

Antimatter in the lab

Lecture 2

Jack Devlin

CERN

25/7/2023

Recap

Lecture 1

1. What is antimatter?

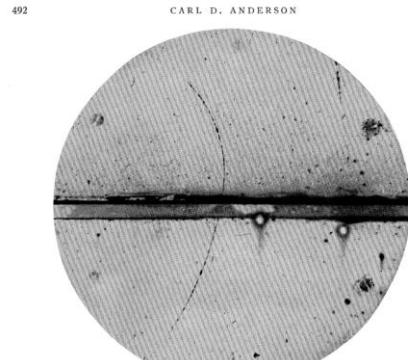

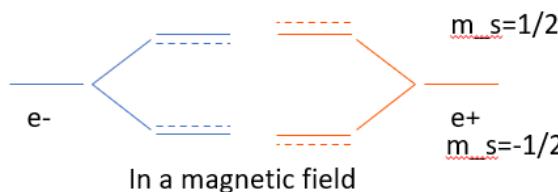

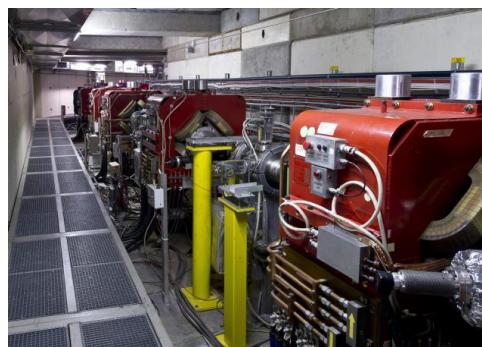

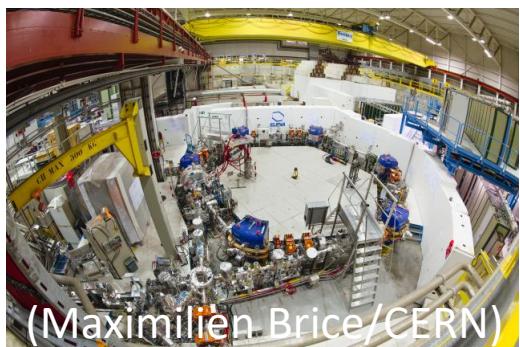

Fig. 1. A 63 million volt positron ($B_F = 7.1 \times 10^4$ gauss-cm) passing through a 6 mm lead plate and emerging as a 23 million volt proton ($B_F = 7.5 \times 10^4$ gauss-cm). The length of this latter path is at least ten times greater than the possible length of a proton path of this curvature.

2. Why study antimatter?

3. How do we make antimatter at CERN?

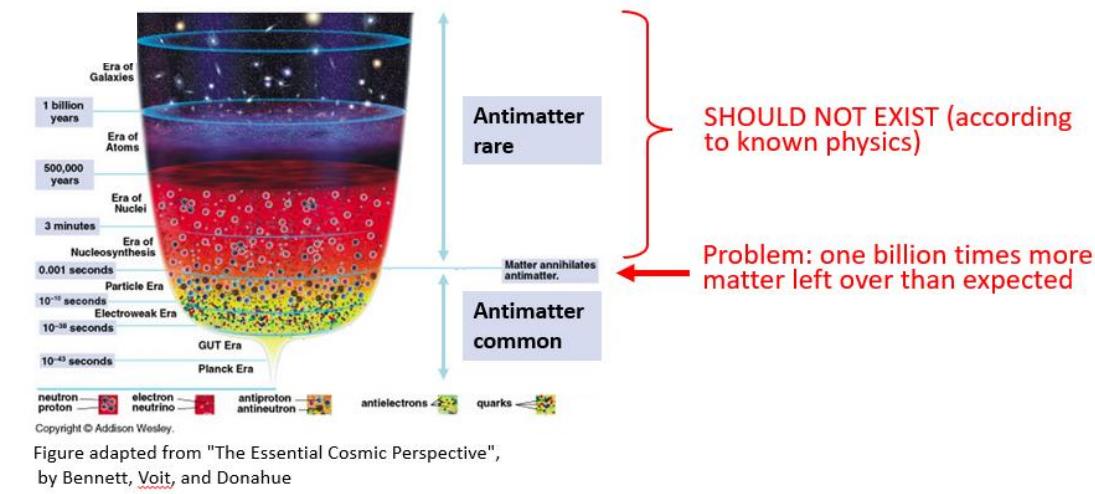

$$(i\gamma^\mu \partial_\mu - m) \Psi(x, t) = 0$$

$$E = +E_p = +\sqrt{p^2 + m^2} \quad E = -E_p = -\sqrt{p^2 + m^2}$$

$$\Psi_1 = A \begin{pmatrix} 1 \\ 0 \\ \frac{p}{m+E_p} \\ 0 \end{pmatrix} e^{-ip^\mu x_\mu} \quad \Psi_3 = A \begin{pmatrix} \frac{-p}{E_p+m} \\ 0 \\ 1 \\ 0 \end{pmatrix} e^{-ip^\mu x_\mu}$$

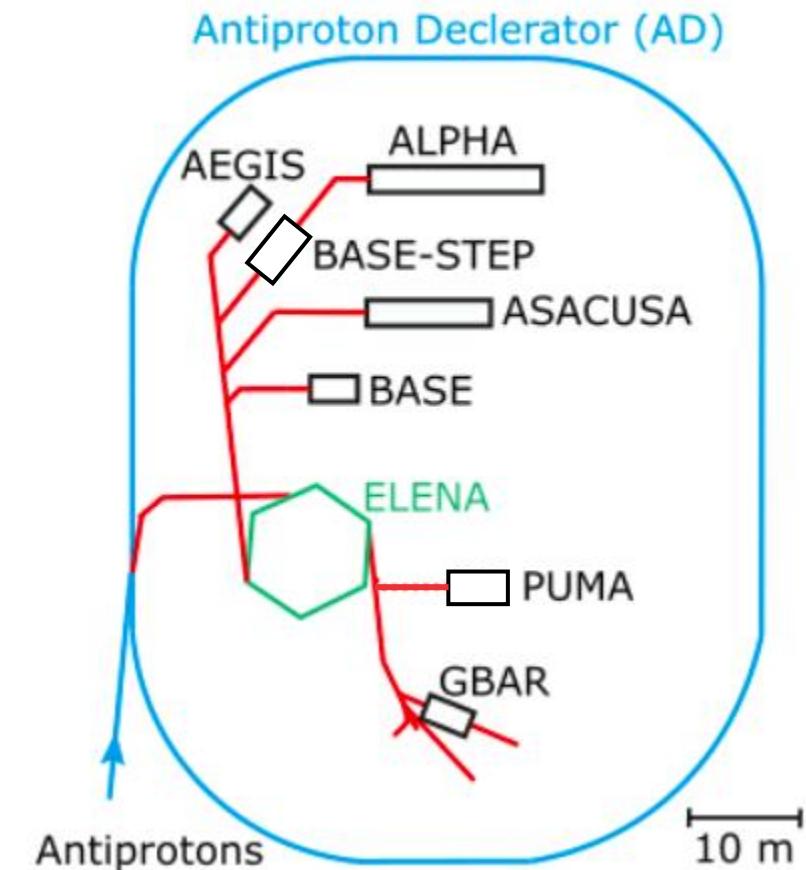

$$\Psi_2 = A \begin{pmatrix} 0 \\ 1 \\ 0 \\ \frac{-p}{E_p+m} \end{pmatrix} e^{-ip^\mu x_\mu} \quad \Psi_4 = A \begin{pmatrix} 0 \\ \frac{p}{E_p+m} \\ 0 \\ 1 \end{pmatrix} e^{-ip^\mu x_\mu}$$

Overview

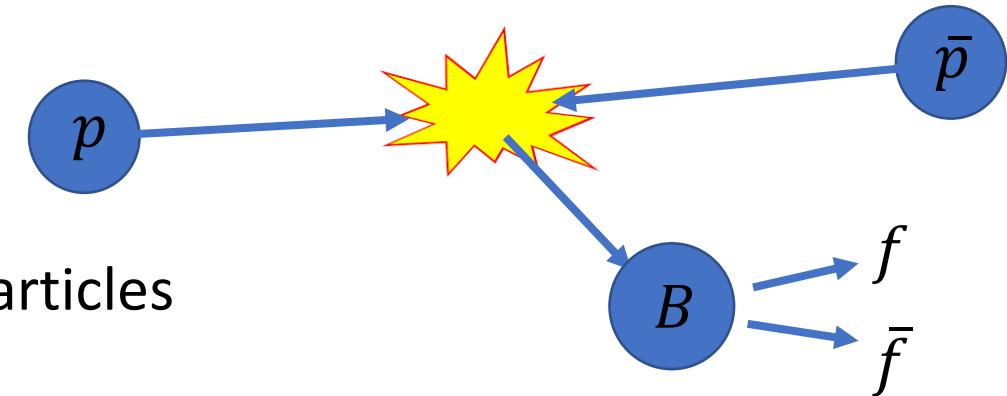

Lecture 2: Experiments at the Antimatter Factory

1. Catching and storing antimatter
2. Measurements on antiprotons
3. Spectroscopy of anti-atoms
4. Gravity and antihydrogen
5. Taking antimatter out of the lab (and into another lab..)

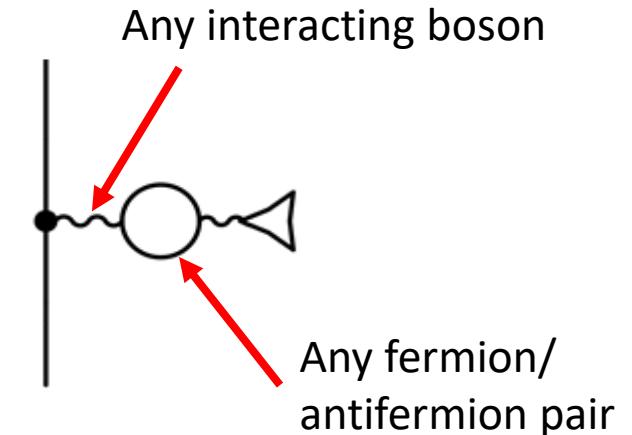

Low energy physics

- High energy experiments (direct search)
 - Produce and detect new particles in high energy particle collisions
 - High energies needed to make non-virtual particles
- Precision experiments: (indirect search)

$$\frac{g_{\text{electron}}}{2} = 1 + a_{QED} + a_{\mu,\tau} + a_{\text{weak}} + a_{\text{hadrons}} + a_{\text{New physics}}$$

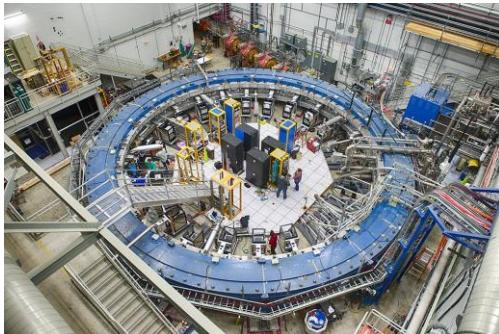

So far, all low energy CPT tests have been consistent with no CPT breaking

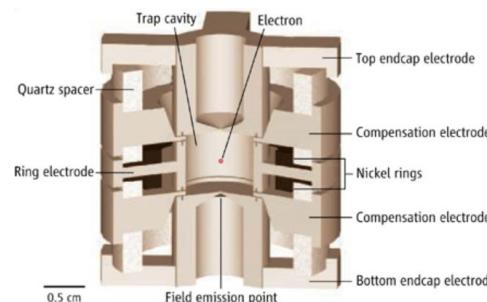

Other efforts

Many groups studying antimatter. Some notable ones are:

Positron-electron magnetic moment University of Washington/Harvard, new effort at Northwestern
Van Dyke& Dehmelt / Gabrielse

Reidar Hahn

Gabrielse /Harvard

Muon-antimuon magnetic moment Fermilab, formerly Brookhaven

Positronium, muonium, bound states of electrons/positron and antimuon+ electron: many groups

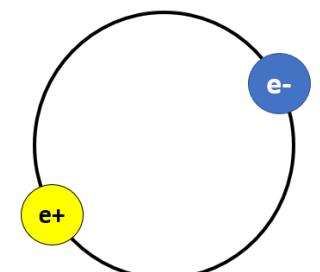

Kaons, B mesons, other collider searches

D. Hanneke et al. Phys. Rev. Lett. **100** (2008)

R.S. Van Dyke, Jr., P.B. Schwinberg, and H.G. Dehmelt, Phys. Rev. Lett. **59**, 26 (1987)

G.W. Bennett et al., Phys. Rev. Lett. **89**, 101804 (2002)

B. Abi et al. (Muon g-2 Collaboration) Phys. Rev. Lett. **126**, (2021)

Why many efforts?

Minimal Standard Model Extension (SME)

$$\mathcal{L}_{\text{lepton}}^{\text{CPT-even}} = \frac{1}{2}i(c_L)_{\mu\nu AB}\bar{L}_A\gamma^\mu \overset{\leftrightarrow}{D}^\nu L_B + \frac{1}{2}i(c_R)_{\mu\nu AB}\bar{R}_A\gamma^\mu \overset{\leftrightarrow}{D}^\nu R_B , \quad (9)$$

$$\mathcal{L}_{\text{lepton}}^{\text{CPT-odd}} = -(a_L)_{\mu AB}\bar{L}_A\gamma^\mu L_B - (a_R)_{\mu AB}\bar{R}_A\gamma^\mu R_B , \quad (10)$$

$$\mathcal{L}_{\text{quark}}^{\text{CPT-even}} = \frac{1}{2}i(c_Q)_{\mu\nu AB}\bar{Q}_A\gamma^\mu \overset{\leftrightarrow}{D}^\nu Q_B + \frac{1}{2}i(c_U)_{\mu\nu AB}\bar{U}_A\gamma^\mu \overset{\leftrightarrow}{D}^\nu U_B + \frac{1}{2}i(c_D)_{\mu\nu AB}\bar{D}_A\gamma^\mu \overset{\leftrightarrow}{D}^\nu D_B , \quad (11)$$

$$\mathcal{L}_{\text{quark}}^{\text{CPT-odd}} = -(a_Q)_{\mu AB}\bar{Q}_A\gamma^\mu Q_B - (a_U)_{\mu AB}\bar{U}_A\gamma^\mu U_B - (a_D)_{\mu AB}\bar{D}_A\gamma^\mu D_B . \quad (12)$$

$$\mathcal{L}_{\text{Yukawa}}^{\text{CPT-even}} = -\frac{1}{2}[(H_L)_{\mu\nu AB}\bar{L}_A\phi\sigma^{\mu\nu}R_B + (H_U)_{\mu\nu AB}\bar{Q}_A\phi\sigma^{\mu\nu}U_B + (H_D)_{\mu\nu AB}\bar{D}_A\phi\sigma^{\mu\nu}D_B] + \text{h.c.} \quad (13)$$

$$\mathcal{L}_{\text{Higgs}}^{\text{CPT-even}} = \frac{1}{2}(k_{\phi\phi})^{\mu\nu}(D_\mu\phi)^\dagger D_\nu\phi + \text{h.c.} - \frac{1}{2}(k_{\phi B})^{\mu\nu}\phi^\dagger B_{\mu\nu} - \frac{1}{2}(k_{\phi W})^{\mu\nu}\phi^\dagger W_{\mu\nu}\phi , \quad (14)$$

$$\mathcal{L}_{\text{Higgs}}^{\text{CPT-odd}} = i(k_\phi)^\mu\phi^\dagger D_\mu\phi + \text{h.c.} . \quad (15)$$

Non-minimal Standard Model Extension (SME)

18 pages to write down

CPT breaking coefficients proportional to
(energy)^{-order}

Measurement	Energy scale	Fractional precision	Measurement in energy units
$K_0 - \bar{K}_0$ mass difference	Mass of two Kaons ~ 1 GeV	4.8×10^{-19}	4.8×10^{-19} GeV
\bar{H} 1S-2S	~ 2500 THz	2×10^{-12}	2×10^{-20} GeV
\bar{p} magnetic moment	Larmor frequency ~ 81 MHz at 1.95 T	1.5×10^{-9}	5×10^{-25} GeV

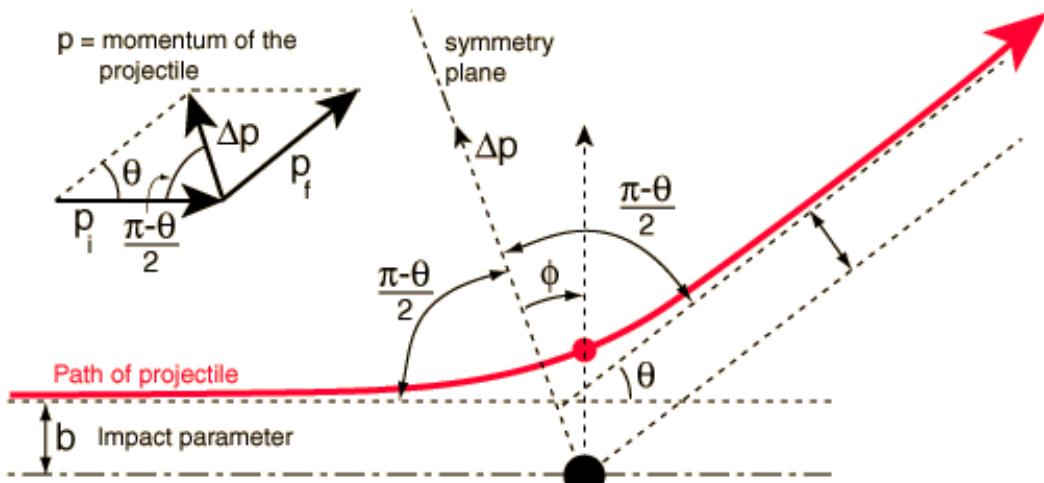

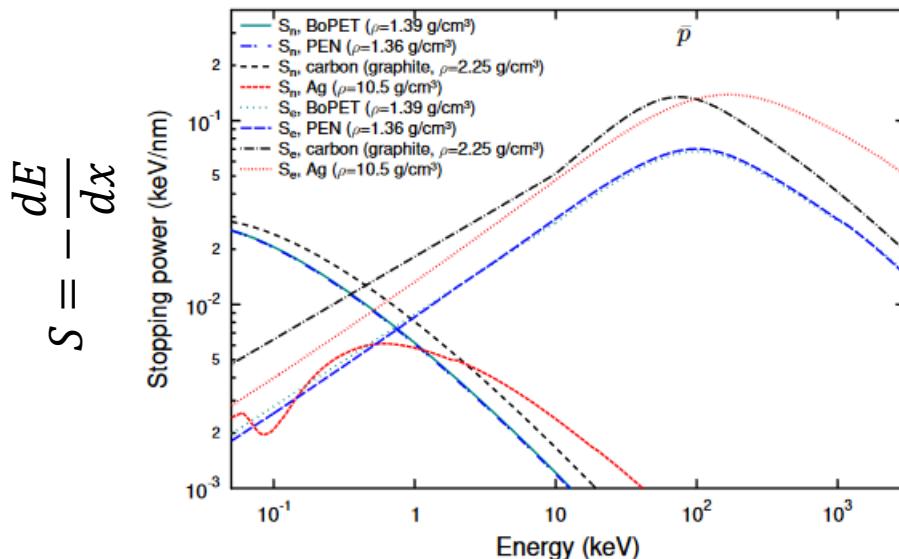

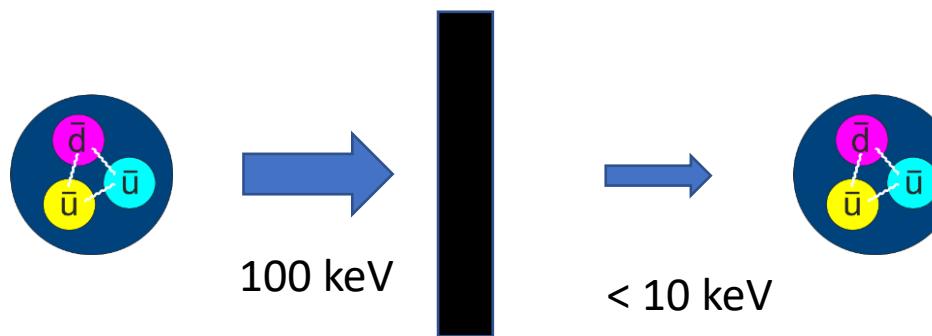

Don't know a priori where to look!

Catching and storing antimatter

Final step of slowing

Final ELENA energy 100 keV, need a final step to reach trappable energies

Degrader foil

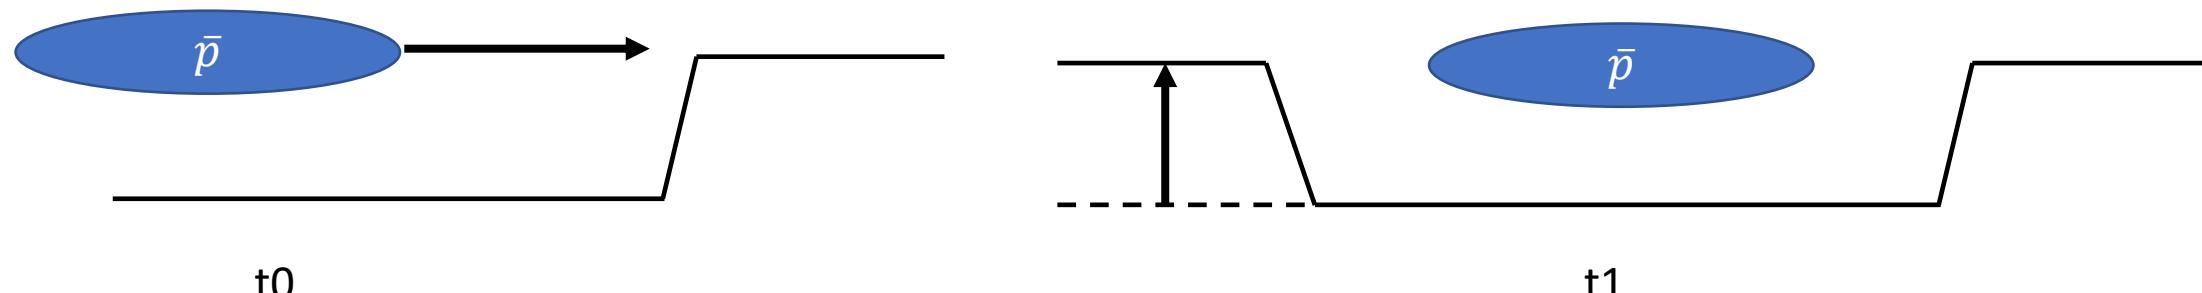

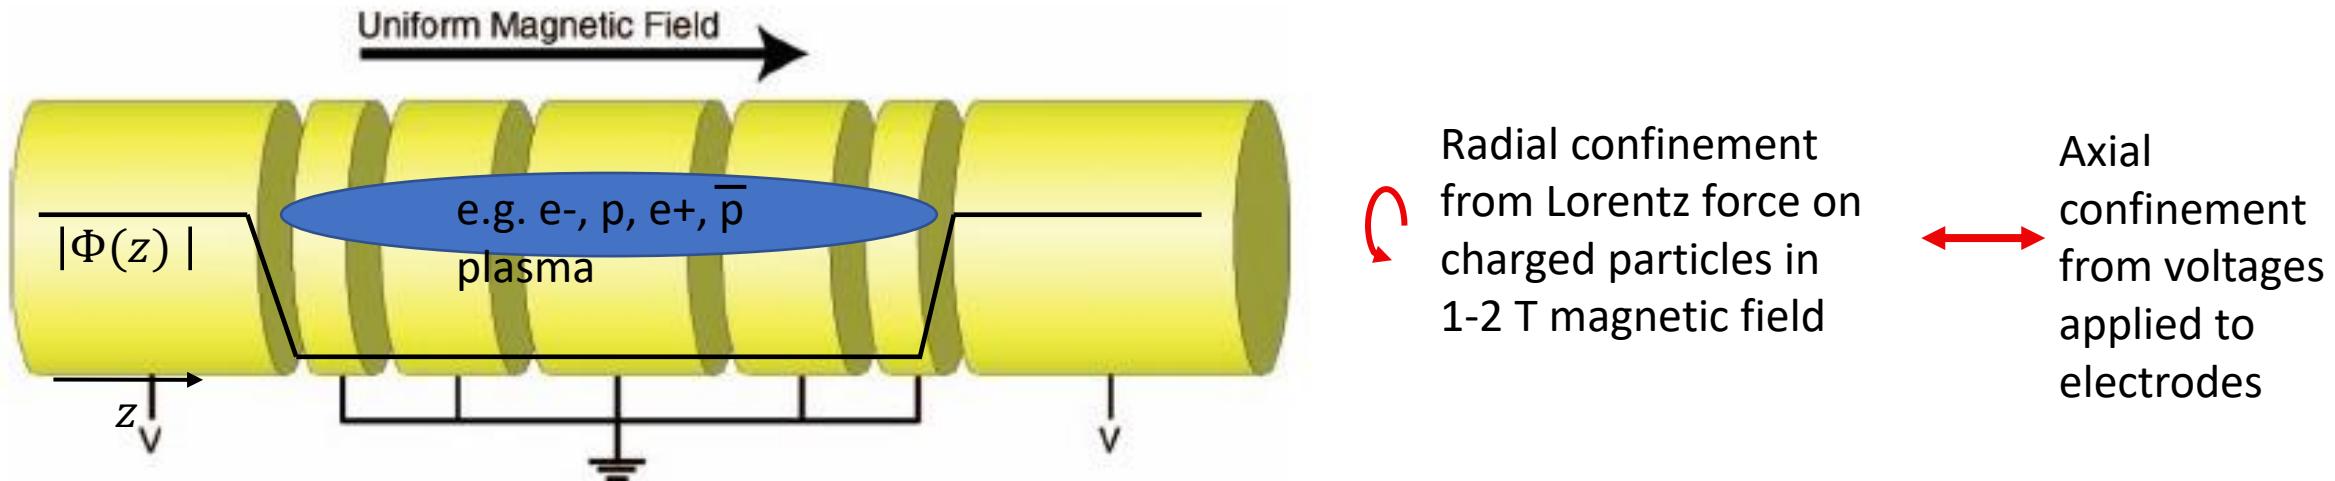

Sum of scattering from electrons and Rutherford scattering from nuclei

Up to ~50% antiprotons transmitted

Catching antiprotons

Strong magnetic and moderate electric fields used

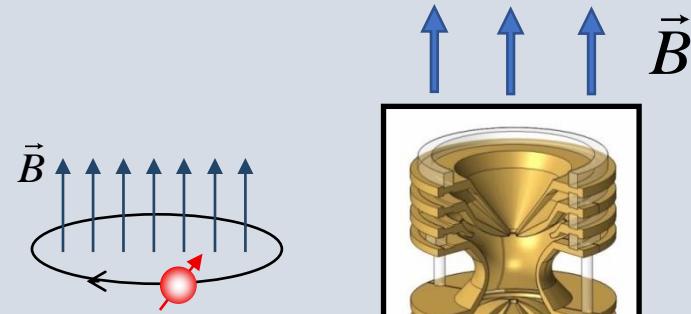

Can co-trap with electrons and use these to sympathetically cool

Measurements on antiprotons

Properties

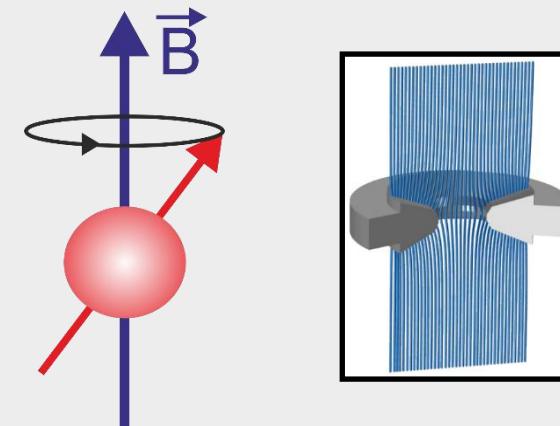

Measurements

Cyclotron Frequency

$$\omega_c = \frac{q}{m} B$$

Larmor Frequency

$$\omega_L = g \frac{e}{2m_p} B$$

Trap loss rate

CPT Tests

$$\frac{\omega_{c,\bar{p}}}{\omega_{c,p}} = \frac{q_{\bar{p}}/m_{\bar{p}}}{q_p/m_p}$$

Charge to mass comparison

$$\frac{\omega_{c,\bar{p}}}{\omega_{c,p}} \text{ (Year)}$$

Gravity, clock comparison

$$\frac{\omega_L}{\omega_c} = \frac{g}{2} = \frac{\mu}{\mu_N}$$

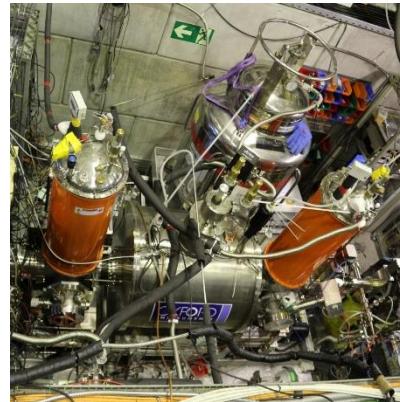

Magnetic moment

$$t_{\bar{p}}$$

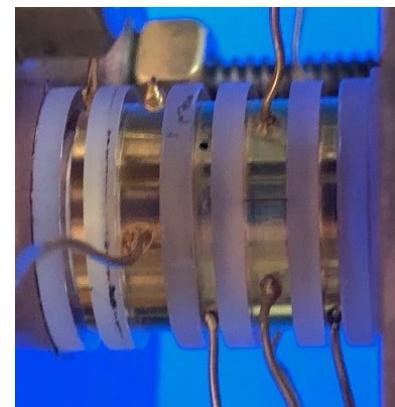

Lifetime

Frequency measurements in a Penning trap

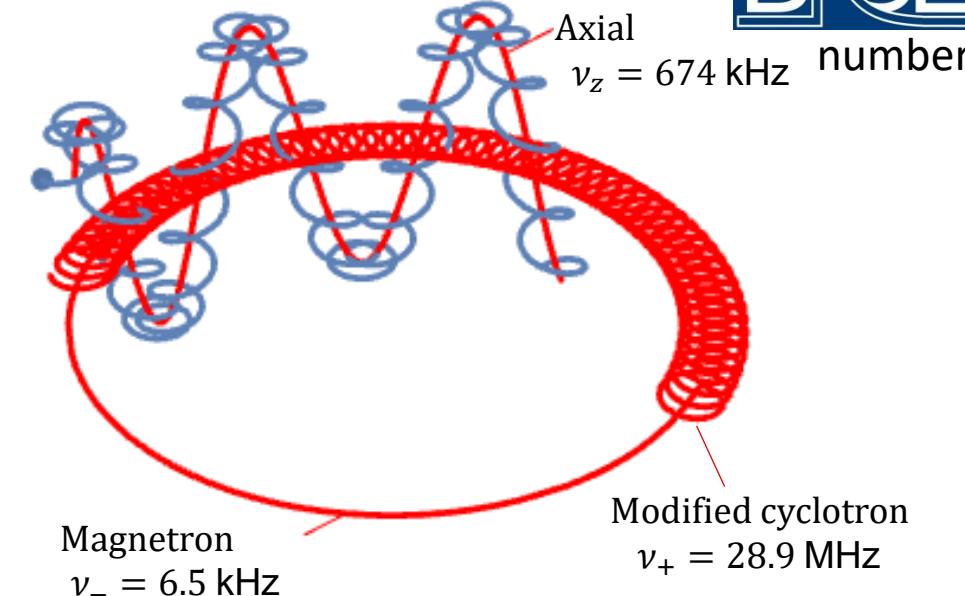

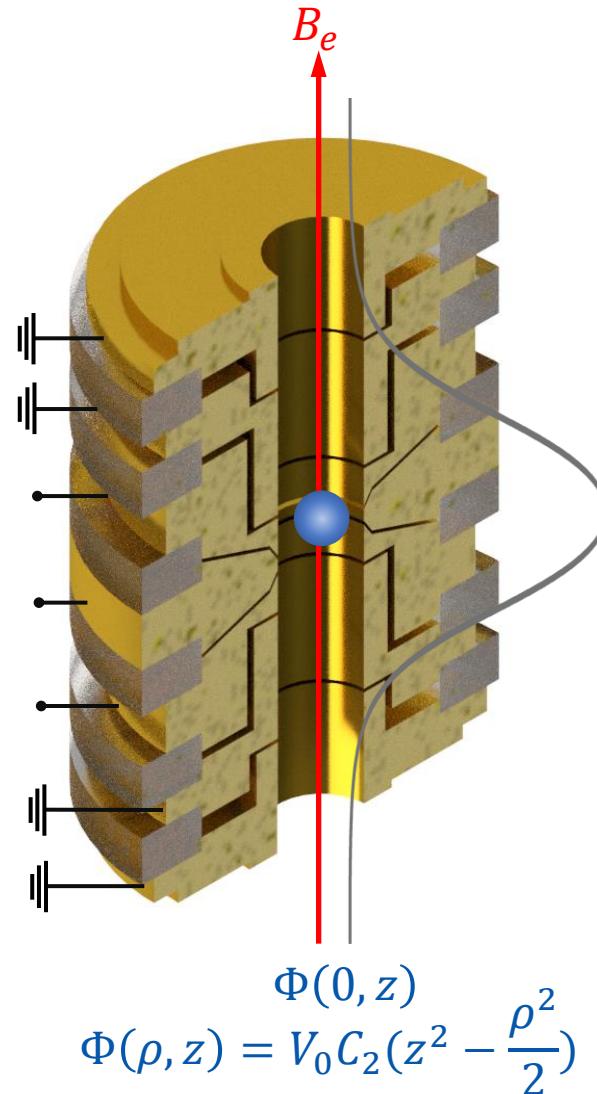

1.95 T B field from solenoid

Voltages applied to ring-shaped electrodes

A Penning trap

$$\sqrt{v_z^2 + v_+^2 + v_-^2} = v_c = \frac{q}{2\pi m} B_e$$

Orbit is sum of three normal modes

Measure frequencies and get access to charge-to-mass ratio and magnetic field

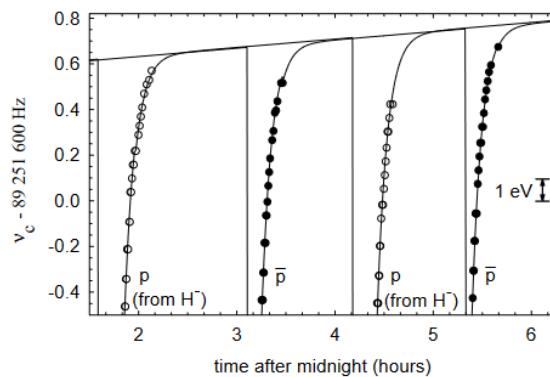

Charge-to-mass ratio comparisons

$$R = \frac{v_{c,\bar{p}}}{v_{c,H^-}} = \frac{(q/m)_{\bar{p}}}{(q/m)_{H^-}} \times \frac{B/2\pi}{B/2\pi} = \frac{(q/m)_{\bar{p}}}{(q/m)_{H^-}}$$

$$m_{H^-} = m_p \left(1 + 2 \frac{m_e}{m_p} - \frac{E_b}{m_p} - \frac{E_a}{m_p} + \frac{\alpha_{pol,H^-} B_0^2}{m_p} \right)$$

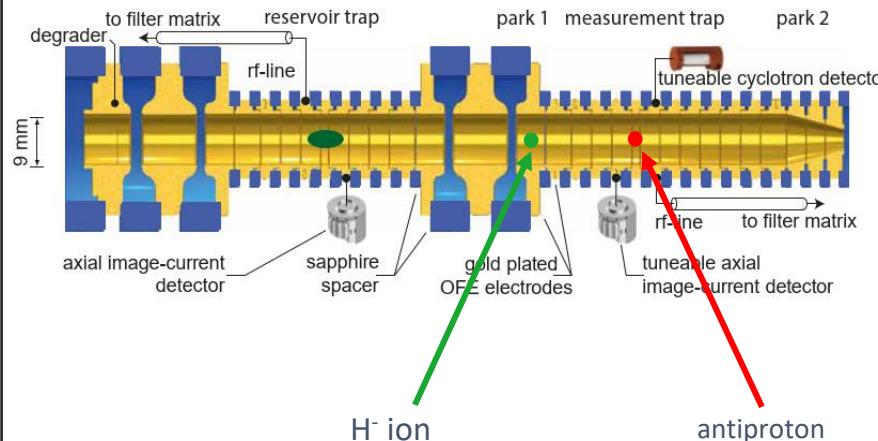

$$R_{theo} = 1.001\ 089\ 218\ 754\ 2(2)$$

Multiyear campaign performed by G. Gabrielse and collaborators at CERN's LEAR Decelerator 1990's

Single trap, 2 hrs to exchange particles,
90 ppt reached

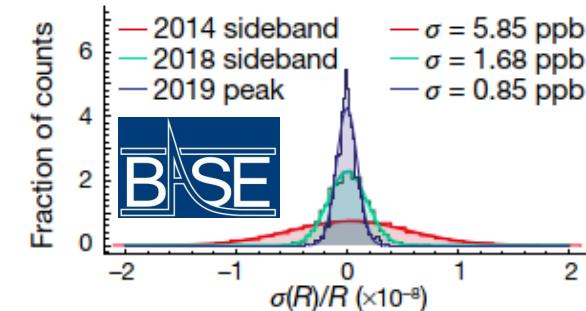

2 measurements by BASE at CERN's AD

Multi trap, 2 minutes to exchange particles,

$$\frac{(q/m)_{\bar{p}}}{(q/m)_p} = 1.000000000003(16)$$

16 ppt reached

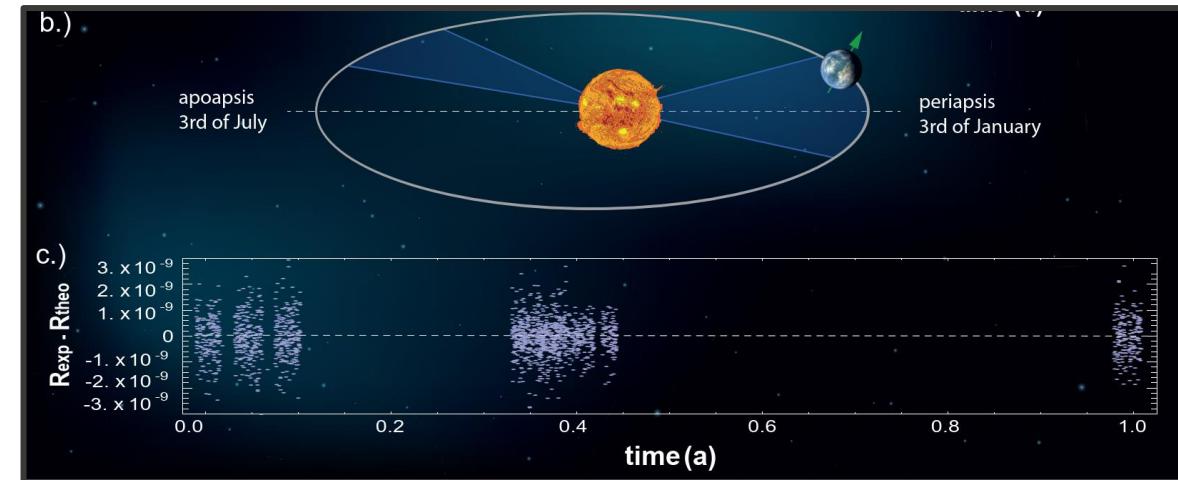

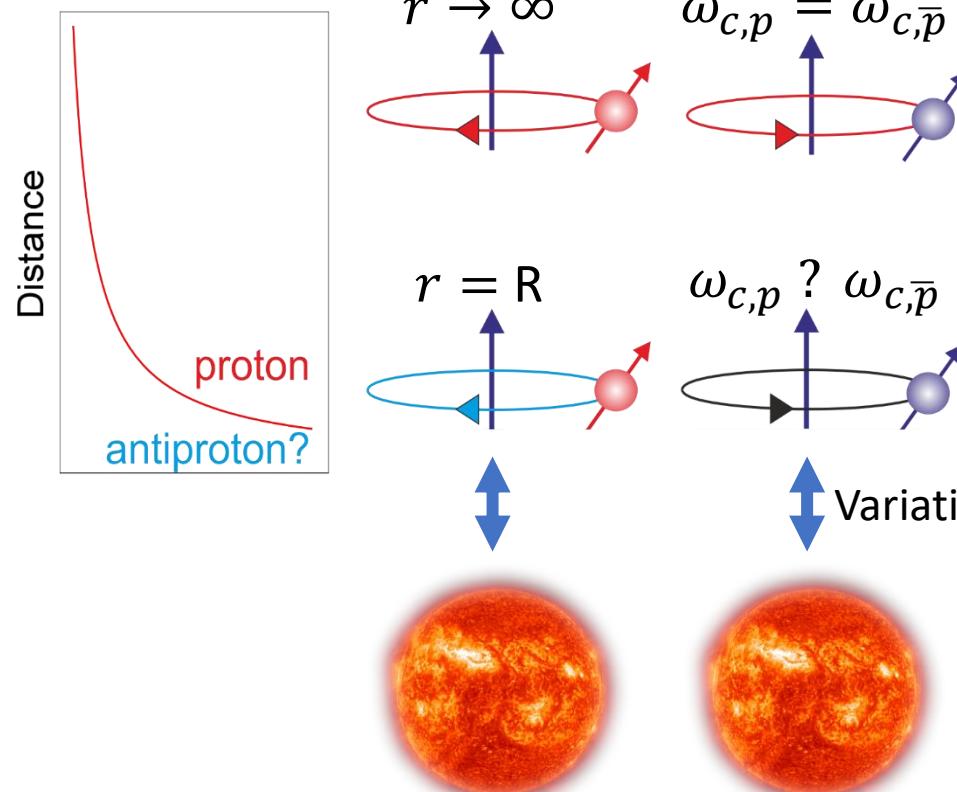

Gravity

Clock comparison between matter and antimatter clocks in a gravitational potential

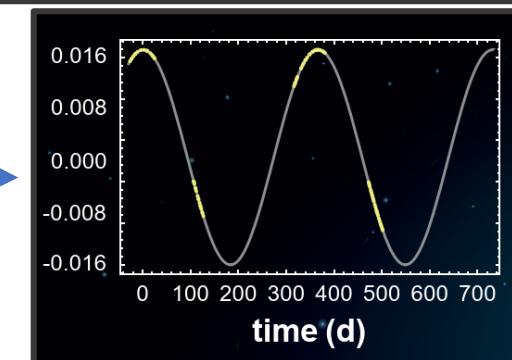

Relies on assumptions about CPT

Gravitation Potential

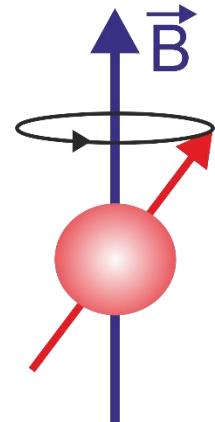

Variation in distance modulates effect

$$\frac{\Delta R(t)}{R_{\text{avg}}} = \frac{3GM_{\text{sun}}}{c^2}(\alpha_{g,D} - 1) \left(\frac{1}{O(t)} - \frac{1}{O(t_0)} \right)$$

Property	Limit
$\alpha_g - 1$	$< 1.8 * 10^{-7}$
$\alpha_{g,D} - 1$	< 0.03

Measuring the magnetic moment

$$\omega_L = g \frac{e}{2m_p} B$$

$$\frac{g}{2} = \frac{\mu}{\mu_N} = \frac{\omega_L}{\omega_c}$$

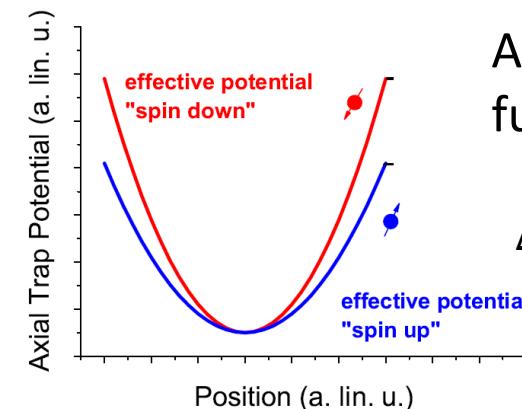

How to measure spin?

Continuous Stern-Gerlach effect

$$H_M = -(\vec{\mu}_p \cdot \vec{B})$$

Energy of magnetic dipole in magnetic field

$$B_z = B_0 + B_2 \left(z^2 - \frac{\rho^2}{2} \right)$$

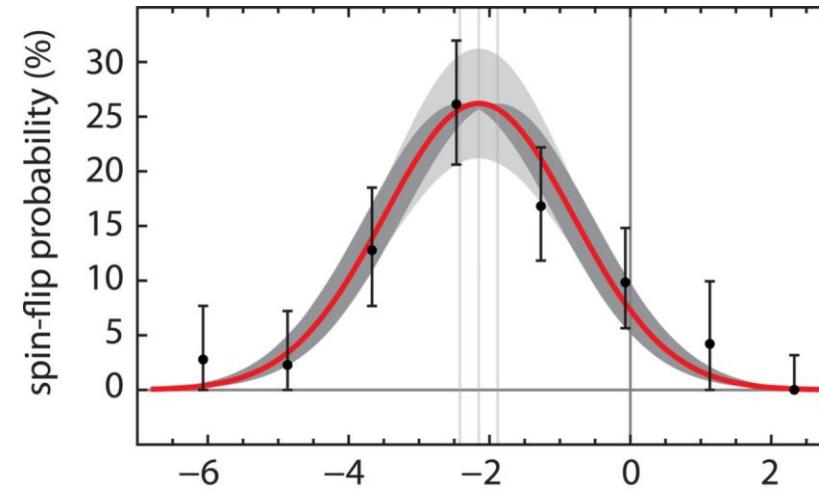

$$\omega_{rf} \frac{2}{g \text{CODATA } \omega_c} - 1 \text{ (ppb)}$$

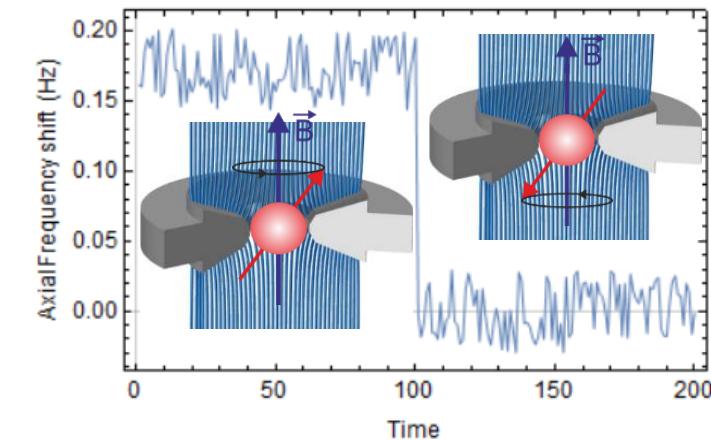

Axial frequency becomes function of spin state

$$\Delta v_z \sim \frac{\mu_p B_2}{m_p v_z} := \alpha_p \frac{B_2}{v_z}$$

How to measure the Larmor frequency ω_L ?

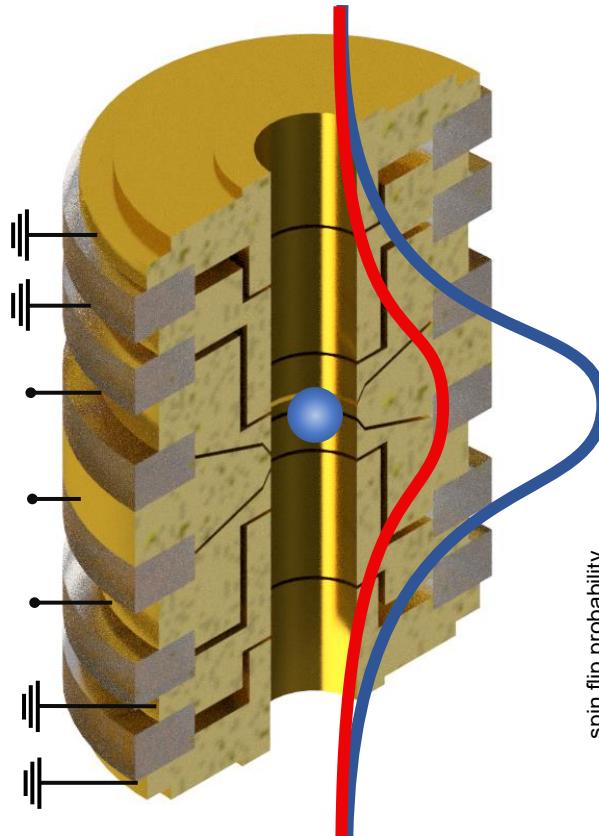

Weak radiofrequency magnetic field most likely to flip antiproton spin at ω_L

Method

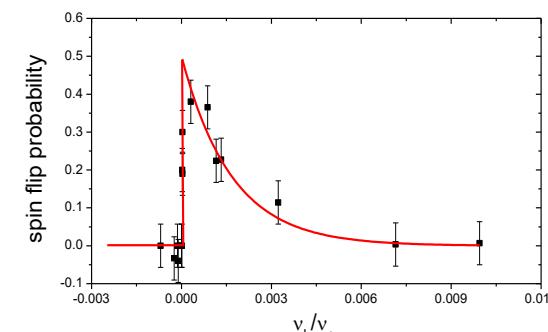

Single trap method

Magnetic field

Measure ω_L and ω_c and spin states in the same trap

Works well for electrons, but large quadratic B field adds temperature broadening, limits measurements

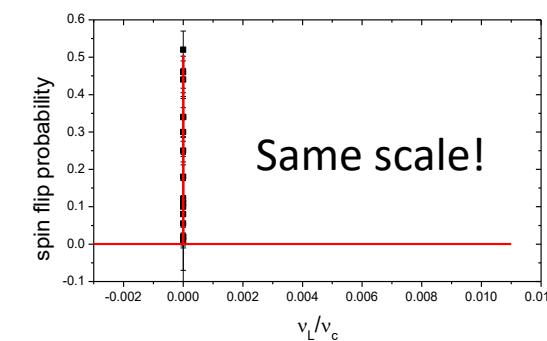

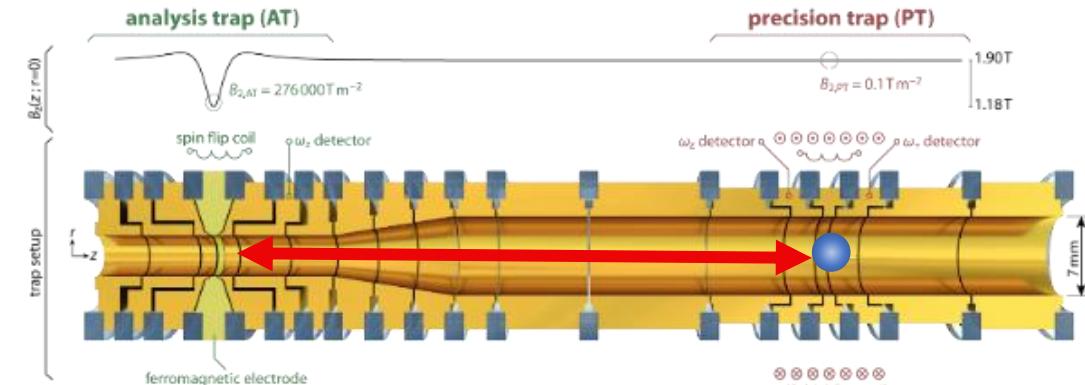

Electric potential

Proton: 2.5 ppm
Antiproton: 0.8 ppm
Electron: 0.28 ppt
Positron: 4.3 ppt

Double trap method

Separate spin state identification from measuring ω_L and ω_c

Proton: 0.3 ppb
Antiproton: 1.2 ppb

Same scale!

- Van Dyck, R.S., Jr.; Schwinberg, P.B.; Dehmelt, H.G. Phys. Rev. Lett. **59** (1987)

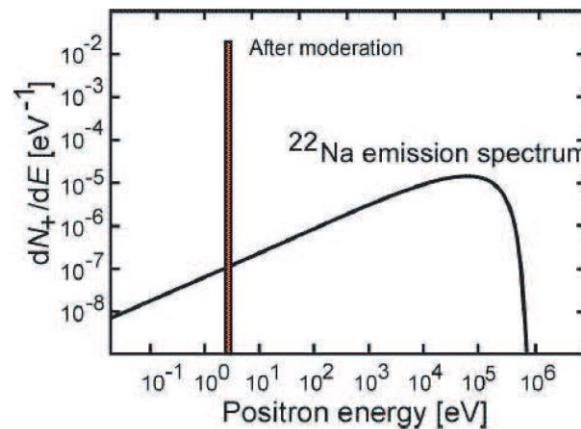

Spectroscopy of anti-atoms

What about the positrons?

Need positrons to make antihydrogen

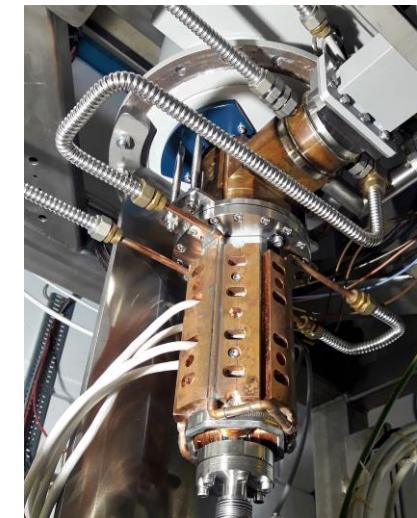

Radioactive source and moderation with frozen noble gas

\sim 5 million slow
e⁺ per second

(CERN/ALPHA)

(CERN/GBAR/Comini)

\sim 40 million slow e⁺
per second

e⁻ accelerated 10 MeV
onto a water-cooled
tungsten target to form
positrons by pair
production, moderated
by tungsten mesh

Producing antihydrogen

- 1) Recombination $\bar{p} + e^+ \rightarrow \bar{H} + \text{UV photon}$
- 2) Three body recombination $\bar{p} + e^+ + e^+ \rightarrow \bar{H} + e^+$

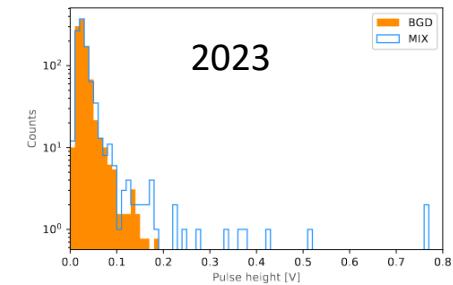

rate 2)>> rate 1) typically

ALPHA: 2.6 ± 0.2 detected \bar{H}
trapped per minute

- 3) Charge transfer $\bar{p} + \text{positronium} \rightarrow \bar{H} + e^-$

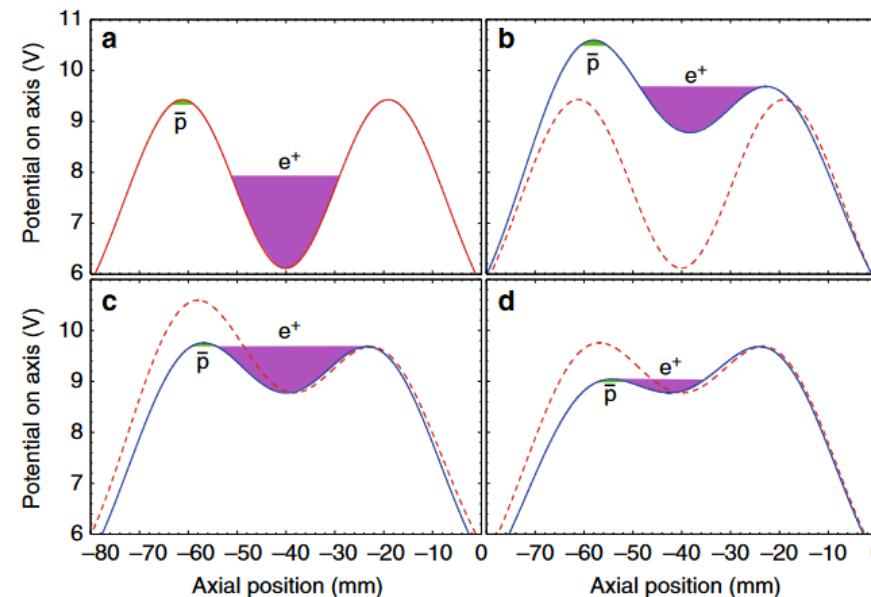

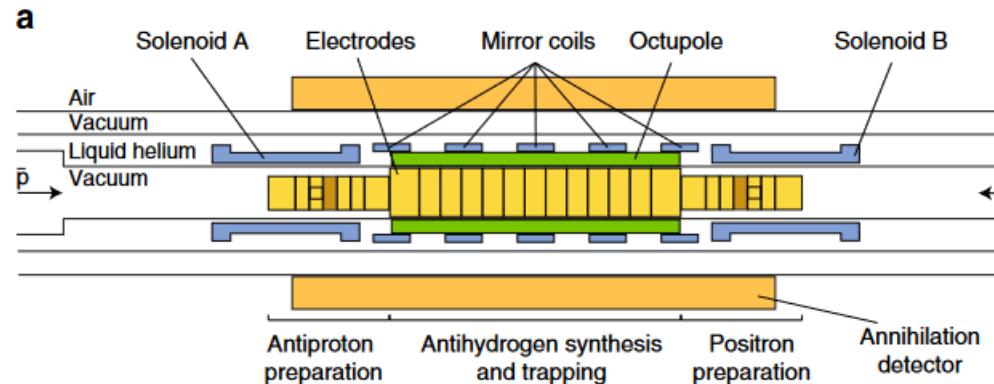

GBAR: $0.0089 \bar{H}$ per
antiproton pulse
 ~ 112 s per pulse

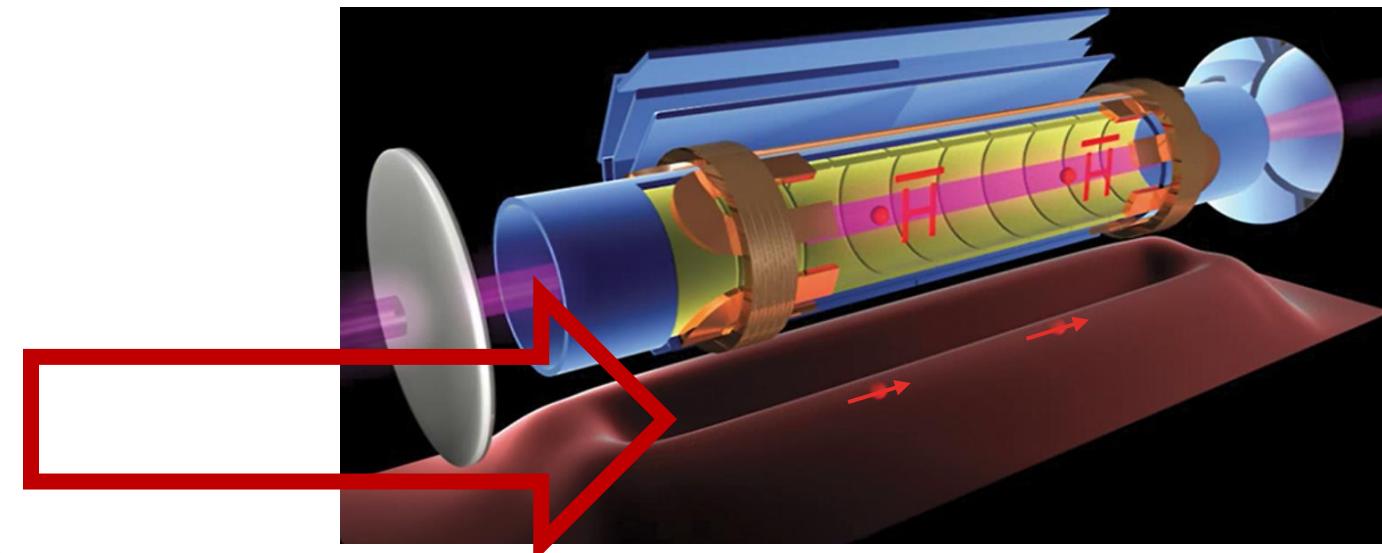

AEGIS: $0.021(5) \bar{H}$ per attempt,
 ~ 15 minutes per attempt

Antihydrogen production in ALPHA

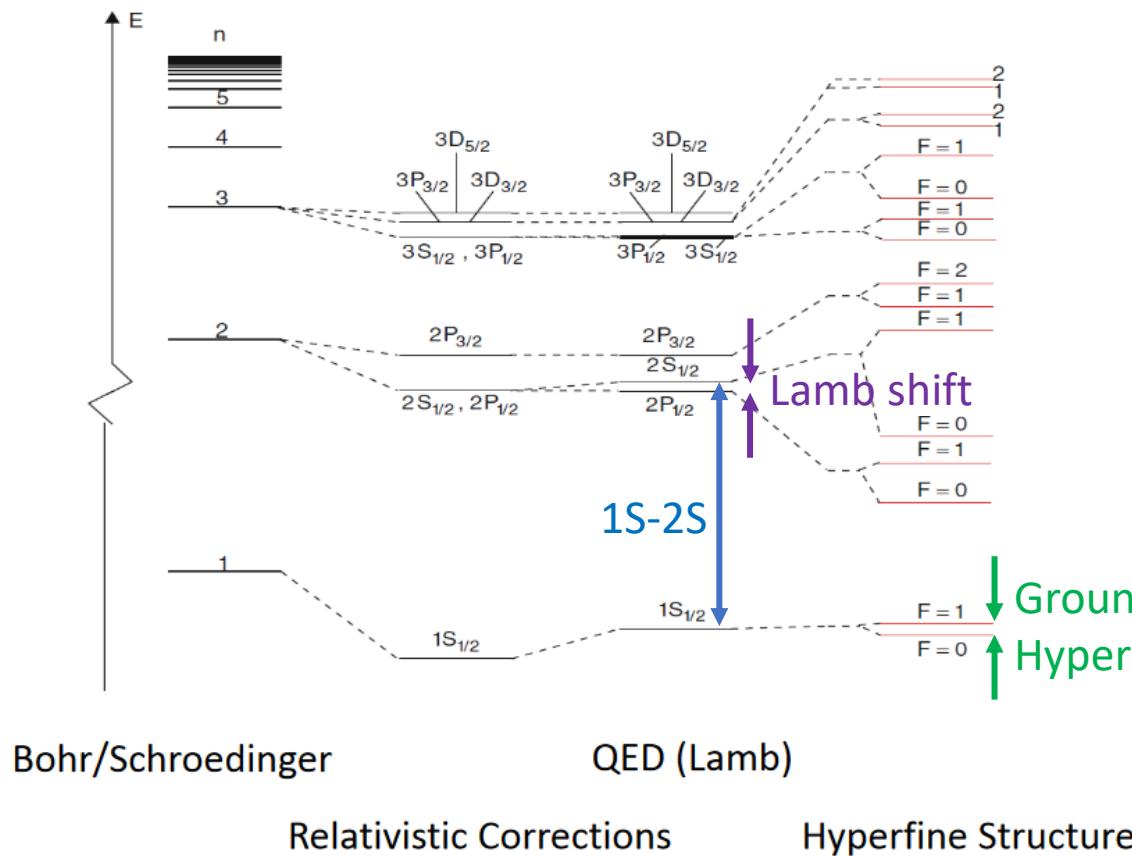

Careful control of antiproton and positron temperatures and densities

Antihydrogen magnetically trapped

(anti)hydrogen

Bohr / Schroedinger: L degeneracy

$$E_n = -\frac{mZ^2e_0^4}{2\hbar^2n^2} = -\frac{(Ze_0)^2}{2an^2} = -\frac{mc^2}{2}\alpha^2 \frac{Z^2}{n^2}$$

Dirac: J degeneracy

$$\langle H_1 + H_2 \rangle_{n,j=l\pm 1/2,l} = \frac{mc^2(Z\alpha)^2}{2n^2} \frac{(Z\alpha)^2}{n^2} \left\{ \frac{3}{4} - \frac{n}{j+1/2} \right\}$$

QED: Lamb Shift

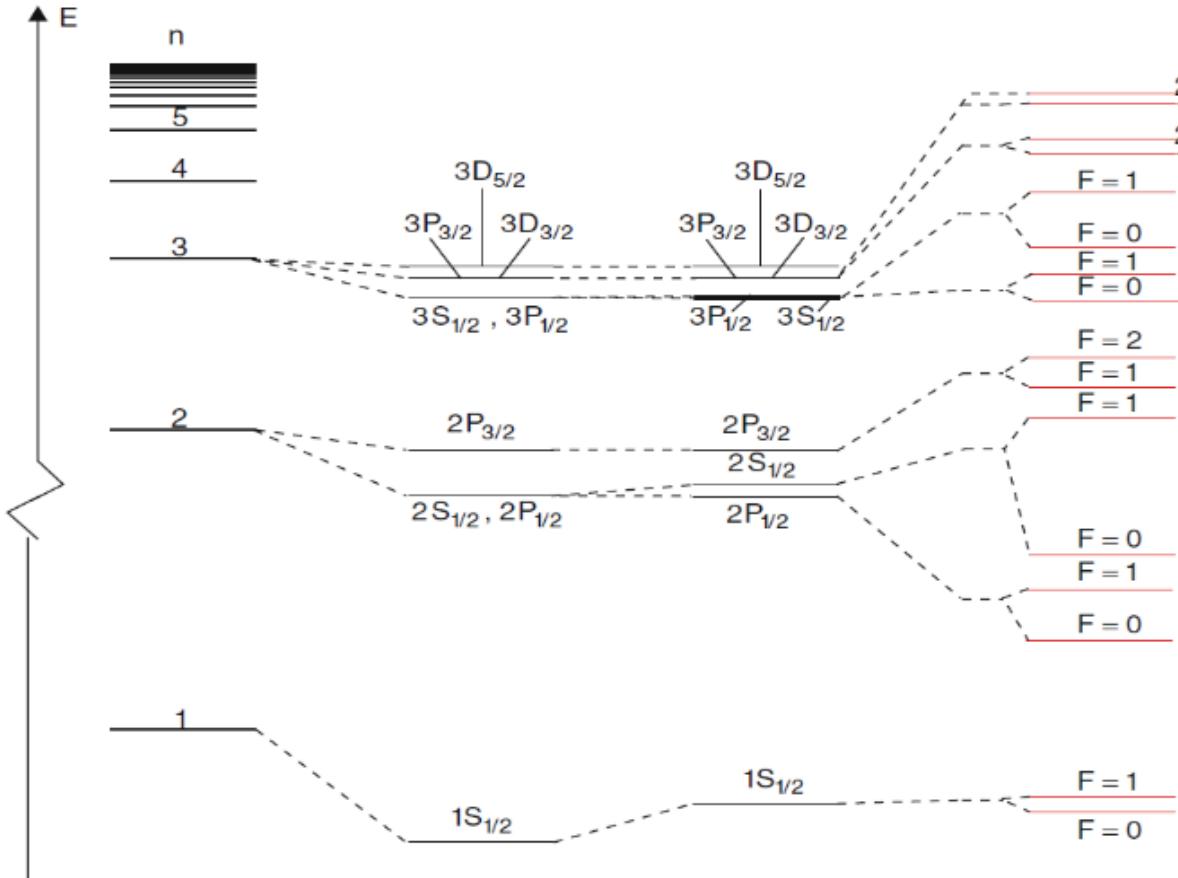

$$\Delta E_{\text{Lamb}} \approx \frac{4}{3\pi} \frac{mc^2 Z^4 \alpha^5}{n^3} \log \frac{1}{\alpha Z} \delta_{l,0}$$

Hyperfine Structure:

$$\Delta E_{n,1/2,0}^{\text{Hyp}} = \frac{4}{3} g_K \frac{m}{M_K} (Z\alpha)^4 \frac{mc^2}{n^3} \frac{(2I+1)}{2}$$

Analytically calculable energy levels, high precision hydrogen measurements (4.5 ppt for 1S-2S) to compare to antihydrogen

Think like a precision measurer

What properties do we want in a transition?

-
-
-

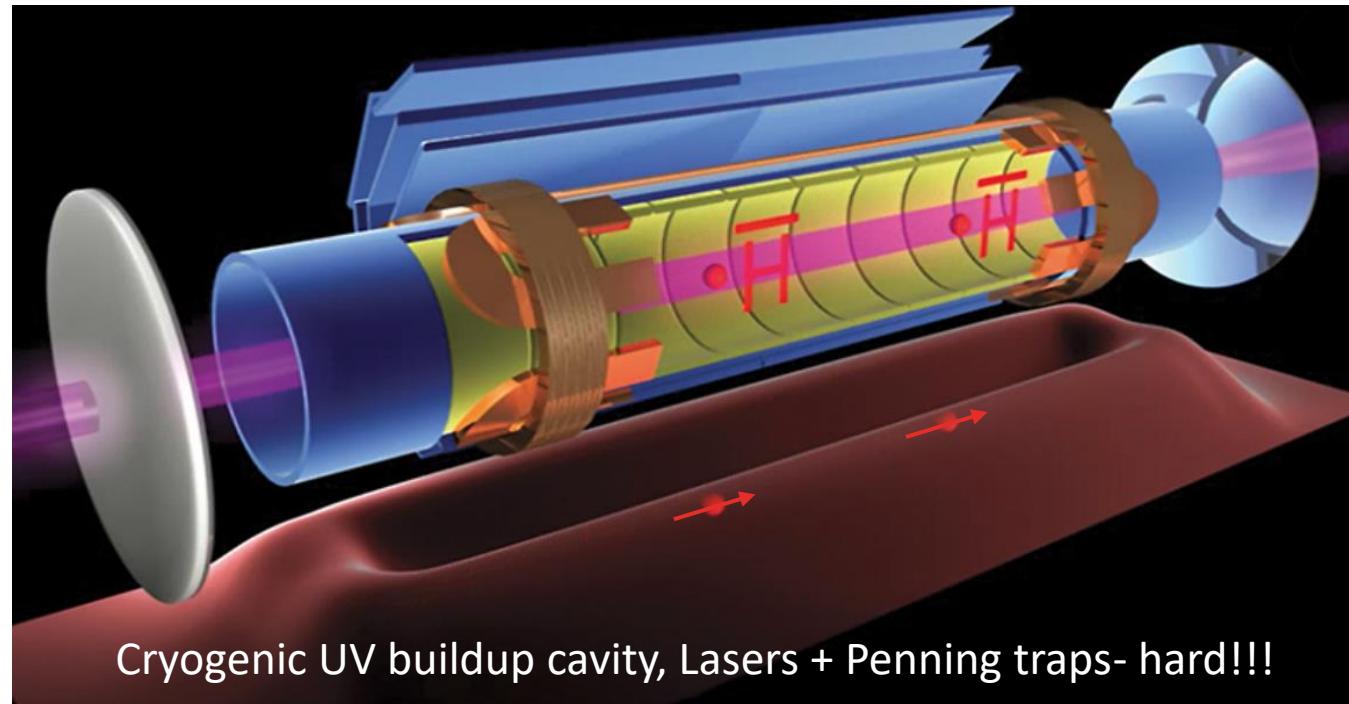

What do we want to control about the atom?

-
-
-

What do we want to control about the environment?

-
-
-

Laser spectroscopy of Antihydrogen 1S-2S

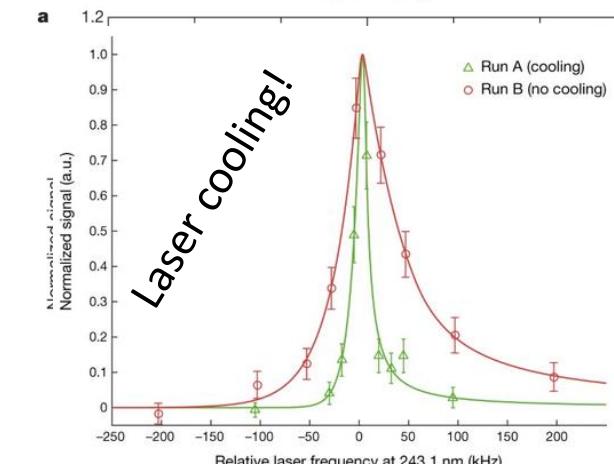

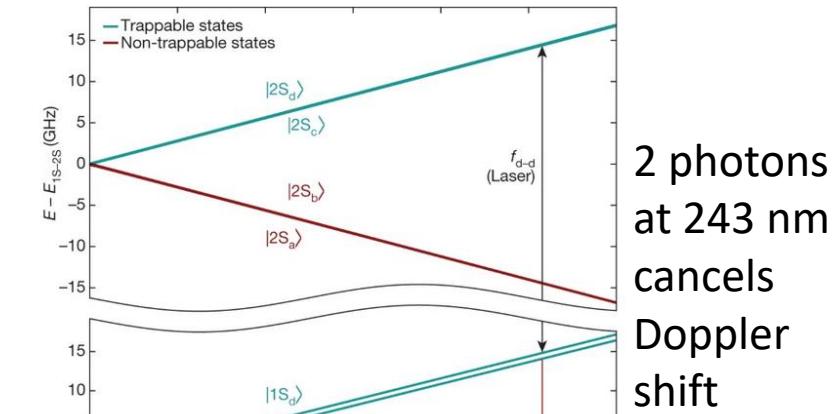

ALPHA collaboration

60 hr antihydrogen storage

$f_{d-d} = 2,466,061,103,079.4(5.4)$ kHz (measured)

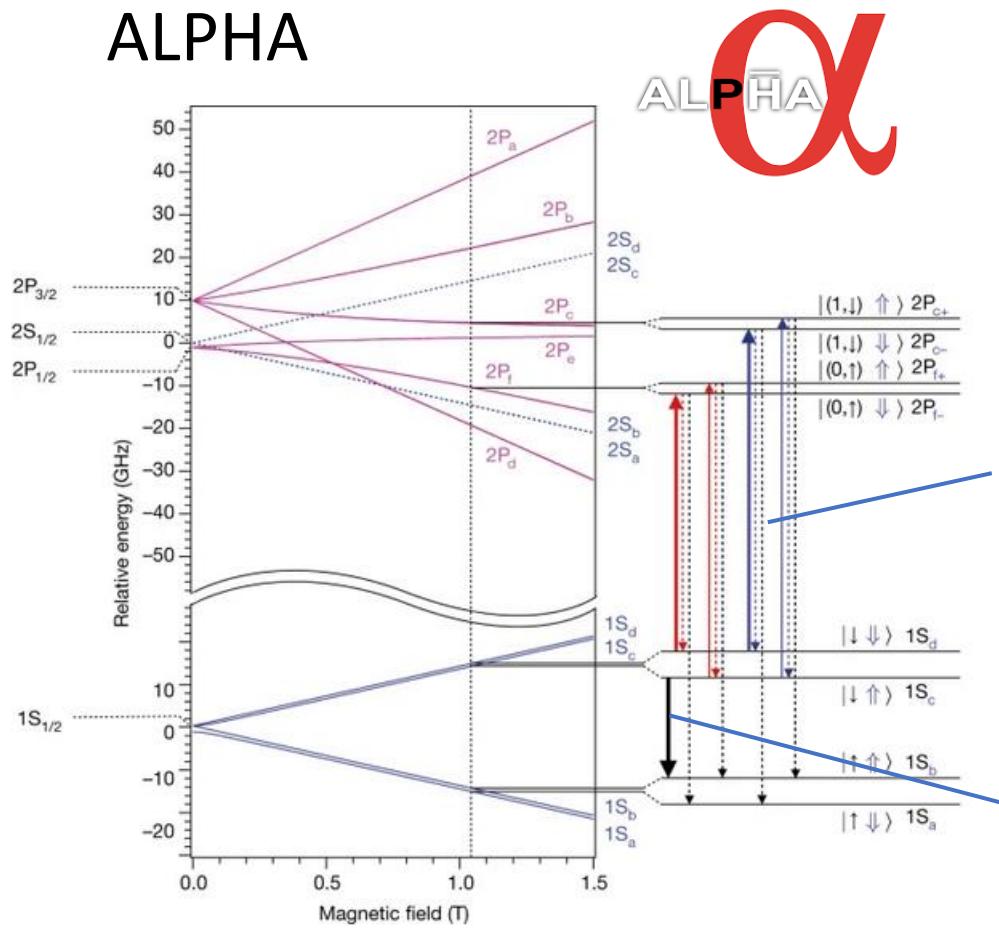

$f_{d-d} = 2,466,061,103,080.3(0.6)$ kHz (predicted)

2 ppt

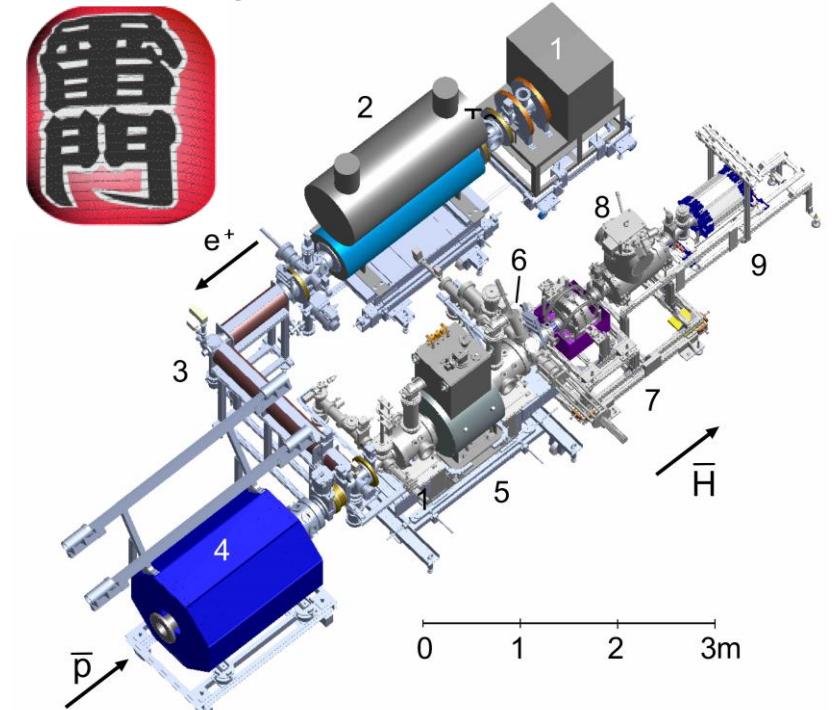

RF spectroscopy hyperfine splitting

ALPHA

ASACUSA

$$\Delta\nu = 1420405748.4(3.4)(1.6) \text{ Hz}$$

- 2.7 ppb in Hydrogen

Lamb shift $2S_{1/2} - 2P_{1/2} \bar{H} 0.99 \pm 0.11 \text{ GHz}$, $H 0.9098717(32) \text{ GHz}$
 Ground state splitting: $\bar{H} 1,420.4 \pm 0.5 \text{ MHz}$, $H 1420\ 405.751\ 766\ 7(9)$

M. Ahmadi, Nature **548**, 66-69 (2017)

M. Ahmadi, Nature **578**, 375–380 (2020)

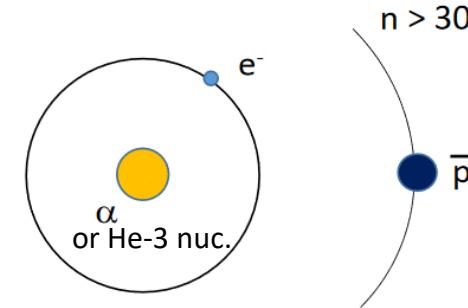

ASACUSA Collaboration. Report No. SPSC-P-307 Add. 1 CERN-SPSC-2005-002 (2005)

N. Ramsey, Hyp. Interactions **81** (1993)

Antiprotonic helium

Antiprotonic
Helium

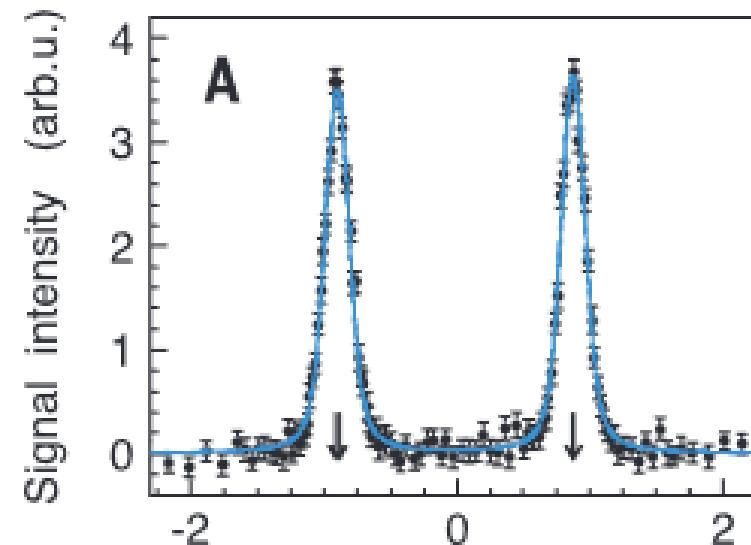

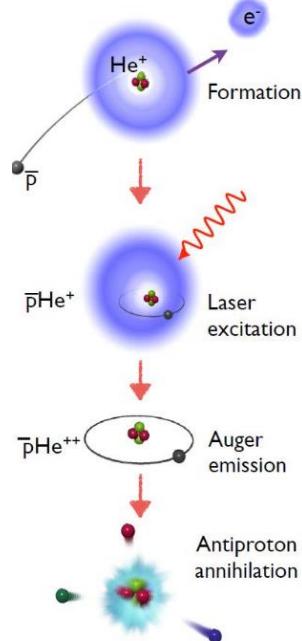

$$E_n = -hcR \frac{Z^2}{n^2}$$

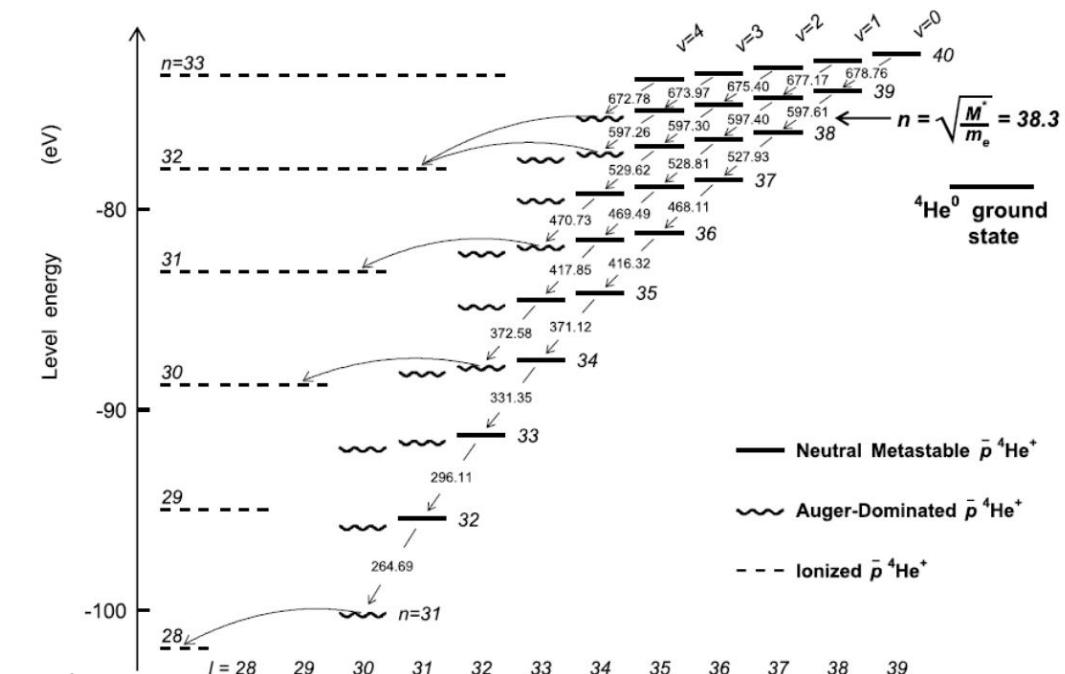

$$R = R_\infty \frac{m_{\bar{p}}}{m_e} \frac{1}{\left(\frac{m_{\bar{p}}}{m_e} + 1\right)}$$

Measure energy levels, determine $\frac{m_{\bar{p}}}{m_e}$

Ground state lifetime: 100 ns
Lifetime $n \sim 38 \sim 1-2 \text{ } \mu\text{s}$ or $\sim \text{ns}$

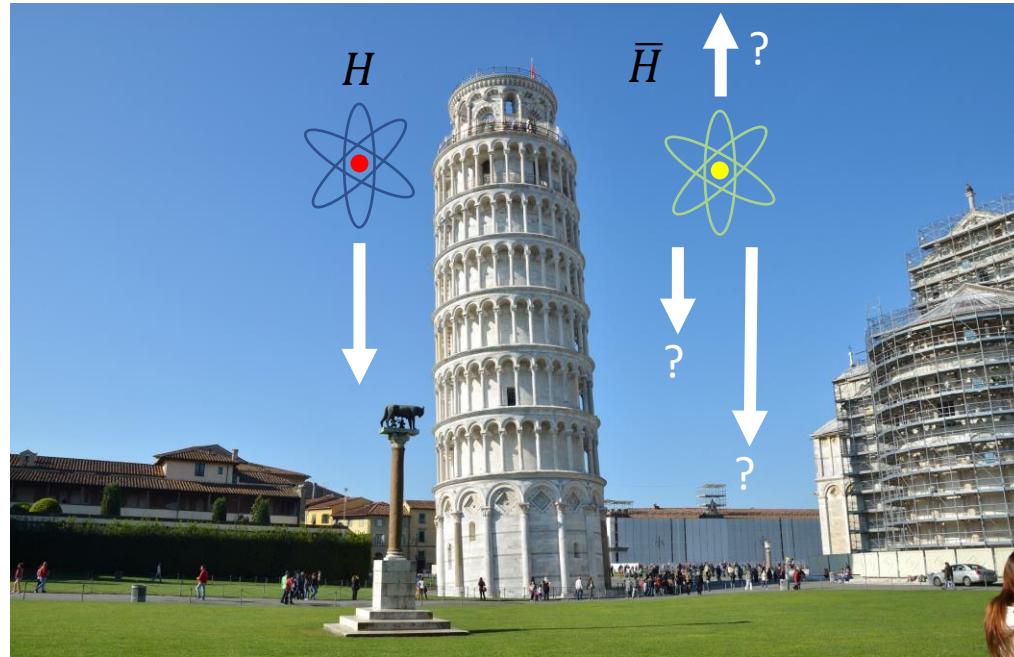

Laser resonance leads to electron ejection and rapid $\bar{p}\text{He}^{2+}$ decay emitting pions, detected via Cherenkov detectors

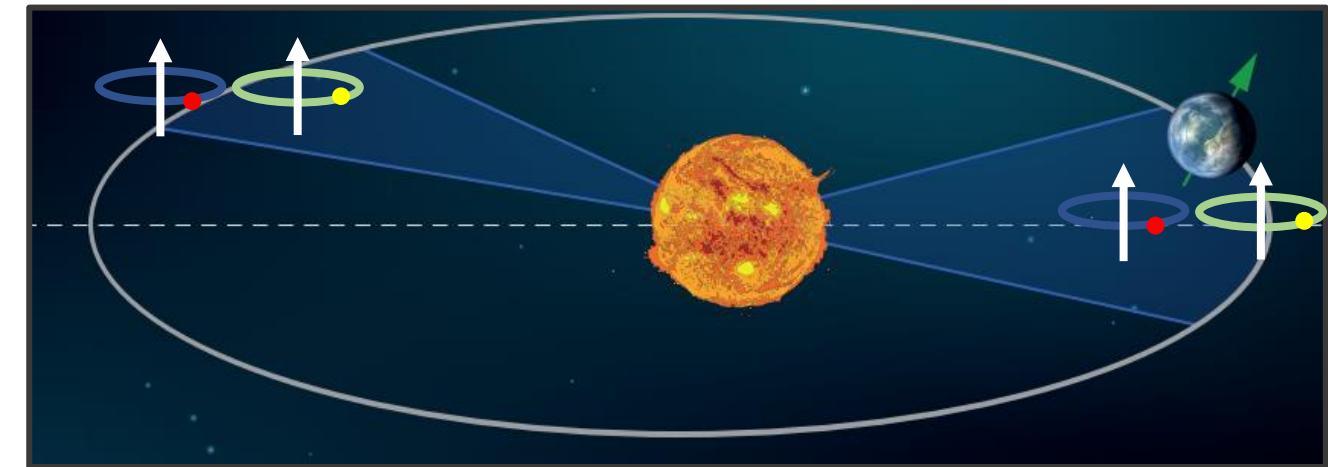

Effect of gravity on antihydrogen

Types of measurement

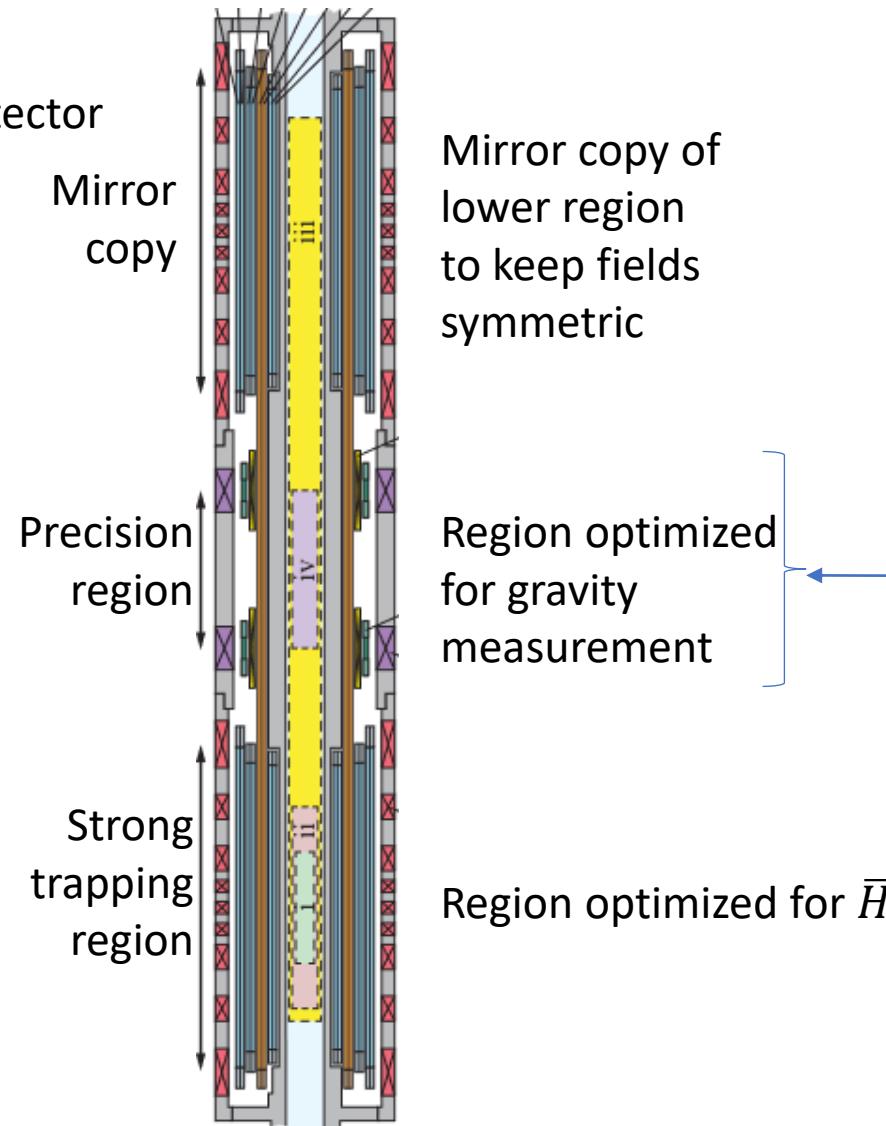

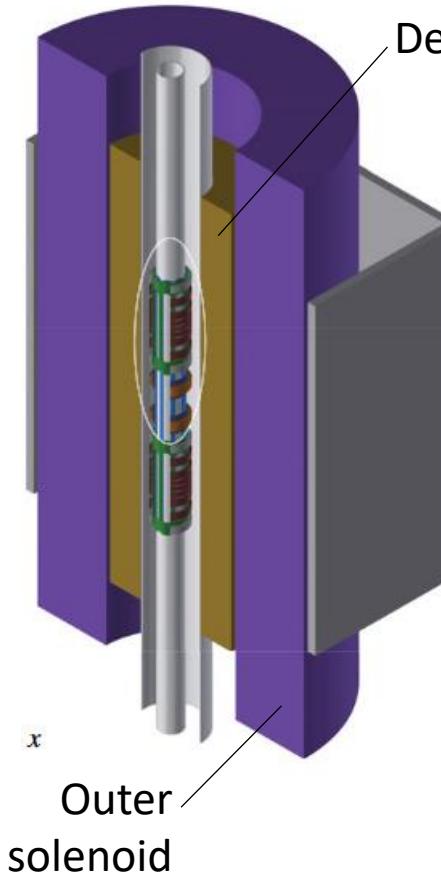

Freefall

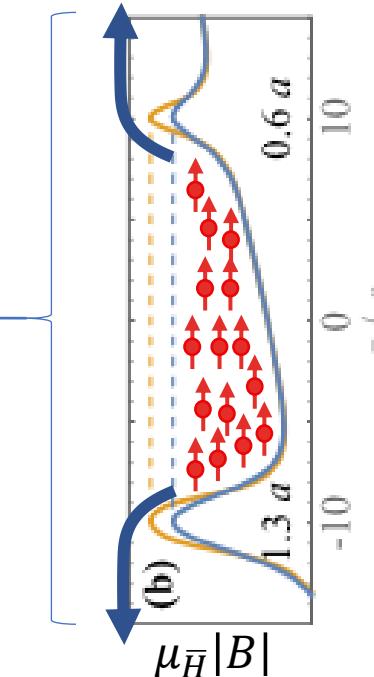

Clock comparison

High precision needed- If proton is any guide, antiquark masses only $\sim 1\%$ of the antiproton

ALPHA-g

$$V = \mu_{\bar{H}} |B| - m_{\bar{H}} g h$$

Slowly ramp magnetic fields until equal numbers escape up and down, Infer $m_{\bar{H}}$

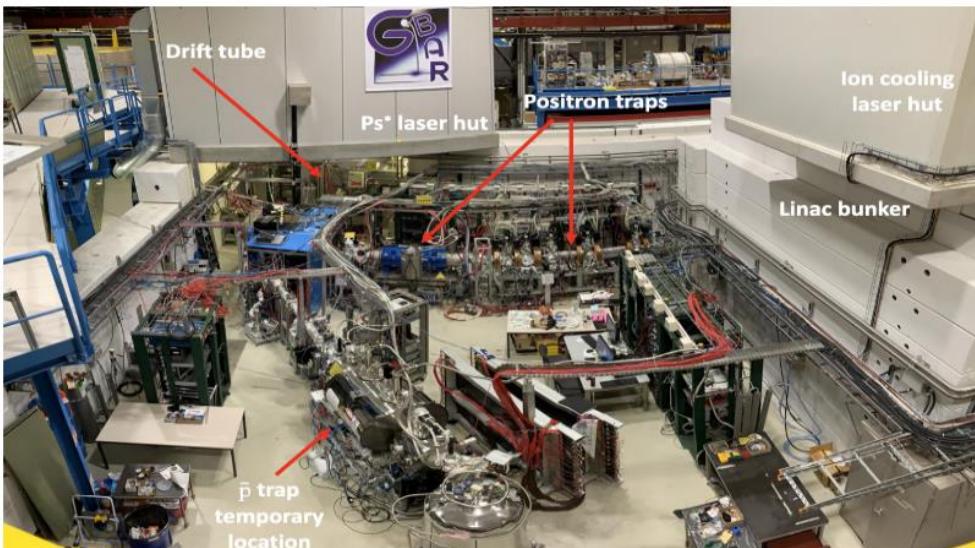

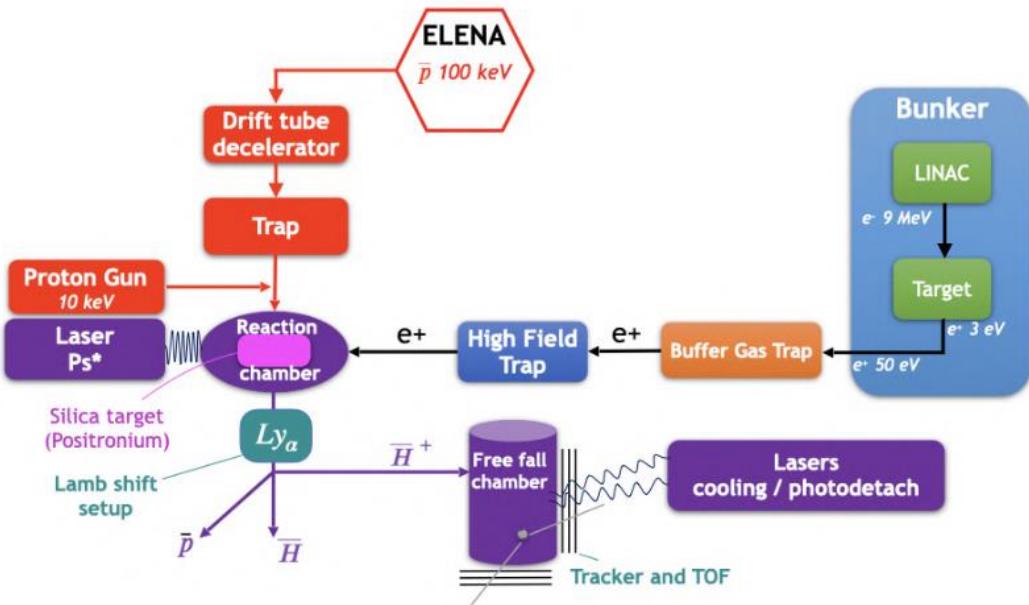

Colder the better!
Initially <0.54 mK
With laser cooling
Initially <0.05 mK

Target 5-1% measurement on $m_{\bar{H}}$

W. A. Bertsche, Phil. Trans. R. Soc. A **376** (2018)
C. So et al., IEEE Trans. Appl. Super. **30** 4 (2020)

GBAR

1. Make \bar{H}^+ by reacting $\bar{H} + e^+$
2. Sympathetically laser cool \bar{H}^+ with Be^+ to 20 μK
3. Photoionise \bar{H}^+ to \bar{H}
4. Drop and measure effect of gravity

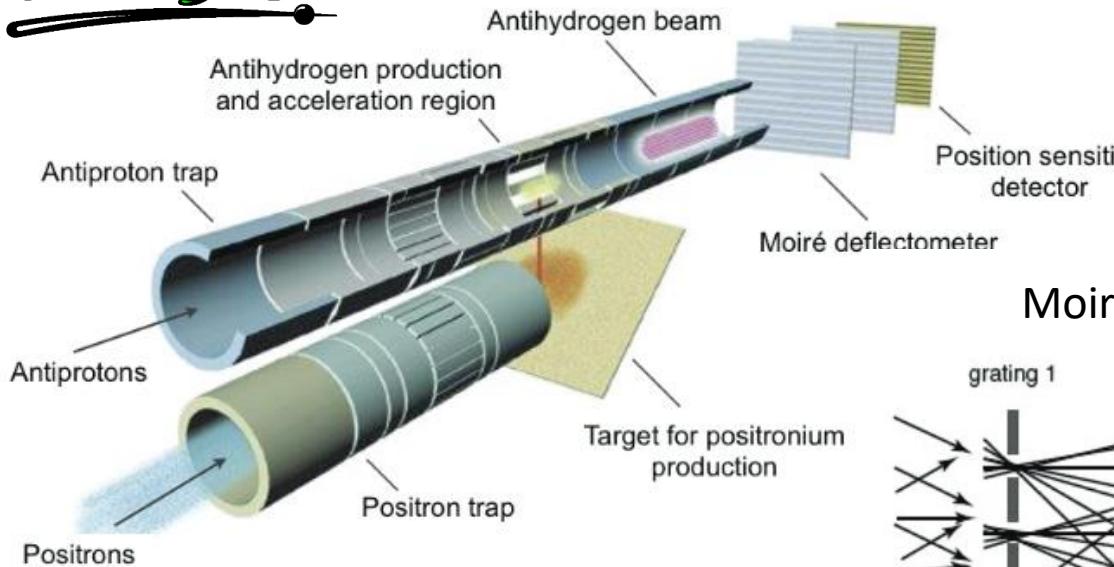

Initial goal 1%, final goal 0.1% with quantum measurement

Also, long term possibility to produce \bar{H}_2^+ molecules and do antimolecular spectroscopy!

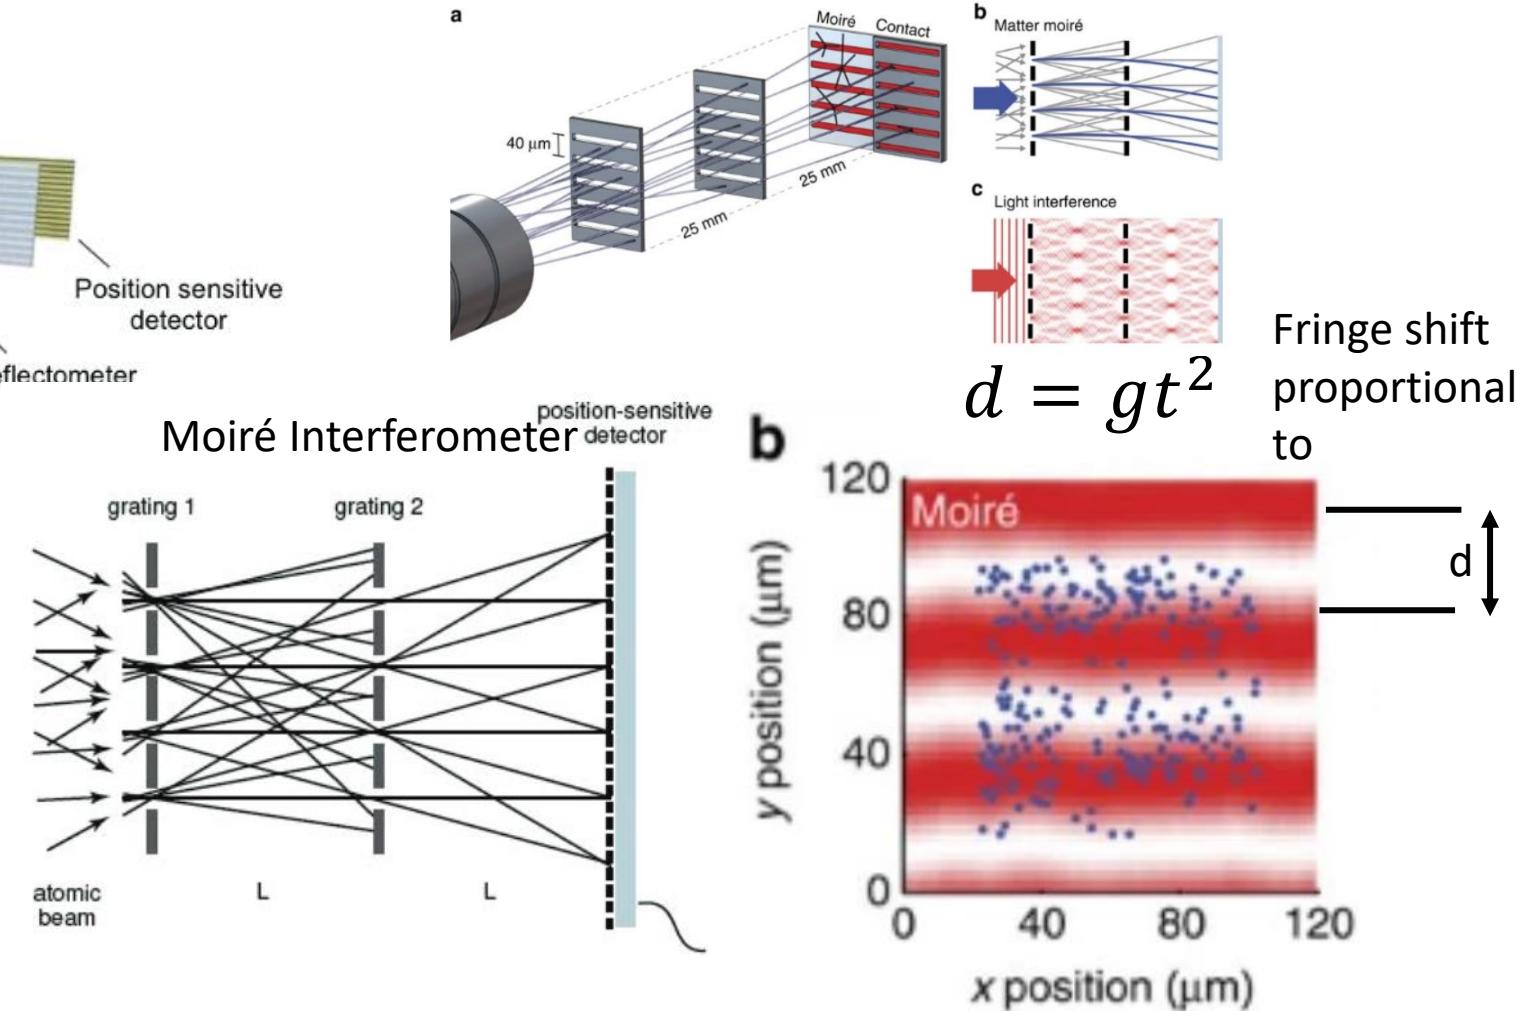

AEGIS

Use beam of \bar{H} for gravity measurement

First used to measure force on antiprotons
 $530 \pm 50 \text{ aN (stat.)} \pm 350 \text{ aN (syst.)}$ in 2014
 Next antihydrogen

100 mK required, 1% accuracy sought

Taking antimatter out of the lab

PUMA

Take 10^9 antiprotons from the antimatter factory to ISOLDE

Some nuclei at the limits of $N>Z$ have a neutron halo where one or more neutrons are found far outside the nucleus.

Others have neutron skins, where the density of neutrons is larger than protons at the nuclear surface – antiproton annihilation study these effects

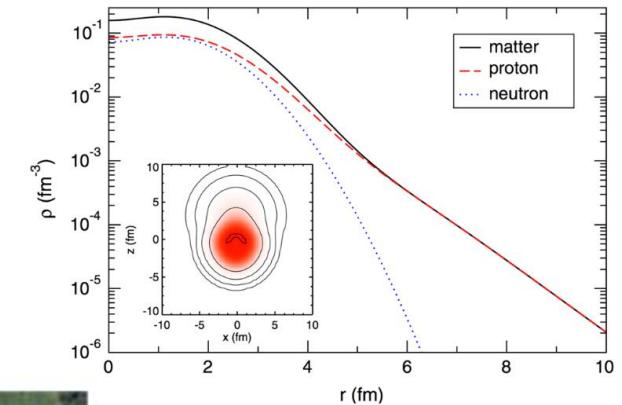

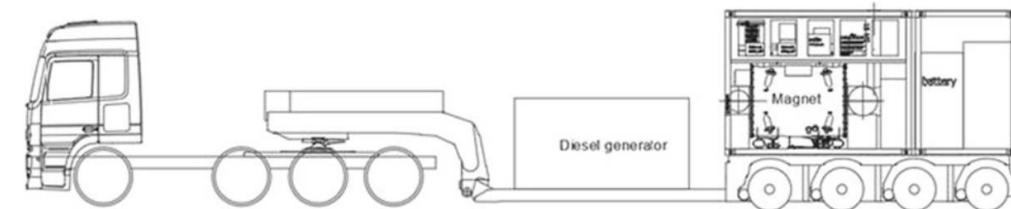

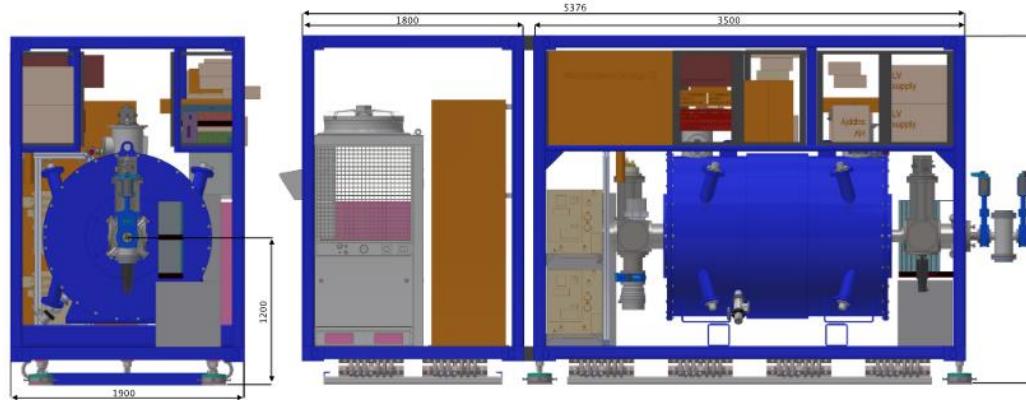

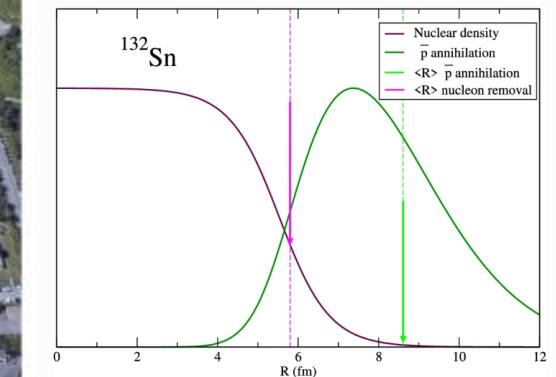

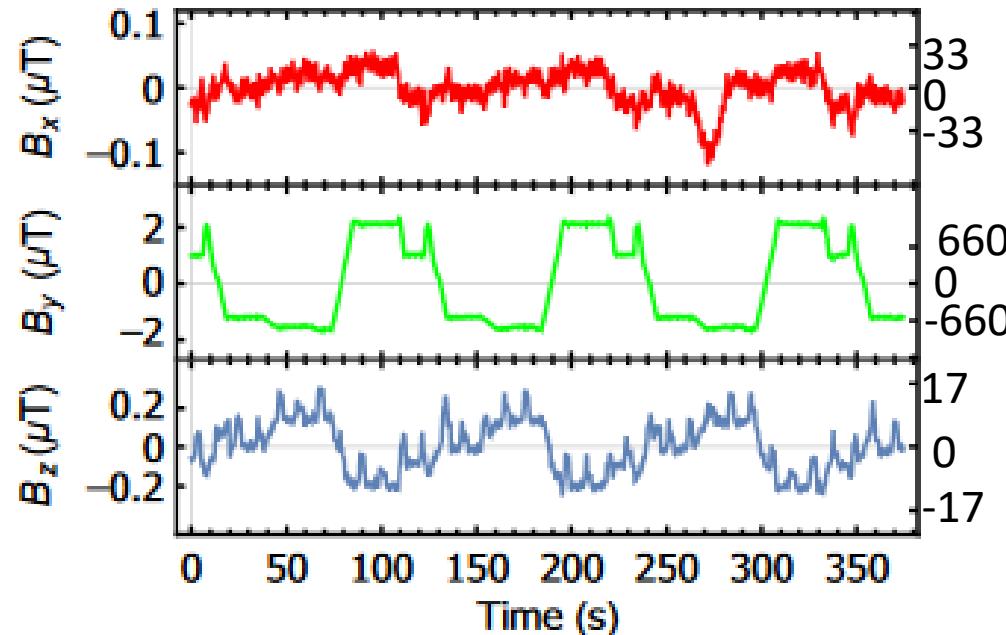

Fig. 6

BASE-STEP

BASE trying to measure frequencies to parts-per-trillion level

Magnetic field fluctuating in the background up to one million times more strongly

Hard to push the limits in this environment

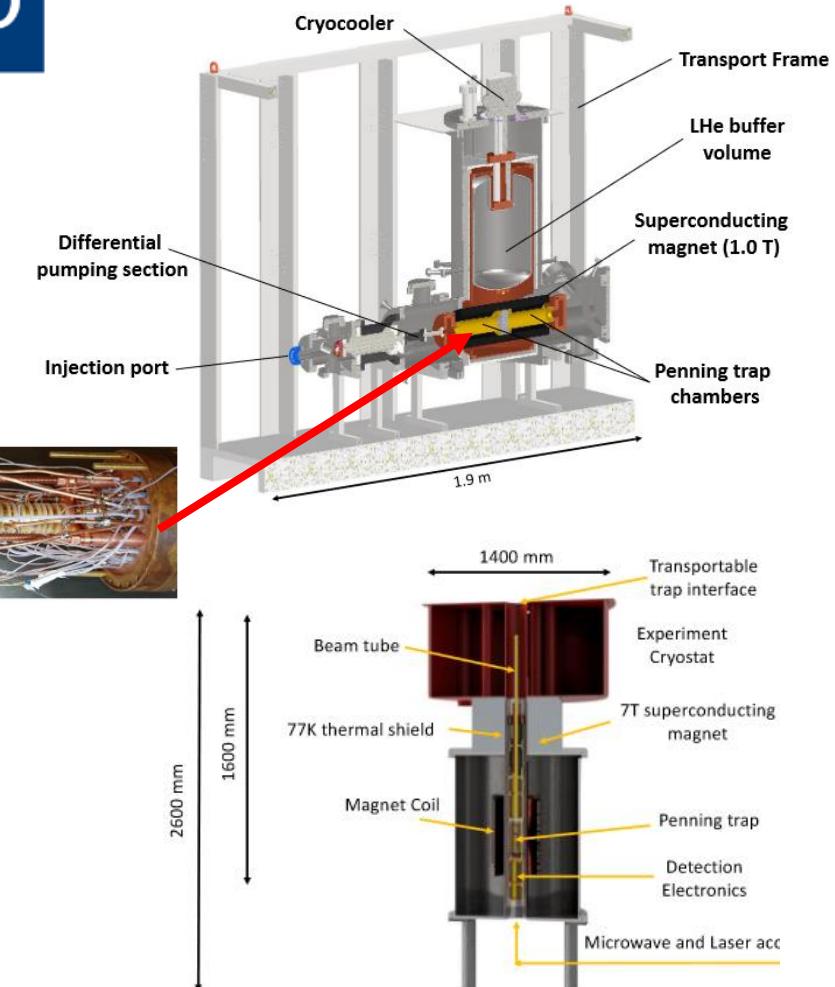

Fractional
magnetic field
fluctuations
(ppb)

Inject into a
separate
magnet in a
quiet lab

Take the antimatter somewhere quiet

Should we be worried?

EXPRESS 

Antimatter bombs: Could antimatter weaponry wipe out all life on Earth? Expert weighs in Wed 21 Jul 2021

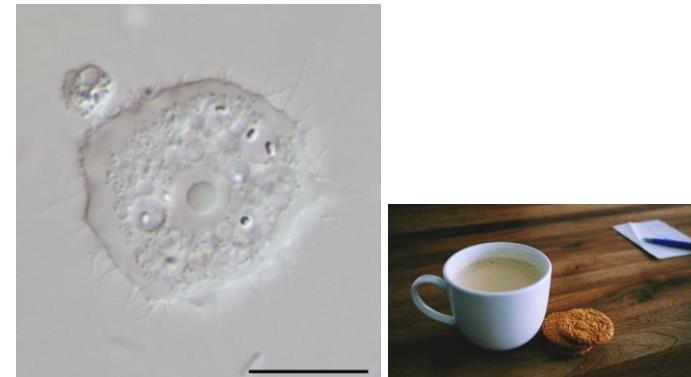

NO!

Professor Robson said: "The idea you can produce masses of antimatter and make a bomb from it or something is not realistic. It's not something anyone needs to worry about."

One billion antiprotons annihilating

$$E = mc^2 = (2 \times 1 \times 10^9 \times 1.6 \times 10^{-27})c^2 = 1 \text{ nJ}$$

1nJ can heat 3 picogram of water from 20->100 °C

About enough to make an espresso for an amoeba

(2015). "An update on *Acanthamoeba* keratitis: diagnosis, pathogenesis and treatment". *Parasite* **22**: 10.

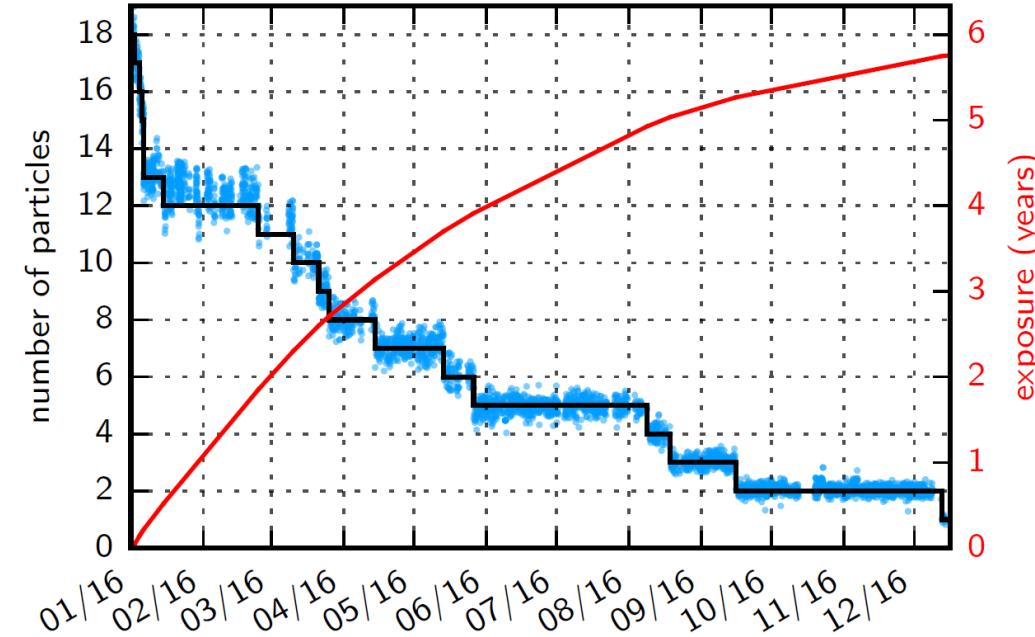

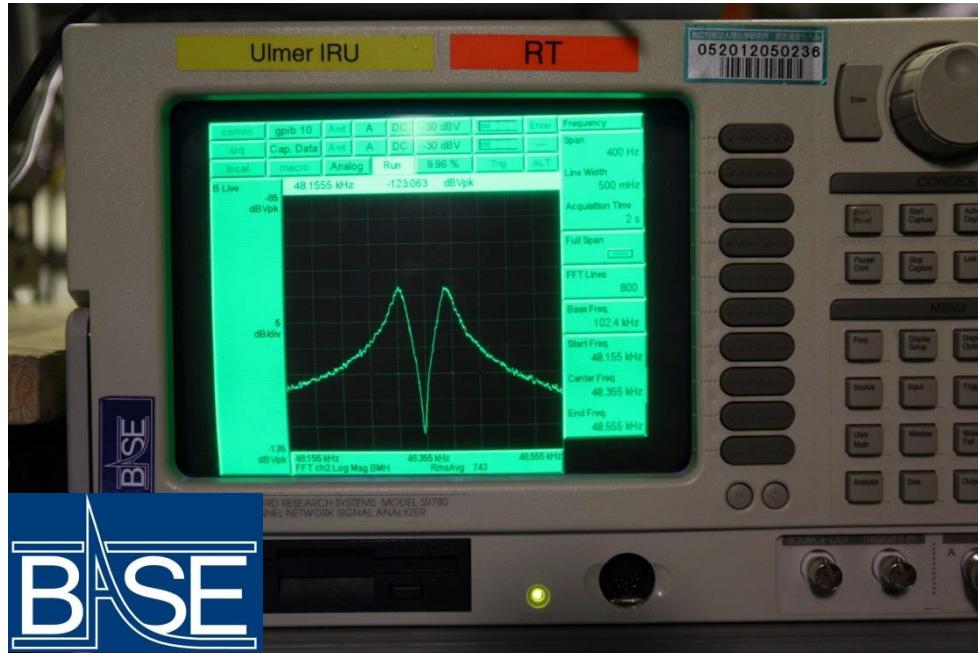

Thank you

Thanks to Stefan Ulmer, Christian Smorra & Andi Mooser for providing slides and materials for these lectures

And thank you for listening

Storing antiprotons

BASE holds record for antiprotons stored from 03.11.2015 – 22.12.2016

- Storage of antiprotons for more than one year: **405.5 days**
- Extraction of single particles by a potential tweezer scheme

Inversion of the baryon asymmetry:

Antibaryon density: $\sim 10^8/\text{cm}^3 \text{ V} < (50 \mu\text{m})^3$
Baryon density: $\sim 1 / \text{cm}^3 \text{ p} < 10^{-16} \text{ Pa}$
