## Lepton Flavor Violation from diphoton effective operators

Friday 12 May 2023 10:10 (30 minutes)

We consider lepton flavor violating transitions mediated by the diphoton effective interaction  $\ell\ell'\gamma\gamma$  and explore which processes can probe it better. Our analysis includes single and double radiative decays,  $\ell \rightarrow \ell'\gamma(\gamma)$ , as well as  $\ell \rightarrow \ell'$  conversions in nuclei for all possible flavor combinations. We find that using the current upper bounds on the rate for  $\ell \rightarrow \ell'\gamma$ , we can derive model-independent upper limits on the rates for  $\ell \rightarrow \ell'\gamma\gamma$ . We conclude that currently, the best limits for the diphoton effective operators provides from the  $\ell \rightarrow \ell'\gamma$  process, while the best future sensitivities are from  $\mu \rightarrow e$  conversion in aluminum and potential  $\tau \rightarrow \ell\gamma(\gamma)$  searches at Belle II or a Super Tau Charm Facility.
