# GW spectrum

Reminder:

$$f_h(t, k) \equiv \frac{\text{Number of gravitons with momentum } k \text{ in } d^3k \text{ interval}}{V d^3k / (2\pi)^3},$$

$$\frac{d}{dt} \rho_{\text{gw}}(t, k) = 2k \dot{f}_h(t, k) \frac{d^3k}{(2\pi)^3}$$

In expanding universe:

$$(\partial_t + 4H)\rho_{\text{gw}}(t) = \int \frac{d^3k}{(2\pi)^3} R(t, k), \quad R(t, k) \equiv 2k \dot{f}_h(t, k)$$

We can integrate this by using  $\dot{s} + 3Hs = 0$ :

$$\frac{\rho_{\text{gw}}(t_1)}{s^{4/3}(t_1)} - \frac{\rho_{\text{gw}}(t_0)}{s^{4/3}(t_0)} = \int_{t_0}^{t_1} dt \frac{1}{s^{4/3}(t)} \int \frac{d^3k}{(2\pi)^3} R(T(t), k)$$

Use to convert to temperature integral:

$$\frac{dT}{dt} = -\sqrt{\frac{4\pi^3}{45}} g_{*\rho}(T)^{\frac{1}{2}} \frac{g_{*s}(T)}{g_{*c}(T)} \frac{T^3}{m_p}$$

# Inflationary bound on $T_{\max}$

From CMB observations:

$$\rho_{\text{inf}} < (1.6 \times 10^{16} \text{ GeV})^4$$

And with

$$\rho_{\text{inf}} = \frac{\pi^2}{30} g_{*\rho}(T_{\max}) T_{\max}^4$$

$$T_{\max} < 6.6 \times 10^{15} \text{ GeV} \left[ \frac{106.75}{g_{*\rho}(T_{\max})} \right]^{\frac{1}{4}}$$

# Stochastic GWs: dark radiation constraints

$$h_0^2 \Omega_{\text{gw}}(f_{\text{peak}}) \leq 1.68 \times 10^{-6} \left( \frac{\Delta N_{\text{eff}}}{0.3} \right)$$
