Model independent Odderon results

based on new TOTEM data at 8 TeV

Outline

Statistically Significant Observations of Odderon in 2021

Model independent (Hungarian-Swedish Collaboration):
Significance ≥ 6.26 σ : *EPJC (2021) 81:180*

Model dependent (Hungarian-Polish Collaboration):
Significance ≥ 7.08 σ :
EPJC (2021) 81:611 and EPJC (2022) 82:827

Partially model independent (D0-TOTEM Collaboration):
Significance ≥ 5.2 σ : *PRL (2021) 127, 062003*

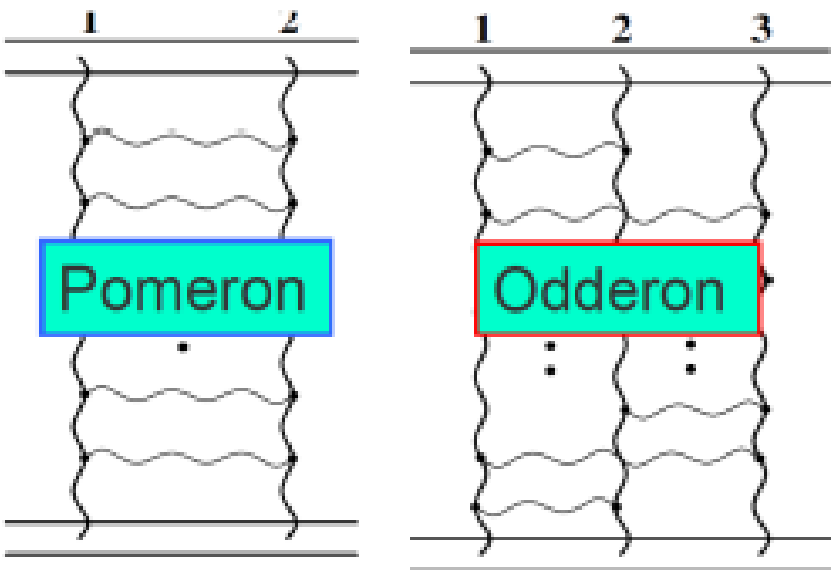
New in 2022:
TOTEM data at 8 TeV published

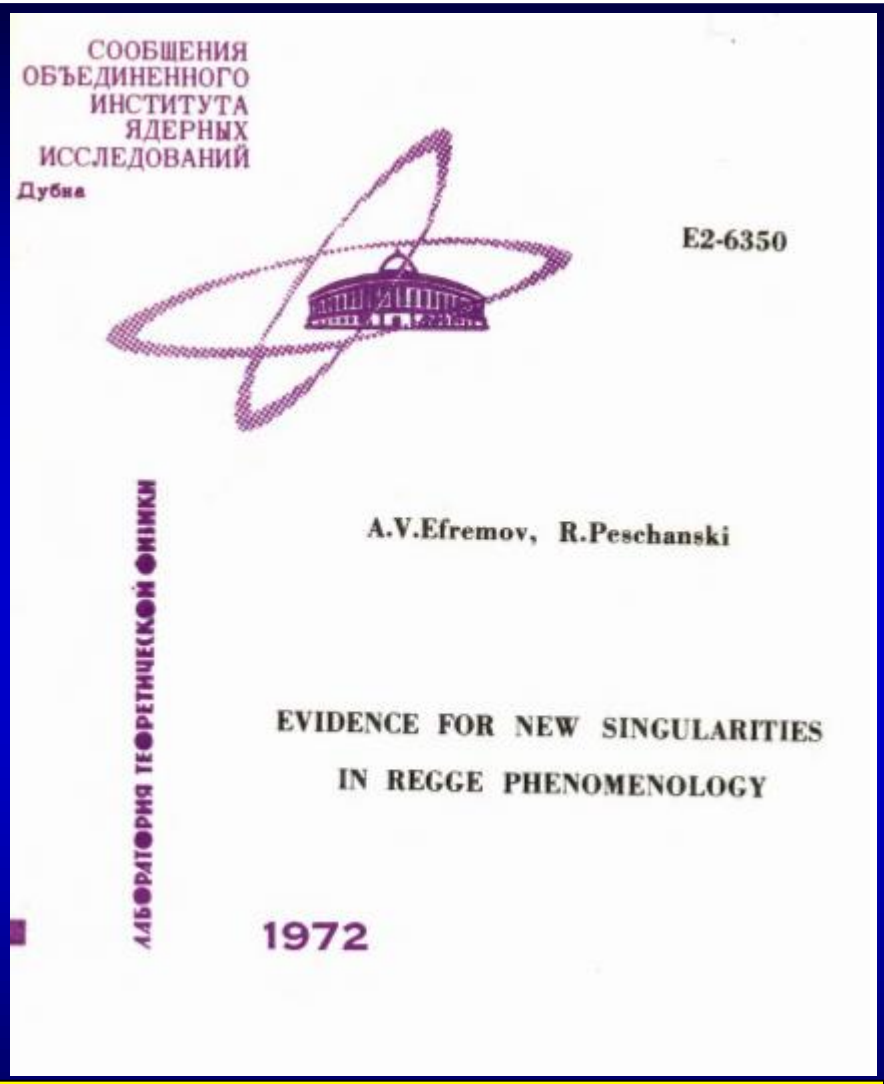
Motivation: Einstein said something like: „Even infinite number of experiments can not prove that you are right, but one experiment is enough to prove that you are wrong"

Odderon: 48 years old scientific puzzle

Odderon: L. Lukaszuk, B. Nicolescu, Lett. Nuovo Cim. 8, 405 (1973)
Received: **31 July 1973**

Odderon is an odd component of elastic scattering:
Changes sign for crossing

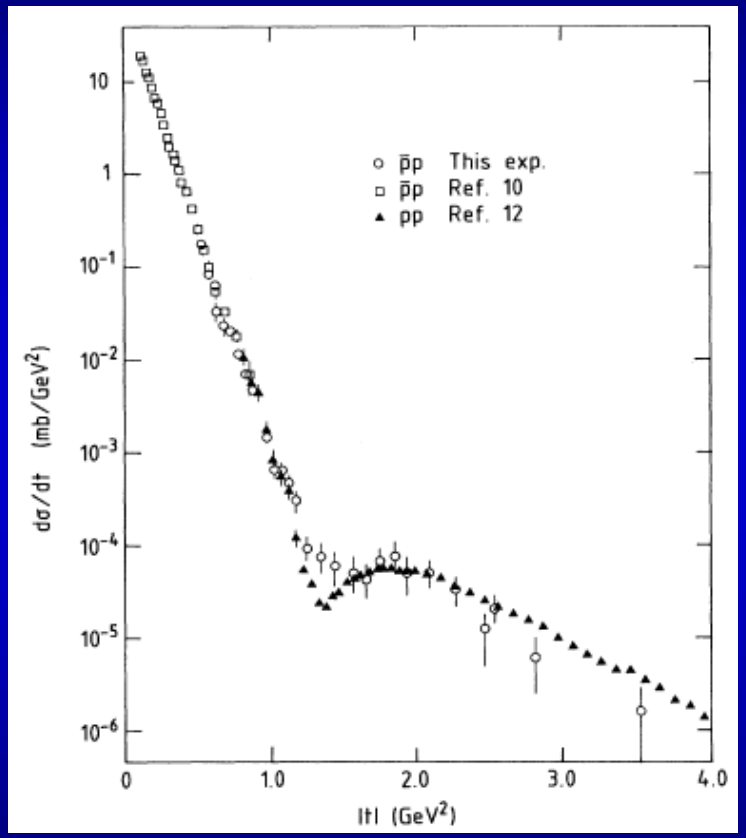


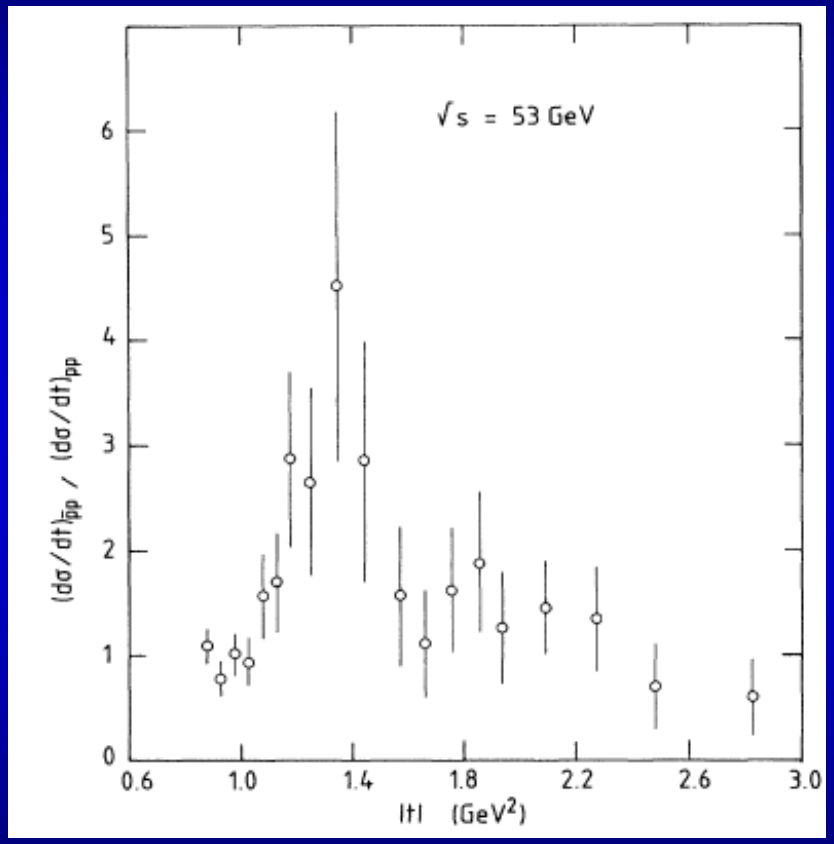


Odderon name coined: D. Joynson, E. Leader, B. Nicolescu, C. Lopez, Nuovo Cim. 30A, 345 (1975) - Well established in QCD by now !
Honorable mention: A. V. Efremov, R. Peschanski, JINR-E2-6350 (1972)

Odderon: elusive experimentally

Odderon search at ISR: indication but no conclusive result
Breakstone et al, Phys. Rev. Lett. 54, 2180 (**1985**): CL = 99.9 %





Indication of Odderon
CL = 99.9 %,
Significance: 3.35 σ

2021 observations of Odderon with > 5 σ

Evidence of Odderon-exchange from scaling properties of elastic scattering at TeV energies #5

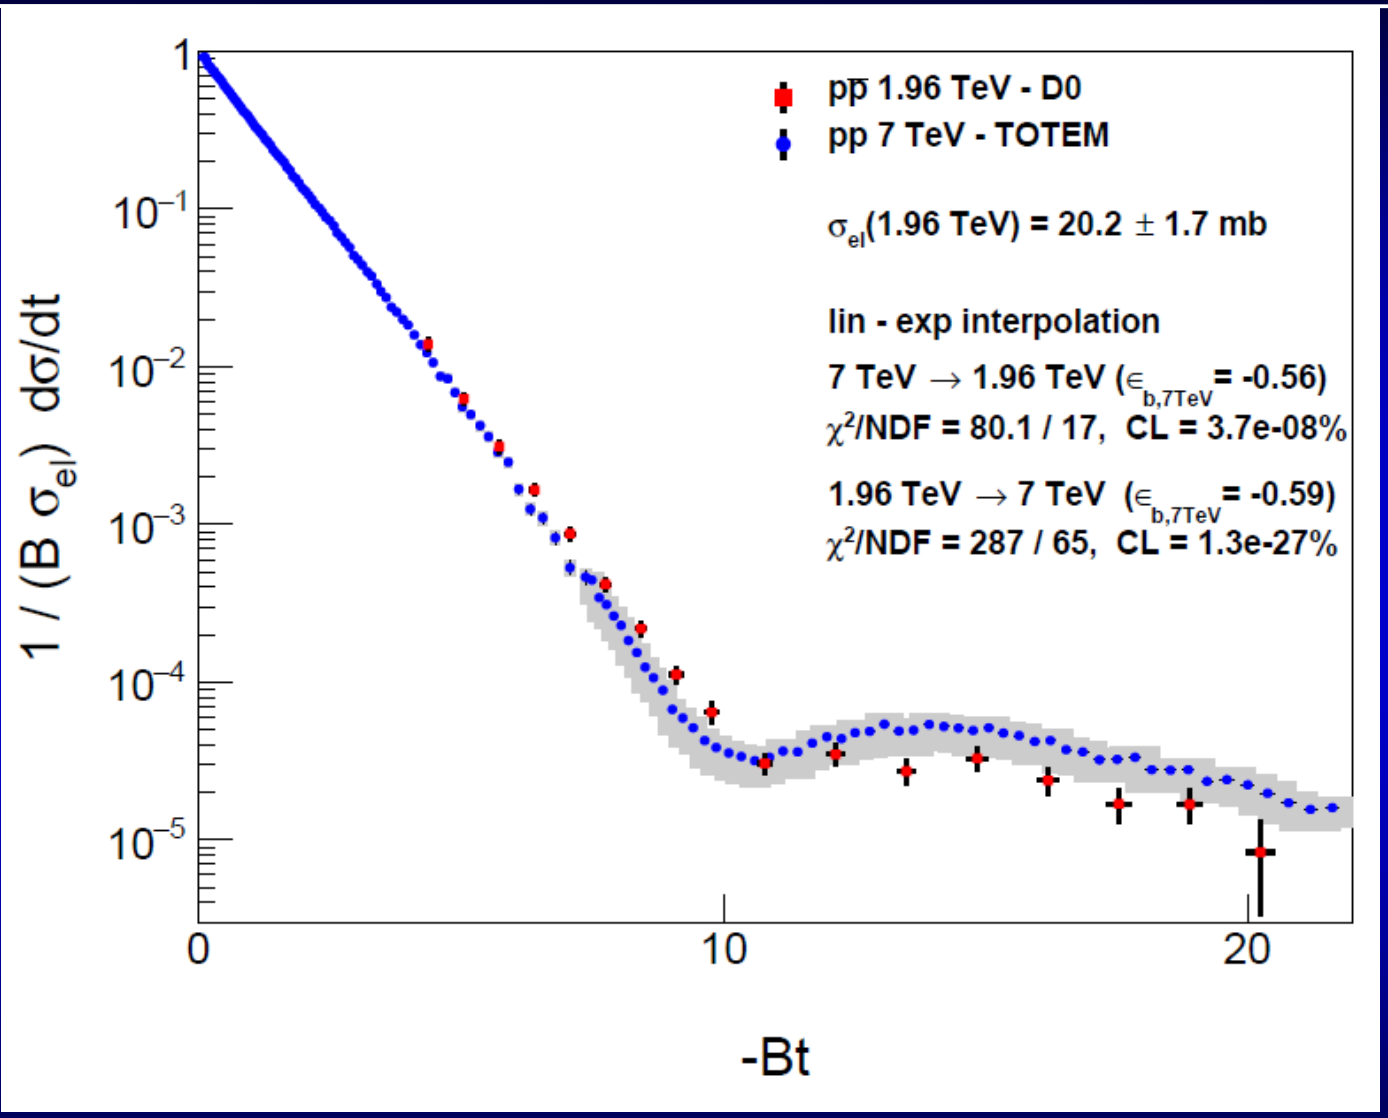
Back to Scaling: Model independently



H(x|pp)
s-independent:
2.76 – 7(8) TeV

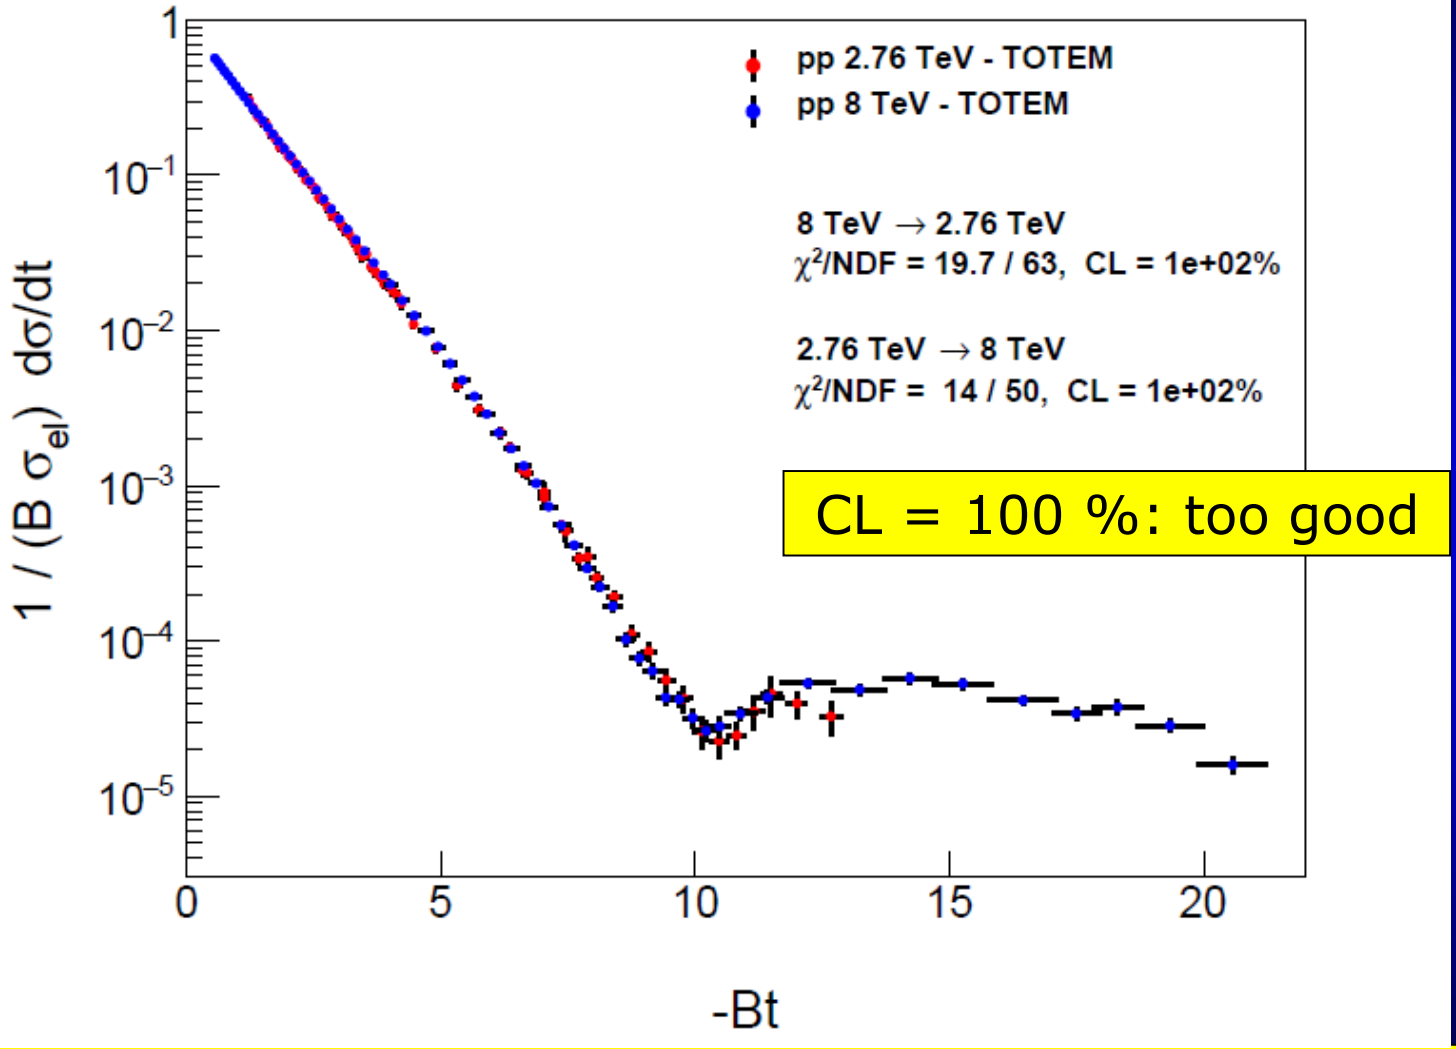
H(x|pp, 7 TeV)
≠
H(x|pbarp, 1.96)

Odderon,
IF scaling holds
in pp down to
1.96 TeV
Domain of validity:
ReBB model
dependent

6.26 σ
Odderon effect

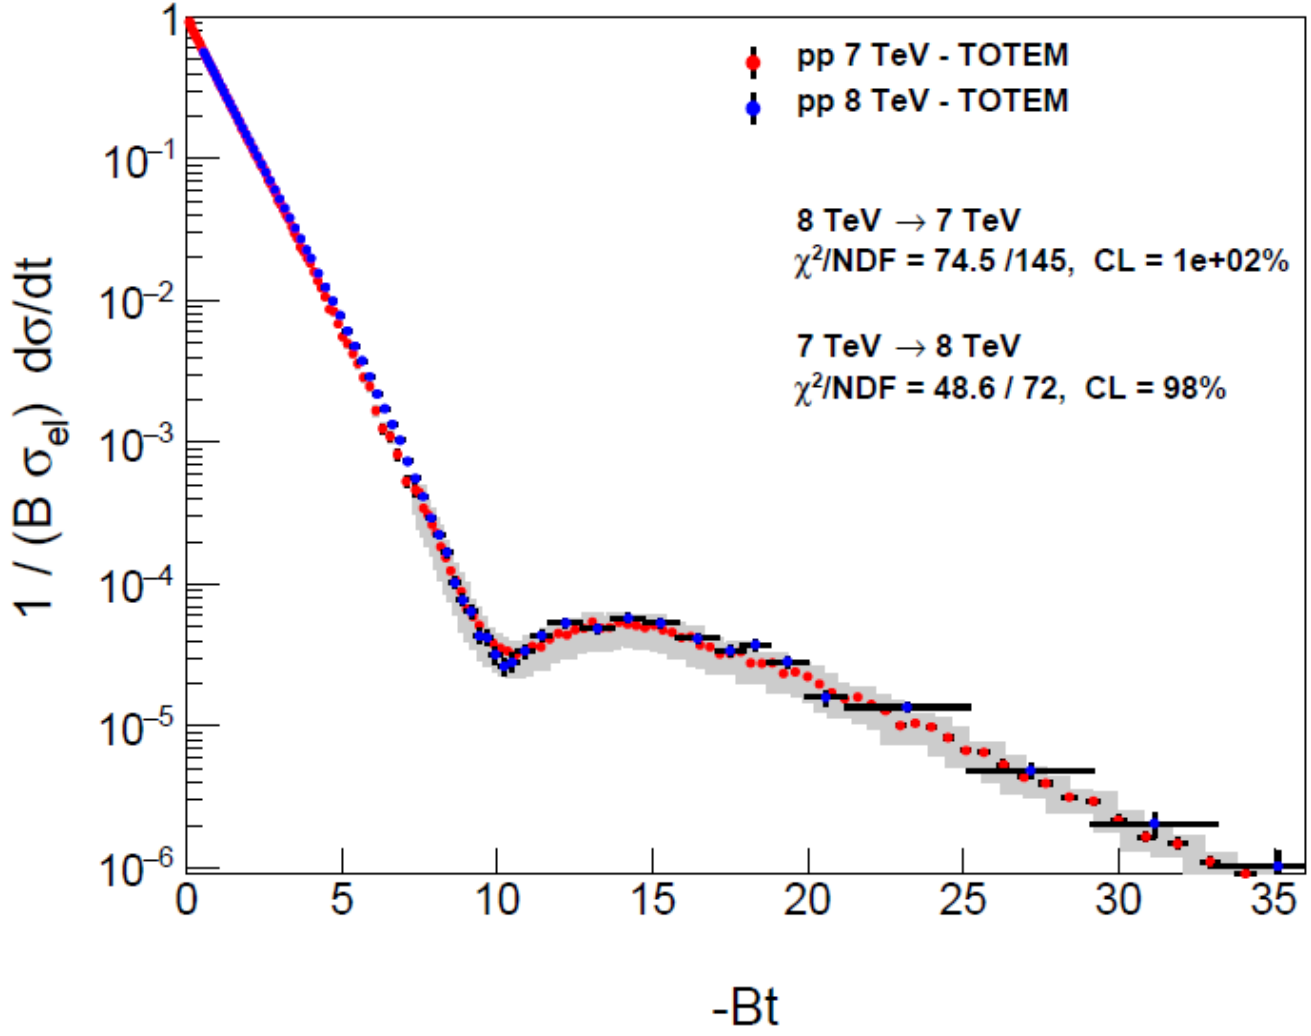
Energy range: tested **both** model independently and with modelling.
Modelling is useful, but model independent tests more important!

H(x) scaling of 2.76 and 8 TeV data



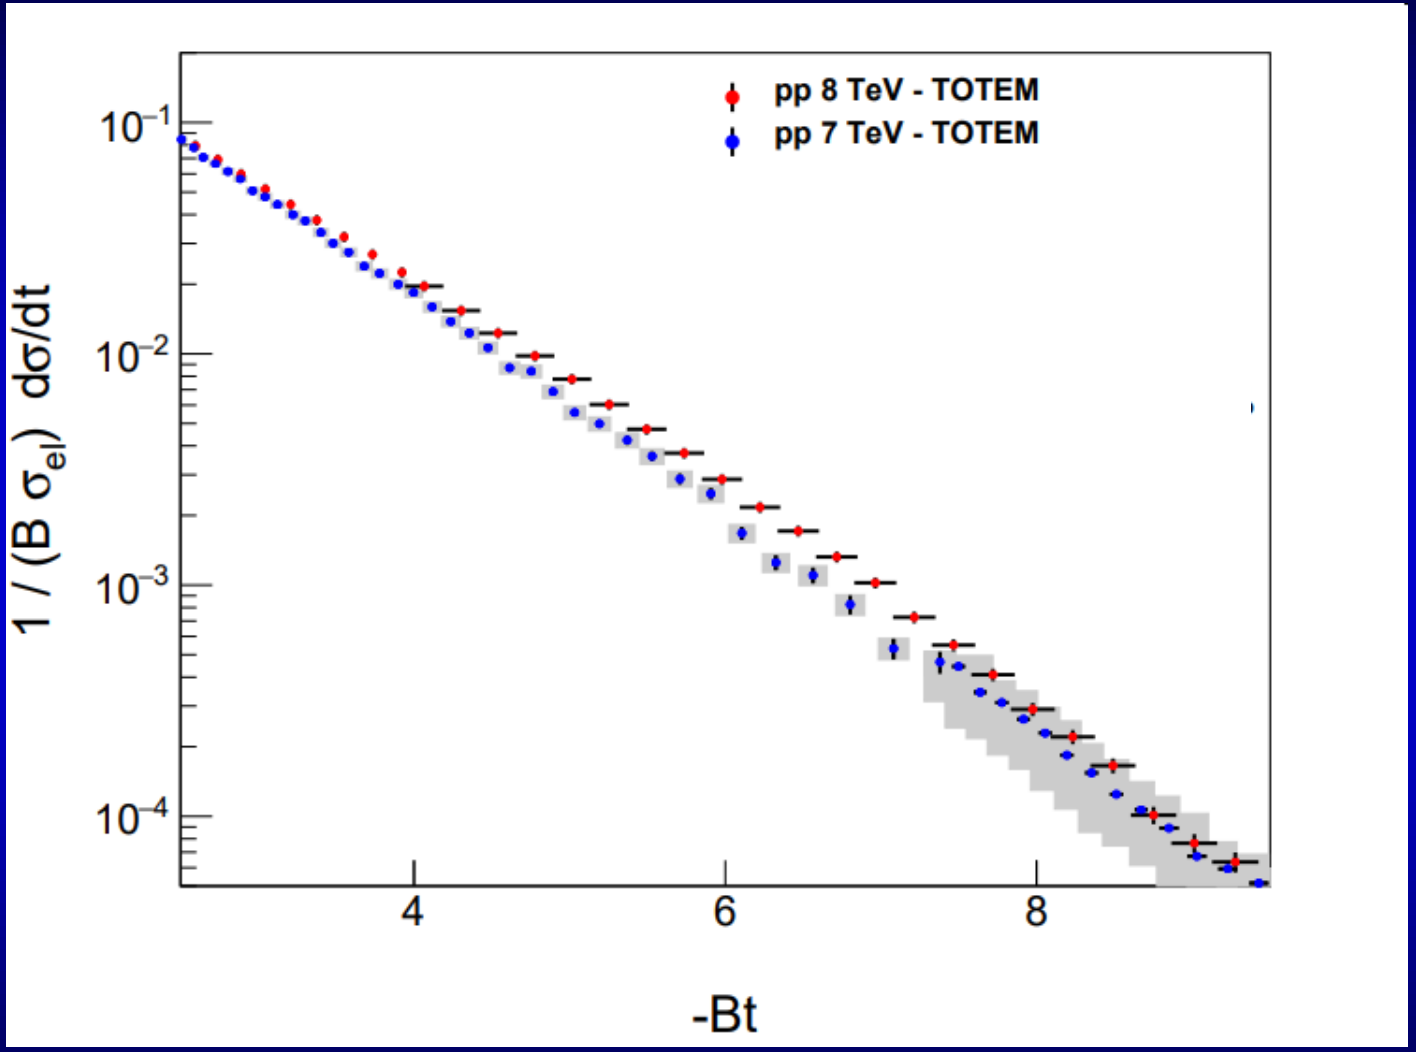
Energy range: H(x) scaling valid between √s= 8 and 2.76 TeV.
Uses final, published TOTEM dσ/dt data at 8 TeV

H(x) scaling of 7 and 8 TeV data



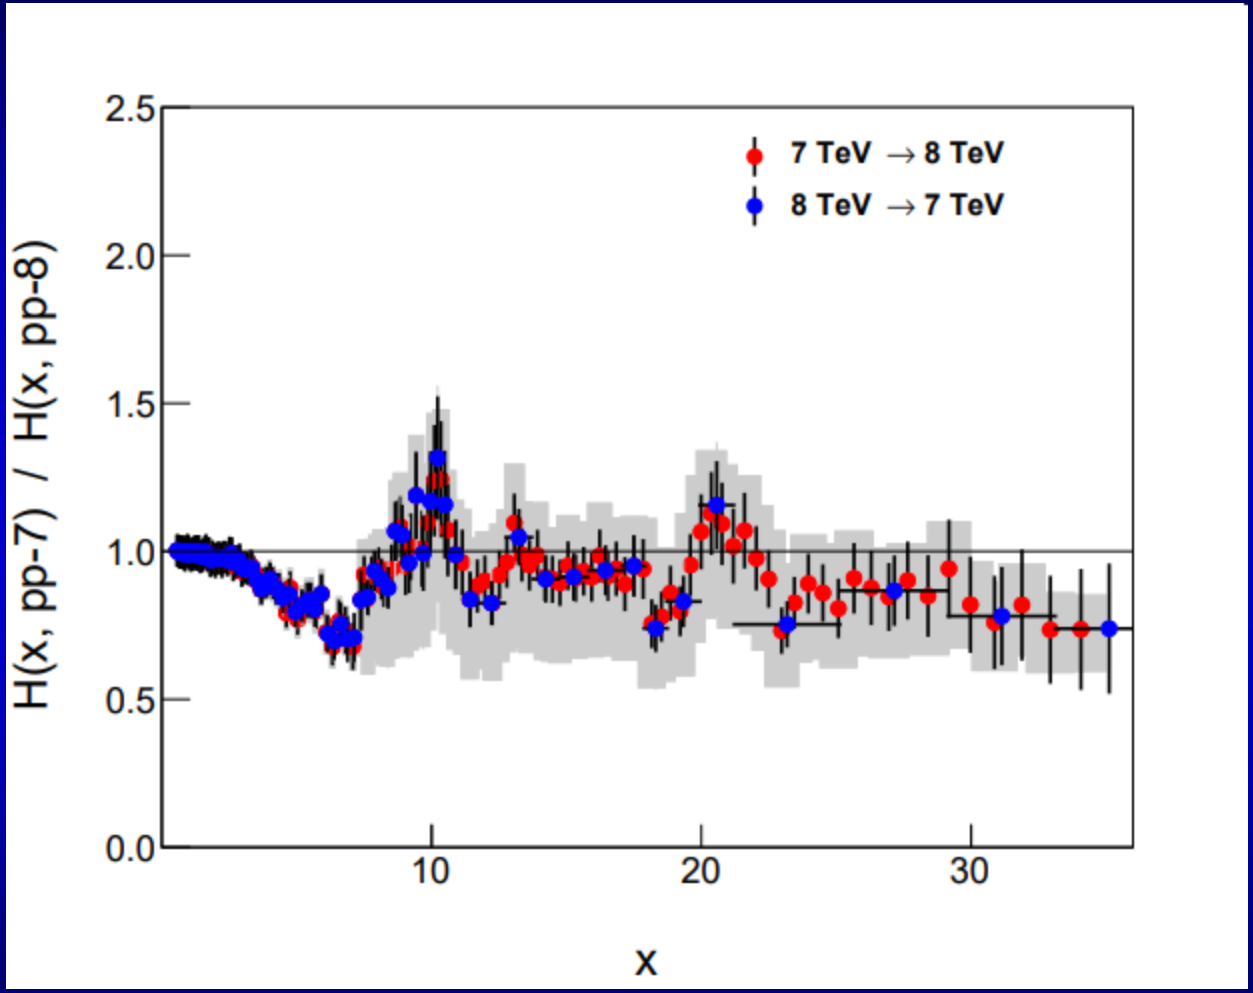
Energy range: H(x) scaling model independently up to √s= 8 TeV.
Uses final, published TOTEM dσ/dt data at 8 TeV

H(x) scaling of 7 and 8 TeV data



Closer look: systematic effects beyond the reported errors at dateset1 of 7 TeV (regarding type A and B ones, Type_C cancels)

H(x) scaling of 7 and 8 TeV data



Closer look: systematic effects beyond the reported errors at dataset1 of 7 TeV (regarding all types of errors, type_C cancels)

H(x) scaling of 7 and 8 TeV data

This is a first direct observation of systematics in the 7 TeV low –t dataset beyond the reported errors.

Such problems were also seen in many earlier data analyses, but the problems were always attributed to the insufficiency of the methods applied in the analyses. A few examples:

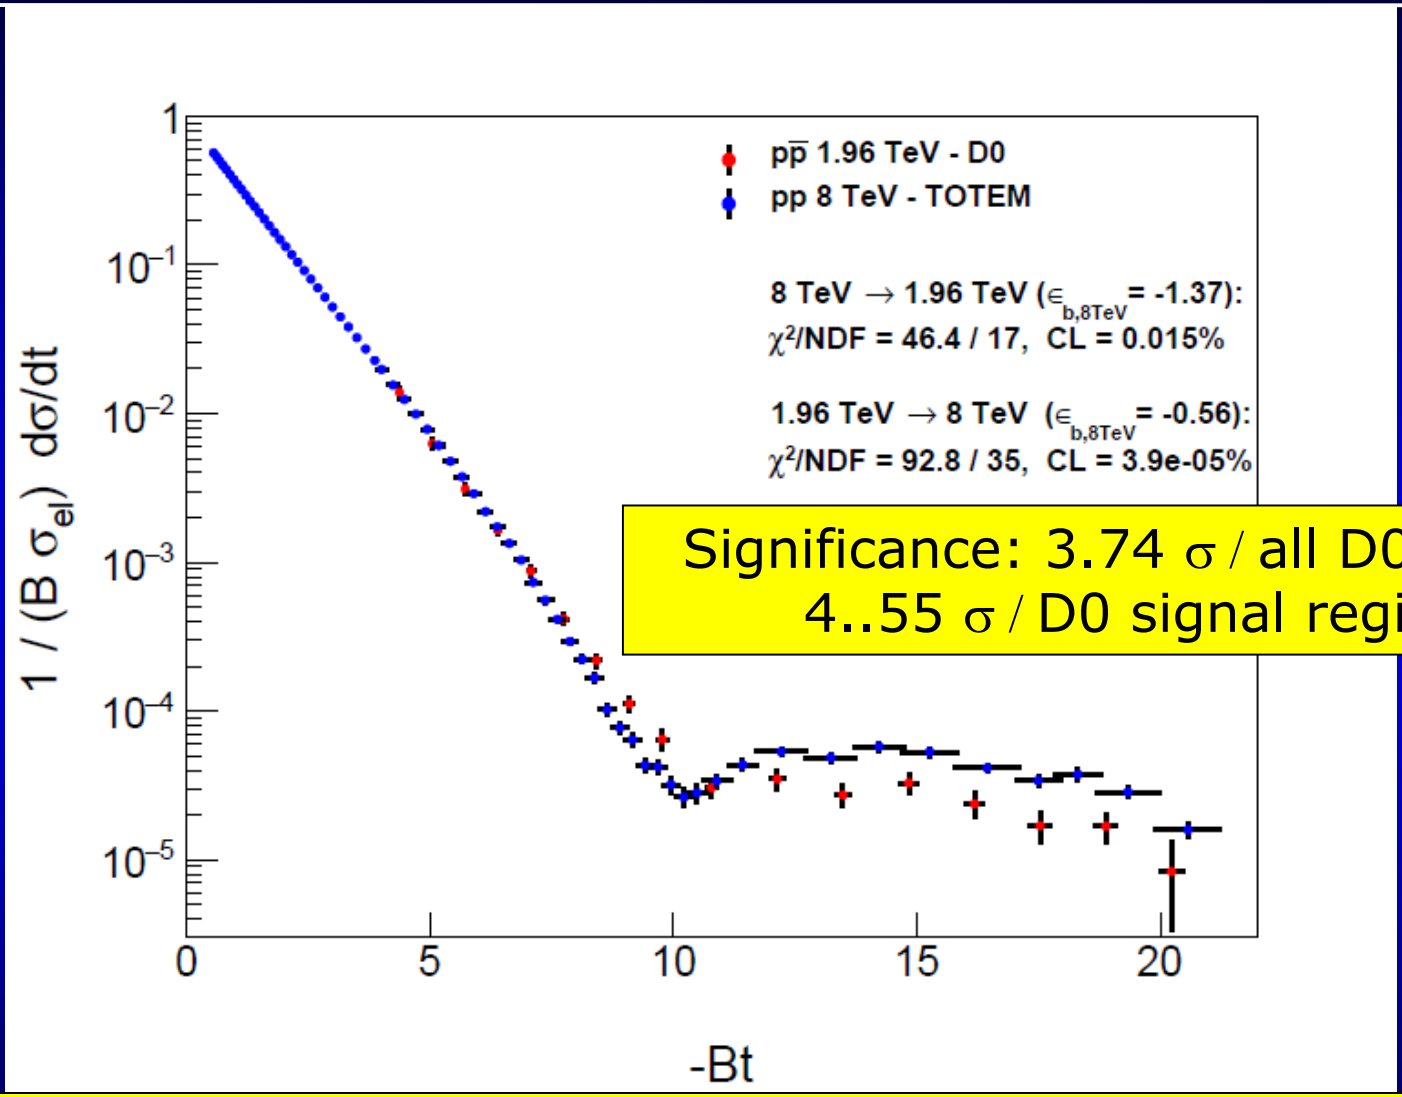
- In tthis presentation: Model independent analysy

- Fagundes et al.,: Phys. Rev. D88, 094019

- Ster, Jenkovszzky and Csörgő. Phys. Rev. D91, 074018; also presented in Bad Honnef at WE Heraeus Physics Scholl, 2015:

„Extracting the Odderon from pp and $p\bar{p}$ scattering data”

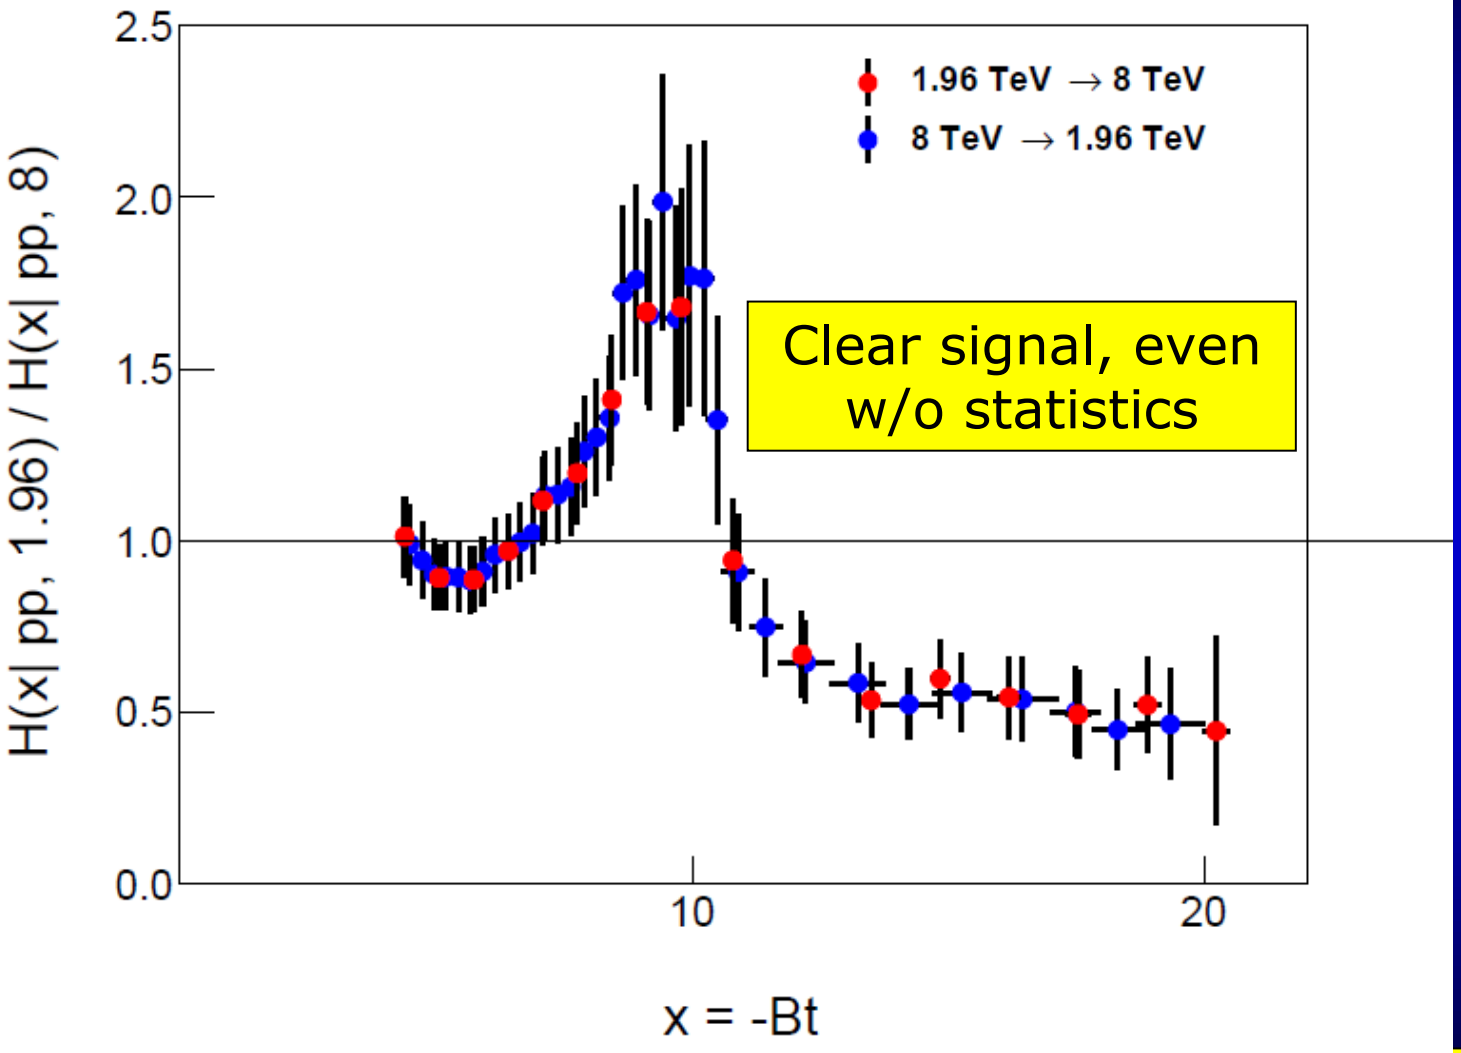
H(x): Odderon signal, new 8 TeV data



Significance: 3.74 σ / all D0 points
4..55 σ / D0 signal region

H(x) scaling is violated between $\sqrt{s}$= 8 TeV pp and 1.96 TeV pbarp. Hungarian-Swedish Odderon signal confirmed with final, published TOTEM dσ/dt data at 8 TeV. Model independently.

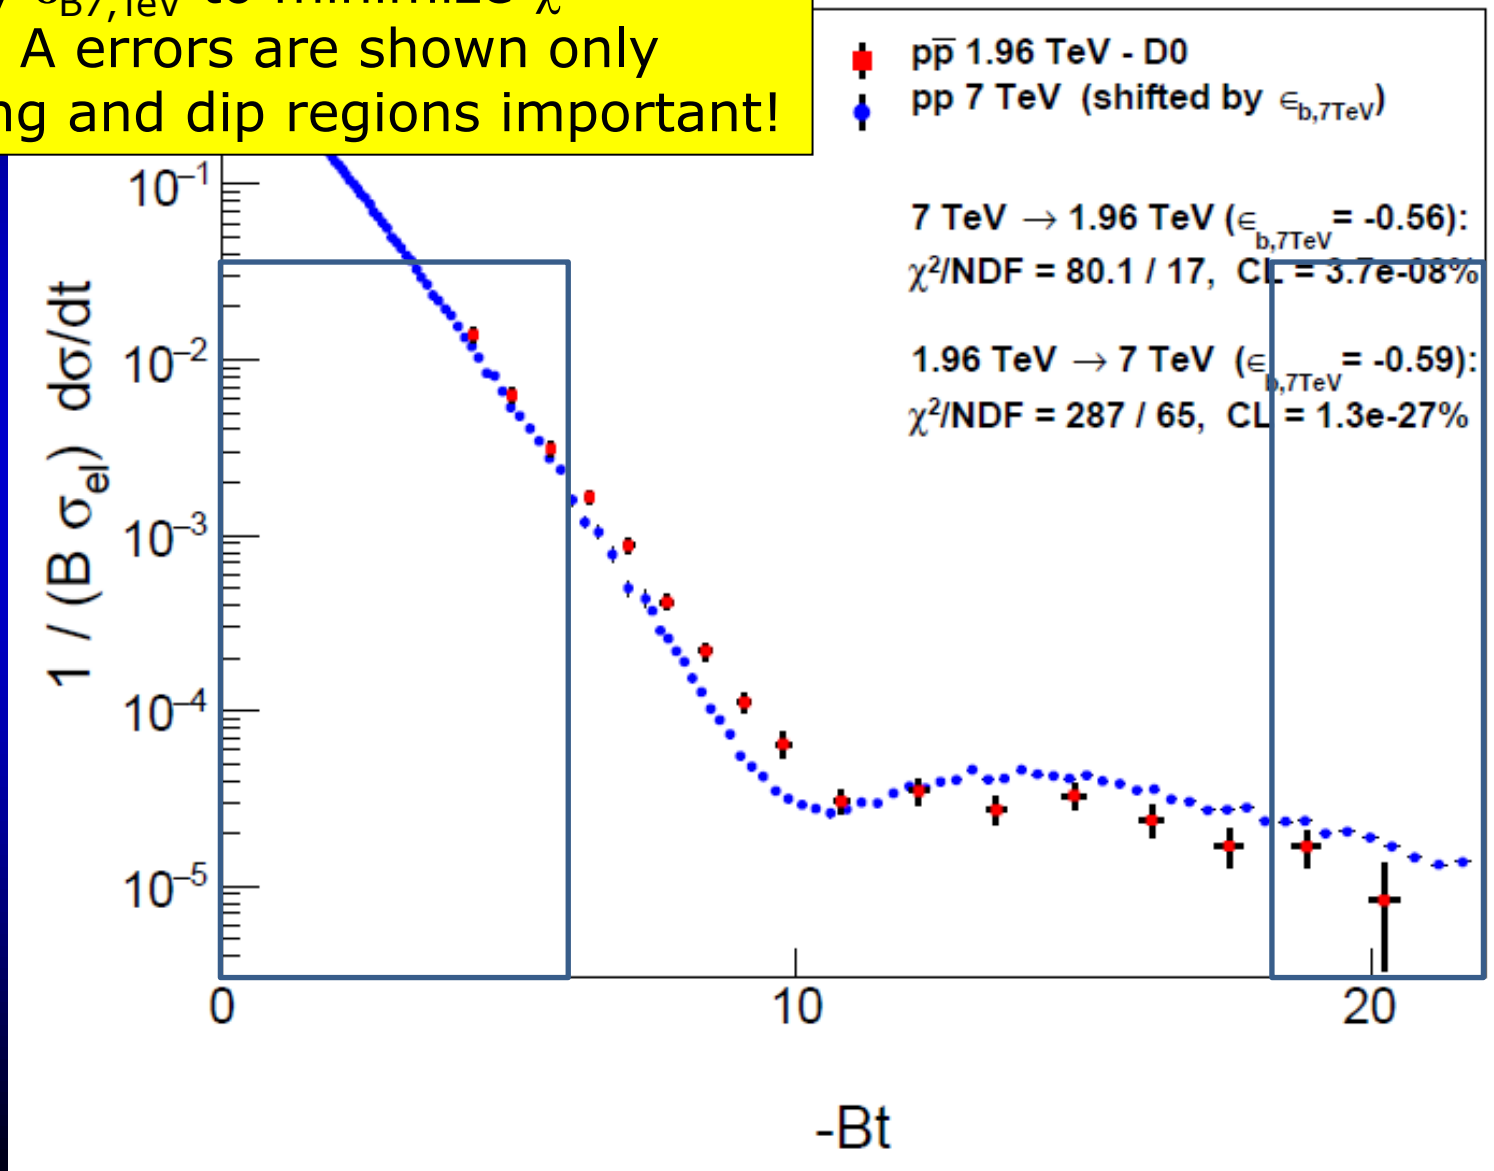
H(x|pbarp)/H(x|pp): Odderon peak



H(x) scaling is violated between √s= 8 TeV pp and 1.96 TeV pbarp. TOTEM dσ/dt data at 8 TeV. Odderon exchange, as a peak.

7 TeV: CLOSING DOORS/GATES

7 TeV data shifted
by $\varepsilon_{B7,TeV}$ to minimize χ^2
Type A errors are shown only
Both swing and dip regions important!



7 TeV RESULTS, CLOSING GATES

Two sliding gates of size n and size m:
(n,m): Leaving out the first n and last m D0 point

Sliding door technique with two wings (n,m)
Left door excludes the first n, right door excludes the last m D0 points

n	m	Odderon signal	Background
2	2	6.27 σ	1.68 σ
3	2	6.33 σ	1.70 σ
4	2	6.21 σ	2.37 σ

MODEL INDEPENT RESULT 1:
In best window, optimized Odderon signal is 6.33 σ

MODEL INDEPENT RESULT 2:
Best window: leaving out first 3 and last 2 D0 point

MODEL INDEPENT RESULT 3:
Outside the best window: H(x|pp) = H(x,pbarp)
pp and pbarp backgrounds agree within 1.7 σ

CROSS-CHECK: SIGNAL AT 8 TeV

Go direction of greater signal

Color code:
Best signal 4.55 σ
5.0 ≥ signal ≥ 4.0 σ
4.0 ≥ signal ≥ 3.0 σ

SUMMARY: ODDERON DISCOVERED IN 3 PAPERS, NEW: FOCUS ON ITS PROPERTIES

The H(x) analysis of the 8 TeV data CONFIRMED the existence Odderon. The united significance with the 7 and 8 TeV data, using the Soufferr methode is: 7.02 σ

Odderon first discovered in three published papers:
three different analysis, each with a statistical significance > 5 σ

0th property: Odderon exists!

Odderon properties: from Bialas-Bzdak model, so far valid in a limited s and $-t > 0.37$ GeV^2 range only.
1.96 TeV – 8 TeV: Threshold effect, just appearing.

There is an ongoing debate in reflective papers about the magnitude of the significance in the D0-TOTEM PRL
For exemple, is there enough evidence for Odderon at t= 0?
