

# TWEPP 2023 Topical Workshop on Electronics for Particle Physics

Oct. 2 – 6, Geremeas, Sardinia

## Design and performance of the front-end electronics of the charged particle detectors of PADME experiment

Simeon Ivanov,  
Sofia University

On behalf of the PADME collaboration

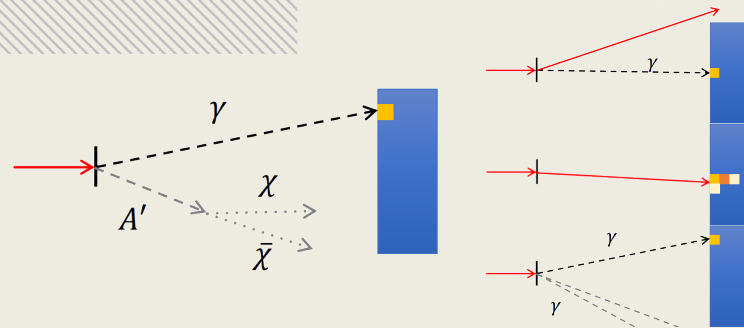

## Search for the Dark Photon

- Hypothesis
  - Dark sector with a vector mediator  $A'$  weakly coupled to SM
  - Wide range of mass and couplings
  - Potentially can explain other physics problems (muon  $g-2$  anomaly,  $^8\text{Be}$  anomaly, etc.)
- Method
  - Missing mass in decays to the dark sector from positron annihilation on a thin target
  - $M^2_{\text{miss}} = (p_{e^+} + p_{e^-} - p_\gamma)^2$
  - Need only to determine initial and final state (**and remove noise**)

## Experiment summary

- Located at LNF, Italy
- LINAC accelerator
  - Beam properties
    - up to 600MeV, tunable
    - <1% energy dispersion
    - 49 bunches/s from 10 to 200 ns
    - up to  $2.5 \times 10^4$   $e^+$ /bunch
- $e^+e^-$  annihilation on optimized thin target
- Signal vs. noise: noise consists mostly from charged particles

## Additional Physics Programme

- X-17 particle
  - Hypothetical heavy invisible particle, decays to  $e^+e^-$  pair
  - Method: number of secondary pairs compared to initial state number
  - Padme detector was easily reconfigurable for this search
- Cross-section observations:
  - 3-way gamma annihilation
  - bremsstrahlung

## The Veto Detectors

- Role:
  - Bremsstrahlung background suppression
  - Registration of visible decays
- Requirements:
  - Momentum resolution: 5MeV or better
  - Time resolution: 1ns or better
- Characteristics
  - Plastic scintillators  $10 \times 10 \times 178 \text{ mm}^3$ , glued-in WLS fiber
  - 96 in  $e^-$  veto, 90 in  $e^+$  veto, 16 in HEP veto
- Readout Electronics
  - **SiPM front-end electronics inside vacuum chamber**
  - Hamamatsu S13360  $3 \times 3 \text{ mm}^2$  25um cells
  - Power supply/analog readout modules

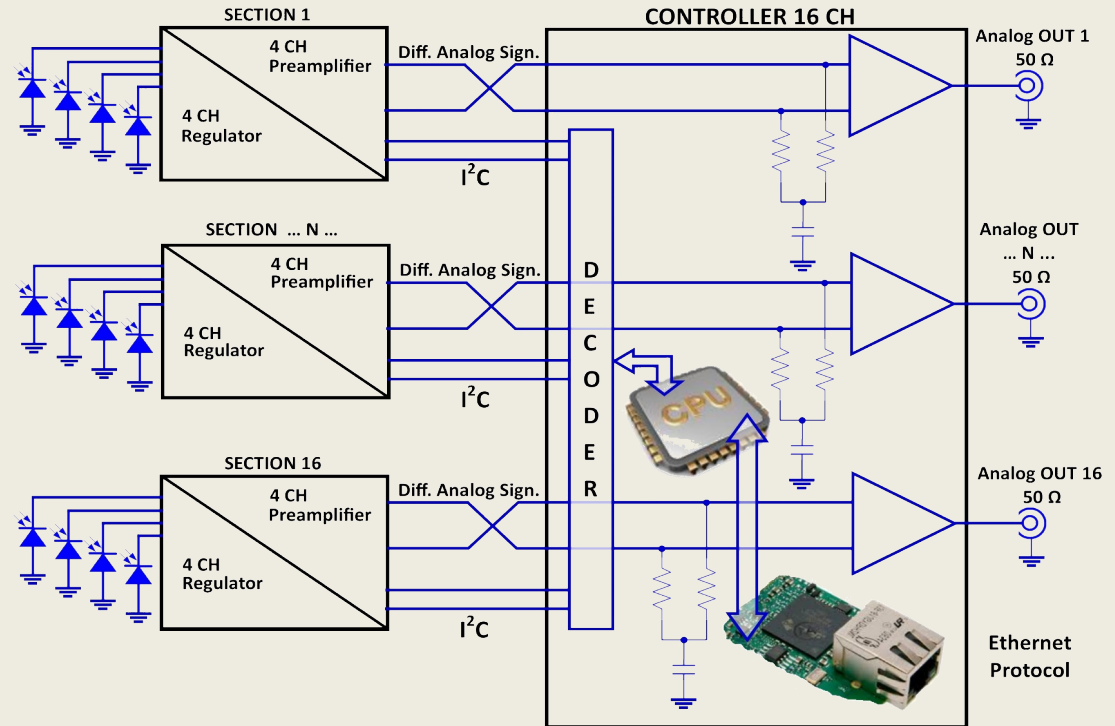

## The veto detectors front-end electronics

### • Requirements

- Fast, ensuring the time resolution, required by the veto detectors
- Low thermal dissipation
- Remotely configurable and controllable

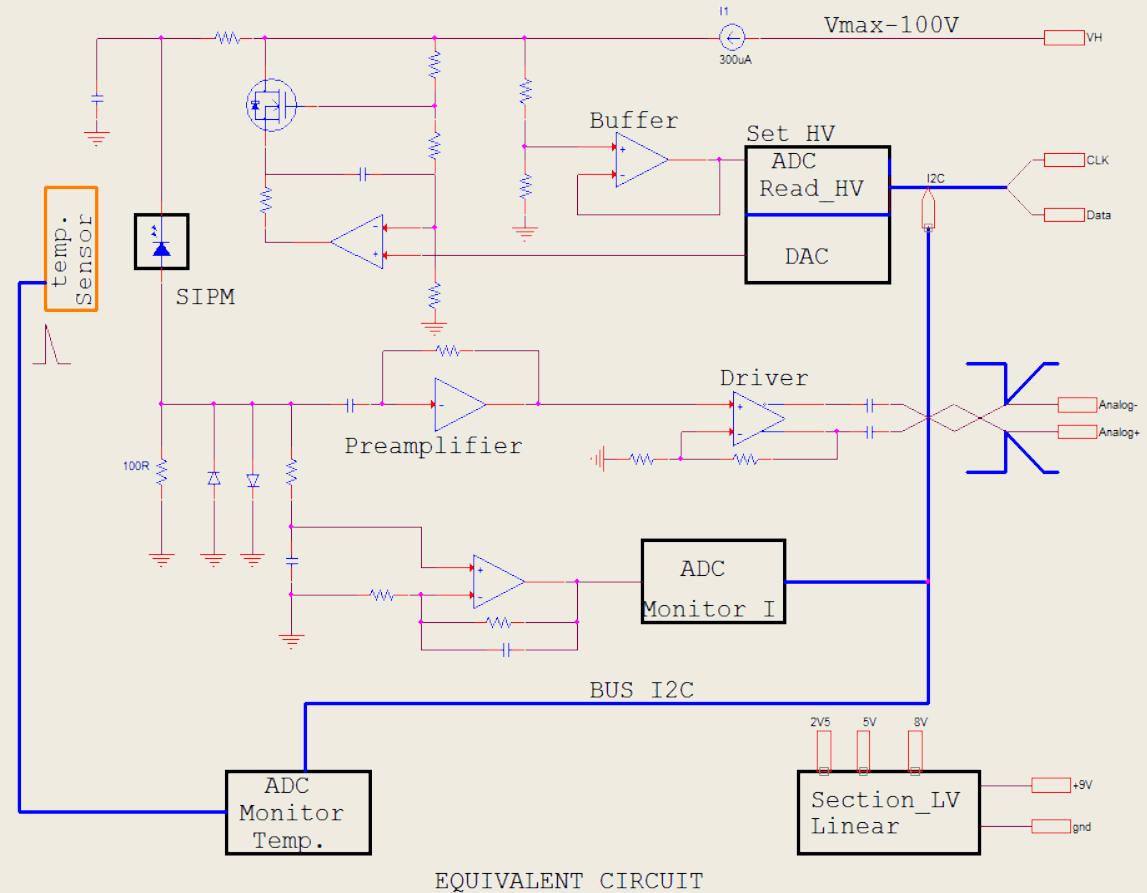

### • General Architecture

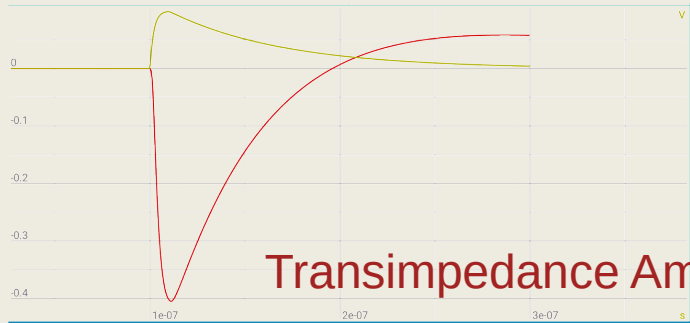

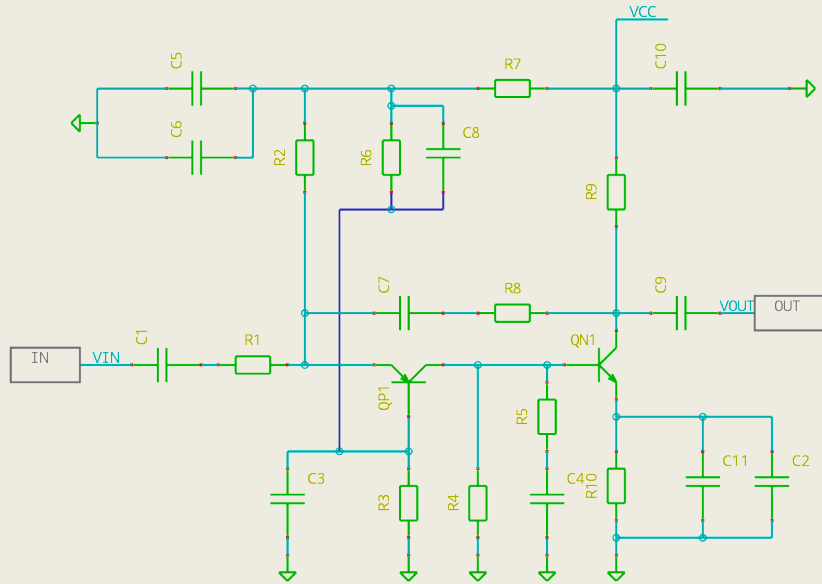

- 4 4-channel pre-amplifier cards operate in vacuum chamber
- Differential analogue signals sent to control unit
- Control of operation using I<sup>2</sup>C
- Telnet/HTTP command interface

## Design Overview

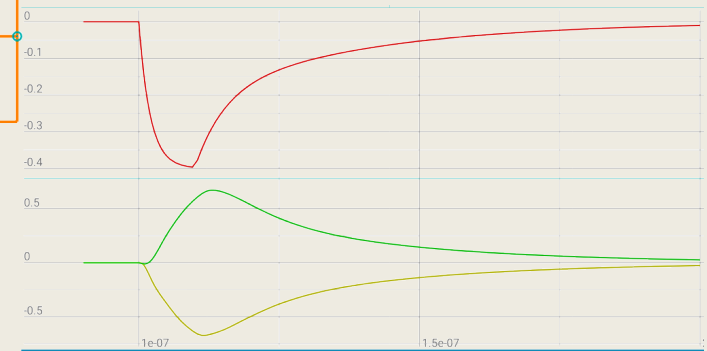

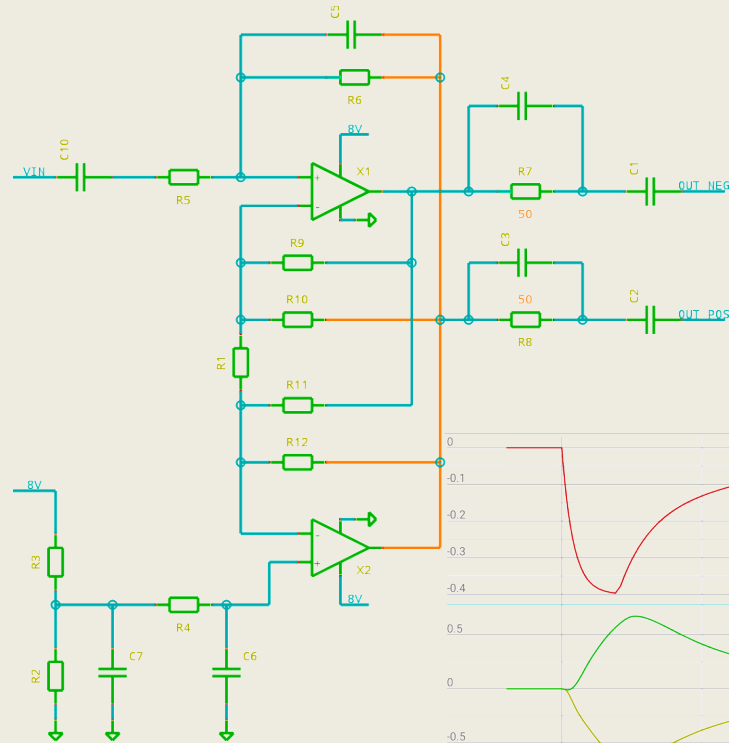

- 4 independent channels per board
- Each channel is composed :
  - Programmable shunt regulator
  - Fixed gain(=4) preamplifier
- Differential 100Ω output analog signal
- Measurement of the current in the detector
- Measurement the temperature of the detectors
- Single supply voltage
- Low power dissipation

**Transimpedance Amplifier**

## Balanced driver

## Performance Overview

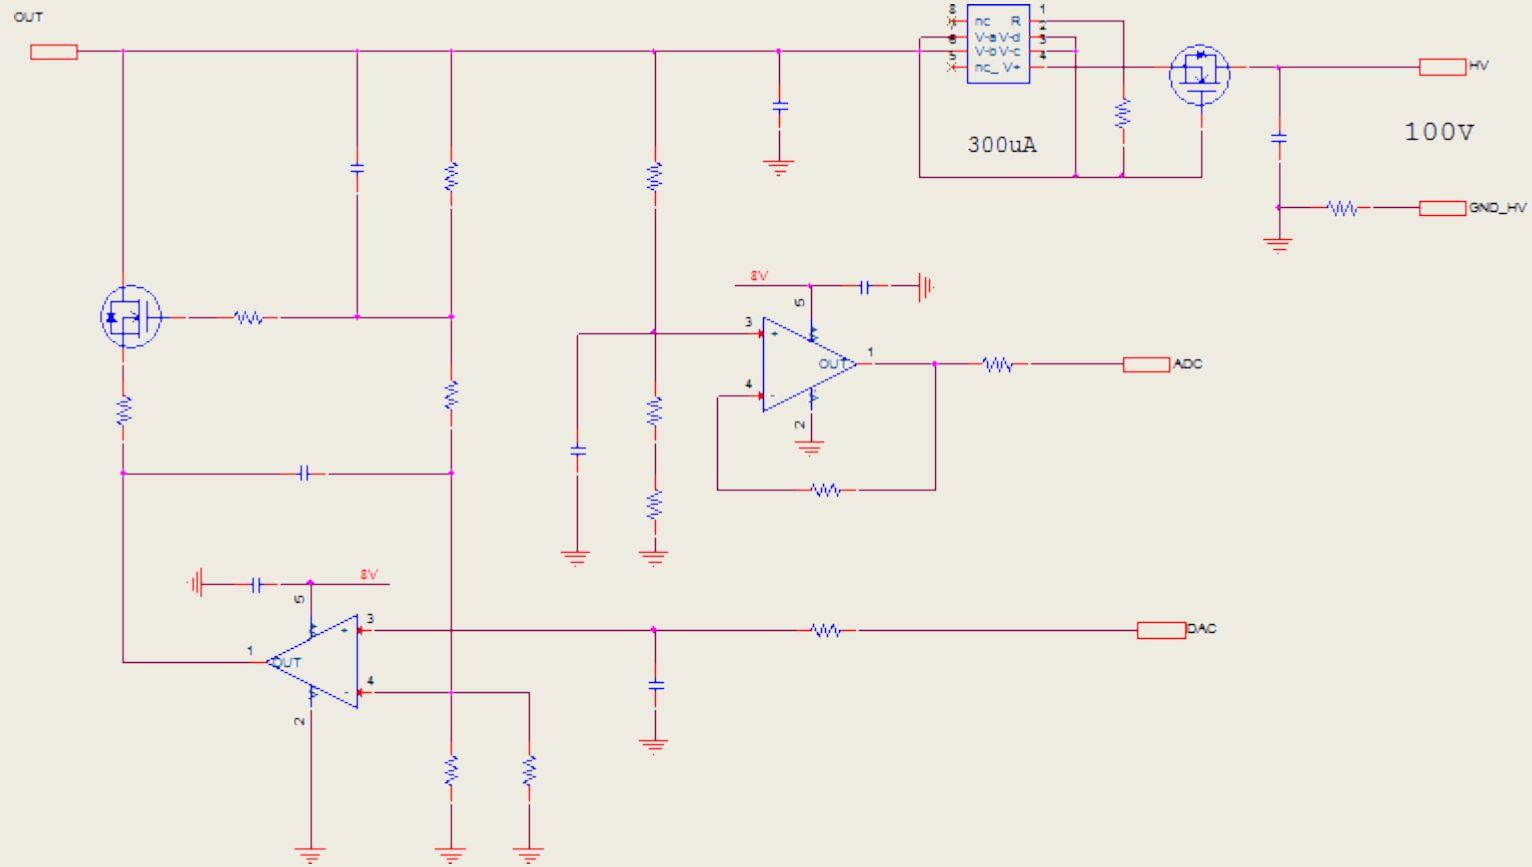

- Fixed Gain = 4
- Differential output at  $100\Omega$
- 70MHz Bandwidth
- Excellent stability with  $C_{in} < 500\text{pF}$
- Repetition rate  $> 1\text{MHz}$
- Pulse resolution: better than 10 ns
- Output signal range = 1V
- Total noise with  $C_{in} 2\text{pF}$  equivalent =  $2\text{nV}/\sqrt{\text{Hz}}$
- Input protection = 300mJ
- Single power supply = 8V
- Dissipated power for channel = 35mW

# Amplitude and Phase Characteristics

# Shunt Linear Regulator

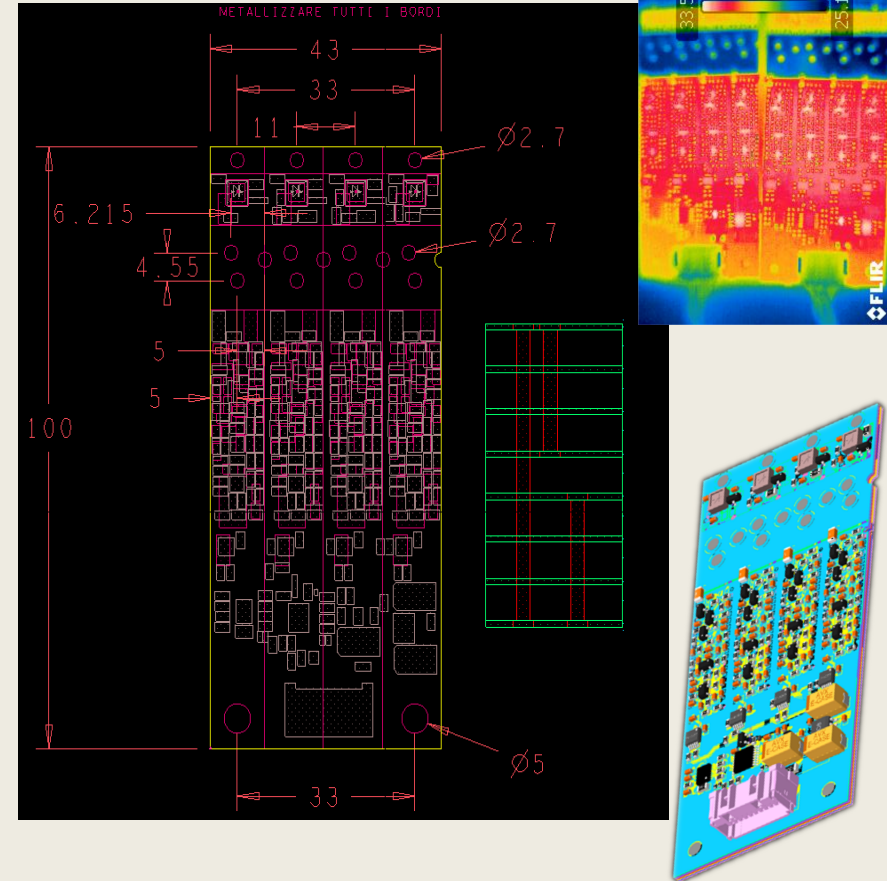

## Linear Regulator Details

- Adjustment range of out voltage:  
0 to 95V
- Accuracy writing and reading voltage:  
16 bit
- Local feedback high stability:  
1/000
- Current protection (adjustable):  
default 300uA
- Thermal stability, theoretical:  
50ppm
- Dissipated power  $V_{in}$  at 100V:  
30mW
- Rejection to the input voltage:  
60dB
- Response load variation:  
100us
- Maximum input voltage:  
200V
- Noise to the maximum load:  
2mVpp
- Control digital I2C - 2wire

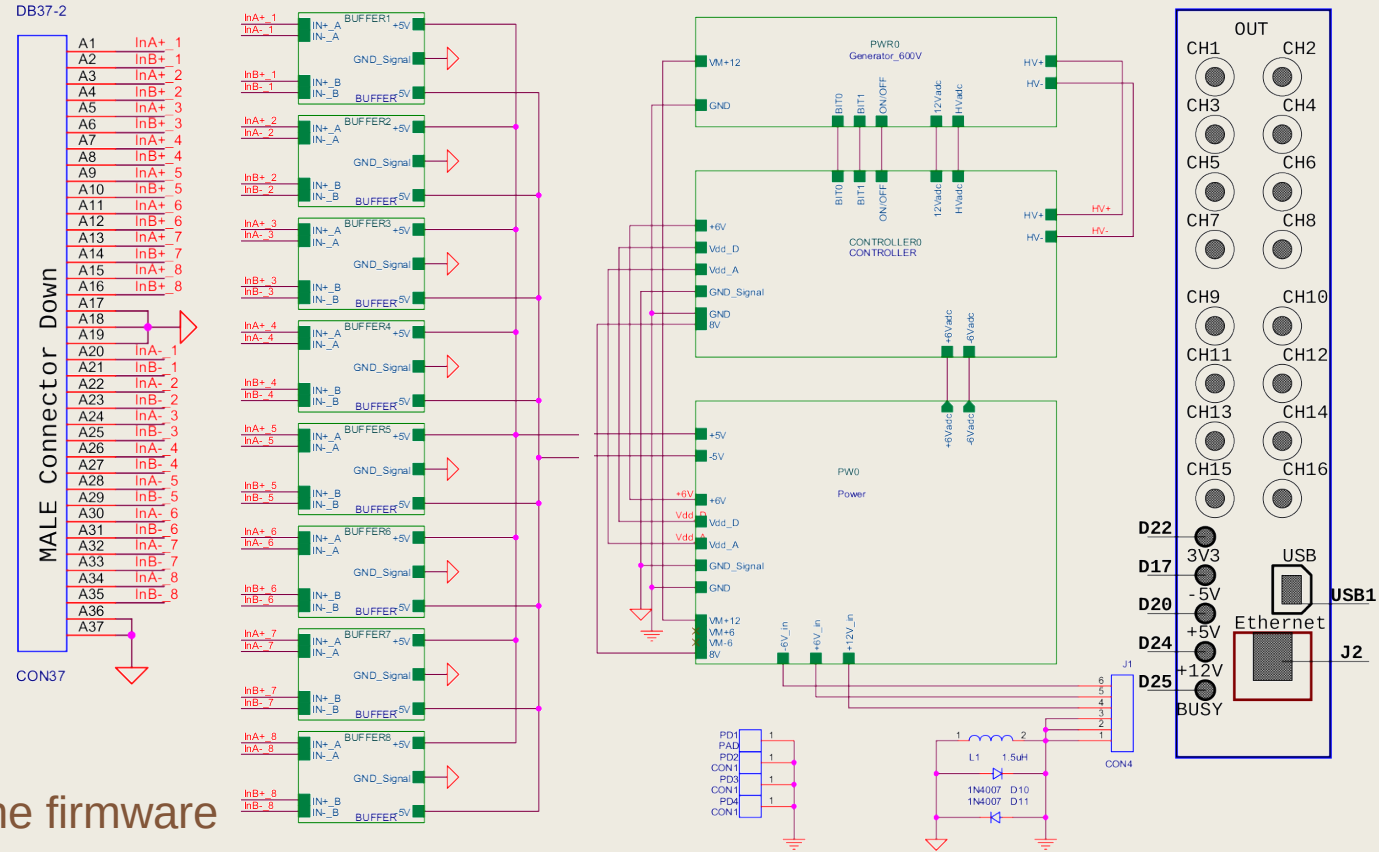

## Multi-layer PCB

- 8 Layer PCB
- Isolated dissipation area to gnd power by means of bridge resistors
- Thermal control through PCB plans (necessary for vacuum operation)
- Theoretical value of the maximum power dissipation, per board with 4 channels online: 400mW

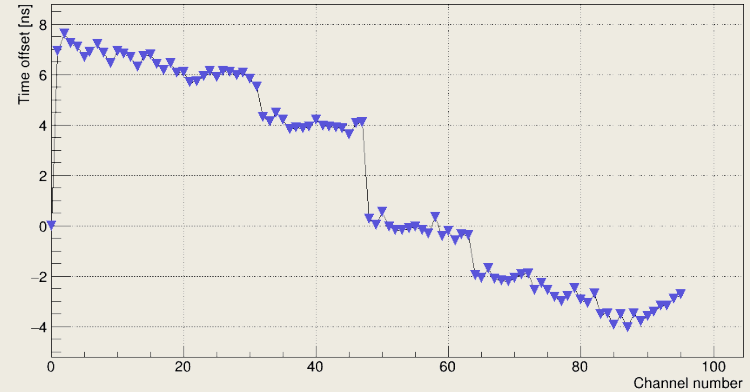

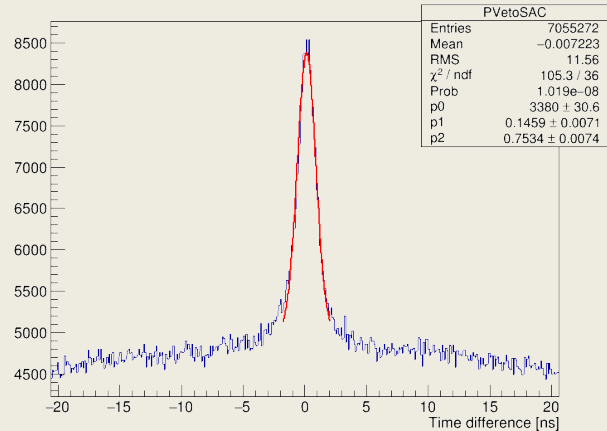

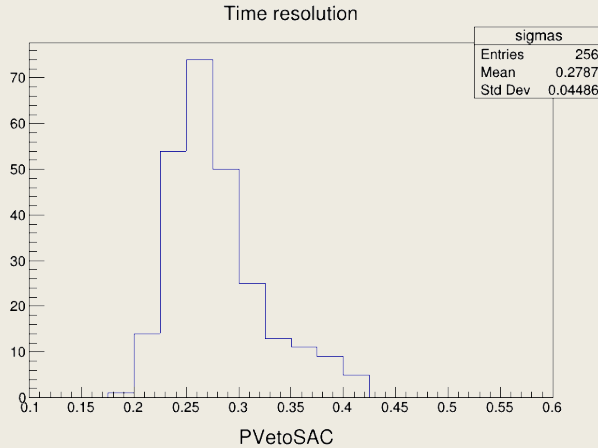

## Design Overview

- Standard Nim realization
- Arm Cortex3 CPU for the control software
- Ethernet port for operation
- Diagnostics USB port
- 16 I2C control lines with peripheral buffers
- Power distribution to the front end
- Integrated primary high voltage generator
- Integrated control panel in the firmware

## Timing Characteristics

- Time resolution between any two SiPM channels:  $\sim 300$  ps
- Time resolution between neighboring scintillators:  $\sim 700$  ps
- Time resolution between veto system and the rest of the detector system (SAC):  $\sim 750$  ps

## Power Dissipation and Thermal Performance in Vacuum

- Power consumption per channel:  $\sim 125\text{mW}$ , for a total of  $12\text{W}$  per veto station (96 channels), 2 veto stations in vacuum
- Only passive cooling used (braided copper wire to mounting)
- Temperatures recorded for extended periods of time show an increase of  $\sim 8$  degrees over ambient temperature in range  $20\text{-}30\text{C}$ , well within the tolerance of all system components

## **FEE electronics developed at LNF**

- Low-power, low-noise, high-speed
- Performs within the experiment design parameters without fancy chips
- Allows fully automated control and management
- Reliable performance in vacuum
- Minor mechanical issues in the prototype versions
