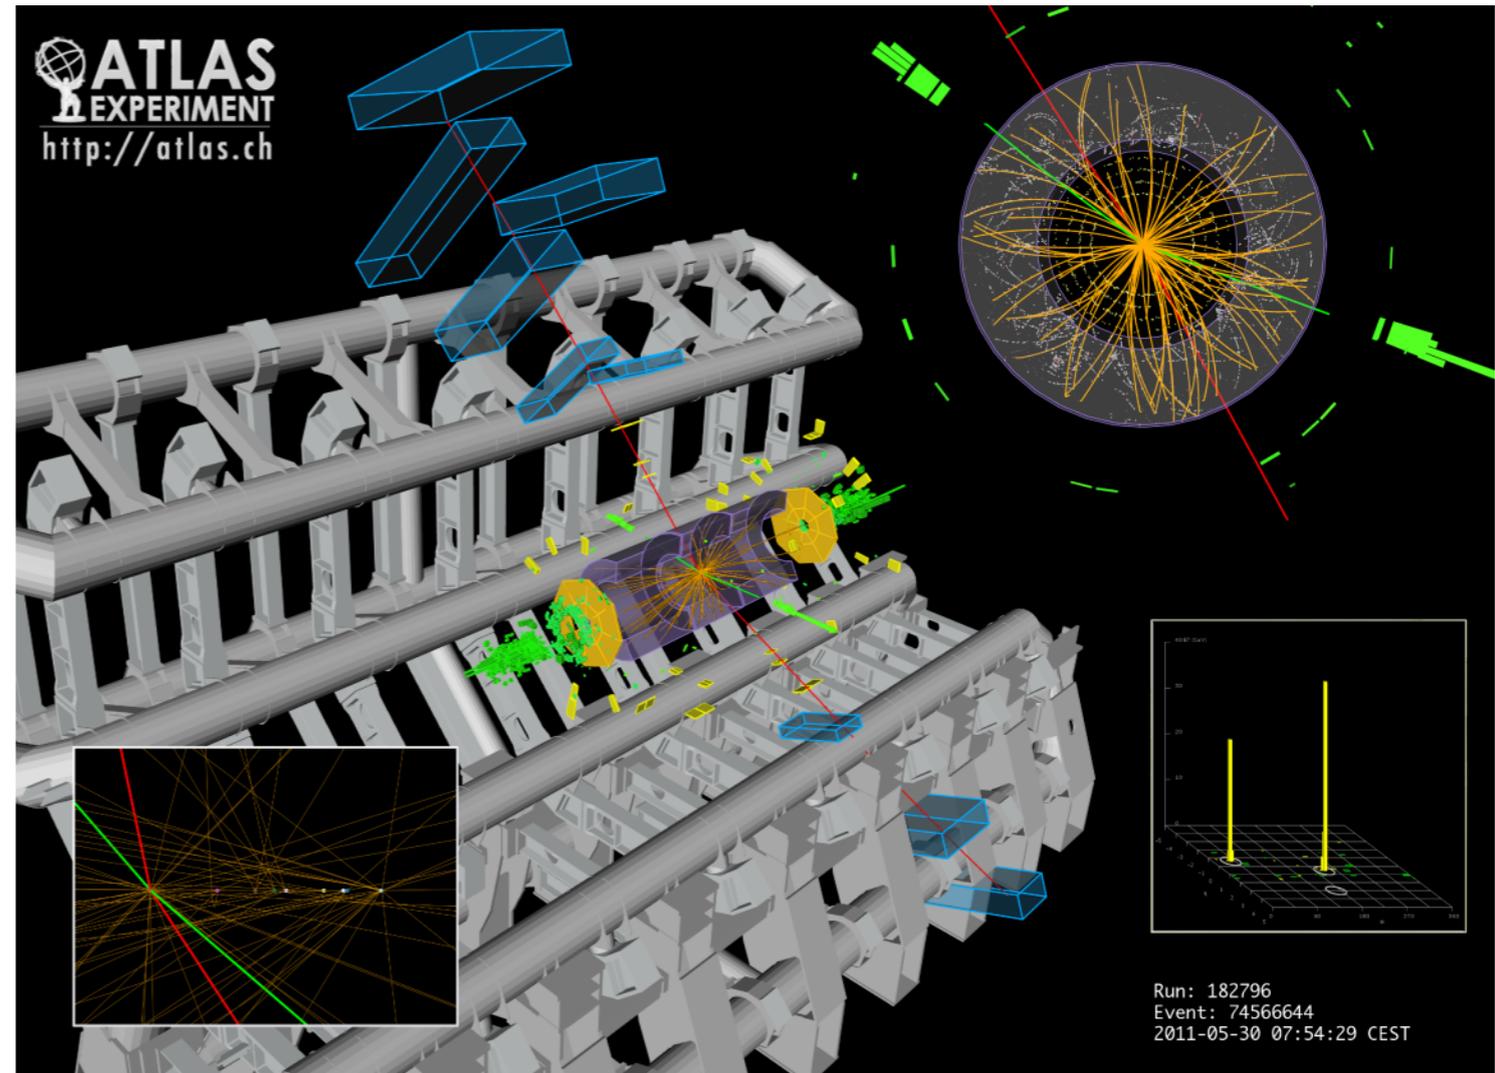

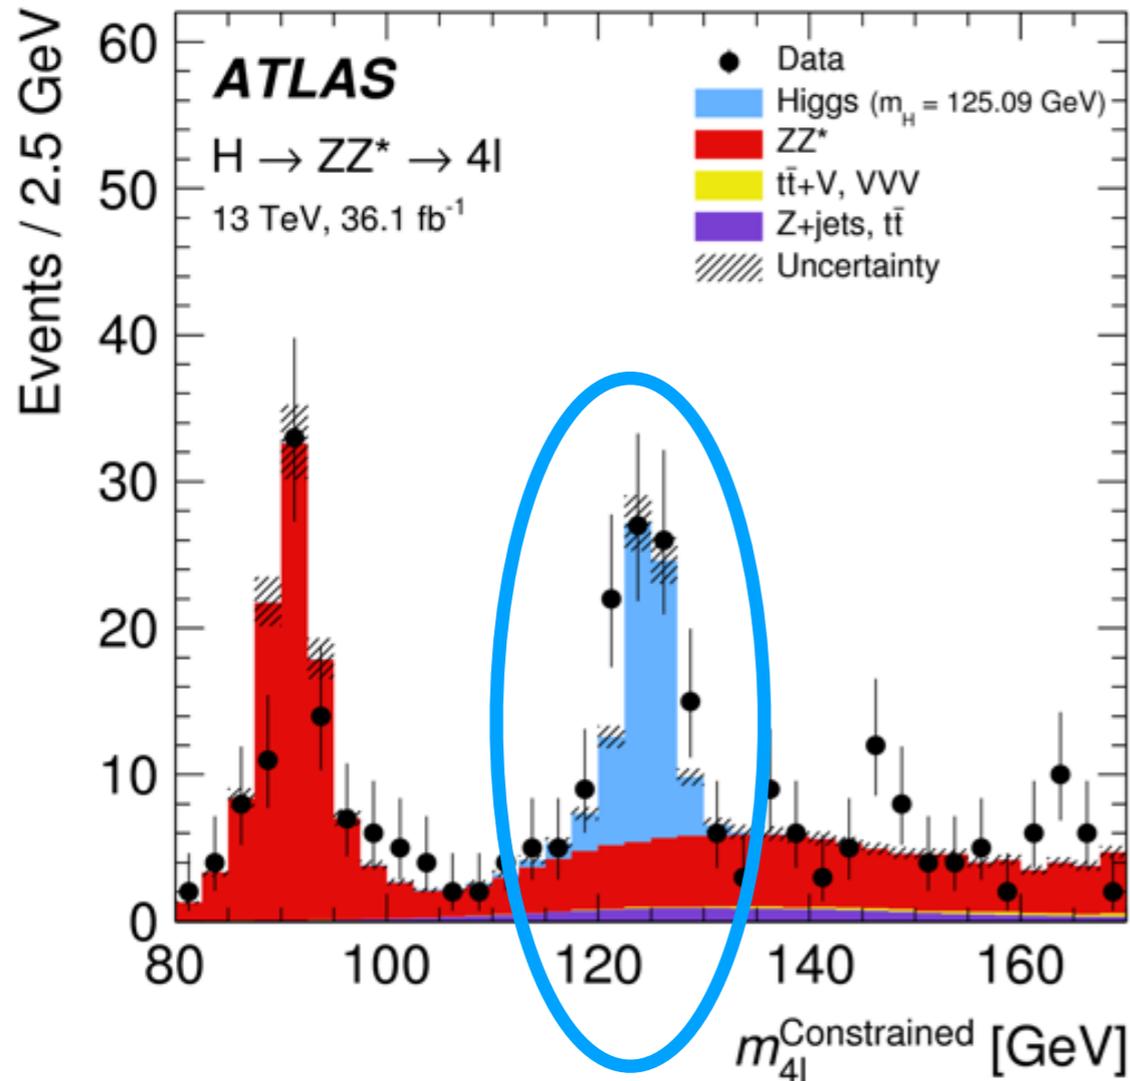

- There are gaps in the detector !

Discovering the Higgs boson: $H \rightarrow \gamma\gamma$

- There are billions of events and the ones we are really interested in are **very rare**
- Often the interesting events are also **very difficult to distinguish** from background
 - Requires **high precision detectors**, which means **lots of data** for each event
- The data are structured but each event is different - **unique data science challenge**

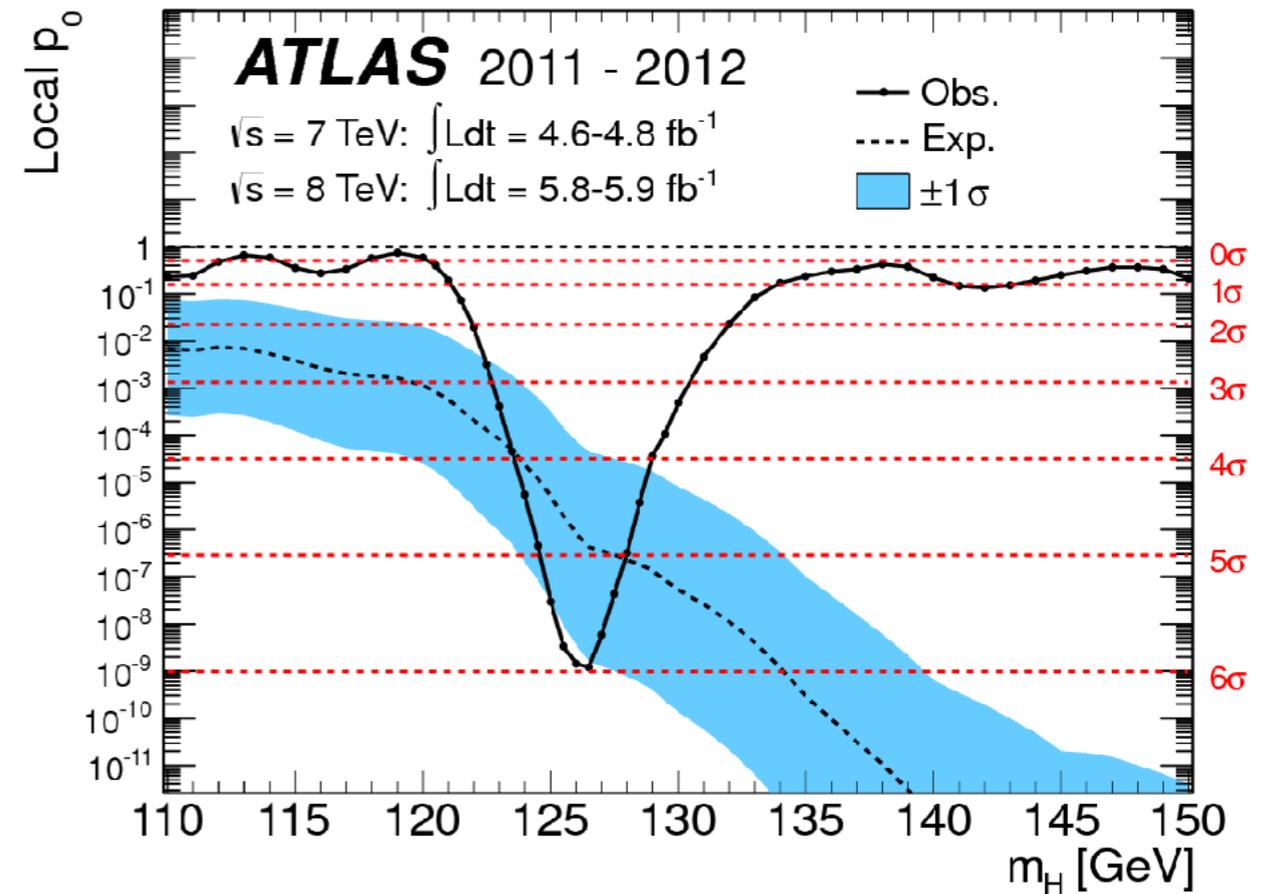

Discovering the Higgs Boson: $H \rightarrow ZZ \rightarrow 4l$

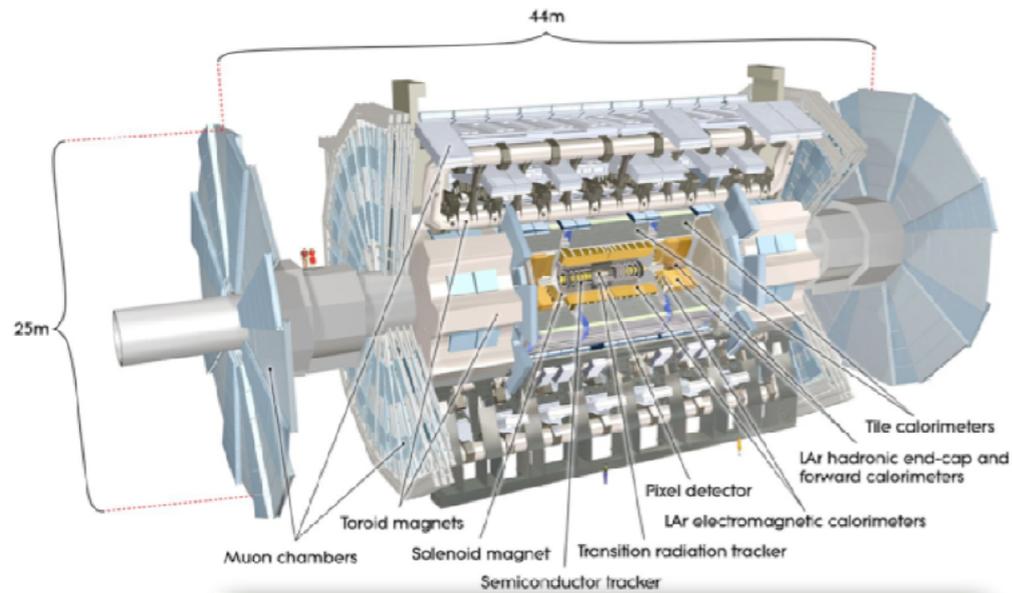

- Here we look for events with **two Z bosons** that have decayed to **four leptons**, and compare to **simulations of different physics processes**
- If the **two Z bosons** were produced by the **decay of a Higgs boson**, when we reconstruct the invariant mass of the system we should see a **peak at the Higgs boson mass**

Higgs discovery on July 4th 2012

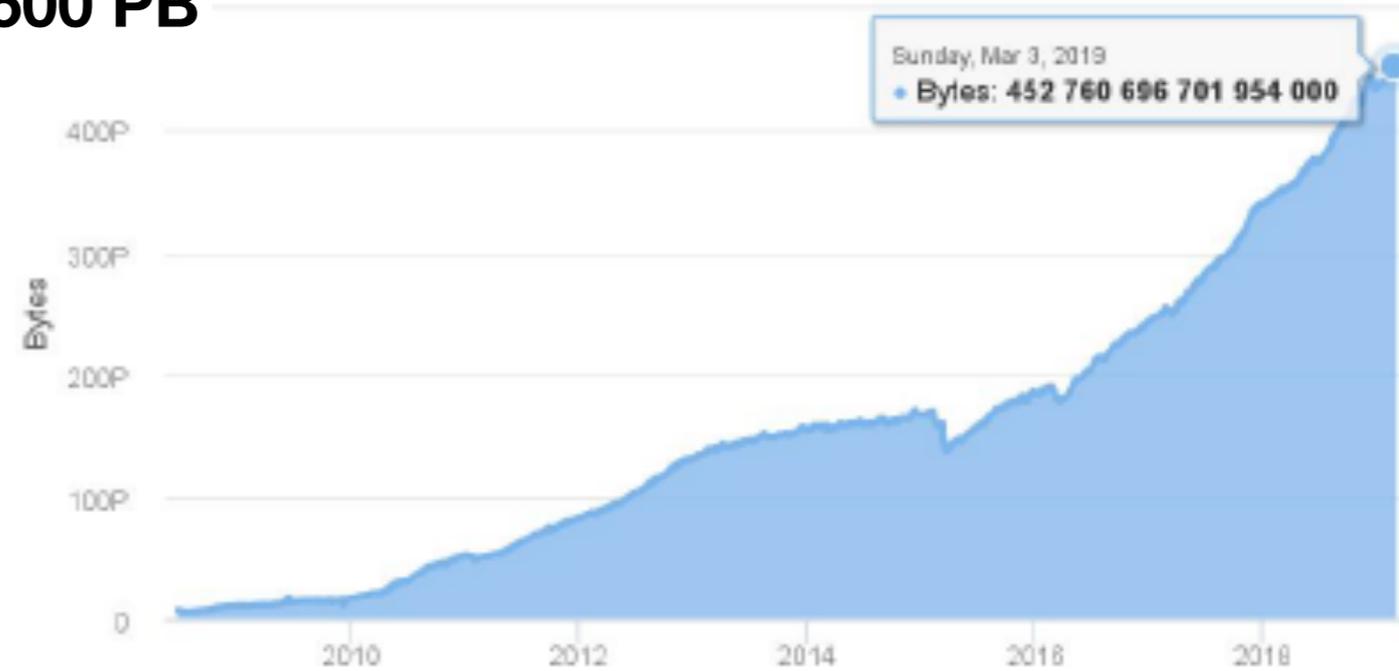

- In 2012 the number of observed events (**6 σ**) was consistent with, and in excess of the number of events expected for a standard model Higgs (**5 σ**)
- **Question** - Imagine we had several more Large Hadron Colliders, with a total of 9 independent measurements possible. Roughly how many measurements would you expect to lie **outside** the $\pm 1\sigma$ blue band?

Exabyte-scale physics analysis

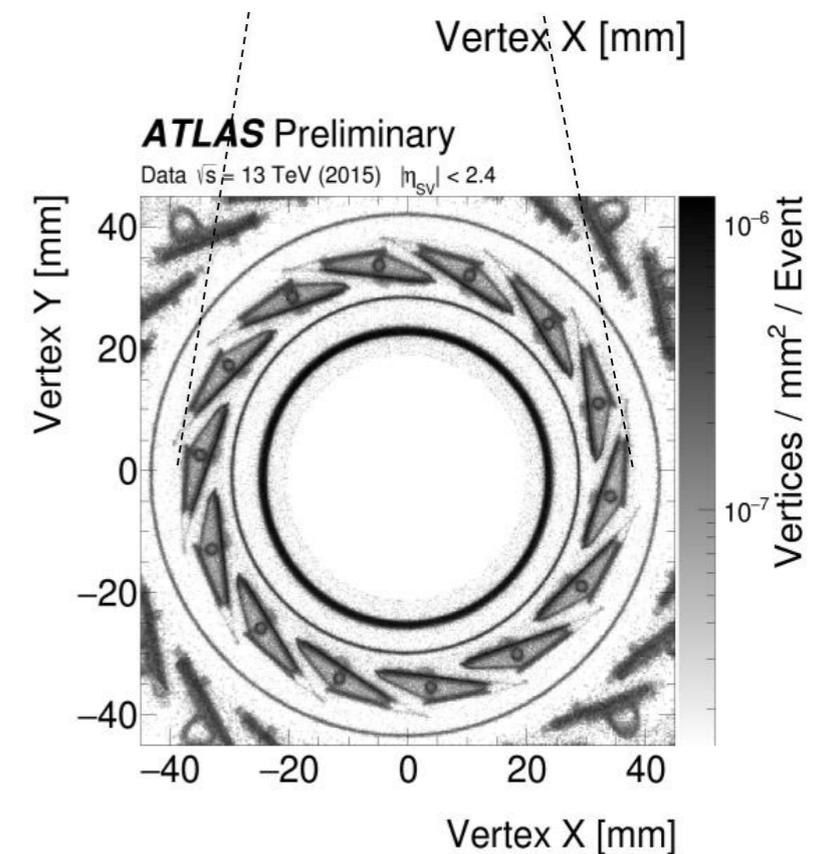

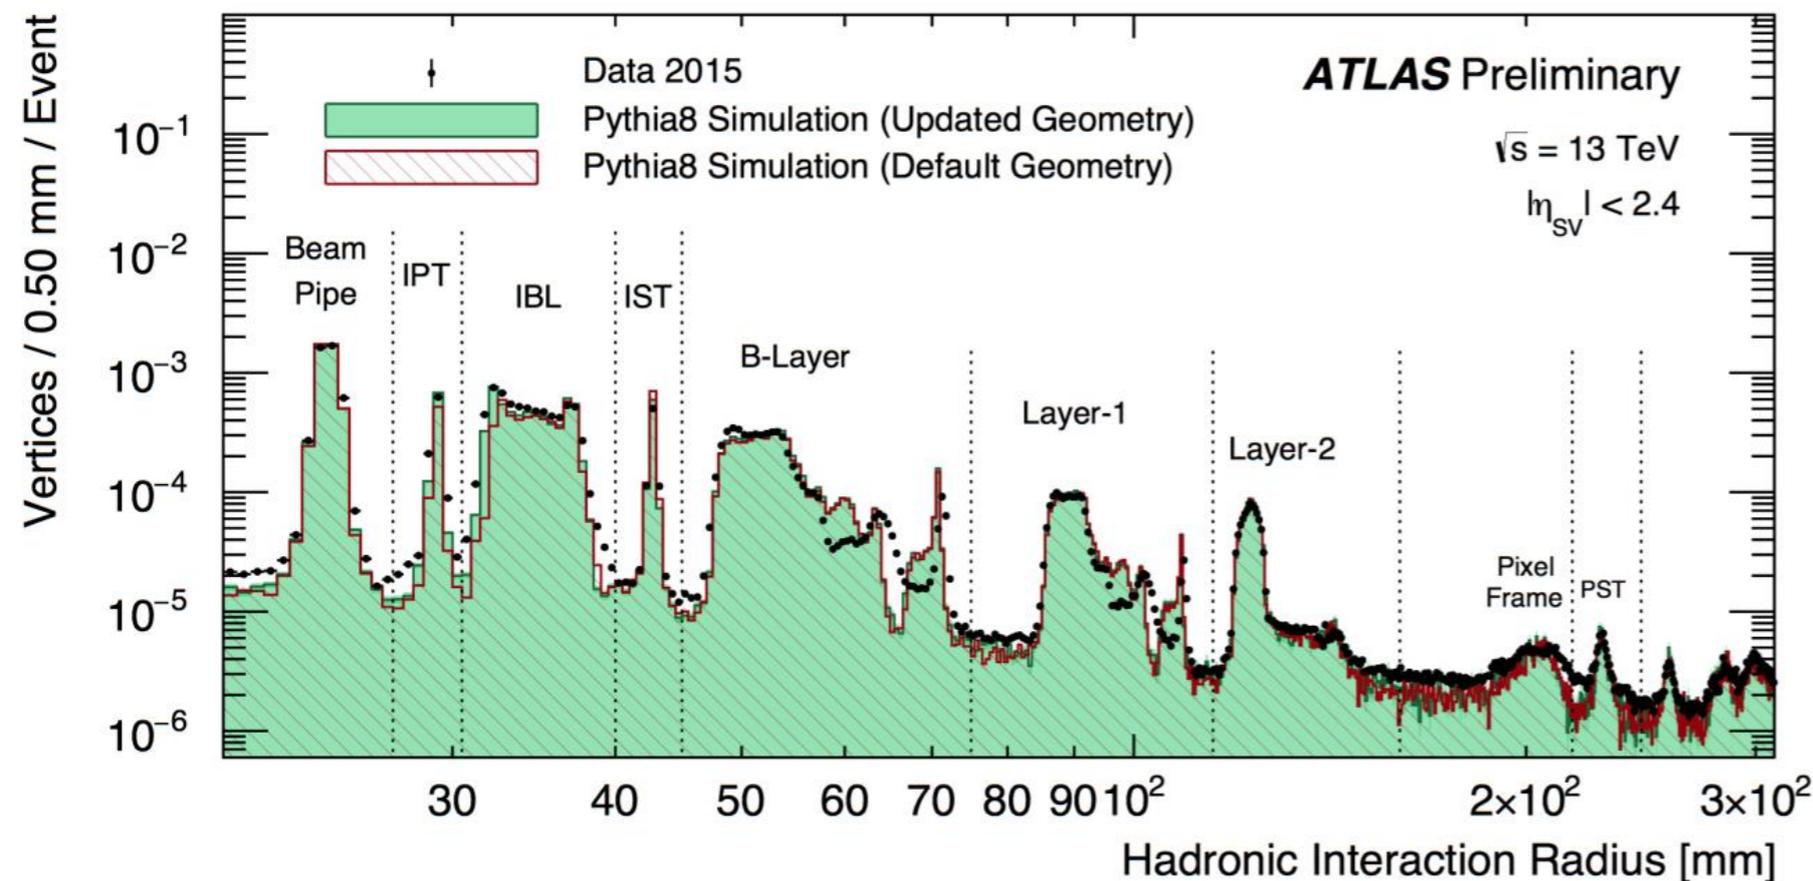

Exabytes of Data

500 PB

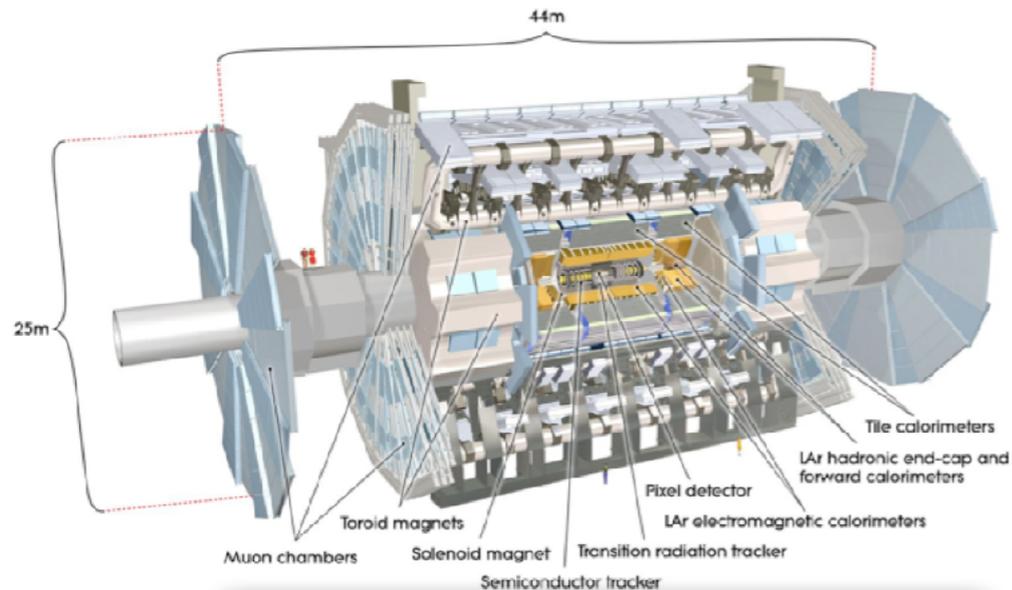

Simulation and understanding detectors

- We use **simulations** to model the detector as **accurately** and **precisely** as possible
- We **test** that our simulations are accurate **using real data**
- We correct our simulations if necessary
- Once our simulation is an **accurate model** of our detector, we can use it to **correct the data for detector response**

Permanent Storage

Q. How long would it take to generate 500PB of data if there were no Trigger?

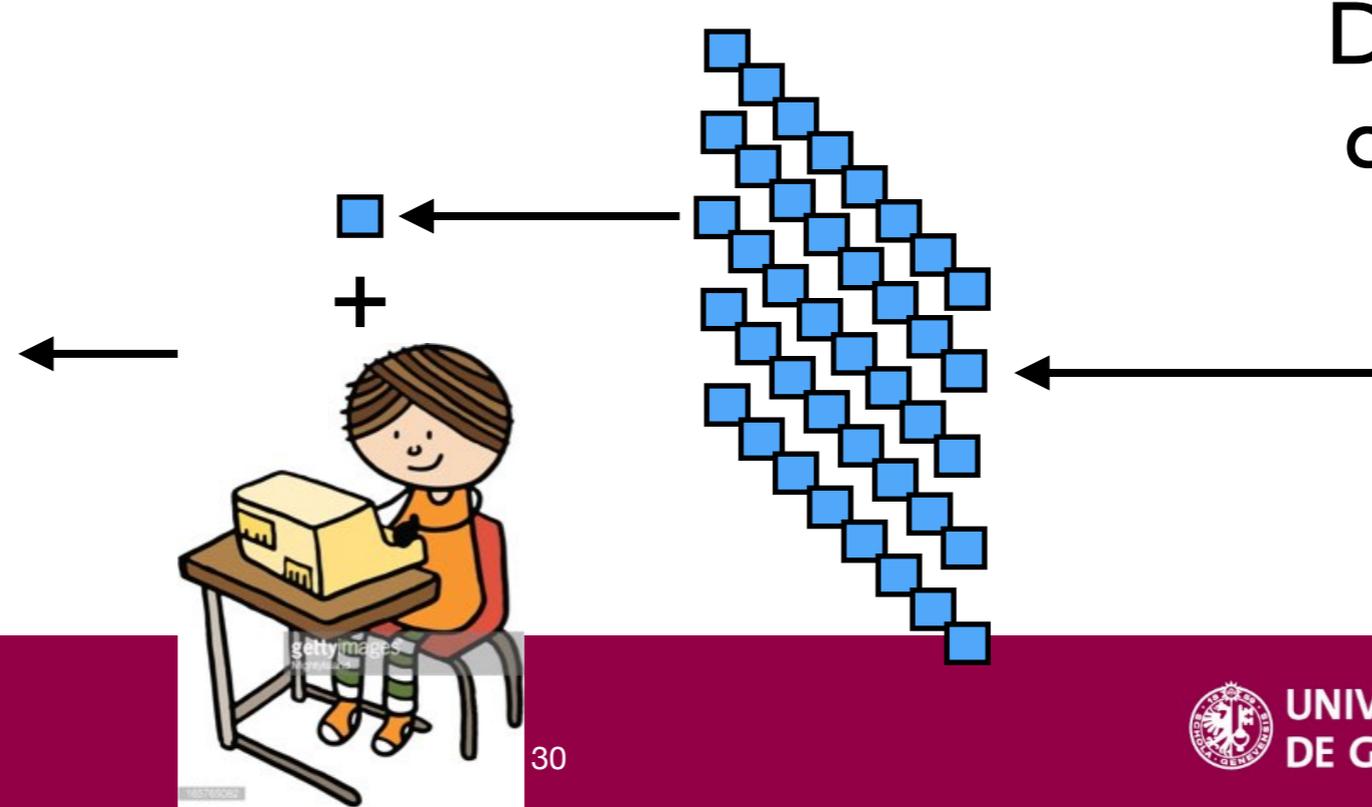

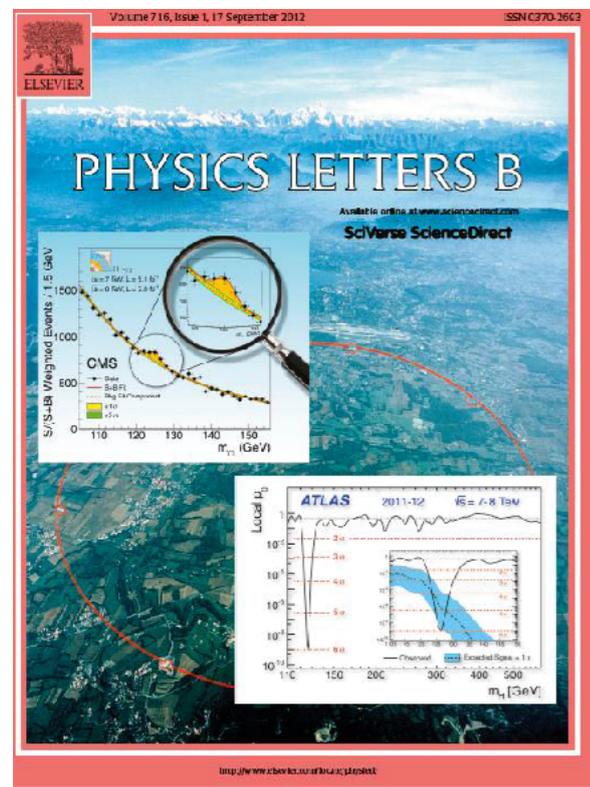

Trigger and DAQ requires a lot of computing power!

Data's journey

Distributed computing

Data Preparation

- Three major steps to **prepare data for physics analysis** and achieve
 - reliable, high quality data (yes, we **reject** low quality data)
 - the **best performance** from our detectors
 - readiness for **physics analysis**

1. Reconstruct physics signals from the data

- Produce information like how many muons does the event have?

and straight in the longitudinal plane

Track fitting

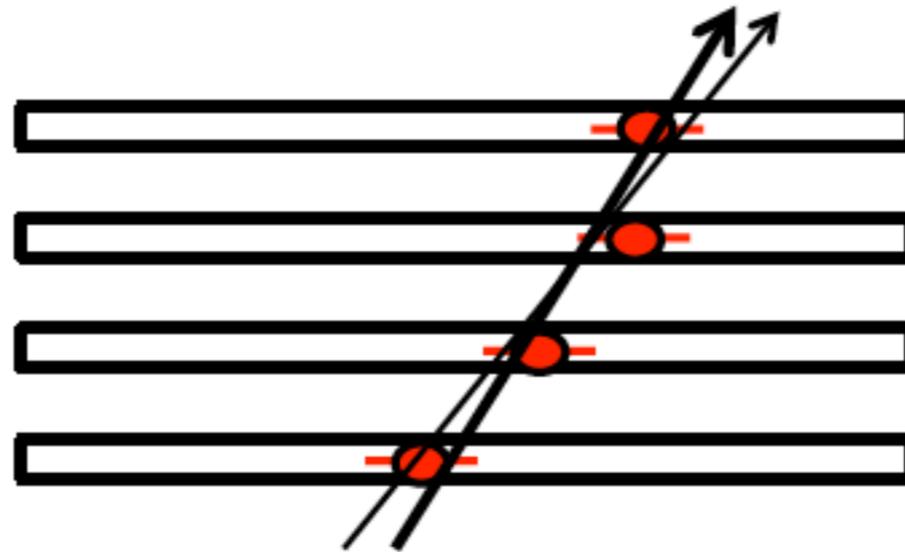

⊙ Perfect measurement – ideal

⊙ Imperfect measurement – reality

⊙ Small errors and more points help to constrain the possibilities

⊙ Quantitatively:

- ⊙ Parameterize the track;
- ⊙ Find parameters by Least-Squares-Minimization;
- ⊙ Obtain also uncertainties on the track parameters.

Data Preparation

- Three major steps to **prepare data for physics analysis** and achieve
 - reliable, high quality data (yes, we **reject** low quality data)
 - the **best performance** from our detectors
 - readiness for **physics analysis**

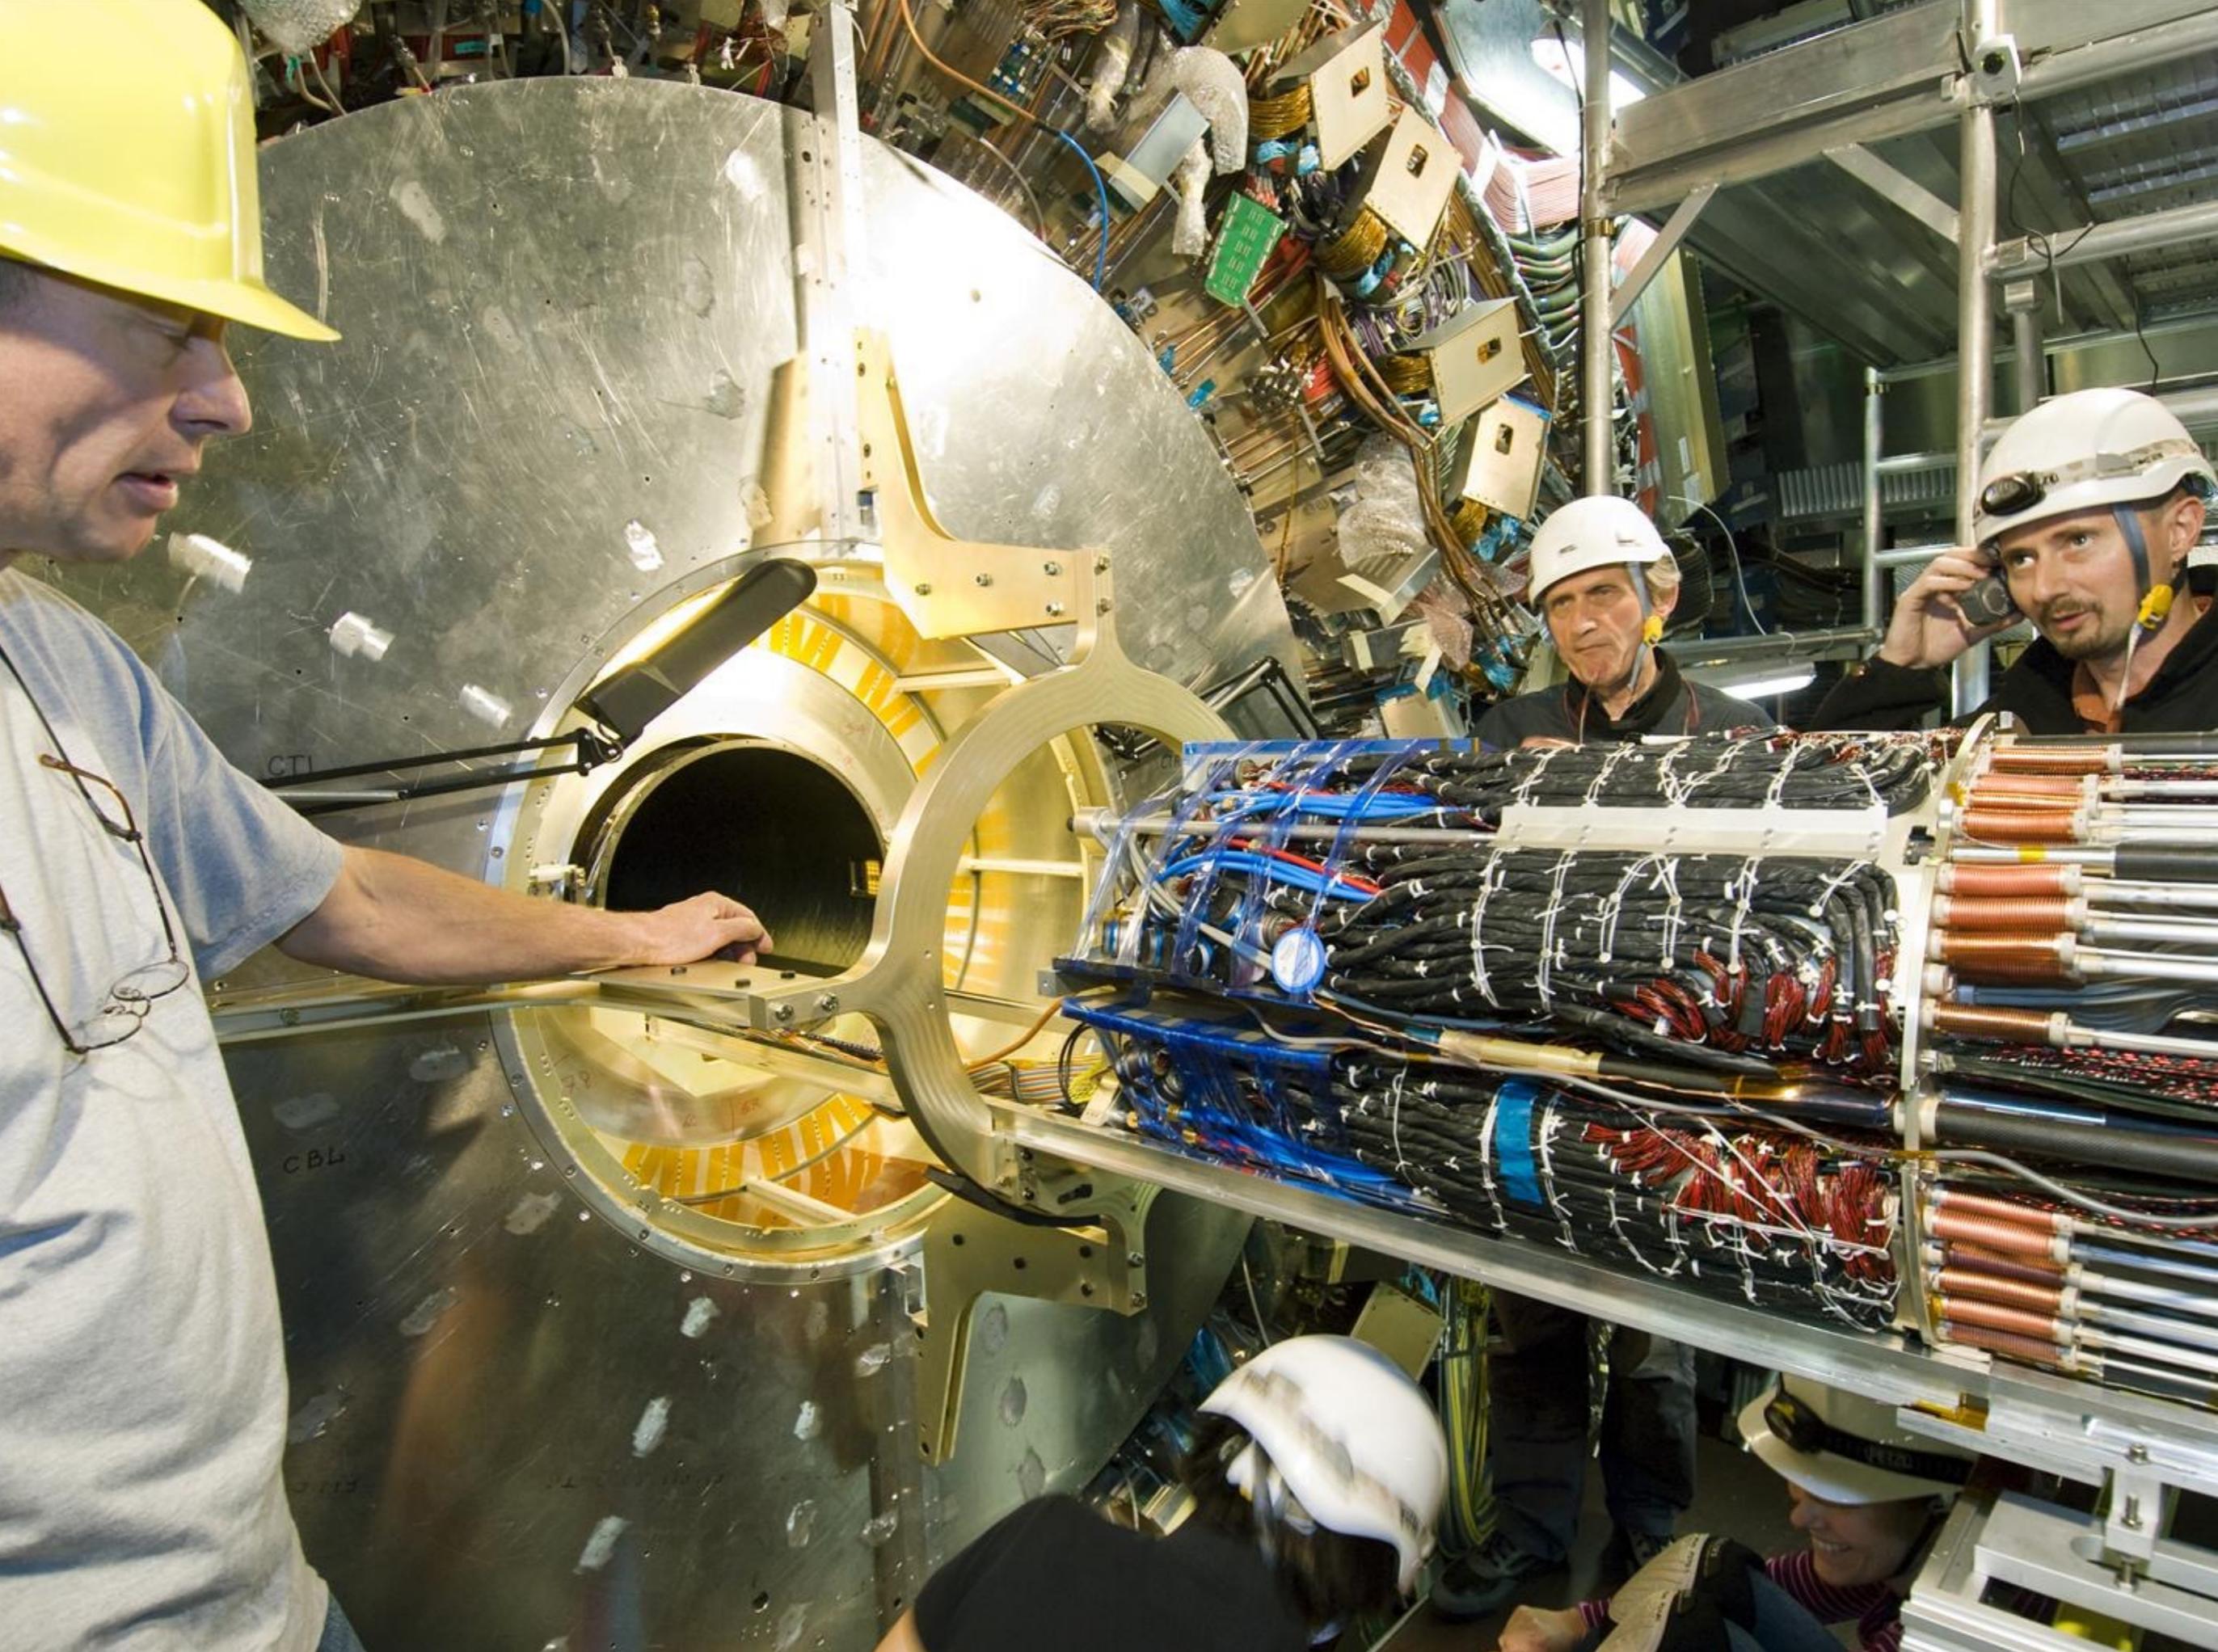

1. Reconstruct physics signals from the data

- Produce information like how many muons does the event have?

2. Calibrate the detectors

- Correct imperfections, account for changes over time...

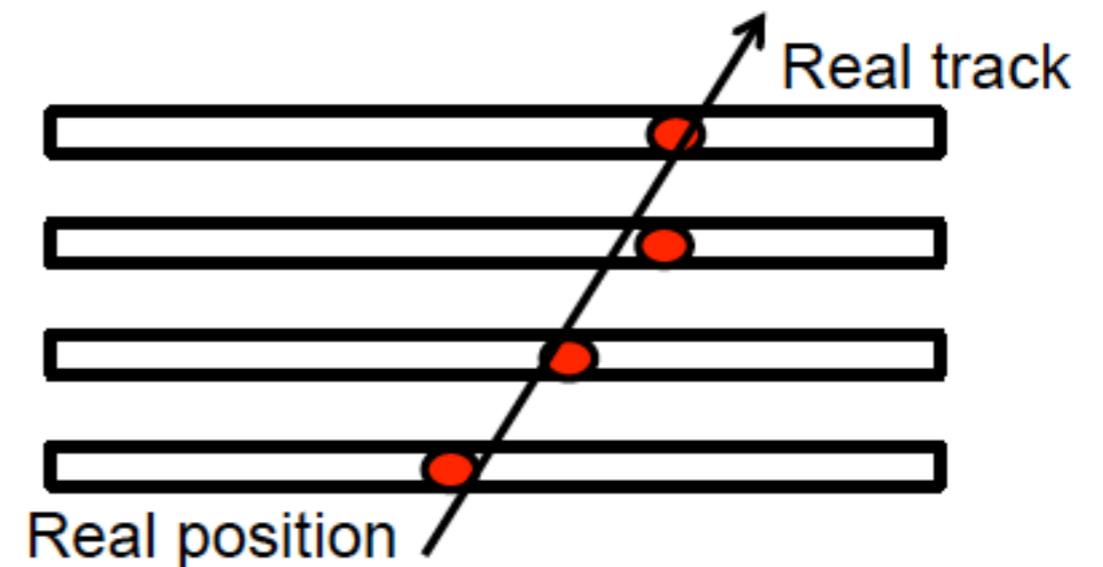

Real detector effects

⊙ Presence of Material

- ⊙ Coulomb scattering off the core of atoms
- ⊙ Energy loss due to ionization
- ⊙ Bremsstrahlung
- ⊙ Hadronic interaction

⊙ Misalignment

- ⊙ Detector elements not positioned in space with perfect accuracy.
- ⊙ Alignment corrections derived from data and applied in track reconstruction.

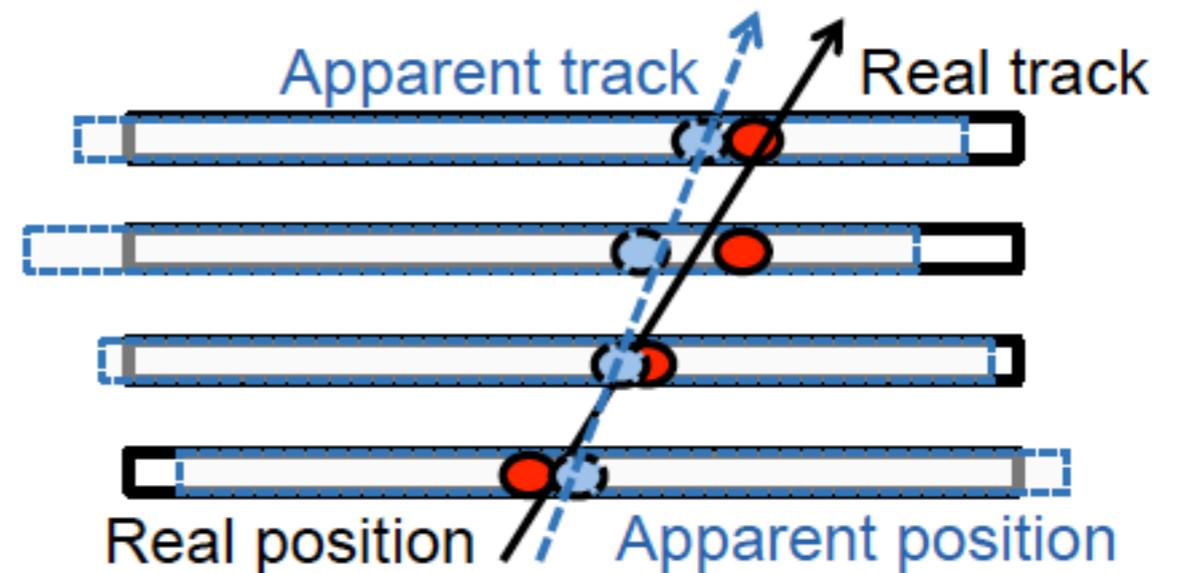

Correcting detector effects - calibration

⊙ Presence of Material

- ⊙ Coulomb scattering off the core of atoms
- ⊙ Energy loss due to ionization
- ⊙ Bremsstrahlung
- ⊙ Hadronic interaction

⊙ Misalignment

- ⊙ Detector elements not positioned in space with perfect accuracy.
- ⊙ Alignment corrections derived from data and applied in track reconstruction.

Data Preparation

- Three major steps to **prepare data for physics analysis** and achieve
 - reliable, high quality data (yes, we **reject** low quality data)
 - the **best performance** from our detectors
 - readiness for **physics analysis**

1. Reconstruct physics signals from the data

- Produce information like how many muons does the event have?

2. Calibrate the detectors

- Correct imperfections, account for changes over time...

3. Make sure that the **data quality** is excellent, also in real time

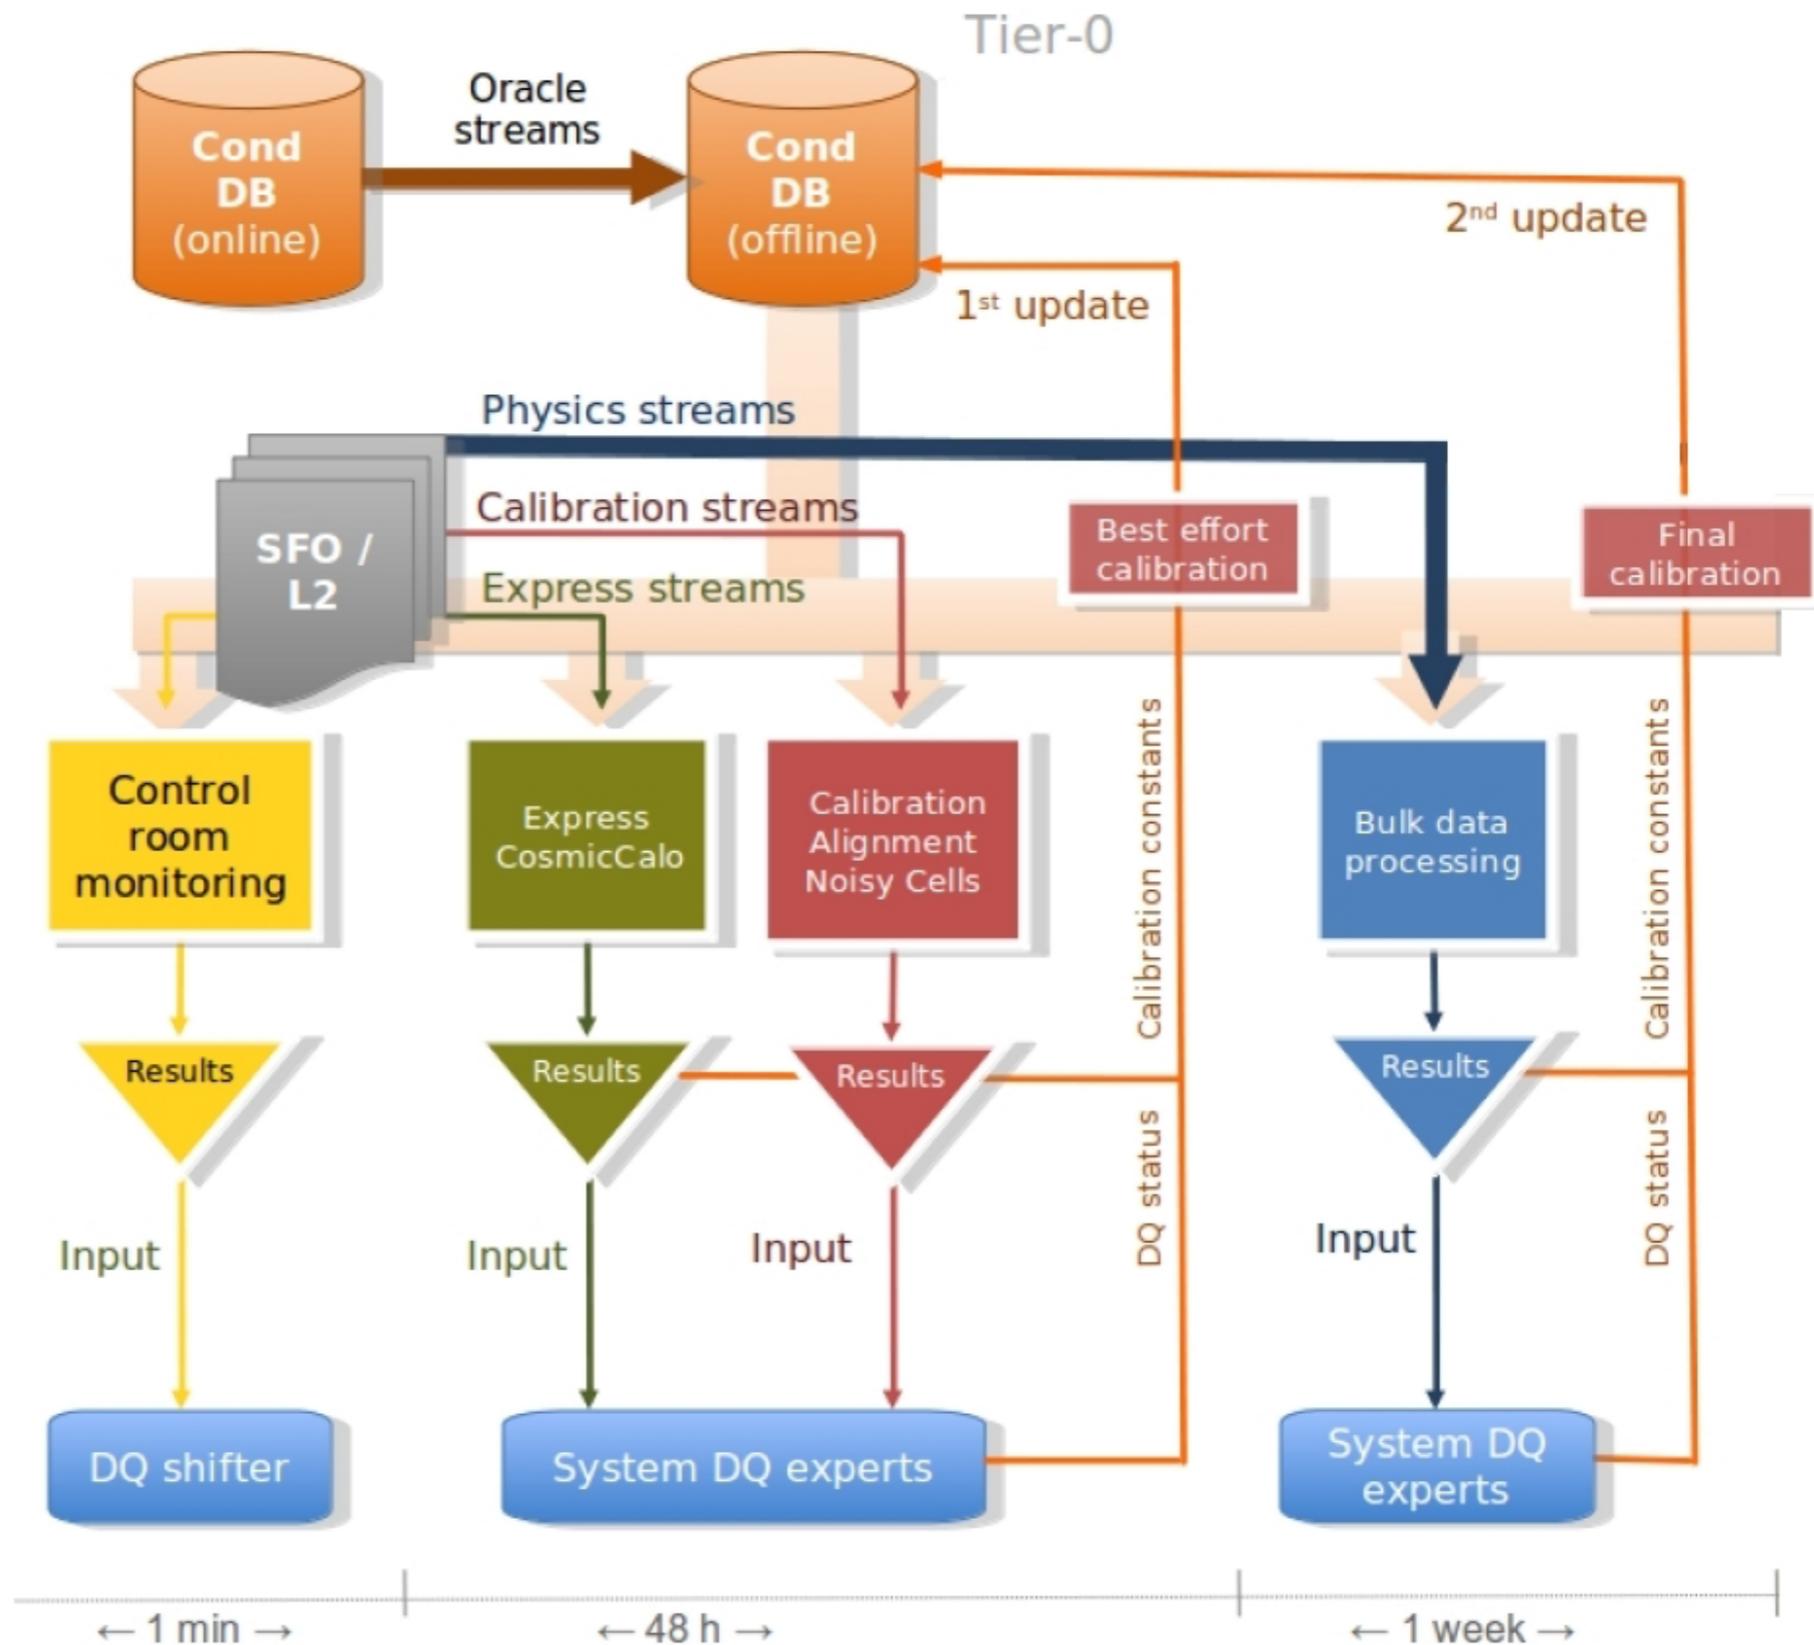

- Maximise the amount of useful data

Data Quality

Check during data taking

Check a fraction of the data with a quick calibration

Check all of the data with the best calibration - publish this data !!

Data's journey

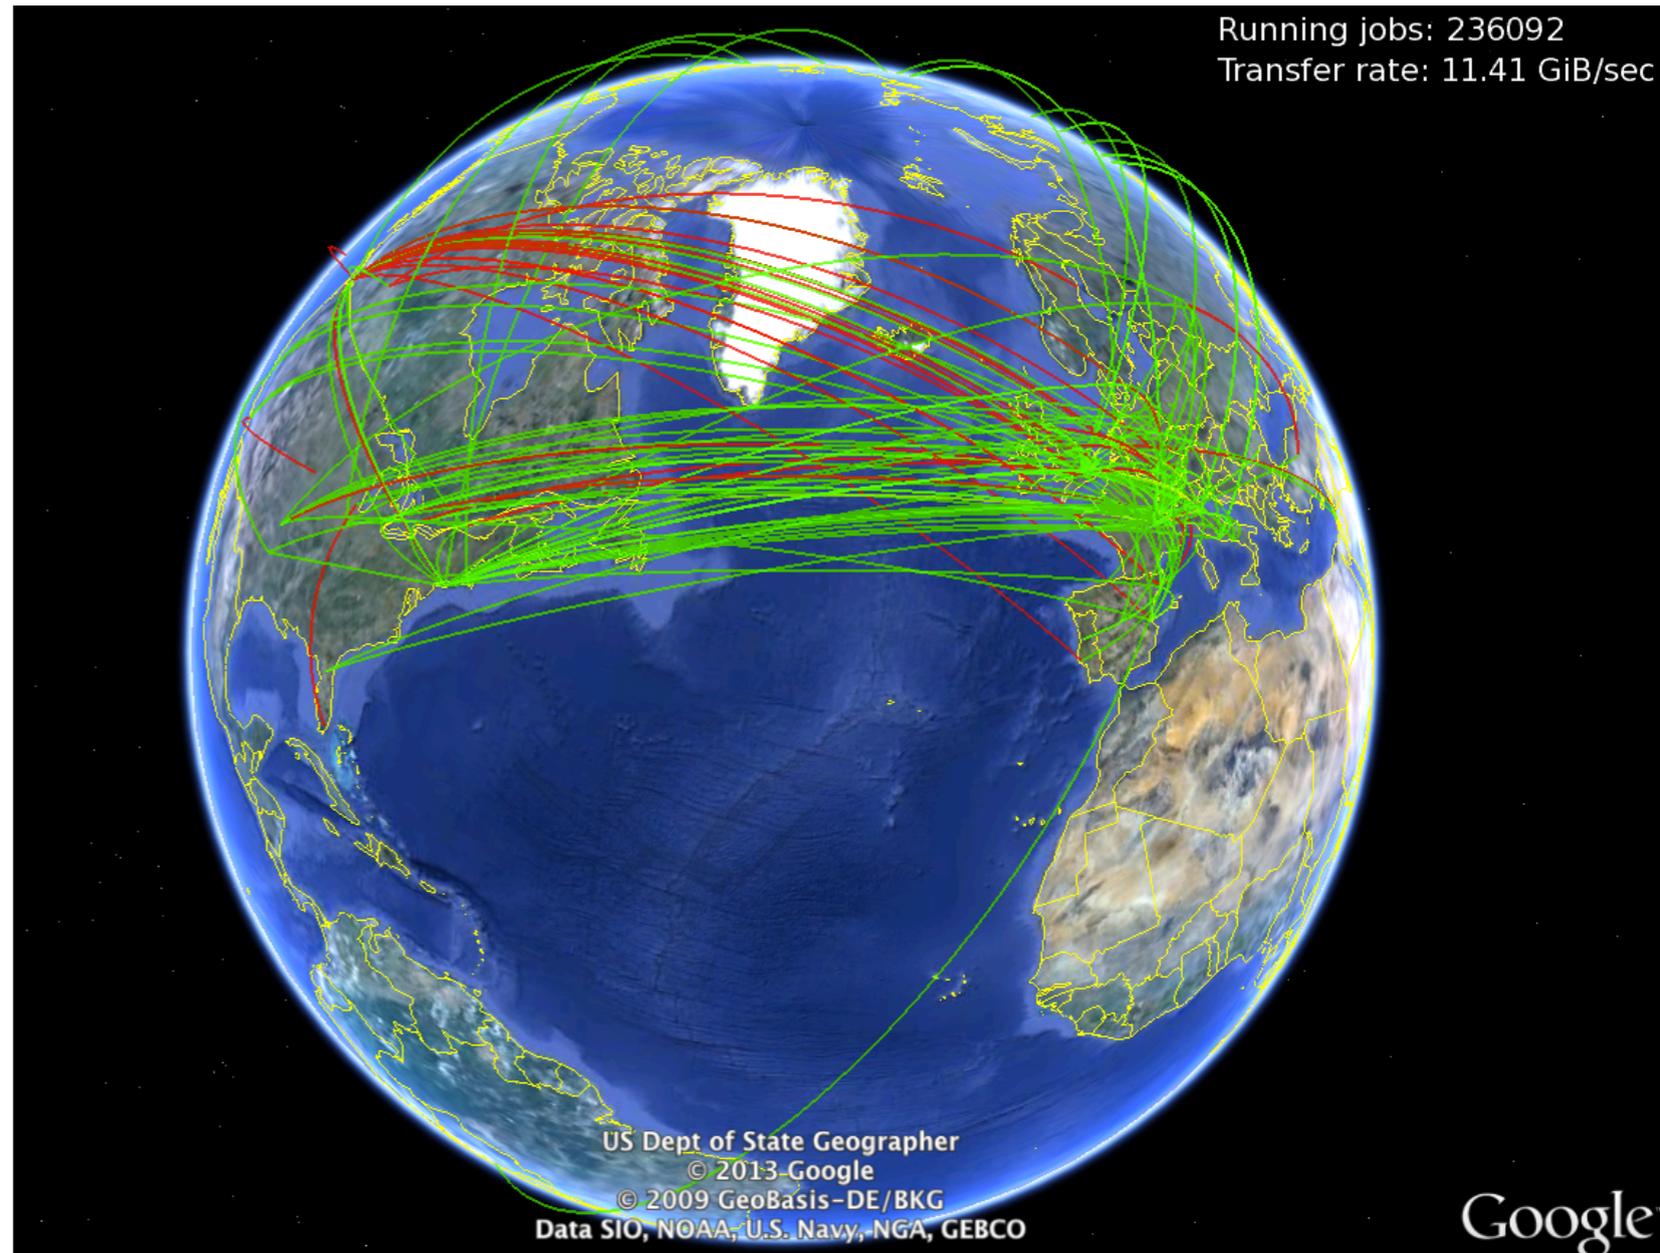

Distributed computing

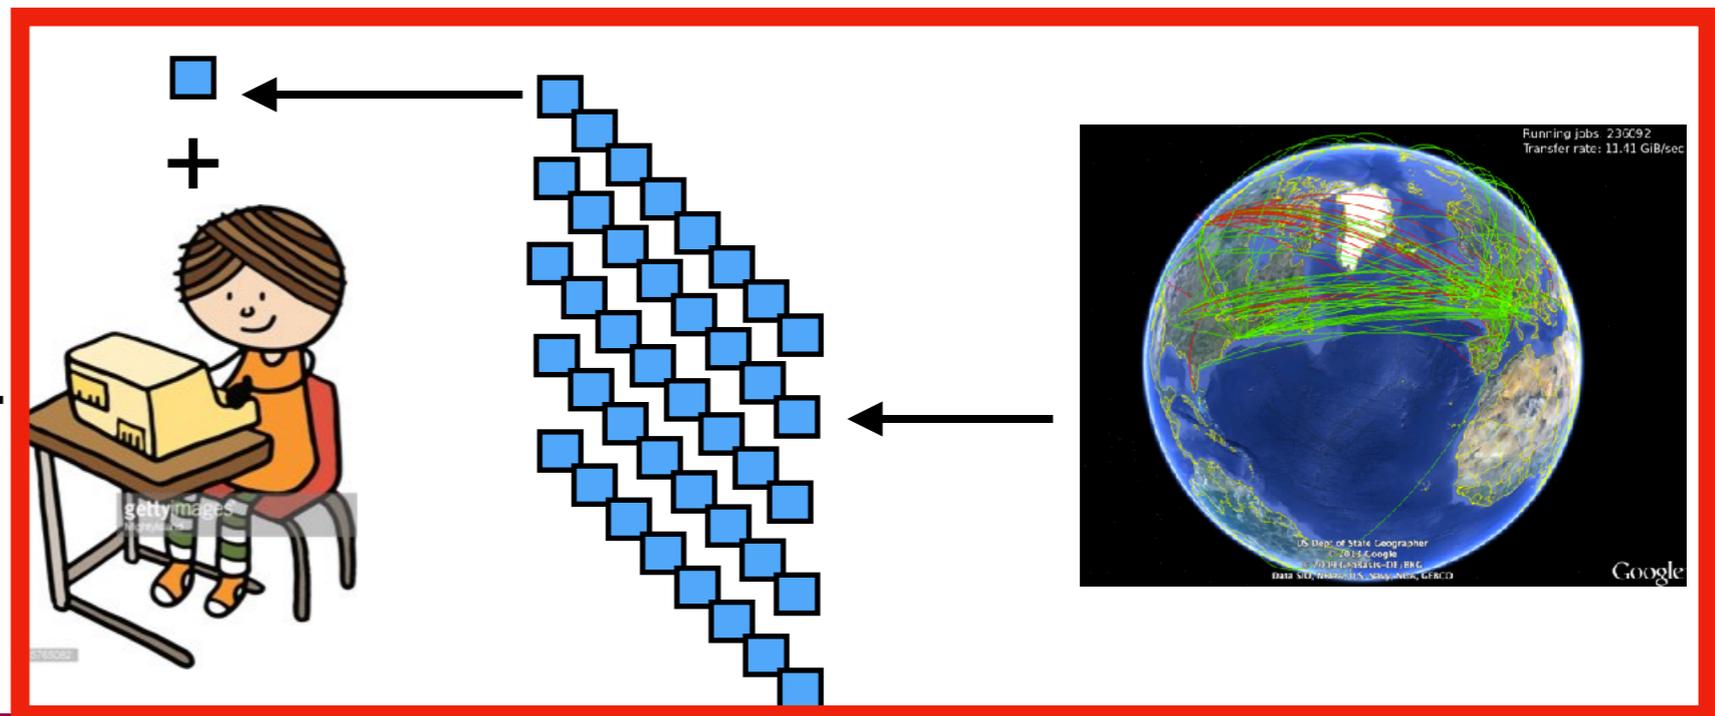

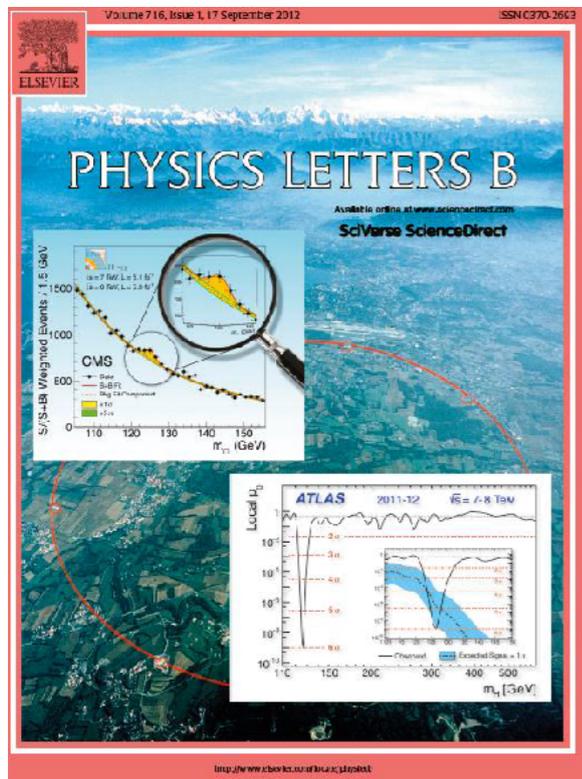

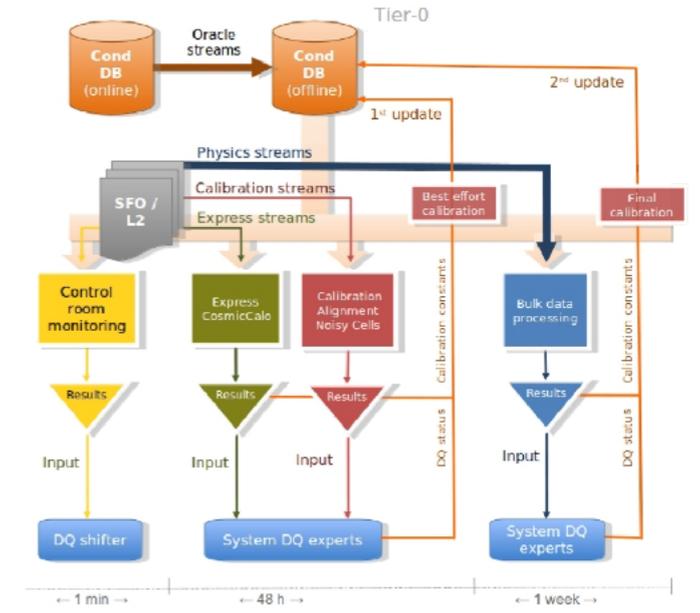

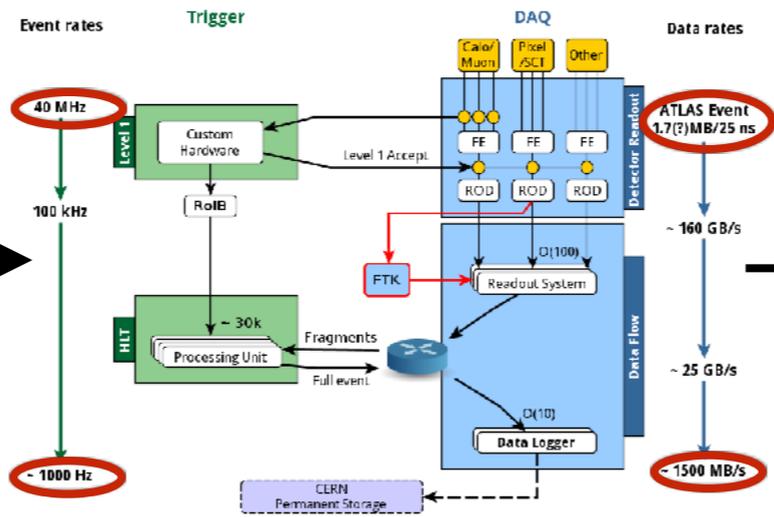

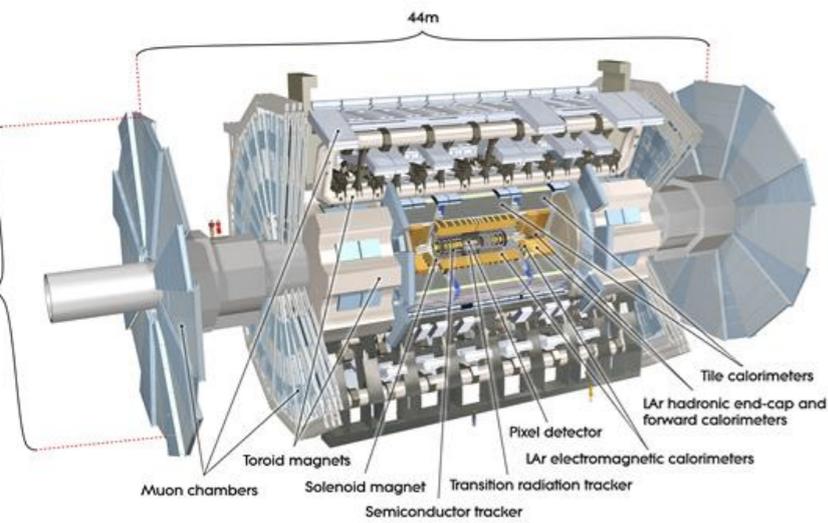

The Worldwide LHC Computing Grid

- Now the data has been ***prepared for physics analysis***, it's time to extract our favourite physics signal!
- Many experiments, particularly those at the **LHC**, use computing sites all over the world via **the grid** to
 - harness all of that ***computing power***
 - enable collaborators ***worldwide*** to access the data

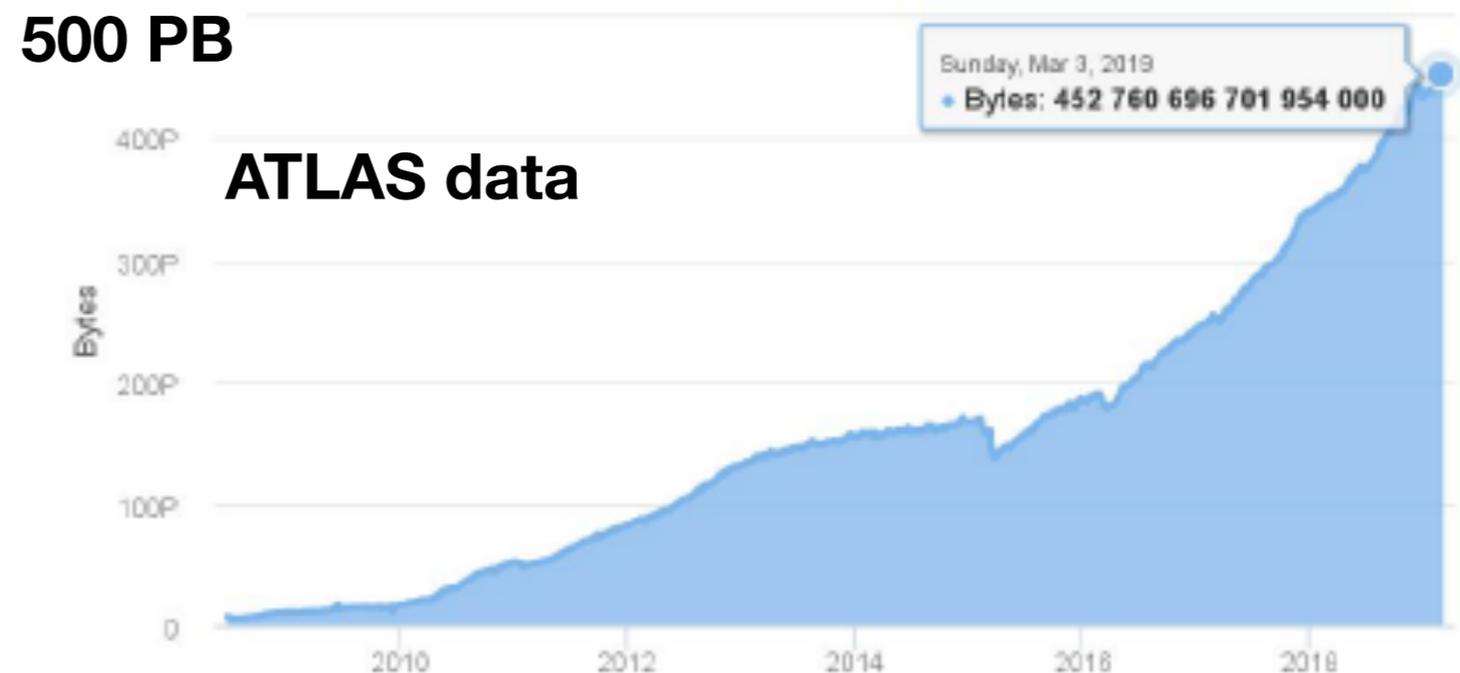

Data's journey

We did it !

- Our data is calibrated and with good data quality
- and we've reconstructed the physics objects in the data
 - ***The data is reliable, accurate, and ready for physics analysis***
- ***More detail on these topics in Lecture 2***
- ***Then we can extract our measurements in Lecture 3***

- ***Question: How long would it take to read 500 PB of ATLAS data?***
(Assume for simplicity you have off-the-shelf SSDs with read speed ~500MB/s)

Contact details

- I am usually based at Geneva Observatory in Versoix, but will be here at CERN Wednesday 28th through Friday 30th June.
 - I will be available for Q&A every afternoon from 3pm-4pm in restaurant 1, feel free to send questions to my email

- email: paul.laycock@unige.ch
