COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

Introduction

- Cosmology is a science based on the study of the origin, and evolution of the universe.
- This is both theoretical and observational development that began over 100 years ago.
- A key to the development of cosmology was Einstein's static universe model derived in 1917.
- The origin was scientifically proposed as a "singularity" over 13.8 billion years ago, leading to the prediction of the Big Bang model(BB).
- BB explains the universe's origin as a big explosion that eventually started to cool forming stars, planets, and galaxies(Smeenk and Ellis 2017).

Introduction.....continues

- Observational relations between distance and recession velocity of galaxies led to Hubble's discovery in 1929 of the expanding universe.
- It has been discovered in 1998 by observing distant supernovae that the expanding universe is undergoing acceleration (Tonry et al. 2003).
- This acceleration is supported by Cosmic Microwave Background radiation (CMBR), Large Scale Structure acoustic oscillations, and weak lensing.
- The basic ΛCDM model has a fluid with constant density, and negative pressure.

COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

Chaplygin gas

• For Chapylgin gas [Kamenshchik et al PLB 511(01)265], the EoS is:

 $p = -\frac{A}{-}$

where A is a positive constant

• Einstein's field equations are:

$$R_{ab} - \frac{1}{2}Rg_{ab} = T_{ab} \tag{2}$$

• The Friedmann–Lemaitre–Robertson–Walker (FLRW) metric is:

$$ds^{2} = -dt^{2} + a^{2}(t) \left[dr^{2} + r^{2}(d\theta^{2} + \sin^{2}\theta^{2}d\phi^{2}) \right]$$

where the symbols have their usual meanings.

Bulk viscous models Comparing

• From (1)-(2) we get the Friedmann-type equation:

$$3\frac{\dot{a^2}}{a^2} = \rho$$

where ρ is the energy density, and the energy conservation equation:

$$d(\rho a^3) = -pd(a^3) \tag{5}$$

Comparing Bulk viscosity and Chaplygin gas

MS.Msweli –

COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

• From the above eqns, we get

$$\rho = \sqrt{A + \frac{B}{a^6}} \tag{6}$$

where B is an integration constant.

 From this equation (6), useful conclusions can be drawn. For positive B and small a (a⁶ << B/A), we get:

$$\rho = \sqrt{\frac{B}{a^3}}$$

which is similar to the eq for the matter-dominated era in general relativity (p=0).

Introduction

Chaplygin Gas (CG)

Other forms of Chaplygin gas

Bulk viscous models

(7)

Comparing Bulk viscosity and Chaplygin gas

COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

• For large values of a, eqs (5) & (6) yield:

$$\rho \sim \sqrt{A}, \quad p \sim -\sqrt{A}$$
(8)

resulting in the deSitter-type (accelerated) universe.

• Let us consider now expanding ρ from Eq (6) in a Taylor series, and retaining terms up to the first order only:

$$\rho = \sqrt{A} + \frac{B}{\sqrt{4A}}a^{-6} \tag{9}$$

• Also by expanding p from (5) and (6) we get

$$p = -\sqrt{A} + \frac{B}{\sqrt{4A}}a^{-6} \tag{10}$$

Eqns (9) and (10) describe a mixture of stiff matter at "intermediate" times $(p = \rho)$ with cosms const at late times \sqrt{A} MS Msweli Sac

COMPARISON

Introduction

Other forms of Chaplygin gas

Bulk viscous models Comparing

Thus we have 3 stages with just one EoS (5): dust (p = 0), stiff matter $(p = \rho)$, and finally deSitter $(p = -\rho)$

These are some of the EoS for other types of CG models:

• Generalized Chaplygin gas (GCG) model (Bento 2002)

$$p = -\frac{A}{\rho^{\alpha}} \tag{11}$$

with A is a positive constant, and α is a constant, $\alpha \geq -1.$

• Modified Chaplygin gas (MCG) model (Debnath et al 2004)

$$p = A\rho - \frac{B}{\rho^{\alpha}} \tag{12}$$

with A, B are positive constants, and α is a constant, $\alpha \geq -1$.

• Variable Modified Chaplygin (VMG) gas model (Debnath 2007)

$$p = A\rho - \frac{B(a)}{\rho^{\alpha}} \tag{13}$$

MS.Msweli _with A is positive constant and B now is a function of a scale factor, $\alpha \ge -1$.

Chaplygin Gas (CG)

Other forms of Chaplygin gas

Bulk viscous models

Comparing Bulk viscosity and Chaplygin gas • To incorporate bulk viscosity, the pressure p has to be modified as follwos:

$$\overline{p} = p - 3\eta H \tag{20}$$

where \overline{p} is the total pressure, p is the perfect fluid pressure and η is the coefficient of bulk viscosity.

• We usually take a barotropic equation of state for the perfect fluid, $\omega \rho$, $\omega = const$, and get:

$$\overline{p} = \omega \rho - 3\eta H \tag{21}$$

• Since $H = \dot{a}/a$, the bulk viscosity eq above becomes:

$$\overline{p} = \omega \rho - 3\eta \frac{\dot{a}}{a}$$

COMPARISON OF CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGICAL MODELS

Comparing Bulk viscosity and Chaplygin gas

• The coefficient of bulk viscosity η is usually (but not always) taken as

$$\eta = \eta_0 \rho^m \tag{23}$$

where m is a constant and $\eta_0 \ge 0$

• Substituting equation (23) and $\frac{\dot{a}}{a} = \sqrt{\rho/3}$ into equation (22), we get the following equation:

$$\overline{p} = \omega \rho - \sqrt{3} \eta_0 \rho^{\mathsf{m}+1/2} \tag{24}$$

We can now compare the above equation for bulk viscosity with the eqns for Chaplygin gas, viz., (5), (11)-(13)

CHAPLYGIN GAS AND BULK VISCOUS COSMOLOGI-CAL MODELS MS.Msweli

COMPARISON

Introduction

Chaplygin Gas (CG)

Other forms of Chaplygin gas

Bulk viscous models

Comparing Bulk viscosity and Chaplygin gas

- Putting for m = -3/2, $\omega = 0$ and $\sqrt{3}\eta_0 = A$ in Eq (24), we get Eq (1), which is the basic Chaplygin Gas equation.
- Putting $m = -\alpha 1/2$, $\omega = 0$ and $\sqrt{3}\eta_0 = A$ in Eq (24) for , results in Eq (11) which is the Generalized Chaplygin gas equation.
- Putting $m = -\alpha 1/2$, $\omega = A$ and $\sqrt{3}\eta_0 = B$ in Eq (24), results in Eq (12) which is the Modified Chaplygin gas equation.
- For the last form, VMG, we go back to the basic eq (16), and comapare with (13). Remembering that we have freedom of choice for η, we put

$$\eta = \frac{B(a)}{\rho^{\alpha + 1/2} 3^{3/2}}$$

(25)

Comparing Bulk viscosity and Chaplygin gas

and then find equivalence between VMG and bulk viscosity again

Conclusion

- In this talk, we have shown that for all the different forms of Chaplygin gas, they can be written as bulk viscous models for different forms of viscosity.
- The viscous models have been studied in great detail [e.g., Barrow...], and by means of simple transformations, the Chaplygin gas solutions may be obtained.
- This is an example showing the richness of bulk viscous models.
